39. Sometimes an event may not, *in itself*, seem to be contrary to the laws of nature, and yet, if it were real, it might, by reason of some circumstances, be denominated a miracle; because, in *fact*, it is contrary to these laws. Thus if a person, claiming a divine authority, should command a sick person to be well, a healthful man to fall down dead, the clouds to pour rain, the winds to blow, in short, should order many natural events, which immediately follow upon his command; these might justly be esteemed miracles, because they are really, in this case, contrary to the laws of nature. For if any suspicion remain, that the event and command concurred by accident, there is no miracle, and a transgression of these laws; because nothing can be more contrary to nature than that the voice or command of a man should have such an influence. A miracle may be accurately defined, *a transgression of a law of nature by a particular volition of the Deity, or by the interposition of some invisible agent*. A miracle may either be discoverable by men or not. This alters not its nature and essence. The raising of a house or ship into the

air is a visible miracle. The raising of a feather, when the wind wants ever so little of a force requisite for that purpose, is as real a miracle, though not so sensible with regard to us.

40. [Marcus Tullius Cicero (106–43 B.C.), the statesman and philosopher, was considered the greatest Roman orator.]

41. [Demosthenes (c. 384–322 B.C.), was a famous Greek orator.]

42. [The Capuchins, founded in the sixteenth century, were Franciscan friars who did extensive preaching and missionary work.]

43. [In *Alexander, the False Prophet*, the Greek writer Lucian (c. 120–c. 180) relates how Alexander of Abonoteichos was hailed as an oracle because of a hoax perpetrated on the people of Paphlagonia, an ancient country in Asia Minor located in what is now Turkey.]

44. [Marcus Aurelius (121–180) was a Roman emperor and a major Stoic philosopher.]

45. [Titus Livius (59 B.C.–17 A.D.), commonly known as Livy, was a Roman historian; his major work, the 142-book *History of Rome*, covered Rome's beginnings until his own time.]

46. [Vespasian (9–79) was emperor of Rome and founder of the Flavian dynasty, which ruled from 69 to 96.]

47. Hist. Bk. IV, Chap. 81. Suetonius gives nearly the same account in VESP.7. [Suetonius (69–140) was a Roman biographer.]

48. [Demetrius I (c. 336–283 B.C.) was a ruler of Macedon.]

49. Those who were present recount both events even now, when nothing is to be gained from deceit.

50. [Cardinal de Retz (1613–1679) was a French political leader.]

51. [Miraculous cures were said to occur at the tomb of Francois de Paris (1690–1727), a follower of the doctrine of Bishop Cornelius Jansen (1585–1638), founder of Jansenism, a Roman Catholic movement that stressed moral austerity and predestination. Notable French Jansenists included the scientist and philosopher Blaise Pascal (1623–1662), the dramatist Jean Racine (1639–1699), the priest and philosopher Antoine Arnauld (1612–1694), and the writer Pierre Nicole (1625–1695).]

52. This book was writ by Mons. Montgerron, counsellor or judge of the parliament of Paris, a man of figure and character, who was also a martyr to the cause, and is now said to be somewhere in a dungeon on account of his book.

There is another book in three volumes (called *Recueil des Miracles de l'Abbé Paris*) giving an account of many of these miracles, and accompanied with prefatory discourses, which are very well written. There runs, however, through the whole of these a ridiculous comparison between the miracles of our Saviour and those of the Abbé wherein it is asserted, that the evidence for the latter is equal to that for the former: As if the testimony of men could ever be put in the balance with that of God himself, who conducted the pen of the inspired writers. If these writers, indeed, were to be considered merely as human testimony, the French author is very moderate in his comparison: Since he might, with some appearance of reason, pretend, that the Jansenist miracles much surpass the other in evidence and authority. The following circumstances are drawn from authentic papers, inserted in the above-mentioned book.

Many of the miracles of Abbé Paris were proved immediately by witnesses before the officiality or bishop's court at Paris, under the eye of cardinal Noailles, whose character for integrity and capacity was never contested even by his enemies.

His successor in the archbishopric was an enemy to the Jansenists, and for that reason promoted to the see by the court. Yet 22 rectors or *curés* of Paris, with infinite earnestness, press him to examine those miracles, which they assert to be known to the whole world, and undisputably certain: But he wisely forbore.

The Molinist party had tried to discredit these miracles in one instance, that of Mademoiselle le Franc. [The Molinists were Jesuits who followed the teachings of the Spanish theologian Luis de Molina (1535–1600).] But, besides that their proceedings were in many respects the most irregular in the world, particularly in citing only a few of the Jansenist witnesses, whom they tampered with: Besides this, I say, they soon found themselves overwhelmed by a cloud of new witnesses, one hundred and twenty in number, most of them persons of credit and substance in Paris, who gave oath for the miracle. This was accompanied with a solemn and earnest appeal to the parliament. But the parliament were forbidden by authority to meddle in the affair. It was at last observed, that where men are heated by zeal and enthusiasm, there is no degree of human testimony so strong as may not be procured for the greatest absurdity: And those who will be so silly as to examine the affair by that medium, and seek particular flaws in the testimony, are almost sure to be confounded. It must be a miserable imposture, indeed, that does not prevail in that contest.

All who have been in France about that time have heard of the reputation of Mons. Heraut, the *lieutenant de Police*, whose vigilance, penetration, activity, and extensive intelligence have been much talked of. This magistrate, who by the nature of his office is almost absolute, was invested with full powers, on purpose to suppress or discredit these miracles; and he frequently seized immediately, and examined the witnesses and subjects of them: But never could reach any thing satisfactory against them.

In the case of Mademoiselle Thibaut he sent the famous De Sylva to examine her; whose evidence is very curious. The physician declares, that it was impossible she could have been so ill as was proved by witnesses; because it was impossible she could, in so short a time, have recovered so perfectly as he found her. He reasoned, like a man of sense, from natural causes; but the opposite party told him, that the whole was a miracle, and that his evidence was the best proof of it.

The Molinists were in a sad dilemma. They durst not assert the absolute insufficiency of human evidence, to prove a miracle. They were obliged to say, that these miracles were wrought by witchcraft and the devil. But they were told, that this was the resource of the Jews of old.

No Jansenist was ever embarrassed to account for the cessation of the miracles, when the church-yard was shut up by the king's edict. It was the touch of the tomb, which produced these extraordinary effects; and when no one could approach the tomb, no effects could be expected.

God, indeed, could have thrown down the walls in a moment; but he is master of his own graces and works, and it belongs not to us to account for them. He did not throw down the walls of every city like those of Jericho, on the sounding of the rams' horns, nor break up the prison of every apostle, like that of St. Paul.

No less a man, than the Duc de Chatillon, a duke and peer of France, of the highest rank and family, gives evidence of a miraculous cure, performed upon a servant of his, who had lived several years in his house with a visible and palpable infirmity.

I shall conclude with observing, that no clergy are more celebrated for strictness of life and manners than the secular clergy of France, particularly the rectors of curés of Paris, who bear testimony to these impostures.

The learning, genius, and probity of the gentlemen, and the austerity of the nuns of Port-Royal, have been much celebrated all over Europe. Yet they all give evidence for a miracle, wrought on the niece of the famous Pascal, whose sanctity of life, as well as extraordinary capacity, is well known. The famous Racine gives an account of this miracle in his famous history of Port-Royal, and fortifies it with all the proofs, which a multitude of nuns, priests, physicians, and men of the world, all of them of undoubted credit, could bestow upon it. Several men of letters, particularly the bishop of Tournay, thought this miracle so certain, as to employ it in the refutation of atheists and free-thinkers. The queen-regent of France, who was extremely prejudiced against the Port-Royal, sent her own physician to examine the miracle, who returned an absolute convert. In short, the supernatural cure was so uncontested, that it saved, for a time, that famous monastery from the ruin with which it was threatened by the Jesuits. Had it been a cheat, it had certainly been detected by such sagacious and powerful antagonists, and must have hastened the ruin of the contrivers. Our divines, who can build up a formidable castle from such despicable materials; what a prodigious fabric could they have reared from these and many other circumstances, which I have not mentioned! How often would the great names of Pascal, Racine, Arnauld, Nicole, have resounded in our ears? But if they be wise, they had better adopt the miracle, as being more worth, a thousand times, than all the rest of their collection. Besides, it may serve very much to their purpose. For that miracle was really performed by the touch of an authentic holy prick of the holy thorn, which composed the holy crown, which, &c.

53. [Philippi, a city in Eastern Macedonia, was in 42 B.C. the scene of two decisive battles in Roman history, at which Octavian (Augustus) and Marc Antony defeated Brutus and Cassius.]

54. [The battle of Pharsalia was fought in 48 B.C. in Pharsalus, a city in Thessaly, Greece, where, at a vital juncture in Roman history, Julius Caesar triumphed over Pompey.]

65. [In Athenian balloting white beans signified agreement, black ones disagreement.]

66. [Zeuxis was a fifth-century-B.C. Greek painter.]

67. [According to Roman mythology, Jupiter was the supreme deity.]

68. In general, it may, I think, be established as a maxim, that where any cause is known only by its particular effects, it must be impossible to infer any new effects from that cause; since the qualities, which are requisite to produce these new effects along with the former, must either be different, or superior, or of more extensive operation, than those which simply produced the effect, whence alone the cause is supposed to be known to us. We can never, therefore, have any reason to suppose the existence of these qualities. To say, that the new effects proceed only from a continuation of the same energy, which is already known from the first effects, will not remove the difficulty. For even granting this to be the case (which can seldom be supposed), the very continuation and exertion of a like energy (for it is impossible it can be absolutely the same), I say, this exertion of a like energy, in a different period of space and time, is a very arbitrary supposition, and what there cannot possibly be any traces of in the effects, from which all our knowledge of the cause is originally derived. Let the *inferred* cause be exactly proportioned (as it should be) to the known effect; and it is impossible that it can possess any qualities, from which new or different effects can be *inferred*.

69. This argument is drawn from Dr. Berkeley; and indeed most of the writings of that very ingenious author form the best lessons of skepticism, which are to be found either among the ancient or modern philosophers, Bayle [Pierre Bayle (1647–1706), a French skeptical philosopher] not excepted. He professes, however, in his title-page (and undoubtedly with great truth) to have composed his book against the skeptics as well as against the atheists and free-thinkers. But that all his arguments, though otherwise intended, are, in reality, merely skeptical, appears from this, *that they admit of no answer and produce no conviction*. Their only effect is to cause that momentary amazement and irresolution and confusion, which is the result of skepticism.

70. Whatever disputes there may be about mathematical points, we must allow that there are physical points; that is, parts of extension, which cannot be divided or lessened, either by the eye or imagination. These images, then, which are present to the fancy or senses, are absolutely indivisible, and consequently must be allowed by mathematicians to be infinitely less than any real part of extension; and yet nothing appears more certain to reason, than that an infinite number of them composes an infinite extension. How much more an infinite number of those infinitely small parts of extension, which are still supposed infinitely divisible?

71. It seems to me not impossible to avoid these absurdities and contradictions, if it be admitted, that there is no such thing as abstract or general ideas, properly speaking; but that all general ideas are, in reality, particular ones, attached to a general term, which recalls, upon occasion, other particular ones, that resemble, in certain circumstances, the idea, present to the mind. Thus when the term *horse* is pronounced, we immediately figure to ourselves the idea of a black or a white animal, of a particular size or figure: But as that term is also usually applied to animals of other colors, figures, and sizes, these ideas, though not actually present to the imagination, are easily recalled; and our reasoning and conclusion proceed in the same way, as if they were actually present. If this is admitted (as seems reasonable), it follows that all the ideas of quantity upon which mathematicians reason are nothing but particular, and such as are suggested by the senses and imagination and, consequently, cannot be infinitely divisible. It is sufficient to have dropped this hint at present without prosecuting it any farther. It certainly concerns all lovers of science not to expose themselves to the ridicule and contempt of the ignorant by their conclusions; and this seems the readiest solution of these difficulties.

72. [Nicolas Copernicus (1473–1543), the Polish astronomer, maintained that the earth revolved around the sun.]

73. [The second-century Greco-Egyptian astronomer Ptolemy maintained that the sun revolved around the earth.]

74. That impious maxim of the ancient philosophy, *Ex nihilo, nihil fit* [From nothing, nothing comes], by which the creation of matter was excluded, ceases to be a maxim, according to this philosophy. Not only the will of the supreme Being may create matter; but, for aught we know *a priori*, the will of any other being might create it, or any other cause, that the most whimsical imagination can assign.

*A Treatise of Human Nature**

BOOK I

Of the Understanding

OF PERSONAL IDENTITY

There are some philosophers who imagine we are every moment intimately conscious of what we call our self, that we feel its existence and its continuance in existence, and are certain beyond the evidence of a demonstration both of its perfect identity and simplicity. The strongest sensation, the most violent passion, they say, instead of distracting us from this view, only fix it the more intensely and make us consider their influence on *self* either by their pain or pleasure. To attempt a further proof of this would be to weaken its evidence, since no proof can be derived from any fact of which we are so intimately conscious, nor is there anything of which we can be certain if we doubt of this.

Unluckily all these positive assertions are contrary to that very experience which is pleaded for them, nor have we any idea of *self* after the manner it is here explained. For from what impression could this idea be derived? This question it is impossible to answer without a manifest contradiction and absurdity, and yet it is a question which must necessarily be answered, if we would have the idea of self pass for clear and intelligible. It must be some one impression that gives rise to every real idea. But self or person is not any one impression, but that to which our several impressions and ideas are supposed to have a reference. If any impression gives rise to the idea of self, that impression must continue invariably the same through the whole course of our lives, since self is supposed to exist after that manner. But there is no impression constant and invariable. Pain and pleasure, grief and joy, passions and sensations succeed each other and never all exist at the same time. It cannot, therefore, be from any of these impressions or from any other that the idea of self is derived, and, consequently, there is no such idea.

But further, what must become of all our particular perceptions upon this hypothesis? All these are different, and distinguishable, and separable from each other, and may be separately considered, and may exist separately, and have no need of anything to support their existence. After what manner therefore do they belong to self and how are they connected with it? For my part, when I enter most intimately into what I call *myself*, I always stumble on some particular perception or other, of heat or cold, light or shade, love or hatred, pain or pleasure. I never can catch *myself* at any time without a perception and never can observe anything but the perception. When my perceptions are removed for any time, as by sound sleep, so long am I insensible of myself and may truly be said not to exist. And were all my perceptions removed by death and could I neither think, nor feel, nor see, nor love, nor hate after the dissolution of my body, I should be entirely annihilated, nor do I conceive what is further requisite to make me a perfect nonentity. If anyone, upon serious and unprejudiced reflection, thinks he has a different notion of *himself*, I must confess I can reason no longer with him. All I can allow him is that he may be in the right as well as I and that we are essentially different in this particular. He may, perhaps, perceive something simple and continued which he calls *himself*, though I am certain there is no such principle in me.

But setting aside some metaphysicians of this kind, I may venture to affirm of the rest of mankind that they are nothing but a bundle or collection of different perceptions which succeed each other with an inconceivable rapidity and are in a perpetual flux and movement. Our eyes cannot turn in their sockets without varying our perceptions. Our thought is still more variable than our sight and all our other senses and faculties contribute to this change; nor is there any single power of the soul which remains unalterably the same perhaps for one moment. The mind is a kind of theater where several perceptions successively make their appearance, pass, repass, glide away, and mingle in an infinite variety of postures and situations. There is properly no *simplicity* in it at one time nor *identity* in different, whatever natural propensity we may have to imagine that simplicity and identity. The comparison of the theater must not mislead us. They are the successive perceptions only that constitute the mind, nor have we the most distant notion of the place where these scenes are represented or of the materials of which it is composed.

What, then, gives us so great a propensity to ascribe an identity to these successive perceptions and to suppose ourselves possessed of an invariable and uninterrupted existence through the whole course of our lives? In order to answer this question we must distinguish between personal identity as it regards our thought or imagination and as it regards our passions or the concern we take in ourselves. The first is our present subject and to explain it perfectly we must take the matter pretty deep and account for that identity which we attribute to plants and animals, there being a great analogy between it and the identity of a self or person.

We have a distinct idea of an object that remains invariable and uninterrupted through a supposed variation of time and this idea we call that of *identity* or *sameness*. We have also a distinct idea of several different objects existing in succession and connected together by a close relation, and this, to an accurate view, affords as perfect a notion of *diversity* as if there was no manner of relation among the objects. But though these two ideas of identity and a succession of related objects be in themselves perfectly distinct and even contrary, yet it is certain that, in our common way of thinking, they are generally confounded with each other. That action of the imagination by which we consider the uninterrupted and invariable object and that by which we reflect on the succession of related objects are almost the same to the feeling, nor is there much more effort of thought required in the latter case than in the former. The relation facilitates the transition of the mind from one object to another and renders its passage as smooth as if it contemplated one continued object. This resemblance is the cause of the confusion and mistake and makes us substitute the notion of identity instead of that of related objects. However at one instant we may consider the related succession as variable or interrupted, we are sure the next to ascribe to it a perfect identity and regard it as invariable and uninterrupted. Our propensity to this mistake is so great from the resemblance above mentioned that we fall into it before we are aware, and though we incessantly correct ourselves by reflection and return to a more accurate method of thinking, yet we cannot long sustain our philosophy or take off this bias from the imagination. Our last resource is to yield to it and boldly assert that these different related objects are in effect the same, however interrupted and variable. In order to justify to ourselves this absurdity, we often feign some new and unintelligible principle that connects the objects together and prevents their interruption or variation. Thus we feign the continued existence of the perceptions of our senses to remove the interruption and run into the notion of a *soul*, and *self*, and *substance* to disguise the variation. But, we may further observe that where we do not give rise to such a fiction, our propensity to confound identity with relation is so great that we are apt to imagine something unknown and mysterious, connecting the parts, besides their relation, and this I take to be the case with regard to the identity we ascribe to plants and vegetables. And even when this does not take place, we still feel a propensity to confound these ideas, though we are not able fully to satisfy ourselves in that particular nor find anything invariable and uninterrupted to justify our notion of identity.

Thus the controversy concerning identity is not merely a dispute of words. For when we attribute identity, in an improper sense, to variable or interrupted objects, our mistake is not confined to the expression, but is commonly attended with a fiction, either of something invariable and uninterrupted, or of something mysterious and inexplicable, or at least with a propensity to such fictions. What will suffice to prove this hypothesis to the satisfaction of every fair inquirer is to show from daily experience and observation that the objects which are variable or interrupted, and yet are supposed to continue the same, are such only as consist of a succession of parts, connected together by resemblance, contiguity, or causation. For as such a succession answers evidently to our notion of diversity, it can only be by mistake we ascribe to it an identity, and as the relation of parts, which leads us into this mistake, is really nothing but a quality which produces an association of ideas and an easy transition of the imagination from one to another, it can only be from the resemblance which this act of the mind bears to that by which we contemplate one continued object that the error arises. Our chief business, then, must be to prove that all objects to which we ascribe identity without observing their invariableness and uninterruptedness are such as consist of a succession of related objects.

In order to [see] this, suppose any mass of matter of which the parts are contiguous and connected to be placed before us. It is plain we must attribute a perfect identity to this mass, provided all the parts continue uninterruptedly and invariably the same, whatever motion or change of place we may observe either in the whole or in any of the parts. But supposing some very *small* or *inconsiderable* part to be added to the mass or subtracted from it, though this absolutely destroys the identity of the whole, strictly speaking, yet as we seldom think so accurately, we scruple not to pronounce a mass of matter the same where we find so trivial an alteration. The passage of the thought from the object before the change to the object after it is so smooth and easy that we scarce perceive the transition and are apt to imagine that it is nothing but a continued survey of the same object.

There is a very remarkable circumstance that attends this experiment, which is that though the change of any considerable part in a mass of matter destroys the identity of the whole, yet we must measure the greatness of the part, not absolutely, but by its *proportion* to the whole. The addition or diminution of a mountain would not be sufficient to produce a diversity in a planet, though the change of a very few inches would be able to destroy the identity of some bodies. It will be impossible to account for this but by reflecting that objects operate upon the mind and break or interrupt the continuity of its actions not according to their real greatness, but according to their proportion to each other, and therefore, since this interruption makes an object cease to appear the same, it must be the uninterrupted progress of the thought which constitutes the imperfect identity.

This may be confirmed by another phenomenon. A change in any considerable part of a body destroys its identity, but it is remarkable that where the change is produced *gradually* and *insensibly* we are less apt to ascribe to it the same effect. The reason can plainly be no other than that the mind, in following the successive changes of the body, feels an easy passage from surveying its condition in one moment to viewing of it in another and at no particular time perceives any interruption in its actions — from which continued perception it ascribes a continued existence and identity to the object.

But whatever precaution we may use in introducing the changes gradually and making them proportional to the whole, it is certain that where the changes are at last observed to become considerable, we make a scruple of ascribing identity to such different objects. There is, however, another artifice by which we may induce the imagination to advance a step further, and that is by producing a reference of the parts to each other and a combination to some *common end* or purpose. A ship of which a considerable part has been changed by frequent repairs is still considered as the same, nor does the difference of the materials hinder us from ascribing an identity to it. The common end, in which the parts conspire, is the same under all their variations and affords an easy transition of the imagination from one situation of the body to another.

But this is still more remarkable when we add a *sympathy* of parts to their *common end* and suppose that they bear to each other the reciprocal relation of cause and effect in all their actions and operations. This is the case with all animals and vegetables, where not only the several parts have a reference to some general purpose, but also a mutual dependence on and connection with each other. The effect of so strong a relation is that though everyone must allow that in a very few years both vegetables and animals endure a *total* change, yet we still attribute identity to them, while their form, size, and substance are entirely altered. An oak that grows from a small plant to a large tree is still the same oak, though there is not one particle of matter or figure of its parts the same. An infant becomes a man and is sometimes fat, sometimes lean without any change in his identity.

We may also consider the two following phenomena, which are remarkable in their kind. The first is that though we are commonly able to distinguish pretty exactly between numerical and specific identity, yet it sometimes happens that we confound them and in our thinking and reasoning employ the one for the other. Thus, a man who hears a noise that is frequently interrupted and renewed says it is still the same noise, though it is evident the sounds have only a specific identity or resemblance and there is nothing numerically the same but the cause which produced them. In like manner it may be said without breach of the propriety of language that such a church, which was formerly of brick, fell to ruin and that the parish rebuilt the same church of freestone and according to modern architecture. Here neither the form nor materials are the same, nor is there anything common to the two objects but their relation to the inhabitants of the parish. Yet this alone is sufficient to make us denominate them the same. But we must observe that in these cases the first object is in a manner annihilated before the second comes into existence, by which means we are never presented in any one point of time with the idea of difference and multiplicity and, for that reason, are less scrupulous in calling them the same.

Secondly, we may remark that though in a succession of related objects it is in a manner requisite that the change of parts are not sudden nor entire in order to preserve the identity, yet where the objects are in their nature changeable and inconstant, we admit of a more sudden transition than would otherwise be consistent with that relation. Thus, as the nature of a river consists in the motion and change of parts, though in less than twenty-four hours these are totally altered, this does not hinder the river from continuing the same during several ages. What is natural and essential to anything is, in a manner, expected, and what is expected makes less impression and appears of less moment than what is unusual and extraordinary. A considerable change of the former kind seems really less to the imagination than the most trivial alteration of the latter and, by breaking less the continuity of the thought, has less influence in destroying the identity.

We now proceed to explain the nature of *personal identity*, which has become so great a question in philosophy, especially of late years, in *England*, where all the more abstruse sciences are studied with a peculiar ardor and application. And here it is evident the same method of reasoning must be continued which has so successfully explained the identity of plants and animals, and ships and houses, and of all the compounded and changeable productions either of art or nature. The identity which we ascribe to the mind of man is only a fictitious one and of a like kind with that which we ascribe to vegetables and animal bodies. It cannot, therefore, have a different origin, but must proceed from a like operation of the imagination upon like objects.

But lest this argument should not convince the reader, though in my opinion perfectly decisive, let him weigh the following reasoning, which is still closer and more immediate. It is evident that the identity which we attribute to the human mind, however perfect we may imagine it to be, is not able to run the several different perceptions into one and make them lose their characters of distinction and difference which are

essential to them. It is still true that every distinct perception which enters into the composition of the mind is a distinct existence, and is different, and distinguishable, and separable from every other perception, either contemporary or successive. But as, notwithstanding this distinction and separability, we suppose the whole train of perceptions to be united by identity, a question naturally arises concerning this relation of identity, whether it is something that really binds our several perceptions together or only associates their ideas in the imagination, that is, in other words, whether, in pronouncing concerning the identity of a person, we observe some real bond among his perceptions or only feel one among the ideas we form of them. This question we might easily decide if we would recollect what has been already proved at large, namely, that the understanding never observes any real connection among objects and that even the union of cause and effect, when strictly examined, resolves itself into a customary association of ideas. For from this it evidently follows that identity is nothing really belonging to these different perceptions and uniting them together but rather is merely a quality which we attribute to them because of the union of their ideas in the imagination when we reflect upon them. Now, the only qualities which can give ideas a union in the imagination are these three relations above mentioned. These are the uniting principles in the ideal world, and without them every distinct object is separable by the mind, and may be separately considered, and appears not to have any more connection with any other object than if disjoined by the greatest difference and remoteness. It is, therefore, on some of these three relations of resemblance, contiguity, and causation that identity depends, and as the very essence of these relations consists in their producing an easy transition of ideas, it follows that our notions of personal identity proceed entirely from the smooth and uninterrupted progress of the thought along a train of connected ideas, according to the principles above explained.

The only question, therefore, which remains is by what relations this uninterrupted progress of our thought is produced when we consider the successive existence of a mind or thinking person. And here it is evident we must confine ourselves to resemblance and causation and must drop contiguity, which has little or no influence in the present case.

To begin with *resemblance*: Suppose we could see clearly into the breast of another and observe that succession of perceptions which constitutes his mind or thinking principle, and suppose that he always preserves the memory of a considerable part of past perceptions, it is evident that nothing could more contribute to bestowing a relation on this succession amid all its variations. For what is the memory but a faculty by which we raise up the images of past perceptions? And as an image necessarily resembles its object, must not the frequent placing of these resembling perceptions in the chain of thought convey the imagination more easily from one link to another and make the whole seem like the continuance of one object? In this particular, then, the memory not only discovers the identity, but also contributes to its production by producing the relation of resemblance among the perceptions. The case is the same whether we consider ourselves or others.

As to *causation*, we may observe that the true idea of the human mind is to consider it as a system of different perceptions or different existences which are linked together by the relation of cause and effect, and mutually produce, destroy, influence, and modify each other. Our impressions give rise to their correspondent ideas, and these ideas, in their turn, produce other impressions. One thought chases another and draws after it a third by which it is expelled in its turn. In this respect, I cannot compare the soul more properly to anything than to a republic or commonwealth in which the several members are united by the reciprocal ties of government and subordination and give rise to other persons who propagate the same republic in the incessant changes of its parts. And as the same individual republic may not only change its members, but also its laws and constitutions, in like manner the same person may vary his character and disposition as well as his impressions and ideas without losing his identity. Whatever changes he endures, his several parts are still connected by the relation of causation. And in this view our identity with regard to the passions serves to corroborate that with regard to the imagination by making our distant perceptions influence each other and by giving us a present concern for our past or future pains or pleasures.

As memory alone acquaints us with the continuance and extent of this succession of perceptions, it is to be considered upon that account chiefly as the source of personal identity. Had we no memory, we never should have any notion of causation nor consequently of that chain of causes and effects which constitute our self or person. But having once acquired this notion of causation from the memory, we can extend the same chain of causes and consequently the identity of our persons beyond our memory and can comprehend times, circumstances, and actions which we have entirely forgotten, but suppose in general to have existed. For how few of our past actions are there of which we have any memory? Who can tell me, for instance, what were his thoughts and actions on the 1st of January 1715, the 11th of March 1719, and the 3rd of August 1733? Or will he affirm, because he has entirely forgotten the incidents of these days, that the present self is not the

same person with the self of that time, and by that means overturn all the most established notions of personal identity? In this view, therefore, memory does not so much *produce* as *discover* personal identity by showing us the relation of cause and effect among our different perceptions. It will be incumbent on those who affirm that memory produces entirely our personal identity to give a reason why we can thus extend our identity beyond our memory.

The whole of this doctrine leads us to a conclusion which is of great importance in the present affair, namely that all the nice and subtle questions concerning personal identity can never possibly be decided and are to be regarded rather as grammatical than as philosophical difficulties. Identity depends on the relations of ideas, and these relations produce identity by means of that easy transition they occasion. But as the relations and the easiness of the transition may diminish by insensible degrees, we have no just standard by which we can decide any dispute concerning the time when they acquire or lose a title to the name of identity. All the disputes concerning the identity of connected objects are merely verbal, except so far as the relation of parts gives rise to some fiction or imaginary principle of union as we have already observed.

What I have said concerning the first origin and uncertainty of our notion of identity, as applied to the human mind, may be extended with little or no variation to that of *simplicity*. An object whose different coexistent parts are bound together by a close relation operates upon the imagination after much the same manner as one perfectly simple and indivisible and does not require a much greater stretch of thought in order to [form] its conception. From this similarity of operation we attribute a simplicity to it and feign a principle of union as the support of this simplicity and the center of all the different parts and qualities of the object.

Thus we have finished our examination of the several systems of philosophy, both of the intellectual and moral world; and, in our miscellaneous way of reasoning, have been led into several topics, which will either illustrate and confirm some preceding part of this discourse, or prepare the way for our following opinions. It is now time to return to a more close examination of our subject, and to proceed in the accurate anatomy of human nature, having fully explained the nature of our judgment and understanding.

CONCLUSION OF THIS BOOK

But before I launch out into those immense depths of philosophy which lie before me, I find myself inclined to stop a moment in my present station, and to ponder that voyage which I have undertaken, and which undoubtedly requires the utmost art and industry to be brought to a happy conclusion. Methinks I am like a man, who, having struck on many shoals, and having narrowly escaped shipwreck in passing a small frith, has yet the temerity to put out to sea in the same leaky weather-beaten vessel, and even carries his ambition so far as to think of compassing the globe under these disadvantageous circumstances. My memory of past errors and perplexities makes me diffident for the future. The wretched condition, weakness, and disorder of the faculties, I must employ in my inquiries, increase my apprehensions. And the impossibility of amending or correcting these faculties, reduces me almost to despair, and makes me resolve to perish on the barren rock, on which I am at present, rather than venture myself upon that boundless ocean which runs out into immensity. This sudden view of my danger strikes me with melancholy; and, as it is usual for that passion, above all others, to indulge itself, I cannot forbear feeding my despair with all those desponding reflections which the present subject furnishes me with in such abundance.

I am first affrighted and confounded with that forlorn solitude in which I am placed in my philosophy, and fancy myself some strange uncouth monster, who, not being able to mingle and unite in society, has been expelled all human commerce, and left utterly abandoned and disconsolate. Fain would I run into the crowd for shelter and warmth, but cannot prevail with myself to mix with such deformity. I call upon others to join me, in order to make a company apart, but no one will hearken to me. Every one keeps at a distance, and dreads that storm which beats upon me from every side. I have exposed myself to the enmity of all metaphysicians, logicians, mathematicians, and even theologians; and can I wonder at the insults I must suffer? I have declared my disapprobation of their systems; and can I be surprised if they should express a hatred of mine and of my person? When I look abroad, I foresee on every side dispute, contradiction, anger, calumny, and detraction. When I turn my eye inward, I find nothing but doubt and ignorance. All the world conspires to oppose and contradict me; though such is my weakness, that I feel all my opinions loosen and fall of themselves, when unsupported by the approbation of others. Every step I take is with hesitation, and every new reflection makes me dread an error and absurdity in my reasoning.

For with what confidence can I venture upon such bold enterprises, when, beside those numberless infirmities peculiar to myself, I find so many which are common to human nature? Can I be sure that, in leaving all established opinions, I am following truth? and by what criterion shall I distinguish her, even if

fortune should at last guide me on her footsteps? After the most accurate and exact of my reasonings, I can give no reason why I should assent to it, and feel nothing but a *strong* propensity to consider objects *strongly* in that view under which they appear to me. Experience is a principle which instructs me in the several conjunctions of objects for the past. Habit is another principle which determines me to expect the same for the future; and both of them conspiring to operate upon the imagination, make me form certain ideas in a more intense and lively manner than others which are not attended with the same advantages. Without this quality, by which the mind enlivens some ideas beyond others (which seemingly is so trivial, and so little founded on reason), we could never assent to any argument, nor carry our view beyond those few objects which are present to our senses. Nay, even to these objects we could never attribute any existence but what was dependent on the senses, and must comprehend them entirely in that succession of perceptions which constitutes our self or person. Nay, further, even with relation to that succession, we could only admit of those perceptions which are immediately present to our consciousness; nor could those lively images, with which the memory presents us, be ever received as true pictures of past perceptions. The memory, senses, and understanding are therefore all of them founded on the imagination, or the vivacity of our ideas.

No wonder a principle so inconstant and fallacious should lead us into errors when implicitly followed (as it must be) in all its variations. It is this principle which makes us reason from cause and effect; and it is the same principle which convinces us of the continued existence of external objects when absent from the senses. But though these two operations be equally natural and necessary in the human mind, yet in some circumstances they are directly contrary; nor is it possible for us to reason justly and regularly from causes and effects, and at the same time believe the continued existence of matter? How shall we adjust those principles together? Which of them shall we prefer? Or in case we prefer neither of them, but successively assent to both, as is usual among philosophers, with what confidence can we afterwards usurp that glorious title, when we thus knowingly embrace a manifest contradiction?

This contradiction would be more excusable were it compensated by any degree of solidity and satisfaction in the other parts of our reasoning. But the case is quite contrary. When we trace up the human understanding to its first principles, we find it to lead us into such sentiments as seem to turn into ridicule all our past pains and industry, and to discourage us from future inquiries. Nothing is more curiously inquired after by the mind of man than the causes of every phenomenon; nor are we content with knowing the immediate causes, but push on our inquiries till we arrive at the original and ultimate principle. We would not willingly stop before we are acquainted with that energy in the cause by which it operates on its effect; that tie, which connects them together; and that efficacious quality on which the tie depends. This is our aim in all our studies and reflections: and how must we be disappointed when we learn that this connection, tie, or energy lies merely in ourselves, and is nothing but that determination of the mind which is acquired by custom, and causes us to make a transition from an object to its usual attendant, and from the impression of one to the lively idea of the other? Such a discovery not only cuts off all hope of ever attaining satisfaction, but even prevents our very wishes; since it appears, that when we say we desire to know the ultimate and operating principle as something which resides in the external object, we either contradict ourselves, or talk without a meaning.

This deficiency in our ideas is not indeed perceived in common life, nor are we sensible that, in the most usual conjunctions of cause and effect, we are as ignorant of the ultimate principle which binds them together, as in the most unusual and extraordinary. But this proceeds merely from an illusion of the imagination; and the question is, how far we ought to yield to these illusions. This question is very difficult, and reduces us to a very dangerous dilemma, whichever way we answer it. For if we assent to every trivial suggestion of the fancy, beside that these suggestions are often contrary to each other, they lead us into such errors, absurdities, and obscurities, that we must at last become ashamed of our credulity. Nothing is more dangerous to reason than the flights of the imagination, and nothing has been the occasion of more mistakes among philosophers. Men of bright fancies may in this respect be compared to those angels, whom the Scripture represents as covering their eyes with their wings. This has already appeared in so many instances, that we may spare ourselves the trouble of enlarging upon it any further.

But, on the other hand, if the consideration of these instances makes us take a resolution to reject all the trivial suggestions of the fancy, and adhere to the understanding, that is, to the general and more established properties of the imagination; even this resolution, if steadily executed, would be dangerous, and attended with the most fatal consequences. For I have already shown that the understanding, when it acts alone, and according to its most general principles, entirely subverts itself, and leaves not the lowest degree of evidence in any proposition, either in philosophy or common life. We save ourselves from this total scepticism only by means of that singular and seemingly trivial property of the fancy, by which we enter with difficulty into

remote views of things, and are not able to accompany them with so sensible an impression, as we do those which are more easy and natural. Shall we, then, establish it for a general maxim, that no refined or elaborate reasoning is ever to be received? Consider well the consequences of such a principle. By this means you cut off entirely all science and philosophy: you proceed upon one singular quality of the imagination, and by a parity of reason must embrace all of them; and you expressly contradict yourself; since this maxim must be built on the preceding reasoning, which will be allowed to be sufficiently refined and metaphysical. What party, then, shall we choose among these difficulties? If we embrace this principle, and condemn all refined reasoning, we run into the most manifest absurdities. If we reject it in favour of these reasonings, we subvert entirely the human understanding. We have therefore no choice left, but betwixt a false reason and none at all. For my part, I know not what ought to be done in the present case. I can only observe what is commonly done; which is, that this difficulty is seldom or never thought of; and even where it has once been present to the mind, is quickly forgot, and leaves but a small impression behind it. Very refined reflections have little or no influence upon us; and yet we do not, and cannot establish it for a rule, that they ought not to have any influence; which implies a manifest contradiction.

But what have I here said, that reflections very refined and metaphysical have little or no influence upon us? This opinion I can scarce forbear retracting, and condemning from my present feeling and experience. The *intense* view of these manifold contradictions and imperfections in human reason has so wrought upon me, and heated my brain, that I am ready to reject all belief and reasoning, and can look upon no opinion even as more probable or likely than another. Where am I, or what? From what causes do I derive my existence, and to what condition shall I return? Whose favour shall I court, and whose anger must I dread? What beings surround me? and on whom have I any influence, or who have any influence on me? I am confounded with all these questions, and begin to fancy myself in the most deplorable condition imaginable, environed with the deepest darkness, and utterly deprived of the use of every member and faculty.

Most fortunately it happens, that since reason is incapable of dispelling these clouds, Nature herself suffices to that purpose, and cures me of this philosophical melancholy and delirium, either by relaxing this bent of mind, or by some avocation, and lively impression of my senses, which obliterate all these chimeras. I dine, I play a game of backgammon, I converse, and am merry with my friends; and when, after three or four hours' amusement, I would return to these speculations, they appear so cold, and strained, and ridiculous, that I cannot find in my heart to enter into them any further.

Here, then, I find myself absolutely and necessarily determined to live, and talk, and act like other people in the common affairs of life. But notwithstanding that my natural propensity, and the course of my animal spirits and passions reduce me to this indolent belief in the general maxims of the world, I still feel such remains of my former disposition, that I am ready to throw all my books and papers into the fire, and resolve never more to renounce the pleasures of life for the sake of reasoning and philosophy. For those are my sentiments in that splenetic humour which governs me at present. I may, nay I must yield to the current of nature, in submitting to my senses and understanding; and in this blind submission I show most perfectly my sceptical disposition and principles. But does it follow that I must strive against the current of nature, which leads me to indolence and pleasure; that I must seclude myself, in some measure, from the commerce and society of men, which is so agreeable; and that I must torture my brain with subtilties and sophistries, at the very time that I cannot satisfy myself concerning the reasonableness of so painful an application, nor have any tolerable prospect of arriving by its means at truth and certainty? Under what obligation do I lie of making such an abuse of time? And to what end can it serve, either for the service of mankind, or for my own private interest? No: if I must be a fool, as all those who reason or believe anything *certainly* are, my follies shall at least be natural and agreeable. Where I strive against my inclination, I shall have a good reason for my resistance; and will no more be led a wandering into such dreary solitudes, and rough passages, as I have hitherto met with.

These are the sentiments of my spleen and indolence; and indeed I must confess, that philosophy has nothing to oppose to them, and expects a victory more from the returns of a serious good-humoured disposition, than from the force of reason and conviction. In all the incidents of life, we ought still to preserve our scepticism. If we believe that fire warms, or water refreshes, it is only because it costs us too much pains to think otherwise. Nay, if we are philosophers, it ought only to be upon sceptical principles, and from an inclination which we feel to the employing ourselves after that manner. Where reason is lively, and mixes itself with some propensity, it ought to be assented to. Where it does not, it never can have any title to operate upon us.

At the time, therefore, that I am tired with amusement and company, and have indulged a *reverie* in my chamber, or in a solitary walk by a river side, I feel my mind all collected within itself, and am naturally

inclined to carry my view into all those subjects, about which I have met with so many disputes in the course of my reading and conversation. I cannot forbear having a curiosity to be acquainted with the principles of moral good and evil, the nature and foundation of government, and the cause of those several passions and inclinations which actuate and govern me. I am uneasy to think I approve of one object, and disapprove of another; call one thing beautiful, and another deformed; decide concerning truth and falsehood, reason and folly, without knowing upon what principles I proceed. I am concerned for the condition of the learned world, which lies under such a deplorable ignorance in all these particulars. I feel an ambition to arise in me of contributing to the instruction of mankind, and of acquiring a name by my inventions and discoveries. These sentiments spring up naturally in my present disposition; and should I endeavour to banish them, by attaching myself to any other business or diversion, I *feel* I should be a loser in point of pleasure; and this is the origin of my philosophy.

But even to suppose this curiosity and ambition should not transport me into speculations without the sphere of common life, it would necessarily happen that from my very weakness I must be led into such inquiries. It is certain that superstition is much more bold in its systems and hypotheses than philosophy; and while the latter contents itself with assigning new causes and principles to the phenomena which appear in the visible world, the former opens a world of its own, and presents us with scenes, and beings, and objects, which are altogether new. Since, therefore, it is almost impossible for the mind of man to rest, like those of beasts, in that narrow circle of objects, which are the subject of daily conversation and action, we ought only to deliberate concerning the choice of our guide, and ought to prefer that which is safest and most agreeable. And in this respect I make bold to recommend philosophy, and shall not scruple to give it the preference to superstition of every kind or denomination. For as superstition arises naturally and easily from the popular opinions of mankind, it seizes more strongly on the mind, and is often able to disturb us in the conduct of our lives and actions. Philosophy, on the contrary, if just, can present us only with mild and moderate sentiments; and if false and extravagant, its opinions are merely the objects of a cold and general speculation, and seldom go so far as to interrupt the course of our natural propensities. The *Cynics*¹ are an extraordinary instance of philosophers, who, from reasonings purely philosophical, ran into as great extravagancies of conduct as any *monk* or *dervish* that ever was in the world. Generally speaking, the errors in religion are dangerous; those in philosophy only ridiculous.

I am sensible that these two cases of the strength and weakness of the mind will not comprehend all mankind, and that there are in England, in particular, many honest gentlemen, who, being always employed in their domestic affairs, or amusing themselves in common recreations, have carried their thoughts very little beyond those objects, which are every day exposed to their senses. And indeed, of such as these I pretend not to make philosophers, nor do I expect them either to be associates in these researches, or auditors of these discoveries. They do well to keep themselves in their present situation; and, instead of refining them into philosophers, I wish we could communicate to our founders of systems, a share of this gross earthy mixture, as an ingredient, which they commonly stand much in need of, and which would serve to temper those fiery particles, of which they are composed. While a warm imagination is allowed to enter into philosophy, and hypotheses embraced merely for being spacious and agreeable, we can never have any steady principles, nor any sentiments, which will suit with common practice and experience. But were these hypotheses once removed, we might hope to establish a system or set of opinions, which if not true (for that, perhaps, is too much to be hoped for), might at least be satisfactory to the human mind, and might stand the test of the most critical examination. Nor should we despair of attaining this end, because of the many chimerical systems, which have successively arisen and decayed away among men, would we consider the shortness of that period, wherein these questions have been the subjects of inquiry and reasoning. Two thousand years with such long interruptions, and under such mighty discouragements, are a small space of time to give any tolerable perfection to the sciences; and perhaps we are still in too early an age of the world to discover any principles which will bear the examination of the latest posterity. For my part, my only hope is, that I may contribute a little to the advancement of knowledge, by giving in some particulars a different turn to the speculations of philosophers, and pointing out to them more distinctly those subjects where alone they can expect assurance and conviction. Human Nature is the only science of man; and yet has been hitherto the most neglected. It will be sufficient for me, if I can bring it a little more into fashion; and the hope of this serves to compose my temper from that spleen, and invigorate it from that indolence, which sometimes prevail upon me. If the reader finds himself in the same easy disposition, let him follow me in my future speculations. If not, let him follow his inclination, and wait the returns of application and good humour. The conduct of a man who studies philosophy in this careless manner, is more truly sceptical than that of one who, feeling in himself an inclination to it, is yet so overwhelmed with doubts and scruples, as totally to reject it. A true sceptic will be diffident of his philosophical doubts, as well as of his philosophical convictions; and will never refuse any

innocent satisfaction which offers itself, upon account of either of them.

Nor is it only proper we should in general indulge our inclination in the most elaborate philosophical researches, notwithstanding our sceptical principles, but also that we should yield to that propensity, which inclines us to be positive and certain in *particular points*, according to the light in which we survey them in any *particular instant*. It is easier to forbear all examination and inquiry, than to check ourselves in so natural a propensity, and guard against that assurance, which always arises from an exact and full survey of an object. On such an occasion we are apt not only to forget our scepticism, but even our modesty too; and make use of such terms as these, *it is evident, it is certain, it is undeniable*; which a due deference to the public ought, perhaps, to prevent. I may have fallen into this fault after the example of others; but I here enter a *caveat* against any objections which may be offered on that head; and declare that such expressions were extorted from me by the present view of the object, and imply no dogmatical spirit, nor conceited idea of my own judgment, which are sentiments that I am sensible can become nobody, and a sceptic still less than any other.

Every one has observed how much more dogs are animated when they hunt in a pack, than when they pursue their game apart; and it is evident this can proceed from nothing but from sympathy. It is also well known to hunters, that this effect follows in a greater degree, and even in too great a degree, where two packs that are strangers to each other are joined together. We might, perhaps, be at a loss to explain this phenomenon, if we had not experience of a similar in ourselves.

Envy and malice are passions very remarkable in animals. They are perhaps more common than pity; as requiring less effort of thought and imagination.

BOOK II

Of the Passions

OF LIBERTY AND NECESSITY

We come now to explain the *direct* passions, or the impressions which arise immediately from good or evil, from pain or pleasure. Of this kind are, *desire and aversion, grief and joy, hope and fear.*

Of all the immediate effects of pain and pleasure, there is none more remarkable than the *will*; and though, properly speaking, it be not comprehended among the passions, yet, as the full understanding of its nature and properties is necessary to the explanation of them, we shall here make it the subject of our inquiry. I desire it may be observed, that, by the *will*, I mean nothing but *the internal impression we feel, and are conscious of, when we knowingly give rise to any new motion of our body, or new perception of our mind.* This impression, like the preceding ones of pride and humility, love and hatred, it is impossible to define, and needless to describe any further; for which reason we shall cut off all those definitions and distinctions with which philosophers are wont to perplex rather than clear up this question; and entering at first upon the subject, shall examine that long-disputed question concerning *liberty and necessity*, which occurs so naturally in treating of the will.

It is universally acknowledged that the operations of external bodies are necessary; and that, in the communication of their motion, in their attraction, and mutual cohesion, there are not the least traces of indifference or liberty. Every object is determined by an absolute fate to a certain degree and direction of its motion, and can no more depart from that precise line in which it moves, than it can convert itself into an angel, or spirit, or any superior substance. The actions, therefore, of matter, are to be regarded as instances of necessary actions; and whatever is, in this respect, on the same footing with matter, must be acknowledged to be necessary. That we may know whether this be the case with the actions of the mind, we shall begin with examining matter, and considering on what the idea of a necessity in its operations are founded, and why we conclude one body or action to be the infallible cause of another.

It has been observed already, that in no single instance the ultimate connection of any objects is discoverable either by our senses or reason, and that we can never penetrate so far into the essence and construction of bodies, as to perceive the principle on which their mutual influence depends. It is their constant union alone with which we are acquainted; and it is from the constant union the necessity arises. If objects had not an uniform and regular conjunction with each other, we should never arrive at any idea of cause and effect; and even after all, the necessity which enters into that idea, is nothing but a determination of the mind to pass from one object to its usual attendant, and infer the existence of one from that of the other. Here then are two particulars which we are to consider as essential to necessity, viz. the constant *union* and the *inference* of the mind; and whenever we discover these, we must acknowledge a necessity. As the actions of matter have no necessity but what is derived from these circumstances, and it is not by any insight into the essence of bodies we discover their connection, the absence of this insight, while the union and inference remain, will never, in any case, remove the necessity. It is the observation of the union which produces the inference; for which reason it might be thought sufficient, if we prove a constant union in the actions of the mind, in order to establish the inference along with the necessity of these actions. But that I may bestow a greater force on my reasoning, I shall examine these particulars apart, and shall first prove from experience that our actions have a constant union with our motives, tempers, and circumstances, before I consider the inferences we draw from it.

To this end a very slight and general view of the common course of human affairs will be sufficient. There is no light in which we can take them that does not confirm this principle. Whether we consider mankind according to the difference of sexes, ages, governments, conditions, or methods of education; the same uniformity and regular operation of natural principles are discernible. Like causes still produce like effects; in the same manner as in the mutual action of the elements and powers of nature.

There are different trees which regularly produce fruit, whose relish is different from each other; and this regularity will be admitted as an instance of necessity and causes in external bodies. But are the products of Guienne and of Champagne more regularly different than the sentiments, actions, and passions of the two sexes, of which the one are distinguished by their force and maturity, the other by their delicacy and softness?

Are the changes of our body from infancy to old age more regular and certain than those of our mind and conduct? And would a man be more ridiculous, who would expect that an infant of four years old will raise a

weight of three hundred pounds, than one who, from a person of the same age, would look for a philosophical reasoning, or a prudent and well concerted action?

We must certainly allow, that the cohesion of the parts of matter arises from natural and necessary principles, whatever difficulty we may find in explaining them: and for a like reason we must allow, that human society is founded on like principles; and our reason in the latter case is better than even that in the former; because we not only observe that men *always* seek society, but can also explain the principles on which this universal propensity is founded. For is it more certain that two flat pieces of marble will unite together, than two young savages of different sexes will copulate? Do the children arise from this copulation more uniformly, than does the parents' care for their safety and preservation? And after they have arrived at years of discretion by the care of their parents, are the inconveniences attending their separation more certain than their foresight of these inconveniences, and their care of avoiding them by a close union and confederacy?

The skin, pores, muscles, and nerves of a day-labourer, are different from those of a man of quality: so are his sentiments, actions, and manners. The different stations of life influence the whole fabric, external and internal; and these different stations arise necessarily, because uniformly, from the necessary and uniform principles of human nature. Men cannot live without society, and cannot be associated without government. Government makes a distinction of property, and establishes the different ranks of men. This produces industry, traffic, manufactures, lawsuits, war, leagues, alliances, voyages, travels, cities, fleets, ports, and all those other actions and objects which cause such a diversity, and at the same time maintain such an uniformity in human life.

Should a traveler, returning from a far country, tell us, that he had seen a climate in the fiftieth degree of northern latitude, where all the fruits ripen and come to perfection in the winter, and decay in the summer, after the same manner as in England they are produced and decay in the contrary seasons, he would find few so credulous as to believe him. I am apt to think a traveler would meet with as little credit, who should inform us of people exactly of the same character with those in Plato's republic on the one hand, or those in Hobbes's *Leviathan* on the other. There is a general course of nature in human actions, as well as in the operations of the sun and the climate. There are also characters peculiar to different nations and particular persons, as well as common to mankind. The knowledge of these characters is founded on the observation of an uniformity in the actions that flow from them; and this uniformity forms the very essence of necessity.

I can imagine only one way of eluding this argument, which is by denying that uniformity of human actions, on which it is founded. As long as actions have a constant union and connection with the situation and temper of the agent, however we may in words refuse to acknowledge the necessity, we really allow the thing. Now, some may perhaps find a pretext to deny this regular union and connection. For what is more capricious than human actions? What more inconstant than the desires of man? And what creature departs more widely, not only from right reason, but from his own character and disposition? An hour, a moment is sufficient to make him change from one extreme to another, and overturn what cost the greatest pain and labour to establish. Necessity is regular and certain. Human conduct is irregular and uncertain. The one therefore proceeds not from the other.

To this I reply, that in judging of the actions of men we must proceed upon the same maxims, as when we reason concerning external objects. When any phenomena are constantly and invariably conjoined together, they acquire such a connection in the imagination, that it passes from one to the other without any doubt or hesitation. But below this there are many inferior degrees of evidence and probability, nor does one single contrariety of experiment entirely destroy all our reasoning. The mind balances the contrary experiments, and, deducting the inferior from the superior, proceeds with that degree of assurance or evidence, which remains. Even when these contrary experiments are entirely equal, we remove not the notion of causes and necessity; but, supposing that the usual contrariety proceeds from the operation of contrary and concealed causes, we conclude, that the chance or indifference lies only in our judgment on account of our imperfect knowledge, not in the things themselves, which are in every case equally necessary, though, to appearance, not equally constant or certain. No union can be more constant and certain than that of some actions with some motives and characters; and it, in other cases, the union is uncertain, it is no more than what happens in the operations of body; nor can we conclude anything from the one irregularity which will not follow equally from the other.

It is commonly allowed that madmen have no liberty. But, were we to judge by their actions, these have less regularity and constancy than the actions of wise men, and consequently are further removed from necessity. Our way of thinking in this particular is, therefore, absolutely inconsistent; but is a natural consequence of these confused ideas and undefined terms, which we so commonly make use of in our reasonings, especially on the present subject.

We must now show, that, as the *union* betwixt motives and actions has the same constancy as that in any

natural operations, so its influence on the understanding is also the same in *determining* us to infer the existence of one from that of another. If this shall appear, there is no known circumstance that enters into the connection and production of the actions of matter that is not to be found in all the operations of the mind; and consequently we cannot, without a manifest absurdity, attribute necessity to the one, and refuse it to the other.

There is no philosopher, whose judgment is so riveted to this fantastical system of liberty, as not to acknowledge the force of *moral evidence*, and both in speculation and practice proceed upon it as upon a reasonable foundation. Now, moral evidence is nothing but a conclusion concerning the actions of men, derived from the consideration of their motives, temper, and situation. Thus, when we see certain characters or figures described upon paper, we infer that the person who produced them would affirm such facts, the death of Caesar, the success of Augustus, the cruelty of Nero; and, remembering many other concurrent testimonies, we conclude that those facts were once really existent, and that so many men, without any interest, would never conspire to deceive us; especially since they must, in the attempt, expose themselves to the derision of all their contemporaries, when these facts were asserted to be recently and universally known. The same kind of reasoning runs through politics, war, commerce, economy, and indeed mixes itself so entirely in human life, that it is impossible to act or subsist a moment without having recourse to it. A prince who imposes a tax upon his subjects, expects their compliance. A general who conducts an army, makes account of a certain degree of courage. A merchant looks for fidelity and skill in his factor or supercargo. A man who gives orders for his dinner, doubts not of the obedience of his servants. In short, as nothing more nearly interests us than our own actions and those of others, the greatest part of our reasonings is employed in judgments concerning them. Now I assert, that whoever reasons after this manner, does *ipso facto* believe the actions of the will to arise from necessity, and that he knows not what he means when he denies it.

All those objects, of which we call the one *cause* and the other *effect*, considered in themselves, are as distinct and separate from each other as any two things in nature; nor can we ever, by the most accurate survey of them, infer the existence of the one from that of the other. It is only from experience and the observation of their constant union, that we are able to form this inference; and even after all, the inference is nothing but the effects of custom on the imagination. We must not here be content with saying, that the idea of cause and effect arises from objects constantly united; but must affirm, that it is the very same with the idea of these objects, and that the *necessary connection* is not discovered by a conclusion of the understanding, but is merely a perception of the mind. Wherever, therefore, we observe the same union, and wherever the union operates in the same manner upon the belief and opinion, we have the idea of cause and necessity, though perhaps we may avoid those expressions. Motion in one body, in all past instances that have fallen under our observation, is followed upon impulse by motion in another. It is impossible for the mind to penetrate further. From this constant union it *forms* the idea of cause and effect, and by its influence *feels* the necessity. As there is the same constancy, and the same influence, in what we call moral evidence, I ask no more. What remains can only be a dispute of words.

And indeed, when we consider how aptly *natural* and *moral* evidence cement together, and form only one chain of argument betwixt them, we shall make no scruple to allow, that they are of the same nature, and derived from the same principles. A prisoner, who has neither money nor interest discovers the impossibility of his escape, as well from the obstinacy of the gaoler, as from the walls and bars with which he is surrounded; and in all attempts for his freedom, chooses rather to work upon the stone and iron of the one, than upon the inflexible nature of the other. The same prisoner, when conducted to the scaffold, foresees his death as certainly from the constancy and fidelity of his guards, as from the operation of the axe or wheel. His mind runs along a certain train of ideas: the refusal of the soldiers to consent to his escape; the action of the executioner; the separation of the head and body, bleeding, convulsive motions, and death. Here is a connected chain of natural causes and voluntary actions; but the mind feels no difference betwixt them in passing from one link to another; nor is less certain of the future event that if it were connected with the present impressions of the memory and senses by a train of causes cemented together by what we are pleased to call a *physical necessity*. The same experienced union has the same effect on the mind, whether the united objects be motives, volitions, and actions, or figure and motion. We may change the names of things, but their nature and their operation on the understanding never change.

I dare be positive no one will ever endeavour to refute these reasonings otherwise than by altering my definitions, and assigning a different meaning to the terms of *cause*, and *effect*, and *necessity*, and *liberty*, and *chance*. According to my definitions, necessity makes an essential part of causation; and consequently liberty, by removing necessity, removes all causes, and is the very same thing with chance. As chance is commonly thought to imply a contradiction, and is at least directly contrary to experience, there are always the same

arguments against liberty or free-will. If any one alters the definitions, I cannot pretend to argue with him till I know the meaning he assigns to these terms.

THE SAME SUBJECT CONTINUED

I believe we may assign the three following reasons for the prevalence of the doctrine of liberty, however absurd it may be in one sense, and unintelligible in any other. First, after we have performed any action, though we confess we were influenced by particular views and motives, it is difficult for us to persuade ourselves we were governed by necessity, and that it was utterly impossible for us to have acted otherwise, the idea of necessity seeming to imply something of force, and violence, and constraint, of which we are not sensible. Few are capable of distinguishing betwixt the liberty of *spontaneity*, as it is called in the schools, and the liberty of *indifference*; betwixt that which is opposed to violence, and that which means a negation of necessity and causes. The first is even the most common sense of the word; and as it is only that species of liberty which it concerns us to preserve, our thoughts have been principally turned towards it, and have almost universally confounded it with the other.

Secondly, there is a *false sensation* or *experience* even of the liberty of indifference, which is regarded as an argument for its real existence. The necessity of any action, whether of matter or of mind, is not properly a quality in the agent, but in any thinking or intelligent being who may consider the action, and consists in the determination of his thought to infer its existence from some preceding objects: as liberty or chance, on the other hand, is nothing but the want of that determination, and a certain looseness, which we feel in passing or not passing from the idea of one to that of the other. Now, we may observe, that though in reflecting on human actions, we seldom feel such a looseness or indifference, yet it very commonly happens, that, in performing the actions themselves, we are sensible of something like it: and as all related or resembling objects are readily taken for each other, this has been employed as a demonstrative, or even an intuitive proof of human liberty. We feel that our actions are subject to our will on most occasions, and imagine we feel that the will itself is subject to nothing; because when, by a denial of it, we are provoked to try, we feel that it moves easily every way, and produces an image of itself even on that side on which it did not settle. This image or faint motion, we persuade ourselves, could have been completed into the thing itself; because, should that be denied, we find, upon a second trial, that it can. But these efforts are all in vain; and whatever capricious and irregular actions we may perform, as the desire of showing our liberty is the sole motive of our actions, we can never free ourselves from the bonds of necessity. We may imagine we feel a liberty within ourselves, but a spectator can commonly infer our actions from our motives and character; and even where he cannot, he concludes in general that he might, were he perfectly acquainted with every circumstance of our situation and temper, and the most secret springs of our complexion and disposition. Now, this is the very essence of necessity, according to the foregoing doctrine.

A third reason why the doctrine of liberty has generally been better received in the world than its antagonist, proceeds from *religion*, which has been very unnecessarily interested in this question. There is no method of reasoning more common, and yet none more blamable, than in philosophical debates to endeavour to refute any hypothesis by a pretext of its dangerous consequences to religion and morality. When any opinion leads us into absurdities, it is certainly false; but it is not certain an opinion is false because it is of dangerous consequence. Such topics, therefore, ought entirely to be forborne, as serving nothing to the discovery of truth, but only to make the person of an antagonist odious. This I observe in general, without pretending to draw any advantage from it. I submit myself frankly to an examination of this kind, and dare venture to affirm, that the doctrine of necessity, according to my explication of it, is not only innocent, but even advantageous to religion and morality.

I define necessity two ways, conformable to the two definitions of *cause*, of which it makes an essential part. I place it either in the constant union and conjunction of like objects, or in the inference of the mind from the one to the other. Now, necessity, in both these senses, has universally, though tacitly, in the schools, in the pulpit, and in common life, been allowed to belong to the will of man; and no one has ever pretended to deny, that we can draw inferences concerning human actions, and that those inferences are founded on the experienced union of like actions with like motives and circumstances. The only particular in which any one can differ from me is, either that perhaps he will refuse to call this necessity; but as long as the meaning is understood, I hope the word can do no harm; or, that he will maintain there is something else in the operations of matter. Now, whether it be so or not, is of no consequence to religion, whatever it may be to natural philosophy. I may be mistaken in asserting, that we have no idea of any other connection in the actions of body, and shall be glad to be further instructed on that head: but sure I am, I ascribe nothing to the actions of the mind, but what must readily be allowed of. Let no one, therefore, put an invidious construction

on my words, by saying simply, that I assert the necessity of human actions, and place them on the same footing with the operations of senseless matter. I do not ascribe to the will that unintelligible necessity, which is supposed to lie in matter. But I ascribe to matter that intelligible quality, call it necessity or not, which the most rigorous orthodoxy does or must allow to belong to the will. I change, therefore, nothing in the received systems, with regard to the will, but only with regard to material objects.

Nay, I shall go further, and assert, that this kind of necessity is so essential to religion and morality, that without it there must ensue an absolute subversion of both, and that every other supposition is entirely destructive to all laws, both *divine* and *human*. It is indeed certain, that as all human laws are founded on rewards and punishments, it is supposed as a fundamental principle, that these motives have an influence on the mind, and both produce the good and prevent the evil actions. We may give to this influence what name we please; but as it is usually conjoined with the action, common sense requires it should be esteemed a cause, and be looked upon as an instance of that necessity, which I would establish.

This reasoning is equally solid, when applied to *divine* laws, so far as the Deity is considered as a legislator, and is supposed to inflict punishment and bestow rewards with a design to produce obedience. But I also maintain, that even where he acts not in his magisterial capacity, but is regarded as the avenger of crimes merely on account of their odiousness and deformity, not only it is impossible, without the necessary connection of cause and effect in human actions, that punishments could be inflicted compatible with justice and moral equity; but also that it could ever enter into the thoughts of any reasonable being to inflict them. The constant and universal object of hatred or anger is a person or creature endowed with thought and consciousness; and when any criminal or injurious actions excite that passion, it is only by their relation to the person or connection with him. But according to the doctrine of liberty or chance, this connection is reduced to nothing, nor are men more accountable for those actions, which are designed and premeditated, than for such as are the most casual and accidental. Actions are, by their very nature, temporary and perishing; and where they proceed not from some cause in the characters and dispositions of the person who performed them, they infix not themselves upon him, and can neither redound to his honour, if good, nor infamy, if evil. The action itself may be blamable; it may be contrary to all the rules of morality and religion: but the person is not responsible for it; and as it proceeded from nothing in him that is durable or constant, and leaves nothing of that nature behind it, it is impossible he can, upon its account, become the object of punishment or vengeance. According to the hypothesis of liberty, therefore, a man is as pure and untainted, after having committed the most horrid crimes, as at the first moment of his birth, nor is his character any way concerned in his actions, since they are derived from it, and the wickedness of the one can never be used as a proof of the depravity of the other. It is only upon the principles of necessity, that a person acquires any merit or demerit from his actions, however the common opinion may incline to the contrary.

But so inconsistent are men with themselves, that though they often assert that necessity utterly destroys all merit and demerit either towards mankind or superior powers, yet they continue still to reason upon these very principles of necessity in all their judgments concerning this matter. Men are not blamed for such evil actions as they perform ignorantly and casually, whatever may be their consequences. Why? but because the causes of these actions are only momentary, and terminate in them alone. Men are less blamed for such evil actions as they perform hastily and unpremeditatedly, than for such as proceed from thought and deliberation. For what reason? but because a hasty temper, though a constant cause in the mind, operates only by intervals, and infects not the whole character. Again, repentance wipes off every crime, especially if attended with an evident reformation of life and manners. How is this to be accounted for? but by asserting that actions render a person criminal, merely as they are proofs of criminal passions or principles in the mind; and when, by any alteration of these principles, they cease to be just proofs, they likewise cease to be criminal. But according to the doctrine of *liberty* or *chance*, they never were just proofs, and consequently never were criminal.

Here then I turn to my adversary, and desire him to free his own system from these odious consequences before he charges them upon others. Or, if he rather chooses that this question should be decided by fair arguments before philosophers, than by declamations before the people, let him return to what I have advanced to prove that liberty and chance are synonymous; and concerning the nature of moral evidence and the regularity of human actions. Upon a review of these reasonings, I cannot doubt of an entire victory; and therefore, having proved that all actions of the will have particular causes, I proceed to explain what these causes are, and how they operate.

OF THE INFLUENCING MOTIVES OF THE WILL

Nothing is more usual in philosophy, and even in common life, than to talk of the combat of passion and

reason, to give the preference to reason, and assert that men are only so far virtuous as they conform themselves to its dictates. Every rational creature, it is said, is obliged to regulate his actions by reason; and if any other motive or principle challenge the direction of his conduct, he ought to oppose it, till it be entirely subdued, or at least brought to a conformity with that superior principle. On this method of thinking the greatest part of moral philosophy, ancient and modern, seems to be founded; nor is there an ampler field, as well for metaphysical arguments, as popular declamations, than this supposed preeminence of reason above passion. The eternity, invariableness, and divine origin of the former, have been displayed to the best advantage: the blindness, inconstancy, and deceitfulness of the latter, have been as strongly insisted on. In order to show the fallacy of all this philosophy, I shall endeavour to prove *first*, that reason alone can never be a motive to any action of the will; and *secondly*, that it can never oppose passion in the direction of the will.

The understanding exerts itself after two different ways, as it judges from demonstration or probability; as it regards the abstract relations of our ideas, or those relations of objects of which experience only gives us information. I believe it scarce will be asserted, that the first species of reasoning alone is ever the cause of any action. As its proper province is the world of ideas, and as the will always places us in that of realities, demonstration and volition seem upon that account to be totally removed from each other. Mathematics, indeed, are useful in all mechanical operations, and arithmetic in almost every art and profession: but it is not of themselves they have any influence. Mechanics are the art of regulating the motions of bodies *to some designed end or purpose*; and the reason why we employ arithmetic in fixing the proportions of numbers, is only that we may discover the proportions of their influence and operation. A merchant is desirous of knowing the sum total of his accounts with any person: why? but that he may learn what sum will have the same *effects* in paying his debt, and going to market, as all the particular articles taken together. Abstract or demonstrative reasoning, therefore, never influences any of our actions, but only as it directs our judgment concerning causes and effects; which leads us to the second operation of the understanding.

It is obvious, that when we have the prospect of pain or pleasure from any object, we feel a consequent emotion of aversion or propensity, and are carried to avoid or embrace what will give us this uneasiness or satisfaction. It is also obvious, that this emotion rests not here, but, making us cast our view on every side, comprehends whatever objects are connected with its original one by the relation of cause and effect. Here then reasoning takes place to discover this relation; and according as our reasoning varies, our actions receive a subsequent variation. But it is evident, in this case, that the impulse arises not from reason, but is only directed by it. It is from the prospect of pain or pleasure that the aversion or propensity arises towards any object: and these emotions extend themselves to the causes and effects of that object, as they are pointed out to us by reason and experience. It can never in the least concern us to know, that such objects are causes, and such others effects, if both the causes and effects be indifferent to us. Where the objects themselves do not affect us, their connection can never give them any influence; and it is plain that, as reason is nothing but the discovery of this connection, it cannot be by its means that the objects are able to affect us.

Since reason alone can never produce any action, or give rise to volition, I infer, that the same faculty is as incapable of preventing volition, or of disputing the preference with any passion or emotion. This consequence is necessary. It is impossible reason could have the latter effect of preventing volition, but by giving an impulse in a contrary direction to our passions; and that impulse, had it operated alone, would have been ample to produce volition. Nothing can oppose or retard the impulse of passion, but a contrary impulse; and if this contrary impulse ever arises from reason, that latter faculty must have an original influence on the will, and must be able to cause, as well as hinder, any act of volition. But if reason has no original influence, it is impossible it can withstand any principle which has such an efficacy, or ever keep the mind in suspense a moment. Thus, it appears, that the principle which opposes our passion cannot be the same with reason, and is only called so in an improper sense. We speak not strictly and philosophically, when we talk of the combat of passion and of reason. Reason is, and ought only to be, the slave of the passions, and can never pretend to any other office than to serve and obey them. As this opinion may appear somewhat extraordinary, it may not be improper to confirm it by some other considerations.

A passion is an original existence, or, if you will, modification of existence, and contains not any representative quality, which renders it a copy of any other existence or modification. When I am angry, I am actually possessed with the passion, and in that emotion have no more a reference to any other object, than when I am thirsty, or sick, or more than five feet high. It is impossible, therefore, that this passion can be opposed by, or be contradictory to truth and reason; since this contradiction consists in the disagreement of ideas, considered as copies, with those objects which they represent.

What may at first occur on this head is, that as nothing can be contrary to truth or reason, except what has a reference to it, and as the judgments of our understanding only have this reference, it must follow that

passions can be contrary to reason only, so far as they are *accompanied* with some judgment or opinion. According to this principle, which is so obvious and natural, it is only in two senses that any affection can be called unreasonable. First, When a passion, such as hope or fear, grief or joy, despair or security, is founded on the supposition of the existence of objects, which really do not exist. Secondly, When in exerting any passion in action, we choose means sufficient for the designed end, and deceive ourselves in our judgment of causes and effects. Where a passion is neither founded on false suppositions, nor chooses means insufficient for the end, the understanding can neither justify nor condemn it. It is not contrary to reason to prefer the destruction of the whole world to the scratching of my finger. It is not contrary to reason for me to choose my total ruin, to prevent the least uneasiness of an Indian, or person wholly unknown to me. It is as little contrary to reason to prefer even my own acknowledged lesser good to my greater, and have a more ardent affection for the former than the latter. A trivial good may, from certain circumstances, produce a desire superior to what arises from the greatest and most valuable enjoyment; nor is there anything more extraordinary in this, than in mechanics to see one pound weight raise up a hundred by the advantage of its situation. In short, a passion must be accompanied with some false judgment, in order to its being unreasonable; and even then it is not the passion, properly speaking, which is unreasonable, but the judgment.

The consequences are evident. Since a passion can never, in any sense, be called unreasonable, but when founded on a false supposition, or when it chooses means insufficient for the designed end, it is impossible that reason and passion can ever oppose each other, or dispute for the government of the will and actions. The moment we perceive the falsehood of any supposition, or the insufficiency of any means, our passions yield to our reason without any opposition. I may desire any fruit as of an excellent relish; but whenever you convince me of my mistake, my longing ceases. I may will the performance of certain actions as means of obtaining any desired good; but as my willing of these actions is only secondary, and founded on the supposition that they are causes of the proposed effect; as soon as I discover the falsehood of that supposition, they must become indifferent to me.

It is natural for one, that does not examine objects with a strict philosophic eye, to imagine, that those actions of the mind are entirely the same, which produce not a different sensation, and are not immediately distinguishable to the feeling and perception. Reason, for instance, exerts itself without producing any sensible emotions; and except in the more sublime disquisitions of philosophy, or in the frivolous subtilties of the schools, scarce ever conveys any pleasure or uneasiness. Hence it proceeds, that every action of the mind which operates with the same calmness and tranquillity, is confounded with reason by all those who judge of things from the first view and appearance. Now it is certain there are certain calm desires and tendencies, which, though they be real passions, produce little emotion in the mind, and are more known by their effects than by the immediate feeling or sensation. These desires are of two kinds; either certain instincts originally implanted in our natures, such as benevolence and resentment, the love of life, and kindness to children; or the general appetite to good, and aversion to evil, considered merely as such. When any of these passions are calm, and cause no disorder in the soul, they are very readily taken for the determinations of reason, and are supposed to proceed from the same faculty with that which judges of truth and falsehood. Their nature and principles have been supposed the same, because their sensations are not evidently different.

Besides these calm passions, which often determine the will, there are certain violent emotions of the same kind, which have likewise a great influence on that faculty. When I receive any injury from another, I often feel a violent passion of resentment, which makes me desire his evil and punishment, independent of all considerations of pleasure and advantage to myself. When I am immediately threatened with any grievous ill, my fears, apprehensions, and aversions rise to a great height, and produce a sensible emotion.

The common error of metaphysicians has lain in ascribing the direction of the will entirely to one of these principles, and supposing the other to have no influence. Men often act knowingly against their interest; for which reason, the view of the greatest possible good does not always influence them. Men often counteract a violent passion in prosecution of their interests and designs; it is not, therefore, the present uneasiness alone which determines them. In general we may observe that both these principles operate on the will; and where they are contrary, that either of them prevails, according to the *general* character or *present* disposition of the person. What we call strength of mind, implies the prevalence of the calm passions above the violent; though we may easily observe, there is no man so constantly possessed of this virtue as never on any occasion to yield to the solicitations of passion and desire. From these variations of temper proceeds the great difficulty of deciding concerning the actions and resolutions of men, where there is any contrariety of motives and passions.

BOOK III

Of Morals

MORAL DISTINCTIONS NOT DERIVED FROM REASON

There is an inconvenience which attends all abstruse reasoning, that it may silence, without convincing an antagonist, and requires the same intense study to make us sensible of its force, that was at first requisite for its invention. When we leave our closet, and engage in the common affairs of life, its conclusions seem to vanish like the phantoms of the night on the appearance of the morning; and it is difficult for us to retain even that conviction which we had attained with difficulty. This is still more conspicuous in a long chain of reasoning, where we must preserve to the end the evidence of the first propositions, and where we often lose sight of all the most received maxims, either of philosophy or common life. I am not, however, without hopes, that the present system of philosophy will acquire new force as it advances; and that our reasonings concerning *morals* will corroborate whatever has been said concerning the *understanding* and the *passions*. Morality is a subject that interests us above all others; we fancy the peace of society to be at stake in every decision concerning it; and it is evident that this concern must make our speculations appear more real and solid, than where the subject is in a great measure indifferent to us. What affects us, we conclude, can never be a chimera; and, as our passion is engaged on the one side or the other, we naturally think that the question lies within human comprehension; which, in other cases of this nature, we are apt to entertain some doubt of. Without this advantage, I never should have ventured upon a third volume of such abstruse philosophy, in an age wherein the greatest part of men seem agreed to convert reading into an amusement, and to reject everything that requires any considerable degree of attention to be comprehended.

It has been observed, that nothing is ever present to the mind but its perceptions; and that all the actions of seeing, hearing, judging, loving, hating, and thinking, fall under this denomination. The mind can never exert itself in any action which we may not comprehend under the term of *perception*; and consequently that term is no less applicable to those judgments by which we distinguish moral good and evil, than to every other operation of the mind. To approve of one character, to condemn another, are only so many different perceptions.

Now, as perceptions resolve themselves into two kinds, viz. *impressions* and *ideas*, this distinction gives rise to a question, with which we shall open up our present inquiry concerning morals, *whether it is by means of our ideas or impressions we distinguish betwixt vice and virtue, and pronounce an action blamable or praiseworthy?* This will immediately cut off all loose discourses and declamations, and reduce us to something precise and exact on the present subject.

Those who affirm that virtue is nothing but a conformity to reason; that there are eternal fitnesses and unfitnesses of things, which are the same to every rational being that considers them; that the immutable measure of right and wrong impose an obligation, not only on human creatures, but also on the Deity himself: all these systems concur in the opinion, that morality, like truth, is discerned merely by ideas, and by their juxtaposition and comparison. In order, therefore, to judge of these systems, we need only consider whether it be possible from reason alone, to distinguish betwixt moral good and evil, or whether there must concur some other principles to enable us to make that distinction.

If morality had naturally no influence on human passions and actions, it were in vain to take such pains to inculcate it; and nothing would be more fruitless than that multitude of rules and precepts with which all moralists abound. Philosophy is commonly divided into *speculative* and *practical*; and as morality is always comprehended under the latter division, it is supposed to influence our passions and actions, and to go beyond the calm and indolent judgments of the understanding. And this is confirmed by common experience, which informs us that men are often governed by their duties, and are deterred from some actions by the opinion of injustice, and impelled to others by that of obligation.

Since morals, therefore, have an influence on the actions and affections, it follows that they cannot be derived from reason; and that because reason alone, as we have already proved, can never have any such influence. Morals excite passions, and produce or prevent actions. Reason of itself is utterly impotent in this particular. The rules of morality, therefore, are not conclusions of our reason.

No one, I believe, will deny the justness of this inference; nor is there any other means of evading it, than by denying that principle on which it is founded. As long as it is allowed, that reason has no influence on our passions and actions, it is in vain to pretend that morality is discovered only by a deduction of reason. An

active principle can never be founded on an inactive; and if reason be inactive in itself, it must remain so in all its shapes and appearances, whether it exerts itself in natural or moral subjects, whether it considers the powers of external bodies, or the actions of rational beings.

It would be tedious to repeat all the arguments by which I have proved that reason is perfectly inert, and can never either prevent or produce any action or affection. It will be easy to recollect what has been said upon that subject. I shall only recall on this occasion one of these arguments, which I shall endeavour to render still more conclusive, and more applicable to the present subject.

Reason is the discovery of truth or falsehood. Truth or falsehood consists in an agreement or disagreement either to the *real* relations of ideas, or to *real* existence and matter of fact. Whatever therefore is not susceptible of this agreement or disagreement, is incapable of being true or false, and can never be an object of our reason. Now, it is evident our passions, volitions, and actions, are not susceptible of any such agreement or disagreement; being original facts and realities, complete in themselves, and implying no reference to other passions, volitions, and actions. It is impossible, therefore, they can be pronounced either true or false, and be either contrary or conformable to reason.

This argument is of double advantage to our present purpose. For it proves *directly*, that actions do not derive their merit from a conformity to reason, nor their blame from a contrariety to it; and it proves the same truth more *indirectly*, by showing us, that as reason can never immediately prevent or produce any action by contradicting or approving of it, it cannot be the source of moral good and evil, which are found to have that influence. Actions may be laudable or blamable; but they cannot be reasonable or unreasonable: laudable or blamable, therefore, are not the same with reasonable or unreasonable. The merit and demerit of actions frequently contradict, and sometimes control our natural propensities. But reason has no such influence. Moral distinctions, therefore, are not the offspring of reason. Reason is wholly inactive, and can never be the source of so active a principle as conscience, or a sense of morals.

But perhaps it may be said, that though no will or action can be immediately contradictory to reason, yet we may find such a contradiction in some of the attendants of the actions, that is, in its causes or effects. The action may cause a judgment, or may be *obliquely* caused by one, when the judgment concurs with a passion; and by an abusive way of speaking, which philosophy will scarce allow of, the same contrariety may, upon that account, be ascribed to the action. How far this truth or falsehood may be the source of morals, it will now be proper to consider.

It has been observed that reason, in a strict and philosophical sense, can have an influence on our conduct only after two ways: either when it excites a passion, by informing us of the existence of something which is a proper object of it; or when it discovers the connection of causes and effects, so as to afford us means of exerting any passion. These are the only kinds of judgment which can accompany our actions, or can be said to produce them in any manner; and it must be allowed, that these judgments may often be false and erroneous. A person may be affected with passion, by supposing a pain or pleasure to lie in an object which has no tendency to produce either of these sensations, or which produces the contrary to what is imagined. A person may also take false measures for the attaining of his end, and may retard, by his foolish conduct, instead of forwarding the execution of any object. These false judgments may be thought to affect the passions and actions, which are connected with them, and may be said to render them unreasonable, in a figurative and improper way of speaking. But though this be acknowledged, it is easy to observe, that these errors are so far from being the source of all immorality, that they are commonly very innocent, and draw no manner of guilt upon the person who is so unfortunate as to fall into them. They extend not beyond a mistake of *fact*, which moralists have not generally supposed criminal, as being perfectly involuntary. I am more to be lamented than blamed, if I am mistaken with regard to the influence of objects in producing pain or pleasure, or if I know not the proper means of satisfying my desires. No one can ever regard such errors as a defect in my moral character. A fruit, for instance, that is really disagreeable, appears to me at a distance, and, through mistake, I fancy it to be pleasant and delicious. Here is one error. I choose certain means of reaching this fruit, which are not proper for my end. Here is a second error; nor is there any third one, which can ever possibly enter into our reasonings concerning actions. I ask, therefore, if a man in this situation, and guilty of these two errors, is to be regarded as vicious and criminal, however unavoidable they might have been? Or if it be possible to imagine that such errors are the sources of all immorality?

And here it may be proper to observe, that if moral distinctions be derived from the truth or falsehood of those judgments, they must take place wherever we form the judgments; nor will there be any difference, whether the question be concerning an apple or a kingdom, or whether the error be avoidable or unavoidable.

For as the very essence of morality is supposed to consist in an agreement or disagreement to reason, the other circumstances are entirely arbitrary, and can never either bestow on any action the character of virtuous

or vicious, or deprive it of that character. To which we may add, that this agreement or disagreement, not admitting of degrees, all virtues and vices would of course be equal.

Should it be pretended, that though a mistake of *fact* be not criminal, yet a mistake of *right* often is; and that this may be the source of immorality: I would answer, that it is impossible such a mistake can ever be the original source of immorality, since it supposes a real right and wrong; that is, a real distinction in morals, independent of these judgments. A mistake, therefore, of right, may become a species of immorality; but it is only a secondary one, and is founded on some other antecedent to it.

As to those judgments which are the *effects* of our actions, and which, when false, give occasion to pronounce the actions contrary to truth and reason; we may observe, that our actions never cause any judgment, either true or false, in ourselves, and that it is only on others they have such an influence. It is certain that an action, on many occasions, may give rise to false conclusions in others; and that a person, who, through a window, sees any lewd behaviour of mine with my neighbour's wife, may be so simple as to imagine she is certainly my own. In this respect my action resembles somewhat a lie or falsehood; only with this difference, which is material, that I perform not the action with any intention of giving rise to a false judgment in another, but merely to satisfy my lust and passion. It causes, however, a mistake and false judgment by accident; and the falsehood of its effects may be ascribed, by some odd figurative way of speaking, to the action itself. But still I can see no pretext of reason for asserting, that the tendency to cause such an error is the first spring or original source of all immorality.

Thus, upon the whole, it is impossible that the distinction betwixt moral good and evil can be made by reason; since that distinction has an influence upon our actions, of which reason alone is incapable. Reason and judgment may, indeed, be the mediate cause of an action, by prompting or by directing a passion; but it is not pretended that a judgment of this kind, either in its truth or falsehood, is attended with virtue or vice. And as to the judgments, which are caused by our judgments, they can still less bestow those moral qualities on the actions which are their causes.

But, to be more particular, and to show that those eternal immutable fitnesses and unfitnesses of things cannot be defended by sound philosophy, we may weigh the following considerations.

If the thought and understanding were alone capable of fixing the boundaries of right and wrong, the character of virtuous and vicious either must lie in some relations of objects, or must be a matter of fact which is discovered by our reasoning. This consequence is evident. As the operations of human understanding divide themselves into two kinds, the comparing of ideas, and the inferring of matter of fact, were virtue discovered by the understanding, it must be an object of one of these operations; nor is there any third operation of the understanding which can discover it. There has been an opinion very industriously propagated by certain philosophers, that morality is susceptible of demonstration; and though no one has ever been able to advance a single step in those demonstrations, yet it is taken for granted that this science may be brought to an equal certainty with geometry or algebra. Upon this supposition, vice and virtue must consist in some relations; since it is allowed on all hands, that no matter of fact is capable of being demonstrated. Let us therefore begin with examining this hypothesis, and endeavour, if possible, to fix those moral qualities which have been so long the objects of our fruitless researches; point out distinctly the relations which constitute morality or obligation, that we may know wherein they consist, and after what manner we must judge of them.

If you assert that vice and virtue consist in relations susceptible of certainty and demonstration, you must confine yourself to those *four* relations which alone admit of that degree of evidence; and in that case you run into absurdities from which you will never be able to extricate yourself. For as you make the very essence of morality to lie in the relations, and as there is no one of these relations but what is applicable, not only to an irrational but also to an inanimate object, it follows that even such objects must be susceptible of merit or demerit. *Resemblance, contrariety, degrees in quality, and proportions in quantity and number*; all these relations belong as properly to matter as to our actions, passions, and volitions. It is unquestionable, therefore, that morality lies not in any of these relations, nor the sense of it in their discovery.

Should it be asserted, that the sense of morality consists in the discovery of some relation distinct from these, and that our enumeration was not complete when we comprehended all demonstrable relations under four general heads; to this I know not what to reply, till some one be so good as to point out to me this new relation. It is impossible to refute a system which has never yet been explained. In such a manner of fighting in the dark, a man loses his blows in the air, and often places them where the enemy is not present.

I must therefore, on this occasion, rest contented with requiring the two following conditions of any one that would undertake to clear up this system. *First*, as moral good and evil belong only to the actions of the mind, and are derived from our situation with regard to external objects, the relations from which these moral

distinctions arise must lie only betwixt internal actions and external objects, and must not be applicable either to internal actions, compared among themselves, or to external objects, when placed in opposition to other external objects. For as morality is supposed to attend certain relations, if these relations could belong to internal actions considered singly, it would follow, that we might be guilty of crimes in ourselves, and independent of our situation with respect to the universe; and in like manner, if these moral relations could be applied to external objects, it would follow that even inanimate beings would be susceptible of moral beauty and deformity. Now, it seems difficult to imagine that any relation can be discovered betwixt our passions, volitions, and actions, compared to external objects, which relation might not belong either to these passions and volitions, or to these external objects, compared among *themselves*.

But it will be still more difficult to fulfill the *second* condition, requisite to justify this system. According to the principles of those who maintain an abstract rational difference betwixt moral good and evil, and a natural fitness and unfitness of things, it is not only supposed, that these relations, being eternal and immutable, are the same, when considered by every rational creature, but their *effects* are also supposed to be necessarily the same; and it is concluded they have no less, or rather a greater, influence in directing the will of the Deity, than in governing the rational and virtuous of our own species. These two particulars are evidently distinct. It is one thing to know virtue, and another to conform the will to it. In order, therefore, to prove that the measures of right and wrong are eternal laws, *obligatory* on every rational mind, it is not sufficient to show the relations upon which they are founded: we must also point out the connection betwixt the relation and the will; and must prove that this connection is so necessary, that in every well-disposed mind, it must take place and have its influence; though the difference betwixt these minds be in other respects immense and infinite. Now, besides what I have already proved, that even in human nature no relation can ever alone produce any action; besides this, I say, it has been shown, in treating of the understanding, that there is no connection of cause and effect, such as this is supposed to be, which is discoverable otherwise than by experience, and of which we can pretend to have any security by the simple consideration of the objects. All beings in the universe, considered in themselves, appear entirely loose and independent of each other. It is only by experience we learn their influence and connection; and this influence we ought never to extend beyond experience.

Thus it will be impossible to fulfill the *first* condition required to the system of eternal rational measures of right and wrong; because it is impossible to show those relations, upon which such a distinction may be founded: and it is as impossible to fulfill the *second* condition; because we cannot prove *a priori*, that these relations, if they really existed and were perceived, would be universally forcible and obligatory.

But to make these general reflections more clear and convincing, we may illustrate them by some particular instances, wherein this character of moral good or evil is the most universally acknowledged. Of all crimes that human creatures are capable of committing, the most horrid and unnatural is ingratitude, especially when it is committed against parents, and appears in the more flagrant instances of wounds and death. This is acknowledged by all mankind, philosophers as well as the people: the question only arises among philosophers, whether the guilt or moral deformity of this action be discovered by demonstrative reasoning, or be felt by an internal sense, and by means of some sentiment, which the reflecting on such an action naturally occasions. This question will soon be decided against the former opinion, if we can show the same relations in other objects, without the notion of any guilt or iniquity attending them. Reason or science is nothing but the comparing of ideas, and the discovery of their relations; and if the same relations have different characters, it must evidently follow, that those characters are not discovered merely by reason. To put the affair, therefore, to this trial, let us choose any inanimate object, such as an oak or elm; and let us suppose, that, by the dropping of its seed, it produces a sapling below it, which, springing up by degrees, at last overtops and destroys the parent tree: I ask, if, in this instance, there be wanting any relation which is discoverable in parricide or ingratitude? Is not the one tree the cause of the other's existence; and the latter the cause of the destruction of the former, in the same manner as when a child murders his parent? It is not sufficient to reply, that a choice or will is wanting. For in the case of parricide, a will does not give rise to any *different* relations, but is only the cause from which the action is derived; and consequently produces the *same* relations, that in the oak or elm arise from some other principles. It is a will or choice that determines a man to kill his parent: and they are the laws of matter and motion that determine a sapling to destroy the oak from which it sprung. Here then the same relations have different causes; but still the relations are the same: and as their discovery is not in both cases attended with a notion of immorality, it follows, that that notion does not arise from such a discovery.

But to choose an instance still more resembling; I would fain ask any one, why incest in the human species is criminal, and why the very same action, and the same relations in animals, have not the smallest moral

turpitude and deformity? If it be answered, that this action is innocent in animals, because they have not reason sufficient to discover its turpitude; but that man, being endowed with that faculty, which *ought* to restrain him to his duty, the same action instantly becomes criminal to him. Should this be said, I would reply, that this is evidently arguing in a circle. For, before reason can perceive this turpitude, the turpitude must exist; and consequently is independent of the decisions of our reason, and is their object more properly than their effect. According to this system, then, every animal that has sense and appetite and will, that is, every animal must be susceptible of all the same virtues and vices, for which we ascribe praise and blame to human creatures. All the difference is, that our superior reason may serve to discover the vice or virtue, and by that means may augment the blame or praise: but still this discovery supposes a separate being in these moral distinctions, and a being which depends only on the will and appetite, and which, both in thought and reality, may be distinguished from reason. Animals are susceptible of the same relations with respect to each other as the human species, and therefore would also be susceptible of the same morality, if the essence of morality consisted in these relations. Their want of a sufficient degree of reason may hinder them from perceiving the duties and obligations of morality, but can never hinder these duties from existing; since they must antecedently exist, in order to their being perceived. Reason must find them, and can never produce them. This argument deserves to be weighed, as being, in my opinion, entirely decisive.

Nor does this reasoning only prove, that morality consists not in any relations that are the objects of science; but if examined, will prove with equal certainty, that it consists not in any *matter of fact*, which can be discovered by the understanding. This is the *second* part of our argument; and if it can be made evident, we may conclude that morality is not an object of reason. But can there be any difficulty in proving that vice and virtue are not matters of fact, whose existence we can infer by reason? Take any action allowed to be vicious; wilful murder, for instance. Examine it in all lights, and see if you can find that matter of fact, or real existence, which you call *vice*. In whichever way you take it, you find only certain passions, motives, volitions, and thoughts. There is no other matter of fact in the case. The vice entirely escapes you, as long as you consider the object. You never can find it, till you turn your reflection into your own breast, and find a sentiment of disapprobation, which arises in you, towards this action. Here is a matter of fact; but it is the object of feeling, not of reason. It lies in yourself, not in the object. So that when you pronounce any action or character to be vicious, you mean nothing, but that from the constitution of your nature you have a feeling or sentiment of blame from the contemplation of it. Vice and virtue, therefore, may be compared to sounds, colours, heat, and cold, which, according to modern philosophy, are not qualities in objects, but perceptions in the mind: and this discovery in morals, like that other in physics, is to be regarded as a considerable advancement of the speculative sciences; though, like that too, it has little or no influence on practice. Nothing can be more real, or concern us more, than our own sentiments of pleasure and uneasiness; and if these be favourable to virtue, and unfavourable to vice, no more can be requisite to the regulation of our conduct and behaviour.

I cannot forbear adding to these reasonings an observation, which may, perhaps, be found of some importance. In every system of morality which I have hitherto met with, I have always remarked, that the author proceeds for some time in the ordinary way of reasoning, and establishes the being of a God, or makes observations concerning human affairs; when of a sudden I am surprised to find, that instead of the usual copulations of propositions, *is*, and *is not*, I meet with no proposition that is not connected with an *ought*, or an *ought not*. This change is imperceptible; but is, however, of the last consequence. For as this *ought*, or *ought not*, expresses some new relation or affirmation, it is necessary that it should be observed and explained; and at the same time that a reason should be given, for what seems altogether inconceivable, how this new relation can be a deduction from others, which are entirely different from it. But as authors do not commonly use this precaution, I shall presume to recommend it to the readers; and am persuaded, that this small attention would subvert all the vulgar systems of morality, and let us see that the distinction of vice and virtue is not founded merely on the relations of objects, nor is perceived by reason.

MORAL DISTINCTIONS DERIVED FROM A MORAL SENSE

Thus the course of the argument leads us to conclude, that since vice and virtue are not discoverable merely by reason, or the comparison of ideas, it must be by means of some impression or sentiment they occasion, that we are able to mark the difference betwixt them. Our decisions concerning moral rectitude and depravity are evidently perceptions; and as all perceptions are either impressions or ideas, the exclusion of the one is a convincing argument for the other. Morality, therefore, is more properly felt than judged of; though this feeling or sentiment is commonly so soft and gentle that we are apt to confound it with an idea, according to our common custom of taking all things for the same which have any near resemblance to each other.

The next question is, of what nature are these impressions, and after what manner do they operate upon us? Here we cannot remain long in suspense, but must pronounce the impression arising from virtue to be agreeable, and that proceeding from vice to be uneasy. Every moment's experience must convince us of this. There is no spectacle so fair and beautiful as a noble and generous action; nor any which gives us more abhorrence than one that is cruel and treacherous. No enjoyment equals the satisfaction we receive from the company of those we love and esteem; as the greatest of all punishments is to be obliged to pass our lives with those we hate or contemn. A very play or romance may afford us instances of this pleasure which virtue conveys to us; and pain, which arises from vice.

Now, since the distinguishing impressions by which moral good or evil is known, are nothing but *particular* pains or pleasures, it follows, that in all inquiries concerning these moral distinctions, it will be sufficient to show the principles which make us feel a satisfaction or uneasiness from the survey of any character, in order to satisfy us why the character is laudable or blamable. An action, or sentiment, or character, is virtuous or vicious; why? because its view causes a pleasure or uneasiness of a particular kind. In giving a reason, therefore, for the pleasure or uneasiness, we sufficiently explain the vice or virtue. To have the sense of virtue, is nothing but to *feel* a satisfaction of a particular kind from the contemplation of a character. The very *feeling* constitutes our praise or admiration. We go no further; nor do we inquire into the cause of the satisfaction. We do not infer a character to be virtuous, because it pleases; but in feeling that it pleases after such a particular manner, we in effect feel that it is virtuous. The case is the same as in our judgments concerning all kinds of beauty, and tastes, and sensations. Our approbation is implied in the immediate pleasure they convey to us.

I have objected to the system which establishes eternal rational measures of right and wrong, that it is impossible to show, in the actions of reasonable creatures, any relations which are not found in external objects; and therefore, if morality always attended these relations, it were possible for inanimate matter to become virtuous or vicious. Now it may, in like manner, be objected to the present system, that if virtue and vice be determined by pleasure and pain, these qualities must, in every case, arise from the sensations; and consequently any object, whether animate or inanimate, rational or irrational, might become morally good or evil, provided it can excite a satisfaction or uneasiness. But though this objection seems to be the very same, it has by no means the same force in the one case as in the other. For, *first*, it is evident that, under the term *pleasure*, we comprehend sensations, which are very different from each other, and which have only such a distant resemblance as is requisite to make them be expressed by the same abstract term. A good composition of music and a bottle of good wine equally produce pleasure; and, what is more, their goodness is determined merely by the pleasure. But shall we say, upon that account, that the wine is harmonious, or the music of a good flavour? In like manner, an inanimate object, and the character or sentiments of any person, may, both of them, give satisfaction; but, as the satisfaction is different, this keeps our sentiments concerning them from being confounded, and makes us ascribe virtue to the one and not to the other. Nor is every sentiment of pleasure or pain, which arises from characters and actions, of that *peculiar* kind which makes us praise or condemn. The good qualities of an enemy are hurtful to us, but may still command our esteem and respect. It is only when a character is considered in general, without reference to our particular interest, that it causes such a feeling or sentiment as denominates it morally good or evil. It is true, those sentiments from interest and morals are apt to be confounded, and naturally run into one another. It seldom happens that we do not think an enemy vicious, and can distinguish betwixt his opposition to our interest and real villainy or baseness. But this hinders not but that the sentiments are in themselves distinct; and a man of temper and judgment may preserve himself from these illusions. In like manner, though it is certain a musical voice is nothing but one that naturally gives a *particular* kind of pleasure; yet it is difficult for a man to be sensible that the voice of an enemy is agreeable, or to allow it to be musical. But a person of a fine ear, who has the command of himself, can separate these feelings, and give praise to what deserves it.

Secondly, we may call to remembrance the preceding system of the passions, in order to remark a still more considerable difference among our pains and pleasures. Pride and humility, love and hatred, are excited, when there is anything presented to us that both bears a relation to the object of the passion, and produces a separate sensation, related to the sensation of the passion. Now, virtue and vice are attended with these circumstances. They must necessarily be placed either in ourselves or others, and excite either pleasure or uneasiness; and therefore must give rise to one of these four passions, which clearly distinguishes them from the pleasure and pain arising from inanimate objects, that often bear no relation to us; and this is, perhaps, the most considerable effect that virtue and vice have upon the human mind.

It may now be asked, *in general*, concerning this pain or pleasure that distinguishes moral good and evil, *From what principle is it derived, and whence does it arise in the human mind?* To this I reply, *first*, that it is

absurd to imagine that, in every particular instance, these sentiments are produced by an *original* quality and *primary* constitution. For as the number of our duties is in a manner infinite, it is impossible that our original instincts should extend to each of them, and from our very first infancy impress on the human mind all that multitude of precepts which are contained in the completest system of ethics. Such a method of proceeding is not conformable to the usual maxims by which nature is conducted, where a few principles produce all that variety we observe in the universe, and everything is carried on in the easiest and most simple manner. It is necessary, therefore, to abridge these primary impulses, and find some more general principles upon which all our notions of morals are founded.

But, in the *second* place, should it be asked, whether we ought to search for these principles in *nature*, or whether we must look for them in some other origin? I would reply, that our answer to this question depends upon the definition of the word Nature, than which there is none more ambiguous and equivocal. If *nature* be opposed to miracles, not only the distinction betwixt vice and virtue is natural, but also every event which has ever happened in the world, *excepting those miracles on which our religion is founded*. In saying, then, that the sentiments of vice and virtue are natural in this sense, we make no very extraordinary discovery.

But *nature* may also be opposed to rare and unusual; and in this sense of the word, which is the common one, there may often arise disputes concerning what is natural or unnatural; and one may in general affirm, that we are not possessed of any very precise standard by which these disputes can be decided. Frequent and rare depend upon the number of examples we have observed; and as this number may gradually increase or diminish, it will be impossible to fix any exact boundaries betwixt them. We may only affirm on this head, that if ever there was anything which could be called natural in this sense, the sentiments of morality certainly may; since there never was any nation of the world, nor any single person in any nation, who was utterly deprived of them, and who never, in any instance, showed the least approbation or dislike of manners. These sentiments are so rooted in our constitution and temper, that, without entirely confounding the human mind by disease or madness, it is impossible to extirpate and destroy them.

But *nature* may also be opposed to artifice, as well as to what is rare and unusual; and in this sense it may be disputed, whether the notions of virtue be natural or not. We readily forget that the designs, and projects, and views of men are principles as necessary in their operation as heat and cold, moist and dry; but, taking them to be free and entirely our own, it is usual for us to set them in opposition to the other principles of nature. Should it therefore be demanded, whether the sense of virtue be natural or artificial, I am of opinion that it is impossible for me at present to give any precise answer to this question. Perhaps it will appear afterwards that our sense of some virtues is artificial, and that of others natural. The discussion of this question will be more proper, when we enter upon an exact detail of each particular vice and virtue.

Meanwhile, it may not be amiss to observe, from these definitions of *natural* and *unnatural*, that nothing can be more unphilosophical than those systems which assert that virtue is the same with what is natural, and vice with what is unnatural. For, in the first sense of the word, nature, as opposed to miracles, both vice and virtue are equally natural; and, in the second sense, as opposed to what is unusual, perhaps virtue will be found to be the most unnatural. At least it must be owned, that heroic virtue, being as unusual, is as little natural as the most brutal barbarity. As to the third sense of the word, it is certain that both vice and virtue are equally artificial and out of nature. For, however it may be disputed, whether the notion of a merit or demerit in certain actions, be natural or artificial, it is evident that the actions themselves are artificial, and performed with a certain design and intention; otherwise they could never be ranked under any of these denominations. It is impossible, therefore, that the character of natural and unnatural can ever, in any sense, mark the boundaries of vice and virtue.

Thus we are still brought back to our first position, that virtue is distinguished by the pleasure, and vice by the pain, that any action, sentiment, or character, gives us by the mere view and contemplation. This decision is very commodious; because it reduces us to this simple question, *Why any action or sentiment, upon the general view or survey, gives a certain satisfaction or uneasiness*, in order to show the origin of its moral rectitude or depravity, without looking for any incomprehensible relations and qualities, which never did exist in nature, nor even in our imagination, by any clear and distinct conception? I flatter myself I have executed a great part of my present design by a state of the question, which appears to me so free from ambiguity and obscurity.

*From *The Philosophical Works of David Hume*, edited by T. H. Green and T. H. Grose (London: Longman's, Green, and Co., 1898), 4 vols., English, modified.

1. [The Cynics were members of an Athenian philosophical school who, considering themselves followers of Socrates, maintained that virtue is self-sufficiency and the suppression of desires.]

Dialogues Concerning Natural Religion

Pamphilus to Hermippus

It has been remarked, my Hermippus, that, though the ancient philosophers conveyed most of their instruction in the form of dialogue, this method of composition has been little practiced in later ages, and has seldom succeeded in the hands of those who have attempted it. Accurate and regular argument, indeed, such as is now expected of philosophical inquirers, naturally throws a man into the methodical and didactic manner; where he can immediately, without preparation, explain the point at which he aims; and thence proceed, without interruption, to deduce the proofs on which it is established. To deliver a *system* in conversation scarcely appears natural; and while the dialogue writer desires, by departing from the direct style of composition, to give a freer air to his performance, and avoid the appearance of *author* and *reader*, he is apt to run into a worse inconvenience and convey the image of *pedagogue* and *pupil*. Or if he carries on the dispute in the natural spirit of good company, by throwing in a variety of topics and preserving a proper balance among the speakers, he often loses so much time in preparations and transitions that the reader will scarcely think himself compensated, by all the graces of dialogue, for the order, brevity, and precision, which are sacrificed to them.

There are some subjects, however, to which dialogue-writing is peculiarly adapted, and where it is still preferable to the direct and simple method of composition.

Any point of doctrine which is so *obvious* that it scarcely admits of dispute, but at the same time so *important* that it cannot be too often inculcated, seems to require some such method of handling it; where the novelty of the manner may compensate the triteness of the subject, where the vivacity of conversation may enforce the precept, and where the variety of lights, presented by various personages and characters, may appear neither tedious nor redundant.

Any question of philosophy, on the other hand, which is so *obscure* and *uncertain* that human reason can reach no fixed determination with regard to it — if it should be treated at all — seems to lead us naturally into the style of dialogue and conversation. Reasonable men may be allowed to differ where no one can reasonably be positive: Opposite sentiments, even without any decision, afford an agreeable amusement; and if the subject be curious and interesting, the book carries us, in a manner, into company, and unites the two greatest and purest pleasures of human life — study and society.

Happily, these circumstances are all to be found in the subject of *natural religion*. What truth so obvious, so certain, as the *being* of a God, which the most ignorant ages have acknowledged, for which the most refined geniuses have ambitiously striven to produce new proofs and arguments? What truth so important as this, which is the ground of all our hopes, the surest foundation of morality, the firmest support of society, and the only principle which ought never to be a moment absent from our thoughts and meditations? But, in treating of this obvious and important truth, what obscure questions occur concerning the *nature* of that Divine Being; his attributes, his decrees, his plan of providence? These have been always subjected to the disputations of men: Concerning these, human reason has not reached any certain determination. But these are topics so interesting that we cannot restrain our restless inquiry with regard to them; though nothing but doubt, uncertainty, and contradiction have as yet been the result of our most accurate researches.

This I had lately occasion to observe, while I passed, as usual, part of the summer season with Cleanthes, and was present at those conversations of his with Philo and Demea, of which I gave you lately some imperfect account. Your curiosity, you then told me, was so excited that I must, of necessity, enter into a more exact detail of their reasonings, and display those various systems which they advanced with regard to so delicate a subject as that of natural religion. The remarkable contrast in their characters still further raised your expectations; while you opposed the accurate philosophical turn of Cleanthes to the careless scepticism of Philo, or compared either of their dispositions with the rigid inflexible orthodoxy of Demea. My youth rendered me a mere auditor of their disputes; and that curiosity, natural to the early season of life, has so deeply imprinted in my memory the whole chain and connection of their arguments, that, I hope, I shall not

omit or confound any considerable part of them in the recital.

Part I

After I joined the company, whom I found sitting in Cleanthes' library, Demea paid Cleanthes some compliments on the great care which he took of my education, and on his unwearied perseverance and constancy in all his friendships. The father of Pamphilus, said he, was your intimate friend; the son is your pupil, and may indeed be regarded as your adopted son, were we to judge by the pains which you bestow in conveying to him every useful branch of literature and science. You are no more wanting, I am persuaded, in prudence than in industry. I shall, therefore, communicate to you a maxim which I have observed with regard to my own children, that I may learn how far it agrees with your practice. The method I follow in their education is founded on the saying of an ancient, "*That students of philosophy ought first to learn logics, then ethics, next physics, last of all the nature of the gods.*"¹ This science of natural theology, according to him, being the most profound and abstruse of any, required the maturest judgment in its students; and none but a mind enriched with all the other sciences can safely be entrusted with it.

Are you so late, says Philo, in teaching your children the principles of religion? Is there no danger of their neglecting or rejecting altogether those opinions of which they have heard so little during the whole course of their education? It is only as a science, replied Demea, subjected to human reasoning and disputation, that I postpone the study of natural theology. To season their minds with early piety is my chief care; and by continual precept and instruction and I hope too, by example, I imprint deeply on their tender minds an habitual reverence for all the principles of religion. While they pass through every other science, I still remark the uncertainty of each part; the eternal disputations of men; the obscurity of all philosophy; and the strange, ridiculous conclusions which some of the greatest geniuses have derived from the principles of mere human reason. Having thus tamed their minds to a proper submission and self-diffidence, I have no longer any scruple of opening to them the greatest mysteries of religion, nor apprehend any danger from that assuming arrogance of philosophy, which may lead them to reject the most established doctrines and opinions.

Your precaution, says Philo, of seasoning your children's minds early with piety is certainly very reasonable, and no more than is requisite in this profane and irreligious age. But what I chiefly admire in your plan of education is your method of drawing advantage from the very principles of philosophy and learning which, by inspiring pride and self-sufficiency, have commonly, in all ages, been found so destructive to the principles of religion. The vulgar, indeed, we may remark, who are unacquainted with science and profound inquiry, observing the endless disputes of the learned, have commonly a thorough contempt for philosophy; and rivet themselves the faster, by that means, in the great points of theology which have been taught them. Those who enter a little into study and inquiry, finding many appearances of evidence in doctrines the newest and most extraordinary, think nothing too difficult for human reason; and, presumptuously breaking through all fences, profane the inmost sanctuaries of the temple. But Cleanthes will, I hope, agree with me that, after we have abandoned ignorance, the surest remedy, there is still one expedient left to prevent this profane liberty. Let Demea's principles be improved and cultivated: Let us become thoroughly sensible of the weakness, blindness, and narrow limits of human reason: Let us duly consider its uncertainty and endless contrarieties, even in subjects of common life and practice: Let the errors and deceptions of our very senses be set before us; the insuperable difficulties which attend first principles in all systems; the contradictions which adhere to the very ideas of matter, cause and effect, extension, space, time, motion; and, in a word, quantity of all kinds, the object of the only science that can fairly pretend to any certainty or evidence. When these topics are displayed in their full light, as they are by some philosophers and almost all divines, who can retain such confidence in this frail faculty of reason as to pay any regard to its determinations in points so sublime, so abstruse, so remote from common life and experience? When the coherence of the parts of a stone, or even that composition of parts which renders it extended; when these familiar objects, I say, are so inexplicable, and contain circumstances so repugnant and contradictory; with what assurance can we decide concerning the origin of worlds or trace their history from eternity to eternity?

While Philo pronounced these words, I could observe a smile in the countenance both of Demea and Cleanthes. That of Demea seemed to imply an unreserved satisfaction in the doctrines delivered; but in Cleanthes' features I could distinguish an air of finesse, as if he perceived some raillery or artificial malice in the reasonings of Philo.

You propose then, Philo, said Cleanthes, to erect religious faith on philosophical scepticism; and you think that, if certainty or evidence be expelled from every other subject of inquiry, it will all retire to these theological doctrines, and there acquire a superior force and authority. Whether your scepticism be as absolute and sincere as you pretend, we shall learn by and by, when the company breaks up; we shall then see whether

you go out at the door or the window, and whether you really doubt if your body has gravity or can be injured by its fall, according to popular opinion derived from our fallacious senses and more fallacious experience. And this consideration, Demea, may, I think, fairly serve to abate our ill-will to this humorous sect of the sceptics. If they be thoroughly in earnest, they will not long trouble the world with their doubts, cavils, and disputes; if they be only in jest, they are, perhaps, bad railers, but can never be very dangerous, either to the state, to philosophy, or to religion.

In reality, Philo, continued he, it seems certain that, though a man in a flush of humor, after intense reflection on the many contradictions and imperfections of human reason, may entirely renounce all belief and opinion, it is impossible for him to persevere in this total scepticism or make it appear in his conduct for a few hours. External objects press in upon him: Passions solicit him: His philosophical melancholy dissipates; and even the utmost violence upon his own temper will not be able, during any time, to preserve the poor appearance of scepticism. And for what reason impose on himself such a violence? This is a point in which it will be impossible for him ever to satisfy himself, consistently with his sceptical principles. So that, upon the whole, nothing could be more ridiculous than the principles of the ancient Pyrrhonians;² if, in reality, they endeavored, as is pretended, to extend throughout the same scepticism which they had learned from the declamations of their schools, and which they ought to have confined to them.

In this view, there appears a great resemblance between the sects of the Stoics and Pyrrhonians, though perpetual antagonists; and both of them seem founded on this erroneous maxim: that what a man can perform sometimes, and in some dispositions, he can perform always and in every disposition. When the mind, by Stoical reflections, is elevated into a sublime enthusiasm of virtue and strongly smit with any *species* of honor or public good, the utmost bodily pain and sufferings will not prevail over such a high sense of duty; and it is possible, perhaps, by its means, even to smile and exult in the midst of tortures. If this sometimes may be the case in fact and reality, much more may a philosopher, in his school or even in his closet, work himself up to such an enthusiasm, and support, in imagination, the acutest pain or most calamitous event which he can possibly conceive. But how shall he support this enthusiasm itself? The bent of his mind relaxes and cannot be recalled at pleasure; avocations lead him astray; misfortunes attack him unawares; and the *philosopher* sinks, by degrees, into the *plebeian*.

I allow of your comparison between the Stoics and Sceptics, replied Philo. But you may observe, at the same time, that though the mind cannot, in Stoicism, support the highest flights of philosophy, yet, even when it sinks lower, it still retains somewhat of its former disposition; and the effects of the Stoic's reasoning will appear in his conduct in common life, and through the whole tenor of his actions. The ancient schools, particularly that of Zeno,³ produced examples of virtue and constancy which seem astonishing to present times.

Vain Wisdom all and false Philosophy.

Yet with a pleasing sorcery could charm

Pain, for a while, or anguish; and excite

Fallacious Hope, or arm the obdurate breast

With stubborn Patience, as with triple steel.⁴

In like manner, if a man has accustomed himself to sceptical considerations on the uncertainty and narrow limits of reason, he will not entirely forget them when he turns his reflection on other subjects; but in all his philosophical principles and reasoning, I dare not say, in his common conduct, he will be found different from those who either never formed any opinions in the case or have entertained sentiments more favorable to human reason.

To whatever length anyone may push his speculative principles of scepticism, he must act, I own, and live, and converse like other men; and for this conduct he is not obliged to give any other reason than the absolute necessity he lies under of so doing. If he ever carries his speculations farther than this necessity constrains him, and philosophizes either on natural or moral subjects, he is allured by a certain pleasure and satisfaction which he finds in employing himself after that manner. He considers, besides, that everyone, even in common life, is constrained to have more or less of this philosophy; that from our earliest infancy we make continual advances in forming more general principles of conduct and reasoning; that the larger experience we acquire, and the stronger reason we are endued with, we always render our principles the more general and comprehensive; and that what we call *philosophy* is nothing but a more regular and methodical operation of the same kind. To

philosophize on such subjects is nothing essentially different from reasoning on common life, and we may only expect greater stability, if not greater truth, from our philosophy on account of its exacter and more scrupulous method of proceeding.

But when we look beyond human affairs and the properties of the surrounding bodies — when we carry our speculations into the two eternities, before and after the present state of things; into the creation and formation of the universe; the existence and properties of spirits; the powers and operations of one universal Spirit existing without beginning and without end, omnipotent, omniscient, immutable, infinite, and incomprehensible—we must be far removed from the smallest tendency to scepticism not to be apprehensive that we have here got quite beyond the reach of our faculties. So long as we confine our speculations to trade, or morals, or politics, or criticism, we make appeals, every moment, to common sense and experience, which strengthen our philosophical conclusions and remove (at least in part) the suspicion, which we so justly entertain with regard to every reasoning, that is very subtle and refined. But in theological reasonings, we have not this advantage; while at the same time we are employed upon objects which, we must be sensible, are too large for our grasp, and of all others, require most to be familiarized to our apprehension. We are like foreigners in a strange country to whom everything must seem suspicious, and who are in danger every moment of transgressing against the laws and customs of the people with whom they live and converse. We know not how far we ought to trust our vulgar methods of reasoning in such a subject, since, even in common life, and in that province which is peculiarly appropriated to them, we cannot account for them and are entirely guided by a kind of instinct or necessity in employing them.

All sceptics pretend that, if reason be considered in an abstract view, it furnishes invincible arguments against itself, and that we could never retain any conviction or assurance, on any subject, were not the sceptical reasonings so refined and subtle that they are not able to counterpoise the more solid and more natural arguments derived from the senses and experience. But it is evident, whenever our arguments lose this advantage and run wide of common life, that the most refined scepticism comes to be upon a footing with them, and is able to oppose and counterbalance them. The one has no more weight than the other. The mind must remain in suspense between them; and it is that very suspense or balance which is the triumph of scepticism.

But I observe, says Cleanthes, with regard to you, Philo, and all speculative sceptics that your doctrine and practice are as much at variance in the most abstruse points of theory as in the conduct of common life. Wherever evidence discovers itself, you adhere to it, notwithstanding your pretended scepticism; and I can observe, too, some of your sect to be as decisive as those who make greater professions of certainty and assurance. In reality, would not a man be ridiculous who pretended to reject Newton's⁵ explication of the wonderful phenomenon of the rainbow because that explication gives a minute anatomy of the rays of light — a subject, forsooth, too refined for human comprehension? And what would you say to one who, having nothing particular to object to the arguments of Copernicus⁶ and Galileo⁷ for the motion of the earth, should withhold his assent on that general principle that these subjects were too magnificent and remote to be explained by the narrow and fallacious reason of mankind?

There is indeed a kind of brutish and ignorant scepticism, as you well observed, which gives the vulgar a general prejudice against what they do not easily understand, and makes them reject every principle which requires elaborate reasoning to prove and establish it. This species of scepticism is fatal to knowledge, not to religion; since we find that those who make greatest profession of it give often their assent, not only to the great truths of theism and natural theology, but even to the most absurd tenets which a traditional superstition has recommended to them. They firmly believe in witches, though they will not believe nor attend to the most simple proposition of Euclid.⁸ But the refined and philosophical sceptics fall into an inconsistency of an opposite nature. They push their researches into the most abstruse corners of science, and their assent attends them in every step, proportioned to the evidence which they meet with. They are even obliged to acknowledge that the most abstruse and remote objects are those which are best explained by philosophy. Light is in reality anatomized; the true system of the heavenly bodies is discovered and ascertained. But the nourishment of bodies by food is still an inexplicable mystery; the cohesion of the parts of matter is still incomprehensible. These sceptics, therefore, are obliged, in every question, to consider each particular evidence apart, and proportion their assent to the precise degree of evidence which occurs. This is their practice in all natural, mathematical, moral, and political science. And why not the same, I ask, in the theological and religious? Why must conclusions of this nature be alone rejected on the general presumption of the insufficiency of human reason, without any particular discussion of the evidence? Is not such an unequal conduct a plain proof of prejudice and passion?

Our senses, you say, are fallacious; our understanding erroneous; our ideas, even of the most familiar objects—extension, duration, motion—full of absurdities and contradictions. You defy me to solve the difficulties or reconcile the repugnancies which you discover in them. I have not capacity for so great an undertaking; I have not leisure for it: I perceive it to be superfluous. Your own conduct, in every circumstance, refutes your principles, and shows the firmest reliance on all the received maxims of science, morals, prudence, and behavior.

I shall never assent to so harsh an opinion as that of a celebrated writer,⁹ who says that the Sceptics are not a sect of philosophers: they are only a sect of liars. I may, however, affirm (I hope without offence) that they are a sect of jesters or railers. But for my part, whenever I find myself disposed to mirth and amusement, I shall certainly choose my entertainment of a less perplexing and abstruse nature. A comedy, a novel, or, at most, a history seems a more natural recreation than such metaphysical subtilties and abstractions.

In vain would the sceptic make a distinction between science and common life, or between one science and another. The arguments employed in all, if just, are of a similar nature and contain the same force and evidence. Or if there be any difference among them, the advantage lies entirely on the side of theology and natural religion. Many principles of mechanics are founded on very abstruse reasoning; yet no man who has any pretensions to science, even no speculative sceptic, pretends to entertain the least doubt with regard to them. The Copernican system contains the most surprising paradox, and the most contrary to our natural conceptions, to appearances, and to our very senses; yet even monks and inquisitors are now constrained to withdraw their opposition to it. And shall Philo, a man of so liberal a genius and extensive knowledge, entertain any general undistinguished scruples with regard to the religious hypothesis, which is founded on the simplest and most obvious arguments and, unless it meets with artificial obstacles, has such easy access and admission into the mind of man?

And here we may observe, continued he, turning himself towards Demea, a pretty curious circumstance in the history of the sciences. After the union of philosophy with the popular religion, upon the first establishment of Christianity, nothing was more usual, among all religious teachers, than declamations against reason, against the senses, against every principle derived merely from human research and inquiry. All the topics of the ancient Academics¹⁰ were adopted by the Fathers,¹¹ and thence propagated for several ages in every school and pulpit throughout Christendom. The Reformers embraced the same principles of reasoning or rather declamation; and all panegyrics on the excellence of faith were sure to be interlarded with some severe strokes of satire against natural reason. A celebrated prelate, too,¹² of the Romish communion, a man of the most extensive learning, who wrote a demonstration of Christianity, has also composed a treatise which contains all the cavils of the boldest and most determined Pyrrhonism. Locke seems to have been the first Christian who ventured openly to assert that *faith* was nothing but a species of *reason*; that religion was only a branch of philosophy; and that a chain of arguments, similar to that which established any truth in morals, politics, or physics, was always employed in discovering all the principles of theology, natural and revealed. The ill use which Bayle¹³ and other libertines made of the philosophical scepticism of the Fathers and first Reformers still further propagated the judicious sentiment of Mr. Locke. And it is now in a manner avowed, by all pretenders to reasoning and philosophy, that atheist and sceptic are almost synonymous. And as it is certain that no man is in earnest when he professes the latter principle, I would fain hope that there are as few who seriously maintain the former.

Don't you remember, said Philo, the excellent saying of Lord Bacon¹⁴ on this head? That a little philosophy, replied Cleanthes, makes a man an atheist; a great deal converts him to religion. That is a very judicious remark, too, said Philo. But what I have in my eye is another passage, where, having mentioned David's fool, who said in his heart there is no God, this great philosopher observes that the atheists nowadays have a double share of folly; for they are not contented to say in their hearts there is no God, but they also utter that impiety with their lips, and are thereby guilty of multiplied indiscretion and imprudence. Some people, though they were ever so much in earnest, cannot, methinks, be very formidable.

But though you should rank me in this class of fools, I cannot forbear communicating a remark that occurs to me from the history of the religious and irreligious scepticism with which you have entertained us. It appears to me that there are strong symptoms of priestcraft in the whole progress of this affair. During ignorant ages, such as those which followed the dissolution of the ancient schools, the priests perceived that atheism, deism, or heresy of any kind, could only proceed from the presumptuous questioning of received opinions, and from a belief that human reason was equal to everything. Education had then a mighty influence over the minds of men, and was almost equal in force to those suggestions of the senses and common understanding by which the most determined sceptic must allow himself to be governed. But at

present, when the influence of education is much diminished and men, from a more open commerce of the world, have learned to compare the popular principles of different nations and ages, our sagacious divines have changed their whole system of philosophy and talk the language of Stoics, Platonists, and Peripatetics,¹⁵ not that of Pyrrhonians and Academics. If we distrust human reason we have now no other principle to lead us into religion. Thus sceptics in one age, dogmatists in another — whichever system best suits the purpose of these reverend gentlemen in giving them an ascendant over mankind—they are sure to make it their favorite principle and established tenet.

It is very natural, said Cleanthes, for men to embrace those principles by which they find they can best defend their doctrines, nor need we have any recourse to priestcraft to account for so reasonable an expedient. And surely, nothing can afford a stronger presumption that any set of principles are true and ought to be embraced than to observe that they tend to the confirmation of true religion, and serve to confound the cavils of atheists, libertines, and freethinkers of all denominations.

Part II

I must own, Cleanthes, said Demea, that nothing can more surprise me than the light in which you have all along put this argument. By the whole tenor of your discourse, one would imagine that you were maintaining the Being of a God against the cavils of atheists and infidels, and were necessitated to become a champion for that fundamental principle of all religion. But this, I hope, is not by any means a question among us. No man; no man, at least of common sense, I am persuaded, ever entertained a serious doubt with regard to a truth so certain and self-evident. The question is not concerning the *being* but the *nature of God*. This I affirm, from the infirmities of human understanding, to be altogether incomprehensible and unknown to us. The essence of that supreme mind, his attributes, the manner of his existence, the very nature of his duration—these and every particular which regards so divine a being are mysterious to men. Finite, weak, and blind creatures, we ought to humble ourselves in his august presence, and, conscious of our frailties, adore in silence his infinite perfections which eye hath not seen, ear hath not heard, neither hath it entered into the heart of man to conceive. They are covered in a deep cloud from human curiosity; it is profaneness to attempt penetrating through these sacred obscurities; and, next to the impiety of denying his existence, is the temerity of prying into his nature and essence, decrees and attributes.

But lest you should think that my *piety* has here got the better of my *philosophy*, I shall support my opinion, if it needs any support, by a very great authority. I might cite all the divines, almost from the foundation of Christianity, who have ever treated of this or any other theological subject; but I shall confine myself, at present, to one equally celebrated for piety and philosophy. It is Father Malebranche who, I remember, thus expresses himself.¹⁶ “One ought not so much (says he) to call God a spirit in order to express positively what he is, as in order to signify that he is not matter. He is a Being infinitely perfect — of this we cannot doubt. But in the same manner as we ought not to imagine, even supposing him corporeal, that he is clothed with a human body, as the anthropomorphites asserted, under color that that figure was the most perfect of any, so neither ought we to imagine that the spirit of God has human ideas or bears any resemblance to our spirit, under color that we know nothing more perfect than a human mind. We ought rather to believe that as he comprehends the perfections of matter without being material ... he comprehends also the perfections of created spirits without being spirit, in the manner we conceive spirit: That his true name is *He that is*, or, in other words, Being without restriction, All Being, the Being infinite and universal.”

After so great an authority, Demea, replied Philo, as that which you have produced, and a thousand more which you might produce, it would appear ridiculous in me to add my sentiment or express my approbation of your doctrine. But surely, where reasonable men treat these subjects, the question can never be concerning the *being* but only the *nature* of the Deity. The former truth, as you well observe, is unquestionable and self-evident. Nothing exists without a cause; and the original cause of this universe (whatever it be) we call *God*, and piously ascribe to him every species of perfection. Whoever scruples this fundamental truth deserves every punishment which can be inflicted among philosophers, to wit, the greatest ridicule, contempt, and disapprobation. But as all perfection is entirely relative, we ought never to imagine that we comprehend the attributes of this divine Being, or to suppose that his perfections have any analogy or likeness to the perfections of a human creature. Wisdom, thought, design, knowledge— these we justly ascribe to him because these words are honorable among men, and we have no other language or other conceptions by which we can express our adoration of him. But let us beware lest we think that our ideas anywise correspond to his perfections, or that his attributes have any resemblance to these qualities among men. He is infinitely superior to our limited view and comprehension; and is more the object of worship in the temple than of disputation in the schools.

In reality, Cleanthes, continued he, there is no need of having recourse to that affected scepticism so displeasing to you in order to come at this determination. Our ideas reach no farther than our experience: We have no experience of divine attributes and operations. I need not conclude my syllogism: You can draw the inference yourself. And it is a pleasure to me (and I hope to you, too) that just reasoning and sound piety here concur in the same conclusion, and both of them establish the adorably mysterious and incomprehensible nature of the Supreme Being.

Not to lose any time in circumlocutions, said Cleanthes, addressing himself to Demea, much less in replying to the pious declamations of Philo, I shall briefly explain how I conceive this matter. Look round the world: Contemplate the whole and every part of it: You will find it to be nothing but one great machine, subdivided into an infinite number of lesser machines, which again admit of subdivisions to a degree beyond what human senses and faculties can trace and explain. All these various machines, and even their most

minute parts, are adjusted to each other with an accuracy which ravishes into admiration all men who have ever contemplated them. The curious adapting of means to ends, throughout all nature, resembles exactly, though it much exceeds, the productions of human contrivance—of human design, thought, wisdom, and intelligence. Since therefore the effects resemble each other, we are led to infer, by all the rules of analogy, that the causes also resemble, and that the Author of Nature is somewhat similar to the mind of man, though possessed of much larger faculties, proportioned to the grandeur of the work which he has executed. By this argument *a posteriori*, and by this argument alone, do we prove at once the existence of a Deity and his similarity to human mind and intelligence.

I shall be so free, Cleanthes, said Demea, as to tell you that from the beginning I could not approve of your conclusion concerning the similarity of the Deity to men, still less can I approve of the mediums by which you endeavor to establish it. What! No demonstration of the Being of God! No abstract arguments! No proofs *a priori*! Are these which have hitherto been so much insisted on by philosophers all fallacy, all sophism? Can we reach no farther in this subject than experience and probability? I will say not that this is betraying the cause of a Deity; but surely, by this affected candor, you give advantages to atheists which they never could obtain by the mere dint of argument and reasoning.

What I chiefly scruple in this subject, said Philo, is not so much that all religious arguments are by Cleanthes reduced to experience, as that they appear not to be even the most certain and irrefragable of that inferior kind. That a stone will fall, that fire will burn, that the earth has solidity, we have observed a thousand and a thousand times; and when any new instance of this nature is presented, we draw without hesitation the accustomed inference. The exact similarity of the cases gives us a perfect assurance of a similar event, and a stronger evidence is never desired nor sought after. But wherever you depart, in the least, from the similarity of the cases, you diminish proportionably the evidence; and may at last bring it to a very weak *analogy*, which is confessedly liable to error and uncertainty. After having experienced the circulation of the blood in human creatures, we make no doubt that it takes place in Titius and Maevius;¹⁷ but from its circulation in frogs and fishes it is only a presumption, though a strong one, from analogy that it takes place in men and other animals. The analogical reasoning is much weaker when we infer the circulation of the sap in vegetables from our experience that the blood circulates in animals; and those who hastily followed that imperfect analogy are found, by more accurate experiments, to have been mistaken.

If we see a house, Cleanthes, we conclude, with the greatest certainty, that it had an architect or builder because this is precisely that species of effect which we have experienced to proceed from that species of cause. But surely you will not affirm that the universe bears such a resemblance to a house that we can with the same certainty infer a similar cause, or that the analogy is here entire and perfect. The dissimilitude is so striking that the utmost you can here pretend to is a guess, a conjecture, a presumption concerning a similar cause; and how that pretension will be received in the world, I leave you to consider.

It would surely be very ill received, replied Cleanthes; and I should be deservedly blamed and detested did I allow that the proofs of a Deity amounted to no more than a guess or conjecture. But is the whole adjustment of means to ends in a house and in the universe so slight a resemblance? the economy of final causes? the order, proportion, and arrangement of every part? Steps of a stair are plainly contrived that human legs may use them in mounting; and this inference is certain and infallible. Human legs are also contrived for walking and mounting; and this inference, I allow, is not altogether so certain because of the dissimilarity which you remark; but does it, therefore, deserve the name only of presumption or conjecture?

Good God! cried Demea, interrupting him, where are we? Zealous defenders of religion allow that the proofs of a Deity fall short of perfect evidence! And you, Philo, on whose assistance I depended in proving the adorable mysteriousness of the Divine Nature, do you assent to all these extravagant opinions of Cleanthes? For what other name can I give them? or, why spare my censure when such principles are advanced, supported by such an authority, before so young a man as Pamphilus?

You seem not to apprehend, replied Philo, that I argue with Cleanthes in his own way, and, by showing him the dangerous consequences of his tenets, hope at last to reduce him to our opinion. But what sticks most with you, I observe, is the representation which Cleanthes has made of the argument *a posteriori*; and, finding that that argument is likely to escape your hold and vanish into air, you think it so disguised that you can scarcely believe it to be set in its true light. Now, however much I may dissent, in other respects, from the dangerous principle of Cleanthes, I must allow that he has fairly represented that argument, and I shall endeavor so to state the matter to you that you will entertain no further scruples with regard to it.

Were a man to abstract from everything which he knows or has seen, he would be altogether incapable, merely from his own ideas, to determine what kind of scene the universe must be, or to give the preference to

one state or situation of things above another. For as nothing which he clearly conceives could be esteemed impossible or implying a contradiction, every chimera of his fancy would be upon an equal footing; nor could he assign just reason why he adheres to one idea or system, and rejects the others which are equally possible.

Again, after he opens his eyes and contemplates the world as it really is, it would be impossible for him at first to assign the cause of any one event, much less the whole of things, or of the universe. He might set his fancy a rambling, and she might bring him in an infinite variety of reports and representations. These would all be possible; but, being all equally possible, he would never of himself give a satisfactory account for his preferring one of them to the rest. Experience alone can point out to him the true cause of any phenomenon.

Now, according to this method of reasoning, Demea, it follows (and is, indeed, tacitly allowed by Cleanthes himself) that order, arrangement, or the adjustment of final causes, is not of itself any proof of design, but only so far as it has been experienced to proceed from that principle. For aught we can know *a priori*, matter may contain the source or spring of order originally within itself, as well as mind does; and there is no more difficulty in conceiving that the several elements, from an internal unknown cause, may fall into the most exquisite arrangement, than to conceive that their ideas, in the great universal mind, from a like internal unknown cause, fall into that arrangement. The equal possibility of both these suppositions is allowed. But, by experience, we find (according to Cleanthes) that there is a difference between them. Throw several pieces of steel together, without shape or form, they will never arrange themselves so as to compose a watch. Stone and mortar and wood, without an architect, never erect a house. But the ideas in a human mind, we see, by an unknown, inexplicable economy, arrange themselves so as to form the plan of a watch or house. Experience, therefore, proves that there is an original principle of order in mind, not in matter. From similar effects we infer similar causes. The adjustment of means to ends is alike in the universe, as in a machine of human contrivance. The causes, therefore, must be resembling.

I was from the beginning scandalized, I must own, with this resemblance which is asserted between the Deity and human creatures, and must conceive it to imply such a degradation of the Supreme Being as no sound theist could endure. With your assistance, therefore, Demea, I shall endeavor to defend what you justly call the adorable mysteriousness of the Divine Nature, and shall refute this reasoning of Cleanthes, provided he allows that I have made a fair representation of it.

When Cleanthes had assented, Philo, after a short pause, proceeded in the following manner.

That all inferences, Cleanthes, concerning fact are founded on experience, and that all experimental reasonings are founded on the supposition that similar causes prove similar effects, and similar effects similar causes, I shall not at present much dispute with you. But observe, I entreat you, with what extreme caution all just reasoners proceed in the transferring of experiments to similar cases. Unless the cases be exactly similar, they repose no perfect confidence in applying their past observation to any particular phenomenon. Every alteration of circumstances occasions a doubt concerning the event; and it requires new experiments to prove certainly that the new circumstances are of no moment or importance. A change in bulk, situation, arrangement, age, disposition of the air, or surrounding bodies — any of these particulars may be attended with the most unexpected consequences. And unless the objects be quite familiar to us, it is the highest temerity to expect with assurance, after any of these changes, an event similar to that which before fell under our observation. The slow and deliberate steps of philosophers here, if anywhere, are distinguished from the precipitate march of the vulgar, who, hurried on by the smallest similitude, are incapable of all discernment or consideration.

But can you think, Cleanthes, that your usual phlegm and philosophy have been preserved in so wide a step as you have taken when you compared to the universe houses, ships, furniture, machines; and, from their similarity in some circumstances, inferred a similarity in their causes? Thought, design, intelligence, such as we discover in men and other animals, is no more than one of the springs and principles of the universe, as well as heat or cold, attraction or repulsion, and a hundred others which fall under daily observation. It is an active cause by which some particular parts of nature, we find, produce alterations on other parts. But can a conclusion, with any propriety, be transferred from parts to the whole? Does not the great disproportion bar all comparison and inference? From observing the growth of a hair, can we learn anything concerning the generation of a man? Would the manner of a leaf's blowing, even though perfectly known, afford us any instruction concerning the vegetation of a tree?

But allowing that we were to take the *operations* of one part of nature upon another for the foundation of our judgment concerning the *origin* of the whole (which never can be admitted), yet why select so minute, so weak, so bounded a principle as the reason and design of animals is found to be upon this planet? What peculiar privilege has this little agitation of the brain which we call *thought*, that we must thus make it the model of the whole universe? Our partiality in our own favor does indeed present it on all occasions, but

sound philosophy ought carefully to guard against so natural an illusion.

So far from admitting, continued Philo, that the operations of a part can afford us any just conclusion concerning the origin of the whole, I will not allow any one part to form a rule for another part if the latter be very remote from the former. Is there any reasonable ground to conclude that the inhabitants of other planets possess thought, intelligence, reason, or anything similar to these faculties in men? When nature has so extremely diversified her manner of operation in this small globe, can we imagine that she incessantly copies herself throughout so immense a universe? And if thought, as we may well suppose, be confined merely to this narrower corner and has even there so limited a sphere of action, with what propriety can we assign it for the original cause of all things? The narrow views of a peasant who makes his domestic economy the rule for the government of kingdoms is in comparison a pardonable sophism.

But were we ever so much assured that a thought and reason resembling the human were to be found throughout the whole universe, and were its activity elsewhere vastly greater and more commanding than it appears in this globe; yet I cannot see why the operations of a world constituted, arranged, adjusted, can with any propriety be extended to a world which is in its embryo-state, and is advancing towards that constitution and arrangement. By observation we know somewhat of the economy, action, and nourishment of a finished animal; but we must transfer with great caution that observation to the growth of a foetus in the womb, and still more to the formation of an animalcule in the loins of its male parent. Nature, we find, even from our limited experience, possesses an infinite number of springs and principles which incessantly discover themselves on every change of her position and situation. And what new and unknown principles would actuate her in so new and unknown a situation as that of the formation of a universe, we cannot, without the utmost temerity, pretend to determine.

A very small part of this great system, during a very short time, is very imperfectly discovered to us; and do we thence pronounce decisively concerning the origin of the whole?

Admirable conclusion! Stone, wood, brick, iron, brass, have not, at this time, in this minute globe of earth, an order or arrangement without human art and contrivance; therefore, the universe could not originally attain its order and arrangement without something similar to human art. But is a part of nature a rule for another part very wide of the former? Is it a rule for the whole? Is a very small part a rule for the universe? Is nature in one situation a certain rule for nature in another situation vastly different from the former?

And can you blame me, Cleanthes, if I here imitate the prudent reserve of Simonides,¹⁸ who, according to the noted story, being asked by Hiero,¹⁹ *What God was?* desired a day to think of it, and then two days more; and after that manner continually prolonged the term, without ever bringing in his definition or description? Could you even blame me if I had answered, at first, *that I did not know*, and was sensible that this subject lay vastly beyond the reach of my faculties? You might cry out sceptic and railer, as much as you pleased; but, having found in so many other subjects much more familiar the imperfections and even contradictions of human reason, I never should expect any success from its feeble conjectures in a subject so sublime and so remote from the sphere of our observation. When two *species* of objects have always been observed to be conjoined together, I can *infer*, by custom, the existence of one wherever I *see* the existence of the other; and this I call an argument from experience. But how this argument can have place where the objects, as in the present case, are single, individual, without parallel or specific resemblance, may be difficult to explain. And will any man tell me with a serious countenance that an orderly universe must arise from some thought and art like the human because we have experience of it? To ascertain this reasoning it were requisite that we had experience of the origin of the worlds; and it is not sufficient, surely, that we have seen ships and cities arise from human art and contrivance... .

Philo was proceeding in this vehement manner, somewhat between jest and earnest, as it appeared to me, when he observed some signs of impatience in Cleanthes, and then immediately stopped short. What I had to suggest, said Cleanthes, is only that you would not abuse terms, or make use of popular expressions to subvert philosophical reasonings. You know that the vulgar often distinguish reason from experience, even where the question relates only to matter of fact and existence, though it is found, where that *reason* is properly analyzed, that it is nothing but a species of experience. To prove by experience the origin of the universe from mind is not more contrary to common speech than to prove the motion of the earth from the same principle. And a caviller might raise all the same objections to the Copernican system which you have urged against my reasonings. Have you other earths, might he say, which you have seen to move? Have... .

Yes! cried Philo, interrupting him, we have other earths. Is not the moon another earth, which we see to turn round its center? Is not Venus another earth, where we observe the same phenomenon? Are not the revolutions of the sun also a confirmation, from analogy, of the same theory? All the planets, are they not

earths which revolve about the sun? Are not the satellites moons which move round Jupiter and Saturn, and along with these primary planets round the sun? These analogies and resemblances, with others which I have not mentioned, are the sole proofs of the Copernican system; and to you it belongs to consider whether you have any analogies of the same kind to support your theory.

In reality, Cleanthes, continued he, the modern system of astronomy is now so much received by all inquirers, and has become so essential a part even of our earliest education, that we are not commonly very scrupulous in examining the reasons upon which it is founded. It is now become a matter of mere curiosity to study the first writers on that subject who had the full force of prejudice to encounter, and were obliged to turn their arguments on every side in order to render them popular and convincing. But if we peruse Galileo's famous *Dialogues*²⁰ concerning the system of the world, we shall find that that great genius, one of the sublimest that ever existed, first bent all his endeavors to prove that there was no foundation for the distinction commonly made between elementary and celestial substances. The schools, proceeding from the illusions of sense, had carried this distinction very far; and had established the latter substances to be ingenerable, incorruptible, unalterable, impassible; and had assigned all the opposite qualities to the former. But Galileo, beginning with the moon, proved its similarity in every particular to the earth: its convex figure, its natural darkness when not illuminated, its density, its distinction into solid and liquid, the variations of its phases, the mutual illuminations of the earth and moon, their mutual eclipses, the inequalities of the lunar surface, etc. After many instances of this kind, with regard to all the planets, men plainly saw that these bodies became proper objects of experience, and that the similarity of their nature enabled us to extend the same arguments and phenomena from one to the other.

In this cautious proceeding of the astronomers you may read your own condemnation, Cleanthes; or rather may see that the subject in which you are engaged exceeds all human reason and inquiry. Can you pretend to show any such similarity between the fabric of a house and the generation of a universe? Have you ever seen nature in any such situation as resembles the first arrangement of the elements? Have worlds ever been formed under your eye, and have you had leisure to observe the whole progress of the phenomenon, from the first appearance of order to its final consummation? If you have, then cite your experience and deliver your theory.

Part III

How the most absurd argument, replied Cleanthes, in the hands of a man of ingenuity and invention, may acquire an air of probability! Are you not aware, Philo, that it became necessary for Copernicus and his first disciples to prove the similarity of the terrestrial and celestial matter because several philosophers, blinded by old systems and supported by some sensible appearances, had denied this similarity; but that it is by no means necessary that theists should prove the similarity of the works of nature to those of art, because this similarity is self-evident and undeniable? The same matter, a like form; what more is requisite to show an analogy between their causes, and to ascertain the origin of all things from a divine purpose and intention? Your objections, I must freely tell you, are no better than the abstruse cavils of those philosophers who denied motion, and ought to be refuted in the same manner — by illustrations, examples, and instances rather than by serious argument and philosophy.

Suppose, therefore, that an articulate voice were heard in the clouds, much louder and more melodious than any which human art could ever reach; suppose that this voice were extended in the same instant over all nations and spoke to each nation in its own language and dialect; suppose that the words delivered not only contain a just sense and meaning, but convey some instruction altogether worthy of a benevolent Being superior to mankind — could you possibly hesitate a moment concerning the cause of this voice, and must you not instantly ascribe it to some design or purpose? Yet I cannot see but all the same objections (if they merit that appellation) which lie against the system of theism may also be produced against this inference.

Might you not say that all conclusions concerning fact were founded on experience; that, when we hear an articulate voice in the dark and thence infer a man, it is only the resemblance of the effects which leads us to conclude that there is a like resemblance in the cause; but that this extraordinary voice, by its loudness, extent, and flexibility to all languages, bears so little analogy to any human voice that we have no reason to suppose any analogy in their causes; and, consequently, that a rational, wise, coherent speech proceeded, you know not whence, from some accidental whistling of the winds, not from any divine reason or intelligence? You see clearly your own objections in these cavils; and I hope too, you see clearly that they cannot possibly have more force in the one case than in the other.

But to bring the case still nearer the present one of the universe, I shall make two suppositions which imply not any absurdity or impossibility. Suppose that there is a natural, universal, invariable language, common to every individual of human race, and that books are natural productions which perpetuate themselves in the same manner with animals and vegetables, by descent and propagation. Several expressions of our passions contain a universal language: All brute animals have a natural speech, which, however limited, is very intelligible to their own species. And as there are infinitely fewer parts and less contrivance in the finest composition of eloquence than in the coarsest organized body, the propagation of an *Iliad*²¹ or *Aeneid*²² is an easier supposition than that of any plant or animal.

Suppose, therefore, that you enter into your library thus peopled by natural volumes containing the most refined reason and most exquisite beauty; could you possibly open one of them and doubt that its original cause bore the strongest analogy to mind and intelligence? When it reasons and discourses; when it expostulates, argues, and enforces its views and topics; when it applies sometimes to the pure intellect, sometimes to the affections; when it collects, disposes, and adorns every consideration suited to the subject; could you persist in asserting that all this, at the bottom, had really no meaning, and that the first formation of this volume in the loins of its original parent proceeded not from thought and design? Your obstinacy, I know, reaches not that degree of firmness; even your sceptical play and wantonness would be abashed at so glaring an absurdity.

But if there be any difference, Philo, between this supposed case and the real one of the universe, it is all to the advantage of the latter. The anatomy of an animal affords many stronger instances of design than the perusal of Livy²³ or Tacitus;²⁴ and any objection which you start in the former case, by carrying me back to so unusual and extraordinary a scene as the first formation of worlds, the same objection has place on the supposition of our vegetating library. Choose, then, your party, Philo, without ambiguity or evasion; assert either that a rational volume is no proof of a rational cause or admit of a similar cause to all the works of nature.

Let me here observe, too, continued Cleanthes, that this religious argument, instead of being weakened by that scepticism so much affected by you, rather acquires force from it and becomes more firm and undisputed. To exclude all argument or reasoning of every kind is either affectation or madness. The declared profession of every reasonable sceptic is only to reject abstruse, remote, and refined arguments; to adhere to common sense

and the plain instincts of nature; and to assent, wherever any reasons strike him with so full a force that he cannot, without the greatest violence, prevent it. Now the arguments for natural religion are plainly of this kind; and nothing but the most perverse, obstinate metaphysics can reject them. Consider, anatomize the eye; survey its structure and contrivance, and tell me, from your own feeling, if the idea of a contriver does not immediately flow in upon you with a force like that of sensation. The most obvious conclusion, surely, is in favor of design; and it requires time, reflection, and study, to summon up those frivolous though abstruse objections which can support infidelity. Who can behold the male and female of each species, the correspondence of their parts and instincts, their passions and whole course of life before and after generation, but must be sensible that the propagation of the species is intended by nature? Millions and millions of such instances present themselves through every part of the universe, and no language can convey a more intelligible, irresistible meaning than the curious adjustment of final causes. To what degree, therefore, of blind dogmatism must one have attained to reject such natural and such convincing arguments?

Some beauties in writing we may meet with which seem contrary to rules, and which gain the affections and animate the imagination in opposition to all the precepts of criticism and to the authority of the established masters of art. And if the argument for theism be, as you pretend, contradictory to the principles of logic, its universal, its irresistible influence proves clearly that there may be arguments of a like irregular nature. Whatever cavils may be urged, an orderly world, as well as a coherent, articulate speech, will still be received as an incontestable proof of design and intention.

It sometimes happens, I own, that the religious arguments have not their due influence on an ignorant savage and barbarian; not because they are obscure and difficult, but because he never asks himself any question with regard to them. Whence arises the curious structure of an animal? From the copulation of its parents. And these whence? From *their* parents? A few removes set the objects at such a distance that to him they are lost in darkness and confusion; nor is he actuated by any curiosity to trace them farther. But this is neither dogmatism nor scepticism, but stupidity: a state of mind very different from your sifting, inquisitive disposition, my ingenious friend. You can trace causes from effects; you can compare the most distant and remote objects; and your greatest errors proceed not from barrenness of thought and invention, but from too luxuriant a fertility which suppresses your natural good sense by a profusion of unnecessary scruples and objections.

Here I could observe, Hermippus, that Philo was a little embarrassed and confounded; but, while he hesitated in delivering an answer, luckily for him, Demea broke in upon the discourse and saved his countenance.

Your instance, Cleanthes, said he, drawn from books and language, being familiar, has, I confess, so much more force on that account; but is there not some danger, too, in this very circumstance, and may it not render us presumptuous, by making us imagine we comprehend the Deity and have some adequate idea of his nature and attributes? When I read a volume, I enter into the mind and intention of the author; I become him, in a manner, for the instant, and have an immediate feeling and conception of those ideas which revolved in his imagination while employed in that composition. But so near an approach we never surely can make to the Deity. His ways are not our ways. His attributes are perfect but incomprehensible. And this volume of nature contains a great and inexplicable riddle, more than any intelligible discourse or reasoning.

The ancient Platonists, you know, were the most religious and devout of all the pagan philosophers; yet many of them, particularly Plotinus, expressly declare that intellect or understanding is not to be ascribed to the Deity, and that our most perfect worship of him consists, not in acts of veneration, reverence, gratitude, or love, but in a certain mysterious self-annihilation or total extinction of all our faculties. These ideas are, perhaps, too far stretched; but still it must be acknowledged that, by representing the Deity as so intelligible and comprehensible, and so similar to a human mind, we are guilty of the grossest and most narrow partiality, and make ourselves the model of the whole universe.

All the *sentiments* of the human mind, gratitude, resentment, love, friendship, approbation, blame, pity, emulation, envy, have a plain reference to the state and situation of man, and are calculated for preserving the existence and promoting the activity of such a being in such circumstances. It seems, therefore, unreasonable to transfer such sentiments to a supreme existence or to suppose him actuated by them; and the phenomena, besides, of the universe will not support us in such a theory. All our *ideas* derived from the senses are confessedly false and illusive, and cannot therefore be supposed to have place in a supreme intelligence. And as the ideas of internal sentiment, added to those of the external senses, compose the whole furniture of human understanding, we may conclude that none of the *materials* of thought are in any respect similar in the human and in the divine intelligence. Now, as to the *manner* of thinking, how can we make any comparison between them or suppose them anywise resembling? Our thought is fluctuating, uncertain, fleeting, successive, and

compounded; and were we to remove these circumstances, we absolutely annihilate its essence, and it would in such a case be an abuse of terms to apply to it the name of thought or reason. At least, if it appear more pious and respectful (as it really is) still to retain these terms when we mention the Supreme Being, we ought to acknowledge that their meaning, in that case, is totally incomprehensible; and that the infirmities of our nature do not permit us to reach any ideas which in the least correspond to the ineffable sublimity of the Divine attributes.

Part IV

It seems strange to me, said Cleanthes, that you, Demea, who are so sincere in the cause of religion, should still maintain the mysterious, incomprehensible nature of the Deity, and should insist so strenuously that he has no manner of likeness or resemblance to human creatures. The Deity, I can readily allow, possesses many powers and attributes of which we can have no comprehension; but, if our ideas, so far as they go, be not just and adequate and correspondent to his real nature, I know not what there is in this subject worth insisting on. Is the name, without any meaning, of such mighty importance? Or how do you *mystics*, who maintain the absolute incomprehensibility of the Deity, differ from sceptics or atheists, who assert that the first cause of all is unknown and unintelligible? Their temerity must be very great if, after rejecting the production by a mind — I mean a mind resembling the human (for I know of no other) — they pretend to assign, with certainty, any other specific intelligible cause; and their conscience must be very scrupulous, indeed, if they refuse to call the universal unknown cause a God or Deity, and to bestow on him as many sublime eulogies and unmeaning epithets as you shall please to require of them.

Who could imagine, replied Demea, that Cleanthes, the calm philosophical Cleanthes, would attempt to refute his antagonists by affixing a nickname to them; and, like the common bigots and inquisitors of the age, have recourse to invective and declamation instead of reasoning? Or does he not perceive that these topics are easily retorted, and that *anthropomorphite* is an appellation as invidious, and implies as dangerous consequences, as the epithet of *mystic* with which he has honored us? In reality, Cleanthes, consider what it is you assert when you represent the Deity as similar to a human mind and understanding. What is the soul of man? A composition of various faculties, passions, sentiments, ideas—united, indeed, into one self or person, but still distinct from each other. When it reasons, the ideas which are the parts of its discourse arrange themselves in a certain form or order which is not preserved entire for a moment, but immediately gives place to another arrangement. New opinions, new passions, new affections, new feelings arise which continually diversify the mental scene and produce in it the greatest variety and most rapid succession imaginable. How is this compatible with that perfect immutability and simplicity which all true theists ascribe to the Deity? By the same act, say they, he sees past, present, and future; his love and hatred, his mercy and justice, are one individual operation; he is entire in every point of space, and complete in every instant of duration. No succession, no change, no acquisition, no diminution. What he is implies not in it any shadow of distinction or diversity. And what he is this moment he ever has been and ever will be, without any new judgment, sentiment, or operation. He stands fixed in one simple, perfect state; nor can you ever say, with any propriety, that this act of his is different from that other, or that this judgment or idea has been lately formed and will give place, by succession, to any different judgment or idea.

I can readily allow, said Cleanthes, that those who maintain the perfect simplicity of the Supreme Being, to the extent in which you have explained it, are complete *mystics*, and chargeable with all the consequences which I have drawn from their opinion. They are, in a word, *atheists*, without knowing it. For though it be allowed that the Deity possesses attributes of which we have no comprehension, yet ought we never to ascribe to him any attributes which are absolutely incompatible with that intelligent nature essential to him. A mind whose acts and sentiments and ideas are not distinct and successive, one that is wholly simple and totally immutable, is a mind which has no thought, no reason, no will, no sentiment, no love, no hatred; or, in a word, is no mind at all. It is an abuse of terms to give it that appellation, and we may as well speak of limited extension without figure, or of number without composition.

Pray consider, said Philo, whom you are at present inveighing against. You are honoring with the appellation of *atheist* all the sound, orthodox divines, almost, who have treated of this subject; and you will at last be, yourself, found, according to your reckoning, the only sound theist in the world. But if idolaters be atheists, as, I think, may justly be asserted, and Christian theologians the same, what becomes of the argument, so much celebrated, derived from the universal consent of mankind?

But, because I know you are not much swayed by names and authorities, I shall endeavor to show you, a little more distinctly, the inconveniences of that anthropomorphism which you have embraced, and shall prove that there is no ground to suppose a plan of the world to be formed in the Divine mind, consisting of distinct ideas, differently arranged, in the same manner as an architect forms in his head the plan of a house which he intends to execute.

It is not easy, I own, to see what is gained by this supposition, whether we judge of the matter by *reason* or by *experience*. We are still obliged to mount higher in order to find the cause of this cause which you had assigned as satisfactory and conclusive.

If *reason* (I mean abstract reason derived from inquiries *a priori*) be not alike mute with regard to all questions concerning cause and effect, this sentence at least it will venture to pronounce: that a mental world or universe of ideas requires a cause as much as does a material world or universe of objects; and, if similar in its arrangement, must require a similar cause. For what is there in this subject which should occasion a different conclusion or inference? In an abstract view, they are entirely alike; and no difficulty attends the one supposition which is not common to both of them.

Again, when we will needs force *experience* to pronounce some sentence, even on these subjects which lie beyond her sphere, neither can she perceive any material difference in this particular between these two kinds of worlds, but finds them to be governed by similar principles, and to depend upon an equal variety of causes in their operations. We have specimens in miniature of both of them. Our own mind resembles the one; a vegetable or animal body the other. Let experience, therefore, judge from these samples. Nothing seems more delicate, with regard to its causes, than thought; and as these causes never operate in two persons after the same manner, so we never find two persons who think exactly alike. Nor indeed does the same person think exactly alike at any two different periods of time. A difference of age, of the disposition of his body, of weather, of food, of company, of books, of passions — any of these particulars, or others more minute, are sufficient to alter the curious machinery of thought and communicate to it very different movements and operations. As far as we can judge, vegetables and animal bodies are not more delicate in their motions, nor depend upon a greater variety or more curious adjustment of springs and principles.

How, therefore, shall we satisfy ourselves concerning the cause of that Being whom you suppose the Author of Nature, or, according to your system of anthropomorphism, the ideal world into which you trace the material? Have we not the same reason to trace that ideal world into another ideal world or new intelligent principle? But if we stop and go no farther, why go so far—why not stop at the material world? How can we satisfy ourselves without going on *in infinitum*? And, after all, what satisfaction is there in that infinite progression? Let us remember the story of the Indian philosopher and his elephant. It was never more applicable than to the present subject. If the material world rests upon a similar ideal world, this ideal world must rest upon some other, and so on without end. It were better, therefore, never to look beyond the present material world. By supposing it to contain the principle of its order within itself, we really assert it to be God; and the sooner we arrive at that Divine Being, so much the better. When you go one step beyond the mundane system, you only excite an inquisitive humor which it is impossible ever to satisfy.

To say that the different ideas which compose the reason of the Supreme Being fall into order of themselves and by their own nature is really to talk without any precise meaning. If it has a meaning, I would fain know why it is not as good sense to say that the parts of the material world fall into order of themselves and by their own nature. Can the one opinion be intelligible, while the other is not so?

We have, indeed, experience of ideas which fall into order of themselves and without any *known* cause. But, I am sure, we have a much larger experience of matter which does the same, as in all instances of generation and vegetation where the accurate analysis of the cause exceeds all human comprehension. We have also experience of particular systems of thought and of matter which have no order; of the first in madness, of the second in corruption. Why, then, should we think that order is more essential to one than the other? And if it requires a cause in both, what do we gain by your system, in tracing the universe of objects into a similar universe of ideas? The first step which we make leads us on forever. It were, therefore, wise in us to limit all our inquiries to the present world, without looking farther. No satisfaction can ever be attained by these speculations which so far exceed the narrow bounds of human understanding.

It was usual with the Peripatetics, you know, Cleanthes, when the cause of any phenomenon was demanded, to have recourse to their *faculties* or *occult qualities*, and to say, for instance, that bread nourished by its nutritive faculty, and senna purged by its purgative. But it has been discovered that this subterfuge was nothing but the disguise of ignorance, and that these philosophers, though less ingenuous, really said the same thing with the sceptics or the vulgar who fairly confessed that they knew not the cause of these phenomena. In like manner, when it is asked, what cause produces order in the ideas of the Supreme Being, can any other reason be assigned by you, anthropomorphites, than that it is a *rational* faculty, and that such is the nature of the Deity? But why a similar answer will not be equally satisfactory in accounting for the order of the world, without having recourse to any such intelligent creator as you insist on, may be difficult to determine. It is only to say that *such* is the nature of material objects, and that they are all originally possessed of a *faculty* of order and proportion. These are only more learned and elaborate ways of confessing our ignorance; nor has the one hypothesis any real advantage above the other, except in its greater conformity to vulgar prejudices.

You have displayed this argument with great emphasis, replied Cleanthes: You seem not sensible how easy it is to answer it. Even in common life, if I assign a cause for any event, is it any objection, Philo, that I cannot

assign the cause of that cause, and answer every new question which may incessantly be started? And what philosophers could possibly submit to so rigid a rule? — philosophers who confess ultimate causes to be totally unknown, and are sensible that the most refined principles into which they trace the phenomena are still to them as inexplicable as these phenomena themselves are to the vulgar. The order and arrangement of nature, the curious adjustment of final causes, the plain use and intention of every part and organ—all of these bespeak in the clearest language an intelligent cause or author. The heavens and the earth join in the same testimony: The whole chorus of nature raises one hymn to the praises of its Creator. You alone, or almost alone, disturb this general harmony. You start abstruse doubts, cavils, and objections; you ask me what is the cause of this cause? I know not; I care not; that concerns not me. I have found a Deity; and here I stop my inquiry. Let those go farther who are wiser or more enterprising.

I pretend to be neither, replied Philo; and for that very reason I should never, perhaps, have attempted to go so far, especially when I am sensible that I must at least be contented to sit down with the same answer which, without further trouble, might have satisfied me from the beginning. If I am still to remain in utter ignorance of causes and can absolutely give an explication of nothing, I shall never esteem it any advantage to shove off for a moment a difficulty which you acknowledge must immediately, in its full force, recur upon me. Naturalists, indeed, very justly explain particular effects by more general causes, though these general causes themselves should remain in the end totally inexplicable; but they never surely thought it satisfactory to explain a particular effect by a particular cause which was no more to be accounted for than the effect itself. An ideal system, arranged of itself, without a precedent design, is not a whit more explicable than a material one which attains its order in a like manner; nor is there any more difficulty in the latter supposition than in the former.

Part V

But to show you still more inconveniences, continued Philo, in your anthropomorphism, please to take a new survey of your principles. *Like effects prove like causes*. This is the experimental argument; and this, you say too, is the sole theological argument. Now it is certain that the liker the effects are which are seen and the liker the causes which are inferred, the stronger is the argument. Every departure on either side diminishes the probability and renders the experiment less conclusive. You cannot doubt of the principle; neither ought you to reject its consequences.

All the new discoveries in astronomy which prove the immense grandeur and magnificence of the works of nature are so many additional arguments for a Deity, according to the true system of theism; but, according to your hypothesis of experimental theism, they become so many objections, by removing the effect still farther from all resemblance to the effects of human art and contrivance. For if Lucretius,²⁵ even following the old system of the world, could exclaim:

Quis regere immensi summam, quis habere profundi
Indu manu validas potis est moderanter habenas?
Quis pariter coelos omnes convertere? et omnes
Ignibus aetheriis terras suffire feraces?
Omnibus inque locis esse omni tempore praesto?²⁶

If Tully²⁷ esteemed this reasoning so natural as to put it into the mouth of his Epicurean:

Quibus enim oculis animi intueri potuit vester Plato fabricam illam tanti operis, qua construi a Deo atque aedificari mundum facit? quae molitio? quae ferramenta? qui vectes? quae machinae? qui ministri tanti muneris fuerunt? quemadmodum autem obedire et parere voluntati architecti aer, ignis, aqua, terra potuerunt?²⁸

If this argument, I say, had any force in former ages, how much greater must it have at present when the bounds of nature are so infinitely enlarged and such a magnificent scene is opened to us? It is still more unreasonable to form our idea of so unlimited a cause from our experience of the narrow productions of human design and invention.

The discoveries by microscopes, as they open a new universe in miniature, are still objections, according to you; arguments, according to me. The further we push our researches of this kind, we are still led to infer the universal cause of all to be vastly different from mankind, or from any object of human experience and observation.

And what say you to the discoveries in anatomy, chemistry, botany? ... These surely are no objections, replied Cleanthes; they only discover new instances of art and contrivance. It is still the image of mind reflected on us from innumerable objects. Add a mind *like the human*, said Philo. I know of no other, replied Cleanthes. And the liker, the better, insisted Philo. To be sure, said Cleanthes.

Now, Cleanthes, said Philo, with an air of alacrity and triumph, mark the consequences. *First*, by this method of reasoning you renounce all claim to infinity in any of the attributes of the Deity. For, as the cause ought only to be proportioned to the effect, and the effect, so far as it falls under our cognizance, is not infinite, what pretensions have we, upon your suppositions, to ascribe that attribute to the divine Being? You will still insist that, by removing him so much from all similarity to human creatures, we give in to the most arbitrary hypothesis, and at the same time weaken all proofs of his existence.

Secondly, you have no reason, on your theory, for ascribing perfection to the Deity, even in his finite capacity; or for supposing him free from every error, mistake, or incoherence, in his undertakings. There are many inexplicable difficulties in the works of nature which, if we allow a perfect author to be proved *a priori*, are easily solved, and become only seeming difficulties from the narrow capacity of man, who cannot trace infinite relations. But according to your method of reasoning, these difficulties become all real; and, perhaps, will be insisted on as new instances of likeness to human art and contrivance. At least, you must acknowledge that it is impossible for us to tell, from our limited views, whether this system contains any great faults or deserves any considerable praise if compared to other possible and even real systems. Could a peasant, if the *Aeneid* were read to him, pronounce that poem to be absolutely faultless, or even assign to it its proper rank among the productions of human wit, he who had never seen any other production?

But were this world ever so perfect a production, it must still remain uncertain whether all the excellences

of the work can justly be ascribed to the workman. If we survey a ship, what an exalted idea must we form of the ingenuity of the carpenter who framed so complicated, useful, and beautiful a machine? And what surprise must we feel when we find him a stupid mechanic who imitated others, and copied an art which, through a long succession of ages, after multiplied trials, mistakes, corrections, deliberations, and controversies, had been gradually improving? Many worlds might have been botched and bungled, throughout an eternity, ere this system was struck out; much labor lost; many fruitless trials made; and a slow but continued improvement carried on during infinite ages in the art of world-making. In such subjects, who can determine where the truth, nay, who can conjecture where the probability lies, amidst a great number of hypotheses which may be proposed, and a still greater which may be imagined?

And what shadow of an argument, continued Philo, can you produce from your hypothesis to prove the unity of the Deity? A great number of men join in building a house or ship, in rearing a city, in framing a commonwealth; why may not several deities combine in contriving and framing a world? This is only so much greater similarity to human affairs. By sharing the work among several, we may so much further limit the attributes of each, and get rid of that extensive power and knowledge which must be supposed in one deity, and which, according to you, can only serve to weaken the proof of his existence. And if such foolish, such vicious creatures as man can yet often unite in framing and executing one plan, how much more those deities or demons, whom we may suppose several degrees more perfect?

To multiply causes without necessity is indeed contrary to true philosophy, but this principle applies not to the present case. Were one deity antecedently proved by your theory who were possessed of every attribute requisite to the production of the universe, it would be needless, I own (though not absurd), to suppose any other deity existent. But while it is still a question whether all these attributes are united in one subject or dispersed among several independent beings; by what phenomena in nature can we pretend to decide the controversy? Where we see a body raised in a scale, we are sure that there is in the opposite scale, however concealed from sight, some counterpoising weight equal to it; but it is still allowed to doubt whether that weight be an aggregate of several distinct bodies or one uniform united mass. And if the weight requisite very much exceeds anything which we have ever seen conjoined in any single body, the former supposition becomes still more probable and natural. An intelligent being of such vast power and capacity as is necessary to produce the universe — or, to speak in the language of ancient philosophy, so prodigious an animal — exceeds all analogy and even comprehension.

But further, Cleanthes, men are mortal, and renew their species by generation; and this is common to all living creatures. The two great sexes of male and female, says Milton, animate the world. Why must this circumstance, so universal, so essential, be excluded from those numerous and limited deities? Behold, then, the theogeny of ancient times brought back upon us.

And why not become a perfect anthropomorphite? Why not assert the deity or deities to be corporeal, and to have eyes, a nose, mouth, ears, etc? Epicurus maintained that no man had ever seen reason but in a human figure; therefore, the gods must have a human figure. And this argument, which is deservedly so much ridiculed by Cicero, becomes, according to you, solid and philosophical.

In a word, Cleanthes, a man who follows your hypothesis is able, perhaps, to assert or conjecture that the universe sometime arose from something like design; but beyond that position he cannot ascertain one single circumstance, and is left afterwards to fix every point of his theology by the utmost license of fancy and hypothesis. This world, for aught he knows, is very faulty and imperfect, compared to a superior standard; and was only the first rude essay of some infant deity who afterwards abandoned it, ashamed of his lame performance; it is the work only of some dependent, inferior deity, and is the object of derision to his superiors; it is the production of old age and dotage in some superannuated deity; and ever since his death has run on at adventures, from the first impulse and active force which it received from him. You justly give signs of horror, Demea, at these strange suppositions; but these, and a thousand more of the same kind, are Cleanthes' suppositions, not mine. From the moment the attributes of the Deity are supposed finite, all these have place. And I cannot, for my part, think that so wild and unsettled a system of theology is, in any respect, preferable to none at all.

These suppositions I absolutely disown, cried Cleanthes; they strike me, however, with no horror, especially when proposed in that rambling way in which they drop from you. On the contrary, they give me pleasure when I see that, by the utmost indulgence of your imagination, you never get rid of the hypothesis of design in the universe, but are obliged at every turn to have recourse to it. To this concession I adhere steadily; and this I regard as a sufficient foundation for religion.

Part VI

It must be a slight fabric, indeed, said Demea, which can be erected on so tottering a foundation. While we are uncertain whether there is one deity or many, whether the deity or deities, to whom we owe our existence, be perfect or imperfect, subordinate or supreme, dead or alive, what trust or confidence can we repose in them? What devotion or worship address to them? What veneration or obedience pay them? To all the purposes of life the theory of religion becomes altogether useless; and even with regard to speculative consequences its uncertainty, according to you, must render it totally precarious and unsatisfactory.

To render it still more unsatisfactory, said Philo, there occurs to me another hypothesis which must acquire an air of probability from the method of reasoning so much insisted on by Cleanthes. That like effects arise from like causes—this principle he supposes the foundation of all religion. But there is another principle of the same kind, no less certain and derived from the same source of experience, that, where several known circumstances are observed to be similar, the unknown will also be found similar. Thus, if we see the limbs of a human body, we conclude that it is also attended with a human head, though hid from us. Thus, if we see, through a chink in a wall, a small part of the sun, we conclude that were the wall removed we should see the whole body. In short, this method of reasoning is so obvious and familiar that no scruple can ever be made with regard to its solidity.

Now, if we survey the universe, so far as it falls under our knowledge, it bears a great resemblance to an animal or organized body, and seems actuated with a like principle of life and motion. A continual circulation of matter in it produces no disorder; a continual waste in every part is incessantly repaired; the closest sympathy is perceived throughout the entire system; and each part or member, in performing its proper offices, operates both to its own preservation and to that of the whole. The world, therefore, I infer, is an animal; and the Deity is the *soul* of the world, actuating it, and actuated by it.

You have too much learning, Cleanthes, to be at all surprised at this opinion which, you know, was maintained by almost all the theists of antiquity, and chiefly prevails in their discourses and reasonings. For though sometimes the ancient philosophers reason from final causes, as if they thought the world the workmanship of God, yet it appears rather their favorite notion to consider it as his body whose organization renders it subservient to him. And it must be confessed that, as the universe resembles more a human body than it does the works of human art and contrivance, if our limited analogy could ever, with any propriety, be extended to the whole of nature, the inference seems juster in favor of the ancient than the modern theory.

There are many other advantages, too, in the former theory which recommended it to the ancient theologians. Nothing more repugnant to all their notions—because nothing more repugnant to common experience—than mind without body; a mere spiritual substance which fell not under their senses nor comprehension, and of which they had not observed one single instance throughout all nature. Mind and body they knew because they felt both; an order, arrangement, organization, or internal machinery, in both they likewise knew, after the same manner; and it could not but seem reasonable to transfer this experience to the universe, and to suppose the divine mind and body to be also coeval and to have, both of them, order and arrangement naturally inherent in them and inseparable from them.

Here, therefore, is a new species of *anthropomorphism*, Cleanthes, on which you may deliberate; and a theory which seems not liable to any considerable difficulties. You are too much superior, surely, to *systematical prejudices* to find any more difficulty in supposing an animal body to be, originally, of itself or from unknown causes, possessed of order and organization, than in supposing a similar order to belong to mind. But the *vulgar prejudice* that body and mind ought always to accompany each other ought not, one should think, to be entirely neglected; since it is founded on *vulgar experience*, the only guide which you profess to follow in all these theological inquiries. And if you assert that our limited experience is an unequal standard by which to judge of the unlimited extent of nature, you entirely abandon your own hypothesis, and must thenceforward adopt our mysticism, as you call it, and admit of the absolute incomprehensibility of the Divine Nature.

This theory, I own, replied Cleanthes, has never before occurred to me, though a pretty natural one; and I cannot readily, upon so short an examination and reflection, deliver any opinion with regard to it. You are very scrupulous, indeed, said Philo; were I to examine any system of yours, I should not have acted with half that caution and reserve, in starting objections and difficulties to it. However, if anything occur to you, you will oblige us by proposing it.

Why then, replied Cleanthes, it seems to me that, though the world does, in many circumstances, resemble an animal body, yet is the analogy also defective in many circumstances the most material: no organ

of sense, no seat of thought or reason; no one precise origin of motion and action. In short, it seems to bear a stronger resemblance to a vegetable than to an animal, and your inference would be so far inconclusive in favor of the soul of the world.

But, in the next place, your theory seems to imply the eternity of the world; and that is a principle which, I think, can be refuted by the strongest reasons and probabilities. I shall suggest an argument to this purpose which, I believe, has not been insisted on by any writer. Those who reason from the late origin of arts and sciences, though their inference wants not force, may perhaps be refuted by considerations derived from the nature of human society, which is in continual revolution between ignorance and knowledge, liberty and slavery, riches and poverty; so that it is impossible for us, from our limited experience, to foretell with assurance what events may or may not be expected. Ancient learning and history seem to have been in great danger of entirely perishing after the inundation of the barbarous nations; and had these convulsions continued a little longer, or been a little more violent, we should not probably have now known what passed in the world a few centuries before us. Nay, were it not for the superstition of the popes, who preserved a little jargon of Latin in order to support the appearance of an ancient and universal church, that tongue must have been utterly lost; in which case the Western world, being totally barbarous, would not have been in a fit disposition for receiving the Greek language and learning, which was conveyed to them after the sacking of Constantinople. When learning and books had been extinguished, even the mechanical arts would have fallen considerably to decay; and it is easily imagined that fable or tradition might ascribe to them a much later origin than the true one. This vulgar argument, therefore, against the eternity of the world seems a little precarious.

But here appears to be the foundation of a better argument. Lucullus²⁹ was the first that brought cherry-trees from Asia to Europe; though that tree thrives so well in many European climates that it grows in the woods without any culture. Is it possible that, throughout a whole eternity, no European had ever passed into Asia and thought of transplanting so delicious a fruit into his own country? Or if the tree was once transplanted and propagated, how could it ever afterwards perish? Empires may rise and fall; liberty and slavery succeed alternately; ignorance and knowledge give place to each other; but the cherry-tree will still remain in the woods of Greece, Spain, and Italy, and will never be affected by the revolutions of human society.

It is not two thousand years since vines were transplanted into France, though there is no climate in the world more favorable to them. It is not three centuries since horses, cows, sheep, swine, dogs, corn, were known in America. Is it possible that during the revolutions of a whole eternity there never arose a Columbus who might open the communication between Europe and that continent? We may as well imagine that all men would wear stockings for ten thousand years, and never have the sense to think of garters to tie them. All these seem convincing proofs of the youth or rather infancy of the world, as being founded on the operation of principles more constant and steady than those by which human society is governed and directed. Nothing less than a total convulsion of the elements will ever destroy all the European animals and vegetables which are now to be found in the Western world.

And what argument have you against such convulsions? replied Philo. Strong and almost incontestable proofs may be traced over the whole earth that every part of this globe has continued for many ages entirely covered with water. And though order were supposed inseparable from matter, and inherent in it; yet may matter be susceptible of many and great revolutions, through the endless periods of eternal duration. The incessant changes to which every part of it is subject seem to intimate some such general transformations; though, at the same time, it is observable that all the changes and corruptions of which we have ever had experience are but passages from one state of order to another; nor can matter ever rest in total deformity and confusion. What we see in the parts, we may infer in the whole; at least, that is the method of reasoning on which you rest your whole theory. And were I obliged to defend any particular system of this nature, which I never willingly should do, I esteem none more plausible than that which ascribes an eternal, inherent principle of order to the world, though attended with great and continual revolutions and alterations. This at once solves all difficulties; and if the solution, by being so general, is not entirely complete and satisfactory, it is at least a theory that we must sooner or later have recourse to, whatever system we embrace. How could things have been as they are, were there not an original inherent principle of order somewhere, in thought or in matter? And it is very indifferent to which of these we give the preference. Chance has no place, on any hypothesis, sceptical or religious. Everything is surely governed by steady, inviolable laws. And were the inmost essence of things laid open to us, we should then discover a scene of which, at present, we can have no idea. Instead of admiring the order of natural beings, we should clearly see that it was absolutely impossible for them, in the smallest article, ever to admit of any other disposition.

Were anyone inclined to revive the ancient pagan theology which maintained, as we learn from Hesiod,³⁰ that this globe was governed by 30,000 deities, who arose from the unknown powers of nature, you would naturally object, Cleanthes, that nothing is gained by this hypothesis; and that it is as easy to suppose all men and animals, beings more numerous but less perfect, to have sprung immediately from a like origin. Push the same inference a step further, and you will find a numerous society of deities as explicable as one universal deity who possesses within himself the powers and perfections of the whole society. All these systems, then, of scepticism, polytheism, and theism, you must allow, on your principles, to be on a like footing, and that no one of them has any advantage over the others. You may thence learn the fallacy of your principles.

Part VII

But here, continued Philo, in examining the ancient system of the soul of the world there strikes me, all of a sudden, a new idea which, if just, must go near to subvert all your reasoning, and destroy even your first inferences on which you repose such confidence. If the universe bears a greater likeness to animal bodies and to vegetables than to the works of human art, it is more probable that its cause resembles the cause of the former than that of the latter, and its origin ought rather to be ascribed to generation or vegetation than to reason or design. Your conclusion, even according to your own principles, is therefore lame and defective.

Pray open up this argument a little further, said Demea, for I do not rightly apprehend it in that concise manner in which you have expressed it.

Our friend Cleanthes, replied Philo, as you have heard, asserts that since no question of fact can be proved otherwise than by experience, the existence of a Deity admits not of proof from any other medium. The world, says he, resembles the works of human contrivance; therefore its cause must also resemble that of the other. Here we may remark that the operation of one very small part of nature, to wit, man, upon another very small part, to wit, that inanimate matter lying within his reach, is the rule by which Cleanthes judges of the origin of the whole; and he measures objects, so widely disproportioned, by the same individual standard. But to waive all objections drawn from this topic, I affirm that there are other parts of the universe (besides the machines of human invention) which bear still a greater resemblance to the fabric of the world, and which, therefore, afford a better conjecture concerning the universal origin of this system. These parts are animals and vegetables. The world plainly resembles more an animal or a vegetable than it does a watch or a knitting-loom. Its cause, therefore, it is more probable, resembles the cause of the former. The cause of the former is generation or vegetation. The cause, therefore, of the world we may infer to be something similar or analogous to generation or vegetation.

But how is it conceivable, said Demea, that the world can arise from anything similar to vegetation or generation?

Very easily, replied Philo. In like manner as a tree sheds its seed into the neighboring fields and produces other trees; so the great vegetable, the world, or this planetary system, produces within itself certain seeds which, being scattered into the surrounding chaos, vegetate into new worlds. A comet, for instance, is the seed of a world; and after it has been fully ripened, by passing from sun to sun, and star to star, it is at last tossed into the unformed elements which everywhere surround this universe, and immediately sprouts up into a new system.

Or if, for the sake of variety (for I see no other advantage) we should suppose this world to be an animal; a comet is the egg of this animal; and in like manner as an ostrich lays its egg in the sand, which, without any further care, hatches the egg and produces a new animal, so ... I understand you, says Demea: But what wild, arbitrary suppositions are these? What *data* have you for such extraordinary conclusions? And is the slight, imaginary resemblance of the world to a vegetable or an animal sufficient to establish the same inference with regard to both? Objects which are in general so widely different; ought they to be a standard for each other?

Right, cries Philo: This is the topic on which I have all along insisted. I have still asserted that we have no *data* to establish any system of cosmogony. Our experience, so imperfect in itself and so limited both in extent and duration, can afford us no probable conjecture concerning the whole of things. But if we must needs fix on some hypothesis, by what rule, pray, ought we to determine our choice? Is there any other rule than the great similarity of the objects compared? And does not a plant or an animal, which springs from vegetation or generation, bear a stronger resemblance to the world than does any artificial machine, which arises from reason and design?

But what is this vegetation and generation of which you talk? said Demea. Can you explain their operations, and anatomize that fine internal structure on which they depend?

As much, at least, replied Philo, as Cleanthes can explain the operations of reason, or anatomize that internal structure on which *it* depends. But without any such elaborate disquisitions, when I see an animal, I infer that it sprang from generation; and that with as great certainty as you conclude a house to have been reared by design. These words *generation*, *reason* mark only certain powers and energies in nature whose effects are known, but whose essence is incomprehensible; and one of these principles, more than the other, has no privilege for being made a standard to the whole of nature.

In reality, Demea, it may reasonably be expected that the larger the views are which we take of things, the better will they conduct us in our conclusions concerning such extraordinary and such magnificent subjects. In

this little corner of the world alone, there are four principles, *reason, instinct, generation, vegetation*, which are similar to each other, and are the causes of similar effects. What a number of other principles may we naturally suppose in the immense extent and variety of the universe could we travel from planet to planet, and from system to system, in order to examine each part of this mighty fabric? Any one of these four principles above mentioned (and a hundred others which lie open to our conjecture) may afford us a theory by which to judge of the origin of the world; and it is a palpable and egregious partiality to confine our view entirely to that principle by which our own minds operate. Were this principle more intelligible on that account, such a partiality might be somewhat excusable; but reason, in its internal fabric and structure, is really as little known to us as instinct or vegetation; and, perhaps, even that vague, undeterminate word *nature* to which the vulgar refer everything is not at the bottom more inexplicable. The effects of these principles are all known to us from experience; but the principles themselves and their manner of operation are totally unknown; nor is it less intelligible or less conformable to experience to say that the world arose by vegetation, from a seed shed by another world, than to say that it arose from a divine reason or contrivance, according to the sense in which Cleanthes understands it.

But methinks, said Demea, if the world had a vegetative quality and could sow the seeds of new worlds into the infinite chaos, this power would be still an additional argument for design in its author. For whence could arise so wonderful a faculty but from design? Or how can order spring from anything which perceives not that order which it bestows?

You need only look around you, replied Philo, to satisfy yourself with regard to this question. A tree bestows order and organization on that tree which springs from it, without knowing the order; an animal in the same manner on its offspring; a bird on its nest; and instances of this kind are even more frequent in the world than those of order which arise from reason and contrivance. To say that all this order in animals and vegetables proceeds ultimately from design is begging the question; nor can that great point be ascertained otherwise than by proving, *a priori*, both that order is, from its nature, inseparably attached to thought, and that it can never of itself or from original unknown principles belong to matter.

But further, Demea, this objection which you urge can never be made use of by Cleanthes, without renouncing a defence which he has already made against one of my objections. When I inquired concerning the cause of that supreme reason and intelligence into which he resolves everything, he told me that the impossibility of satisfying such inquiries could never be admitted as an objection in any species of philosophy. *We must stop somewhere*, says he; *nor is it ever within the reach of human capacity to explain ultimate causes or show the last connections of any objects. It is sufficient if any steps, so far as we go, are supported by experience and observation.* Now, that vegetation and generation, as well as reason, are experienced to be principles of order in nature is undeniable. If I rest my system of cosmogony on the former, preferably to the latter, it is at my choice. The matter seems entirely arbitrary. And when Cleanthes asks me what is the cause of my great vegetative or generative faculty, I am equally entitled to ask him the cause of his great reasoning principle. These questions we have agreed to forbear on both sides; and it is chiefly his interest on the present occasion to stick to this agreement. Judging by our limited and imperfect experience, generation has some privileges above reason; for we see every day the latter arise from the former, never the former from the latter.

Compare, I beseech you, the consequences on both sides. The world, say I, resembles an animal; therefore it is an animal, therefore it arose from generation. The steps, I confess, are wide; yet there is some small appearance of analogy in each step. The world, says Cleanthes, resembles a machine; therefore it is a machine, therefore it arose from design. The steps are here equally wide, and the analogy less striking. And if he pretends to carry on *my* hypothesis a step further, and to infer design or reason from the great principle of generation on which I insist, I may, with better authority, use the same freedom to push further *his* hypothesis, and infer a divine generation or theogony from his principle of reason. I have at least some faint shadow of experience, which is the utmost that can ever be attained in the present subject. Reason, in innumerable instances, is observed to arise from the principle of generation, and never to arise from any other principle.

Hesiod and all the ancient mythologists were so struck with this analogy that they universally explained the origin of nature from an animal birth, and copulation. Plato, too, so far as he is intelligible, seems to have adopted some such notion in his *Timaeus*.

The Brahmins³¹ assert that the world arose from an infinite spider, who spun this whole complicated mass from his bowels, and annihilates afterwards the whole or any part of it, by absorbing it again and resolving it into his own essence. Here is a species of cosmogony which appears to us ridiculous because a spider is a little contemptible animal whose operations we are never likely to take for a model of the whole universe. But still here is a new species of analogy, even in our globe. And were there a planet wholly inhabited by spiders

(which is very possible), this inference would there appear as natural and irrefragable as that which in our planet ascribes the origin of all things to design and intelligence, as explained by Cleanthes. Why an orderly system may not be spun from the belly as well as from the brain, it will be difficult for him to give a satisfactory reason.

I must confess, Philo, replied Cleanthes, that, of all men living, the task which you have undertaken, of raising doubts and objections, suits you best and seems, in a manner, natural and unavoidable to you. So great is your fertility of invention that I am not ashamed to acknowledge myself unable, on a sudden, to solve regularly such out-of-the-way difficulties as you incessantly start upon me; though I clearly see, in general, their fallacy and error. And I question not, but you are yourself, at present, in the same case, and have not the solution so ready as the objection; while you must be sensible that common sense and reason are entirely against you, and that such whimsies as you have delivered may puzzle but never can convince us.

Part VIII

What you ascribe to the fertility of my invention, replied Philo, is entirely owing to the nature of the subject. In subjects adapted to the narrow compass of human reason there is commonly but one determination which carries probability or conviction with it; and to a man of sound judgment all other suppositions but that one appear entirely absurd and chimerical. But in such questions as the present, a hundred contradictory views may preserve a kind of imperfect analogy, and invention has here full scope to exert itself. Without any great effort of thought, I believe that I could, in an instant, propose other systems of cosmogony which would have some faint appearance of truth; though it is a thousand, a million to one if either yours or any one of mine be the true system.

For instance, what if I should revive the old Epicurean hypothesis? This is commonly, and I believe justly, esteemed the most absurd system that has yet been proposed; yet I know not whether, with a few alterations, it might not be brought to bear a faint appearance of probability. Instead of supposing matter infinite, as Epicurus did, let us suppose it finite. A finite number of particles is only susceptible of finite transpositions, and it must happen, in an eternal duration, that every possible order or position must be tried an infinite number of times. This world, therefore, with all its events, even the most minute, has before been produced and destroyed, and will again be produced and destroyed, without any bounds and limitations. No one who has a conception of the powers of infinite, in comparison of finite, will ever scruple this determination.

But this supposes, said Demea, that matter can acquire motion without any voluntary agent or first mover.

And where is the difficulty, replied Philo, of that supposition? Every event, before experience, is equally difficult and incomprehensible; and every event, after experience, is equally easy and intelligible. Motion, in many instances, from gravity, from elasticity, from electricity, begins in matter, without any known voluntary agent; and to suppose always, in these cases, an unknown voluntary agent is mere hypothesis — and hypothesis attended with no advantages. The beginning of motion in matter itself is as conceivable *a priori* as its communication from mind and intelligence.

Besides, why may not motion have been propagated by impulse through all eternity, and the same stock of it, or nearly the same, be still upheld in the universe? As much as is lost by the composition of motion, as much is gained by its resolution. And whatever the causes are, the fact is certain that matter is and always has been in continual agitation, as far as human experience or tradition reaches. There is not probably, at present, in the whole universe, one particle of matter at absolute rest.

And this very consideration, too, continued Philo, which we have stumbled on in the course of the argument suggests a new hypothesis of cosmogony that is not absolutely absurd and improbable. Is there a system, an order, an economy of things, by which matter can preserve that perpetual agitation which seems essential to it, and yet maintain a constancy in the forms which it produces? There certainly is such an economy, for this is actually the case with the present world. The continual motion of matter, therefore, in less than infinite transpositions, must produce this economy or order; and, by its very nature, that order, when once established, supports itself for many ages if not to eternity. But wherever matter is so poised, arranged, and adjusted, as to continue in perpetual motion, and yet preserve a constancy in the forms, its situation must, of necessity, have all the same appearance of art and contrivance which we observe at present. All the parts of each form must have a relation to each other and to the whole; and the whole itself must have a relation to the other parts of the universe, to the element in which the form subsists, to the materials with which it repairs its waste and decay, and to every other form which is hostile or friendly. A defect in any of these particulars destroys the form; and the matter of which it is composed is again set loose, and is thrown into irregular motions and fermentations till it unite itself to some other regular form. If no such form be prepared to receive it, and if there be a great quantity of this corrupted matter in the universe, the universe itself is entirely disordered, whether it be the feeble embryo of a world in its first beginnings that is thus destroyed or the rotten carcass of one languishing in old age and infirmity. In either case, a chaos ensues till finite though innumerable revolutions produce, at last, some forms whose parts and organs are so adjusted as to support the forms amidst a continued succession of matter.

Suppose (for we shall endeavor to vary the expression) that matter were thrown into any position by a blind, unguided force; it is evident that this first position must, in all probability, be the most confused and most disorderly imaginable, without any resemblance to those works of human contrivance which, along with a symmetry of parts, discover an adjustment of means to ends and a tendency to self-preservation. If the actuating force cease after this operation, matter must remain forever in disorder, and continue an immense chaos, without any proportion or activity. But suppose that the actuating force, whatever it be, still continues

in matter, this first position will immediately give place to a second which will likewise, in all probability, be as disorderly as the first, and so on through many successions of changes and revolutions. No particular order or position ever continues a moment unaltered. The original force, still remaining in activity, gives a perpetual restlessness to matter. Every possible situation is produced, and instantly destroyed. If a glimpse or dawn of order appears for a moment, it is instantly hurried away and confounded by that never-ceasing force which actuates every part of matter.

Thus the universe goes on for many ages in a continued succession of chaos and disorder. But is it not possible that it may settle at last, so as not to lose its motion and active force (for that we have supposed inherent in it), yet so as to preserve a uniformity of appearance, amidst the continual motion and fluctuation of its parts? This we find to be the case with the universe at present. Every individual is perpetually changing, and every part of every individual; and yet the whole remains, in appearance, the same. May we not hope for such a position or rather be assured of it from the eternal revolutions of unguided matter; and may not this account for all the appearing wisdom and contrivance which is in the universe? Let us contemplate the subject a little, and we shall find this adjustment if attained by matter of a seeming stability in the forms, with a real and perpetual revolution or motion of parts, affords a plausible, if not a true, solution of the difficulty.

It is in vain, therefore, to insist upon the uses of the parts in animals or vegetables, and their curious adjustment to each other. I would fain know how an animal could subsist unless its parts were so adjusted? Do we not find that it immediately perishes whenever this adjustment ceases, and that its matter, corrupting, tries some new form? It happens indeed that the parts of the world are so well adjusted that some regular form immediately lays claim to this corrupted matter; and if it were not so, could the world subsist? Must it not dissolve, as well as the animal, and pass through new positions and situations till in great but finite succession it fall, at last, into the present or some such order?

It is well, replied Cleanthes, you told us that this hypothesis was suggested on a sudden, in the course of the argument. Had you had leisure to examine it, you would soon have perceived the insuperable objections to which it is exposed. No form, you say, can subsist unless it possess those powers and organs requisite for its subsistence; some new order or economy must be tried, and so on, without intermission, till at last some order which can support and maintain itself is fallen upon. But according to this hypothesis, whence arise the many conveniences and advantages which men and all animals possess? Two eyes, two ears are not absolutely necessary for the subsistence of the species. Human race might have been propagated and preserved without horses, dogs, cows, sheep, and those innumerable fruits and products which serve to our satisfaction and enjoyment. If no camels had been created for the use of man in the sandy deserts of Africa and Arabia, would the world have been dissolved? If no loadstone had been framed to give that wonderful and useful direction to the needle, would human society and the human kind have been immediately extinguished? Though the maxims of nature be in general very frugal, yet instances of this kind are far from being rare; and any one of them is sufficient proof of design — and of a benevolent design — which gave rise to the order and arrangement of the universe.

At least, you may safely infer, said Philo, that the foregoing hypothesis is so far incomplete and imperfect, which I shall not scruple to allow. But can we ever reasonably expect greater success in any attempts of this nature? Or can we ever hope to erect a system of cosmogony that will be liable to no exceptions, and will contain no circumstance repugnant to our limited and imperfect experience of the analogy of nature? Your theory itself cannot surely pretend to any such advantage; even though you have run into *anthropomorphism*, the better to preserve a conformity to common experience. Let us once more put it to trial. In all instances which we have ever seen, ideas are copied from real objects, and are ectypal, not archetypal, to express myself in learned terms. You reserve this order and give thought the precedence. In all instances which we have ever seen, thought has no influence upon matter except where that matter is so conjoined with it as to have an equal reciprocal influence upon it. No animal can move immediately anything but the members of its own body; and, indeed, the equality of action and reaction seems to be an universal law of nature; but your theory implies a contradiction to this experience. These instances, with many more which it were easy to collect (particularly the supposition of a mind or system of thought that is eternal or, in other words, an animal ingenerable and immortal) — these instances, I say, may teach all of us sobriety in condemning each other, and let us see that no system of this kind ought ever to be received from a slight analogy, so neither ought any to be rejected on account of a small incongruity. For that is an inconvenience from which we can justly pronounce no one to be exempted.

All religious systems, it is confessed, are subject to great and insuperable difficulties. Each disputant triumphs in his turn, while he carries on an offensive war, and exposes the absurdities, barbarities, and pernicious tenets of his antagonist. But all of them, on the whole, prepare a complete triumph for the *sceptic*,

who tells them that no system ought ever to be embraced with regard to such subjects; for this plain reason, that no absurdity ought ever to be assented to with regard to any subject. A total suspense of judgment is here our only reasonable resource. And if every attack, as is commonly observed, and no defence among theologians is successful, how complete must be *his* victory who remains always, with all mankind, on the offensive, and has himself no fixed station or abiding city which he is ever, on any occasion, obliged to defend?

Part IX

But if so many difficulties attend the argument *a posteriori*, said Demea, had we not better adhere to that simple and sublime argument *a priori* which, by offering to us infallible demonstration, cuts of fat once all doubt and difficulty? By this argument, too, we may prove the *infinity* of the Divine attributes, which, I am afraid, can never be ascertained with certainty from any other topic. For how can an effect which either is finite or, for aught we know, may be so — how can such an effect, I say, prove an infinite cause? The unity, too, of the Divine Nature it is very difficult, if not absolutely impossible, to deduce merely from contemplating the works of nature; nor will the uniformity alone of the plan, even were it allowed, give us any assurance of that attribute. Whereas the argument *a priori* ...

You seem to reason, Demea, interposed Cleanthes, as if those advantages and conveniences in the abstract argument were full proofs of its solidity. But it is first proper, in my opinion, to determine what argument of this nature you choose to insist on; and we shall afterwards, from itself, better than from its *useful* consequences, endeavor to determine what value we ought to put upon it.

The argument, replied Demea, which I would insist on is the common one. Whatever exists must have a cause or reason of its existence, it being absolutely impossible for anything to produce itself or be the cause of its own existence. In mounting up, therefore, from effects to causes, we must either go on in tracing an infinite succession, without any ultimate cause at all, or must at last have recourse to some ultimate cause that is *necessarily* existent. Now, that the first supposition is absurd may be thus proved. In the infinite chain or succession of causes and effects, each single effect is determined to exist by the power and efficacy of that cause which immediately preceded; but the whole eternal chain or succession, taken together, is not determined or caused by anything; and yet it is evident that it requires a cause or reason, as much as any particular object which begins to exist in time. The question is still reasonable why this particular succession of causes existed from eternity, and not any other succession or no succession at all. If there be no necessarily existent being, any supposition which can be formed is equally possible; nor is there any more absurdity in nothing's having existed from eternity than there is in that succession of causes which constitutes the universe. What was it, then, which determined something to exist rather than nothing, and bestowed being on a particular possibility, exclusive of the rest? *External causes*, there are supposed to be none. *Chance* is a word without meaning. Was it *nothing*? But that can never produce anything. We must, therefore, have recourse to a necessarily existent Being who carries the *reason* of his existence in himself; and who cannot be supposed not to exist, without an express contradiction. There is, consequently, such a Being—that is, there is a Deity.

I shall not leave it to Philo, said Cleanthes (though I know that the starting objections is his chief delight), to point out the weakness of this metaphysical reasoning. It seems to me so obviously ill-grounded, and at the same time of so little consequence to the cause of true piety and religion, that I shall myself venture to show the fallacy of it.

I shall begin with observing that there is an evident absurdity in pretending to demonstrate a matter of fact, or to prove it by any arguments *a priori*. Nothing is demonstrable unless the contrary implies a contradiction. Nothing that is distinctly conceivable implies a contradiction. Whatever we conceive as existent, we can also conceive as non-existent. There is no being, therefore, whose non-existence implies a contradiction. Consequently there is no being whose existence is demonstrable. I propose this argument as entirely decisive, and am willing to rest the whole controversy upon it.

It is pretended that the Deity is a necessarily existent being; and this necessity of his existence is attempted to be explained by asserting that, if we knew his whole essence or nature, we should perceive it to be as impossible for him not to exist, as for twice two not to be four. But it is evident that this can never happen, while our faculties remain the same as at present. It will still be possible for us, at any time, to conceive the non-existence of what we formerly conceived to exist; nor can the mind ever lie under a necessity of supposing any object to remain always in being; in the same manner as we lie under a necessity of always conceiving twice two to be four. The words, therefore, *necessary existence* have no meaning; or, which is the same thing, none that is consistent.

But further, why may not the material universe be the necessarily existent Being, according to this pretended explication of necessity? We dare not affirm that we know all the qualities of matter; and, for aught we can determine, it may contain some qualities which, were they known, would make its non-existence appear as great a contradiction as that twice two is five. I find only one argument employed to prove that the material world is not the necessarily existent Being; and this argument is derived from the contingency both of the matter and the form of the world. "Any particle of matter," it is said, "may be *conceived* to be annihilated,

and any form may be *conceived* to be altered. Such an annihilation or alteration, therefore, is not impossible.”³² But it seems a great partiality not to perceive that the same argument extends equally to the Deity, so far as we have any conception of him; and that the mind can at least imagine him to be non-existent, or his attributes to be altered. It must be some unknown, inconceivable qualities which can make his non-existence appear impossible or his attributes unalterable: And no reason can be assigned why these qualities may not belong to matter. As they are altogether unknown and inconceivable, they can never be proved incompatible with it.

Add to this that in tracing an eternal succession of objects it seems absurd to inquire for a general cause or first author. How can anything that exists from eternity have a cause, since that relation implies a priority in time and in a beginning of existence?

In such a chain, too, or succession of objects, each part is caused by that which preceded it, and causes that which succeeds it. Where then is the difficulty? But the *whole*, you say, wants a cause. I answer that the uniting of these parts into a whole, like the uniting of several distinct countries into one kingdom, or several distinct members into one body, is performed merely by an arbitrary act of the mind, and has no influence on the nature of things. Did I show you the particular causes of each individual in a collection of twenty particles of matter, I should think it very unreasonable should you afterwards ask me what was the cause of the whole twenty. This is sufficiently explained in explaining the cause of the parts.

Though the reasonings which you have urged, Cleanthes, may well excuse me, said Philo, from starting any further difficulties; yet I cannot forbear insisting still upon another topic. It is observed by arithmeticians that the products of 9 compose always either 9 or some lesser product of 9 if you add together all the characters of which any of the former products is composed. Thus, of 18, 27, 36, which are products of 9, you make 9 by adding 1 to 8, 2 to 7, 3 to 6. Thus 369 is a product also of 9; and if you add 3, 6, and 9, you make 18, a lesser product of 9.³³ To a superficial observer so wonderful a regularity may be admired as the effect either of chance or design; but a skilful algebraist immediately concludes it to be the work of necessity, and demonstrates that it must forever result from the nature of these numbers. Is it not probable, I ask, that the whole economy of the universe is conducted by a like necessity, though no human algebra can furnish a key which solves the difficulty? And instead of admiring the order of natural beings, may it not happen that, could we penetrate into the intimate nature of bodies, we should clearly see why it was absolutely impossible they could ever admit of any other disposition? So dangerous is it to introduce this idea of necessity into the present question! and so naturally does it afford an inference directly opposite to the religious hypothesis!

But dropping all these abstractions, continued Philo, and confining ourselves to more familiar topics, I shall venture to add an observation that the argument *a priori* has seldom been found very convincing, except to people of a metaphysical head who have accustomed themselves to abstract reasoning, and who, finding from mathematics that the understanding frequently leads to truth through obscurity, and contrary to first appearances, have transferred the same habit of thinking to subjects where it ought not to have place. Other people, even of good sense and the best inclined to religion, feel always some deficiency in such arguments, though they are not perhaps able to explain distinctly where it lies — a certain proof that men ever did and ever will derive their religion from other sources than from this species of reasoning.

Part X

It is my opinion, I own, replied Demea, that each man feels, in a manner, the truth of religion within his own breast; and, from a consciousness of his imbecility and misery rather than from any reasoning, is led to seek protection from that Being on whom he and all nature are dependent. So anxious or so tedious are even the best scenes of life that futurity is still the object of all our hopes and fears. We incessantly look forward and endeavor, by prayers, adoration, and sacrifice, to appease those unknown powers whom we find, by experience, so able to afflict and oppress us. Wretched creatures that we are! What resource for us amidst the innumerable ills of life did not religion suggest some methods of atonement, and appease those terrors with which we are incessantly agitated and tormented?

I am indeed persuaded, said Philo, that the best and indeed the only method of bringing everyone to a due sense of religion is by just representations of the misery and wickedness of men. And for that purpose a talent of eloquence and strong imagery is more requisite than that of reasoning and argument. For is it necessary to prove what everyone feels within himself? It is only necessary to make us feel it, if possible, more intimately and sensibly.

The people, indeed, replied Demea, are sufficiently convinced of this great and melancholy truth. The miseries of life, the unhappiness of man, the general corruptions of our nature, the unsatisfactory enjoyment of pleasures, riches, honors—these phrases have become almost proverbial in all languages. And who can doubt of what all men declare from their own immediate feeling and experience?

In this point, said Philo, the learned are perfectly agreed with the vulgar; and in all letters, *sacred* and *profane*, the topic of human misery has been insisted on with the most pathetic eloquence that sorrow and melancholy could inspire. The poets, who speak from sentiment, without a system, and whose testimony has therefore the more authority, abound in images of this nature. From Homer down to Dr. Young,³⁴ the whole inspired tribe have ever been sensible that no other representation of things would suit the feeling and observation of each individual.

As to authorities, replied Demea, you need not seek them. Look round this library of Cleanthes. I shall venture to affirm that, except authors of particular sciences, such as chemistry or botany, who have no occasion to treat of human life, there is scarce one of those innumerable writers from whom the sense of human misery has not, in some passage or other, extorted a complaint and confession of it. At least, the chance is entirely on that side; and no one author has ever, so far as I can recollect, been so extravagant as to deny it.

There you must excuse me, said Philo: Leibniz has denied it, and is perhaps the first³⁵ who ventured upon so bold and paradoxical an opinion; at least, the first who made it essential to his philosophical system.

And by being the first, replied Demea, might he not have been sensible of his error? For is this a subject in which philosophers can propose to make discoveries especially in so late an age? And can any man hope by a simple denial (for the subject scarcely admits of reasoning) to bear down the united testimony of mankind, founded on sense and consciousness?

And why should man, added he, pretend to an exemption from the lot of all other animals? The whole earth, believe me, Philo, is cursed and polluted. A perpetual war is kindled amongst all living creatures. Necessity, hunger, want stimulate the strong and courageous; fear, anxiety, terror agitate the weak and infirm. The first entrance into life gives anguish to the new-born infant and to its wretched parent; weakness, impotence, distress attend each stage of that life, and it is, at last, finished in agony and horror.

Observe, too, says Philo, the curious artifices of nature in order to embitter the life of every living being. The stronger prey upon the weaker and keep them in perpetual terror and anxiety. The weaker, too, in their turn, often prey upon the stronger, and vex and molest them without relaxation. Consider that innumerable race of insects, which either are bred on the body of each animal or, flying about, infix their stings in him. These insects have others still less than themselves which torment them. And thus on each hand, before and behind, above and below, every animal is surrounded with enemies which incessantly seek his misery and destruction.

Man alone, said Demea, seems to be, in part, an exception to this rule. For by combination in society he can easily master lions, tigers, and bears, whose greater strength and agility naturally enable them to prey upon him.

On the contrary, it is here chiefly, cried Philo, that the uniform and equal maxims of nature are most apparent. Man, it is true, can, by combination, surmount all his *real* enemies and become master of the whole

animal creation; but does he not immediately raise up to himself *imaginary* enemies, the demons of his fancy, who haunt him with superstitious terrors and blast every enjoyment of life? His pleasure, as he imagines, becomes in their eyes a crime; his food and repose give them umbrage and offence; his very sleep and dreams furnish new materials to anxious fear; and even death, his refuge from every other ill, presents only the dread of endless and innumerable woes. Nor does the wolf molest more the timid flock than superstition does the anxious breast of wretched mortals.

Besides, consider, Demea: This very society by which we surmount those wild beasts, our natural enemies, what new enemies does it not raise to us? What woe and misery does it not occasion? Man is the greatest enemy of man. Oppression, injustice, contempt, contumely, violence, sedition, war, calumny, treachery, fraud — by these they mutually torment each other, and they would soon dissolve that society which they had formed were it not for the dread of still greater ills which must attend their separation.

But though these external insults, said Demea, from animals, from men, from all the elements, which assault us form a frightful catalogue of woes, they are nothing in comparison of those which arise within ourselves, from the distempered condition of our mind and body. How many lie under the lingering torment of diseases? Hear the pathetic enumeration of the great poet.

Intestine stone and ulcer, colic-pangs,
Demoniac frenzy, moping melancholy,
And moon-struck madness, pining atrophy,
Marasmus, and wide-wasting pestilence.
Dire was the tossing, deep the groans: *Despair*
Tended the sick, busiest from couch to couch.
And over them triumphant *Death* his dart
Shook: but delay'd to strike, though oft invok'd
With vows, as their chief good and final hope.³⁶

The disorders of the mind, continued Demea, though more secret, are not perhaps less dismal and vexatious. Remorse, shame, anguish, rage, disappointment, anxiety, fear, dejection, despair—who has ever passed through life without cruel inroads from these tormentors? How many have scarcely ever felt any better sensations? Labor and poverty, so abhorred by everyone, are the certain lot of the far greater number; and those few privileged persons who enjoy ease and opulence never reach contentment or true felicity. All the goods of life united would not make a very happy man, but all the ills united would make a wretch indeed; and any one of them almost (and who can be free from every one), nay, often the absence of one good (and who can possess all) is sufficient to render life ineligible.

Were a stranger to drop on a sudden into this world, I would show him, as a specimen of its ills, a hospital full of diseases, a prison crowded with malefactors and debtors, a field of battle strewn with carcasses, a fleet foundering in the ocean, a nation languishing under tyranny, famine, or pestilence. To turn the gay side of life to him and give him a notion of its pleasures—whither should I conduct him? To a ball, to an opera, to court? He might justly think that I was only showing him a diversity of distress and sorrow.

There is no evading such striking instances, said Philo, but by apologies which still further aggravate the charge. Why have all men, I ask, in all ages, complained incessantly of the miseries of life? ... They have no just reason, says one: These complaints proceed only from their discontented, repining, anxious disposition... . And can there possibly, I reply, be a more certain foundation of misery than such a wretched temper?

But if they were really as unhappy as they pretend, says my antagonist, why do they remain in life? ...

Not satisfied with life, afraid of death.

This is the secret chain, say I, that holds us. We are terrified, not bribed to the continuance of our existence.

It is only a false delicacy, he may insist, which a few refined spirits indulge, and which has spread these complaints among the whole race of mankind... . And what is this delicacy, I ask, which you blame? Is it anything but a greater sensibility to all the pleasures and pains of life? And if the man of a delicate, refined temper, by being so much more alive than the rest of the world, is only so much more unhappy, what

judgment must we form in general of human life?

Let men remain at rest, says our adversary, and they will be easy. They are willing artificers of their own misery... . No! reply I: An anxious languor follows their repose; disappointment, vexation, trouble, their activity and ambition.

I can observe something like what you mention in some others, replied Cleanthes; but I confess I feel little or nothing of it in myself, and hope that it is not so common as you represent it.

If you feel not human misery yourself, cried Demea, I congratulate you on so happy a singularity. Others, seemingly the most prosperous, have not been ashamed to vent their complaints in the most melancholy strains. Let us attend to the great, the fortunate emperor, Charles V,³⁷ when, tired with human grandeur, he resigned all his extensive dominions into the hands of his son. In the last harangue which he made on that memorable occasion, he publicly avowed *that the greatest prosperities which he had ever enjoyed had been mixed with so many adversities that he might truly say he had never enjoyed any satisfaction or contentment*. But did the retired life in which he sought for shelter afford him any greater happiness? If we may credit his son's account, his repentance commenced the very day of his resignation.

Cicero's fortune, from small beginnings, rose to the greatest luster and renown; yet what pathetic complaints of all ills of life do his familiar letters, as well as philosophical discourses, contain? And suitably to his own experience, he introduces Cato,³⁸ the great, the fortunate Cato protesting in his old age that had he a new life in his offer he would reject the present.

As yourself, ask any of your acquaintance, whether they would live over again the last ten or twenty years of their life. No! but the next twenty, they say, will be better:

And from the dregs of life, hope to receive

What the first sprightly running could not give.³⁹

Thus, at last, they find (such is the greatness of human misery, it reconciles even contradictions) that they complain at once of the shortness of life and of its vanity and sorrow.

And is it possible, Cleanthes, said Philo, that after all these reflections, and infinitely more which might be suggested, you can still persevere in your anthropomorphism, and assert the moral attributes of the Deity, his justice, benevolence, mercy, and rectitude, to be of the same nature with these virtues in human creatures? His power, we allow, is infinite; whatever he wills is executed; but neither man nor any other animal is happy; therefore, he does not will their happiness. His wisdom is infinite; he is never mistaken in choosing the means to any end; but the course of nature tends not to human or animal felicity; therefore, it is not established for that purpose. Through the whole compass of human knowledge there are no inferences more certain and infallible than these. In what respect, then, do his benevolence and mercy resemble the benevolence and mercy of men?

Epicurus' old questions are yet unanswered.

Is he willing to prevent evil, but not able? then is he impotent. Is he able, but not willing? then is he malevolent. Is he both able and willing? whence then is evil?

You ascribe, Cleanthes (and I believe justly), a purpose and intention to nature. But what, I beseech you, is the object of that curious artifice and machinery which she has displayed in all animals — the preservation alone of individuals, and propagation of the species? It seems enough for her purpose, if such a rank be barely upheld in the universe, without any care or concern for the happiness of the members that compose it. No resource for this purpose: no machinery in order merely to give pleasure or ease: no fund of pure joy and contentment: no indulgence without some want or necessity accompanying it. At least, the few phenomena of this nature are overbalanced by opposite phenomena of still greater importance.

Our sense of music, harmony, and indeed beauty of all kinds, gives satisfaction, without being absolutely necessary to the preservation and propagation of the species. But what racking pains, on the other hand, arise from gouts, gravels, megrims, toothaches, rheumatisms, where the injury to the animal machinery is either small or incurable? Mirth, laughter, play, frolic seem gratuitous satisfactions which have no further tendency; spleen, melancholy, discontent, superstition are pains of the same nature. How then does the divine benevolence display itself, in the sense of you anthropomorphites? None but we mystics, as you were pleased to call us, can account for this strange mixture of phenomena, by deriving it from attributes infinitely perfect but incomprehensible.

And have you, at last, said Cleanthes smiling, betrayed your intentions, Philo? Your long agreement with

Demea did indeed a little surprise me, but I find you were all the while erecting a concealed battery against me. And I must confess that you have now fallen upon a subject worthy of your noble spirit of opposition and controversy. If you can make out the present point, and prove mankind to be unhappy or corrupted, there is an end at once of all religion. For to what purpose establish the natural attributes of the Deity, while the moral are still doubtful and uncertain?

You take umbrage very easily, replied Demea, at opinions the most innocent and the most generally received, even amongst the religious and devout themselves; and nothing can be more surprising than to find a topic like this — concerning the wickedness and misery of man—charged with no less than atheism and profaneness. Have not all pious divines and preachers who have indulged their rhetoric on so fertile a subject; have they not easily, I say, given a solution of any difficulties which may attend it? This world is but a point in comparison of the universe; this life but a moment in comparison of eternity. The present evil phenomena, therefore, are rectified in other regions, and in some future period of existence. And the eyes of men, being then opened to larger views of things, see the whole connection of general laws, and trace, with adoration, the benevolence and rectitude of the Deity through all the mazes and intricacies of his providence.

No! replied Cleanthes, no! These arbitrary suppositions can never be admitted, contrary to matter of fact, visible and uncontroverted. Whence can any cause be known but from its known effects? Whence can any hypothesis be proved but from the apparent phenomena? To establish one hypothesis upon another is building entirely in the air; and the utmost we ever attain by these conjectures and fictions is to ascertain the bare possibility of our opinion, but never can we, upon such terms, establish its reality.

The only method of supporting divine benevolence—and it is what I willingly embrace—is to deny absolutely the misery and wickedness of man. Your representations are exaggerated; your melancholy views mostly fictitious; your inferences contrary to fact and experience. Health is more common than sickness; pleasure than pain; happiness than misery. And for one vexation which we meet with, we attain, upon computation, a hundred enjoyments.

Admitting your position, replied Philo, which yet is extremely doubtful, you must at the same time allow that, if pain be less frequent than pleasure, it is infinitely more violent and durable. One hour of it is often able to outweigh a day, a week, a month of our common insipid enjoyments; and how many days, weeks, and months are passed by several in the most acute torments? Pleasure, scarcely in one instance, is ever able to reach ecstasy and rapture; and in no one instance can it continue for any time at its highest pitch and altitude. The spirits evaporate, the nerves relax, the fabric is disordered, and the enjoyment quickly degenerates into fatigue and uneasiness. But pain often, good God, how often! rises to torture and agony; and the longer it continues, it becomes still more genuine agony and torture. Patience is exhausted, courage languishes, melancholy seizes us, and nothing terminates our misery but the removal of its cause or another event which is the sole cure of all evil, but which, from our natural folly, we regard with still greater horror and consternation.

But not to insist upon these topics, continued Philo, though most obvious, certain, and important, I must use the freedom to admonish you, Cleanthes, that you have put the controversy upon a most dangerous issue, and are unawares introducing a total scepticism into the most essential articles of natural and revealed theology. What! no method of fixing a just foundation for religion unless we allow the happiness of human life, and maintain a continued existence even in this world, with all our present pains, infirmities, vexations, and follies, to be eligible and desirable! But this is contrary to everyone's feeling and experience; it is contrary to an authority so established as nothing can subvert. No decisive proofs can ever be produced against this authority; nor is it possible for you to compute, estimate, and compare all the pains and all the pleasures in the lives of all men and of all animals; and thus, by your resting the whole system of religion on a point which, from its very nature, must forever be uncertain, you tacitly confess that that system is equally uncertain.

But allowing you what never will be believed, at least, what you never possibly can prove, that animal or, at least, human happiness in this life exceeds its misery, you have yet done nothing; for this is not, by any means, what we expect from infinite power, infinite wisdom, and infinite goodness. Why is there any misery at all in the world? Not by chance, surely. From some cause then. Is it from the intention of the Deity? But he is perfectly benevolent. Is it contrary to his intention? But he is almighty. Nothing can shake the solidity of this reasoning, so short, so clear, so decisive, except we assert that these subjects exceed all human capacity, and that our common measures of truth and falsehood are not applicable to them — a topic which I have all along insisted on, but which you have, from the beginning, rejected with scorn and indignation.

But I will be contented to retire still from this intrenchment, for I deny that you can ever force me in it. I will allow that pain or misery in man is *compatible* with infinite power and goodness in the Deity, even in your sense of these attributes: what are you advanced by all these concessions? A mere possible compatibility is not

sufficient. You must *prove* these pure, unmixed and uncontrollable attributes from the present mixed and confused phenomena, and from these alone. A hopeful undertaking! Were the phenomena ever so pure and unmixed, yet, being finite, they would be insufficient for that purpose. How much more, where they are also so jarring and discordant!

Here, Cleanthes, I find myself at ease in my argument. Here I triumph. Formerly, when we argued concerning the natural attributes of intelligence and design, I needed all my sceptical and metaphysical subtilty to elude your grasp. In many views of the universe and of its parts, particularly the latter, the beauty and fitness of final causes strike us with such irresistible force that all objections appear (what I believe they really are) mere cavils and sophisms; nor can we then imagine how it was ever possible for us to repose any weight on them. But there is no view of human life or of the condition of mankind from which, without the greatest violence, we can infer the moral attributes or learn that infinite benevolence, conjoined with infinite power and infinite wisdom, which we must discover by the eyes of faith alone. It is your turn now to tug the laboring oar, and to support your philosophical subtilties against the dictates of plain reason and experience.

Part XI

I scruple not to allow, said Cleanthes, that I have been apt to suspect the frequent repetition of the word *infinite*, which we meet with in all theological writers, to savor more of panegyric than of philosophy, and that any purposes of reasoning, and even of religion, would be better served were we to rest contented with more accurate and more moderate expressions. The terms *admirable*, *excellent*, *superlatively great*, *wise*, and *holy* — these sufficiently fill the imaginations of men, and anything beyond, besides that it leads into absurdities, has no influence on the affections or sentiments. Thus, in the present subject, if we abandon all human analogy, as seems your intention, Demea, I am afraid we abandon all religion and retain no conception of the great object of our adoration. If we preserve human analogy, we must forever find it impossible to reconcile any mixture of evil in the universe with infinite attributes; much less can we ever prove the latter from the former. But supposing the Author of Nature to be finitely perfect, though far exceeding mankind, a satisfactory account may then be given of natural and moral evil, and every untoward phenomenon be explained and adjusted. A less evil may then be chosen in order to avoid a greater; inconveniences be submitted to in order to reach a desirable end; and, in a word, benevolence, regulated by wisdom and limited by necessity, may produce just such a world as the present. You, Philo, who are so prompt at starting views and reflections and analogies, I would gladly hear, at length, without interruption, your opinion of this new theory; and if it deserves our attention, we may afterwards, at more leisure, reduce it into form.

My sentiments, replied Philo, are not worth being made a mystery of; and, therefore, without any ceremony, I shall deliver what occurs to me with regard to the present subject. It must, I think, be allowed that, if a very limited intelligence whom we shall suppose utterly unacquainted with the universe were assured that it were the production of a very good, wise, and powerful being, however finite, he would, from his conjectures, form *beforehand* a different notion of it from what we find it to be by experience; nor would he ever imagine, merely from these attributes of the cause of which he is informed, that the effect could be so full of vice and misery and disorder, as it appears in this life. Supposing now that this person were brought into the world, still assured that it was the workmanship of such a sublime and benevolent being, he might, perhaps, be surprised at the disappointment, but would never retract his former belief if founded on any very solid argument, since such a limited intelligence must be sensible of his own blindness and ignorance, and must allow that there may be many solutions of those phenomena which will forever escape his comprehension. But supposing, which is the real case with regard to man, that this creature is not antecedently convinced of a supreme intelligence, benevolent, and powerful, but is left to gather such a belief from the appearances of things — this entirely alters the case, nor will he ever find any reason for such a conclusion. He may be fully convinced of the narrow limits of his understanding, but this will not help him in forming an inference concerning the goodness of superior powers, since he must form that inference from what he knows, not from what he is ignorant of. The more you exaggerate his weakness and ignorance, the more diffident you render him, and give him the greater suspicion that such subjects are beyond the reach of his faculties. You are obliged, therefore, to reason with him merely from the known phenomena, and to drop every arbitrary supposition or conjecture.

Did I show you a house or palace where there was not one apartment convenient or agreeable; where the windows, doors, fires, passages, stairs, and the whole economy of the building were the source of noise, confusion, fatigue, darkness, and the extremes of heat and cold, you would certainly blame the contrivance, without any further examination. The architect would in vain display his subtilty, and prove to you that, if this door or that window were altered, greater ills would ensue. What he says may be strictly true: The alteration of one particular, while the other parts of the building remain, may only augment the inconveniences. But still you would assert in general that, if the architect had had skill and good intentions, he might have formed such a plan of the whole, and might have adjusted the parts in such a manner as would have remedied all or most of these inconveniences. His ignorance, or even your own ignorance of such a plan, will never convince you of the impossibility of it. If you find any inconveniences and deformities in the building, you will always, without entering into any detail, condemn the architect.

In short, I repeat the question: Is the world, considered in general and as it appears to us in this life, different from what a man or such a limited being would, *beforehand*, expect from a very powerful, wise, and benevolent Deity? It must be strange prejudice to assert the contrary. And from thence I conclude that, however consistent the world may be, allowing certain suppositions and conjectures with the idea of such a Deity, it can never afford us an inference concerning his existence. The consistency is not absolutely denied, only the inference. Conjectures, especially where infinity is excluded from the divine attributes, may perhaps be sufficient to prove a consistency, but can never be foundations for any inference.

There seem to be *four* circumstances on which depend all or the greatest part of the ills that molest sensible creatures; and it is not impossible but all these circumstances may be necessary and unavoidable. We know so little beyond common life, or even of common life, that, with regard to the economy of a universe, there is no conjecture, however wild, which may not be just; nor any one, however plausible, which may not be erroneous. All that belongs to human understanding, in this deep ignorance and obscurity, is to be sceptical or at least cautious, and not to admit of any hypothesis whatever, much less of any which is supported by no appearance of probability. Now this I assert to be the case with regard to all the causes of evil and the circumstances on which it depends. None of them appear to human reason in the least degree necessary or unavoidable, nor can we suppose them such, without the utmost license of imagination.

The *first* circumstance which introduces evil is that contrivance or economy of the animal creation by which pains, as well as pleasures, are employed to excite all creatures to action, and make them vigilant in the great work of self-preservation. Now pleasure alone, in its various degrees, seems to human understanding sufficient for this purpose. All animals might be constantly in a state of enjoyment; but when urged by any of the necessities of nature, such as thirst, hunger, weariness; instead of pain, they might feel a diminution of pleasure by which they might be prompted to seek that object which is necessary to their subsistence. Men pursue pleasure as eagerly as they avoid pain; at least, they might have been so constituted. It seems, therefore, plainly possible to carry on the business of life without any pain. Why then is any animal ever rendered susceptible of such a sensation? If animals can be free from it an hour, they might enjoy a perpetual exemption from it, and it required as particular a contrivance of their organs to produce that feeling as to endow them with sight, hearing, or any of the senses. Shall we conjecture that such a contrivance was necessary, without any appearance of reason; and shall we build on that conjecture as on the most certain truth?

But a capacity of pain would not alone produce pain were it not for the *second* circumstance, viz., the conducting of the world by general laws; and this seems nowise necessary to a very perfect being. It is true, if everything were conducted by particular volitions, the course of nature would be perpetually broken, and no man could employ his reason in the conduct of life. But might not other particular volitions remedy this inconvenience? In short, might not the Deity exterminate all ill, wherever it were to be found, and produce all good, without any preparation or long progress of causes and effects?

Besides, we must consider that, according to the present economy of the world, the course of nature, though supposed exactly regular, yet to us appears not so, and many events are uncertain, and many disappoint our expectations. Health and sickness, calm and tempest, with an infinite number of other accidents whose causes are unknown and variable, have a great influence both on the fortunes of particular persons and on the prosperity of public societies; and indeed all human life, in a manner, depends on such accidents. A being, therefore, who knows the secret springs of the universe might easily, by particular volitions, turn all these accidents to the good of mankind and render the whole world happy, without discovering himself in any operation. A fleet whose purposes were salutary to society might always meet with a fair wind; good princes enjoy sound health and long life; persons born to power and authority be framed with good tempers and virtuous dispositions. A few such events as these, regularly and wisely conducted, would change the face of the world; and yet would no more seem to disturb the course of nature or confound human conduct than the present economy of things where the causes are secret and variable and compounded. Some small torches given to Caligula's⁴⁰ brain in his infancy might have converted him into a Trajan.⁴¹ One wave, a little higher than the rest, by burying Caesar and his fortune in the bottom of the ocean, might have restored liberty to a considerable part of mankind. There may, for aught we know, be good reasons why Providence interposes not in this manner, but they are unknown to us; and, though the mere supposition that such reasons exist may be sufficient to *save* the conclusion concerning the divine attributes, yet surely it can never be sufficient to *establish* that conclusion.

If everything in the universe be conducted by general laws, and if animals be rendered susceptible of pain, it scarcely seems possible but some ill must arise in the various shocks of matter and the various concurrence and opposition of general laws; but this ill would be very rare were it not for the *third* circumstance which I proposed to mention, viz., the great frugality with which all powers and faculties are distributed to every particular being. So well adjusted are the organs and capacities of all animals, and so well fitted to their preservation, that, as far as history or tradition reaches, there appears not to be any single species which has yet been extinguished in the universe. Every animal has the requisite endowments, but these endowments are bestowed with so scrupulous an economy that any considerable diminution must entirely destroy the creature. Wherever one power is increased, there is a proportional abatement in the other. Animals which excel in swiftness are commonly defective in force. Those which possess both are either imperfect in some of their senses or are oppressed with the most craving wants. The human species, whose chief excellence is reason and

sagacity, is of all others the most necessitous, and the most deficient in bodily advantages, without clothes, without arms, without food, without lodging, without any convenience of life, except what they owe to their own skill and industry. In short, nature seems to have formed an exact calculation of the necessities of her creatures; and, like a *rigid master*, has afforded them little more powers or endowments than what are strictly sufficient to supply those necessities. An *indulgent parent* would have bestowed a large stock in order to guard against accidents, and secure the happiness and welfare of the creature in the most unfortunate concurrence of circumstances. Every course of life would not have been so surrounded with precipices that the least departure from the true path, by mistake or necessity, must involve us in misery and ruin. Some reserve, some fund, would have been provided to ensure happiness, nor would the powers and the necessities have been adjusted with so rigid an economy. The Author of Nature is inconceivably powerful; his force is supposed great, if not altogether inexhaustible; nor is there any reason, as far as we can judge, to make him observe this strict frugality in his dealings with his creatures. It would have been better, were his power extremely limited, to have created fewer animals, and to have endowed these with more faculties for their happiness and preservation. A builder is never esteemed prudent who undertakes a plan beyond what his stock will enable him to finish.

In order to cure most of the ills of human life, I require not that man should have the wings of the eagle, the swiftness of the stag, the force of the ox, the arms of the lion, the scales of the crocodile or rhinoceros; much less do I demand the sagacity of an angel or cherubim. I am contented to take an increase in one single power or faculty of his soul. Let him be endowed with a greater propensity to industry and labor, a more vigorous spring and activity of mind, a more constant bent to business and application. Let the whole species possess naturally an equal diligence with that which many individuals are able to attain by habit and reflection, and the most beneficial consequences, without any alloy of ill, is the immediate and necessary result of this endowment. Almost all the moral as well as natural evils of human life arise from idleness; and were our species, by the original constitution of their frame, exempt from this vice or infirmity, the perfect cultivation of land, the improvement of arts and manufactures, the exact execution of every office and duty, immediately follow; and men at once may fully reach that state of society which is so imperfectly attained by the best regulated government. But as industry is a power, and the most valuable of any, nature seems determined, suitably to her usual maxims, to bestow it on men with a very sparing hand; and rather to punish him severely for his deficiency in it than to reward him for his attainments. She has so contrived his frame that nothing but the most violent necessity can oblige him to labor; and she employs all his other wants to overcome, at least in part, the want of diligence, and to endow him with some share of a faculty of which she has thought fit naturally to bereave him. Here our demands may be allowed very humble, and therefore the more reasonable. If we required the endowments of superior penetration and judgment, of a more delicate taste of beauty, of a nicer sensibility to benevolence and friendship, we might be told that we impiously pretend to break the order of nature, that we want to exalt ourselves into a higher rank of being, that the presents which we require, not being suitable to our state and condition, would only be pernicious to us. But it is hard, I dare to repeat it, it is hard that, being placed in a world so full of wants and necessities, where almost every being and element is either our foe or refuses its assistance ... we should also have our own temper to struggle with, and should be deprived of that faculty which can alone fence against these multiplied evils.

The *fourth* circumstance whence arises the misery and ill of the universe is the inaccurate workmanship of all the springs and principles of the great machine of nature. It must be acknowledged that there are few parts of the universe which seem not to serve some purpose, and whose removal would not produce a visible defect and disorder in the whole. The parts hang all together, nor can one be touched without affecting the rest, in a greater or less degree. But at the same time, it must be observed that none of these parts or principles, however useful, are so accurately adjusted as to keep precisely within those bounds in which their utility consists; but they are, all of them, apt, on every occasion, to run into the one extreme or the other. One would imagine that this grand production had not received the last hand of the maker — so little finished is every part, and so coarse are the strokes with which it is executed. Thus the winds are requisite to convey the vapors along the surface of the globe, and to assist men in navigation; but how often, rising up to tempests and hurricanes, do they become pernicious? Rains are necessary to nourish all the plants and animals of the earth; but how often are they defective? how often excessive? Heat is requisite to all life and vegetation, but is not always found in the due proportion. On the mixture and secretion of the humors and juices of the body depend the health and prosperity of the animal; but the parts perform not regularly their proper function. What more useful than all the passions of the mind, ambition, vanity, love, anger? But how often do they break their bounds and cause the greatest convulsions in society? There is nothing so advantageous in the universe but what frequently becomes pernicious, by its excess or defect; nor has nature guarded, with the requisite accuracy, against all disorder or confusion. The irregularity is never perhaps so great as to destroy any

species, but is often sufficient to involve the individuals in ruin and misery.

On the concurrence, then, of these *four* circumstances does all or the greatest part of natural evil depend. Were all living creatures incapable of pain, or were the world administered by particular volitions, evil never could have found access into the universe; and were animals endowed with a large stock of powers and faculties, beyond what strict necessity requires, or were the several springs and principles of the universe so accurately framed as to preserve always the just temperament and medium, there must have been very little ill in comparison of what we feel at present. What then shall we pronounce on this occasion? Shall we say that these circumstances are not necessary, and that they might easily have been altered in the contrivance of the universe? This decision seems too presumptuous for creatures so blind and ignorant. Let us be more modest in our conclusions. Let us allow that, if the goodness of the Deity (I mean a goodness like the human) could be established on any tolerable reasons *a priori*, these phenomena, however untoward, would not be sufficient to subvert that principle, but might easily, in some unknown manner, be reconcilable to it. But let us still assert that, as this goodness is not antecedently established but must be inferred from the phenomena, there can be no grounds for such an inference while there are so many ills in the universe, and while these ills might so easily have been remedied, as far as human understanding can be allowed to judge on such a subject. I am sceptic enough to allow that the bad appearances, notwithstanding all my reasonings, may be compatible with such attributes as you suppose, but surely they can never prove these attributes. Such a conclusion cannot result from scepticism, but must arise from the phenomena, and from our confidence in the reasonings which we deduce from these phenomena.

Look round this universe. What an immense profusion of beings, animated and organized, sensible and active! You admire this prodigious variety and fecundity. But inspect a little more narrowly these living existences, the only beings worth regarding. How hostile and destructive to each other! How insufficient all of them for their own happiness! How contemptible or odious to the spectator! The whole presents nothing but the idea of a blind nature, impregnated by a great vivifying principle, and pouring forth from her lap, without discernment or parental care, her maimed and abortive children!

Here the Manichæan⁴² system occurs as a proper hypothesis to solve the difficulty; and, no doubt, in some respects it is very specious and has more probability than the common hypothesis, by giving a plausible account of the strange mixture of good and ill which appears in life. But if we consider, on the other hand, the perfect uniformity and agreement of the parts of the universe, we shall not discover in it any marks of the combat of a malevolent with a benevolent being. There is indeed an opposition of pains and pleasures in the feelings of sensible creatures; but are not all the operations of nature carried on by an opposition of principles, of hot and cold, moist and dry, light and heavy? The true conclusion is that the original source of all things is entirely indifferent to all these principles, and has no more regard to good above ill than to heat above cold, or to drought above moisture, or to light above heavy.

There may *four* hypotheses be framed concerning the first causes of the universe: that they are endowed with perfect goodness; that they have perfect malice; that they are opposite and have both goodness and malice; that they have neither goodness nor malice. Mixed phenomena can never prove the two former unmixed principles; and the uniformity and steadiness of general laws seem to oppose the third. The fourth, therefore, seems by far the most probable.

What I have said concerning natural evil will apply to moral with little or no variation; and we have no more reason to infer that the rectitude of the Supreme Being resembles human rectitude than that his benevolence resembles the human. Nay, it will be thought that we have still greater cause to exclude from him moral sentiments, such as we feel them, since moral evil, in the opinion of many, is much more predominant above moral good than natural evil above natural good.

But even though this should not be allowed, and though the virtue which is in mankind should be acknowledged much superior to the vice; yet, so long as there is any vice at all in the universe, it will very much puzzle you anthropomorphites how to account for it. You must assign a cause for it, without having recourse to the first cause. But as every effect must have a cause, and that cause another, you must either carry on the progression *in infinitum* or rest on that original principle, who is the ultimate cause of all things... .

Hold! hold! cried Demea: Whither does your imagination hurry you? I joined in alliance with you in order to prove the incomprehensible nature of the Divine Being, and refute the principles of Cleanthes, who would measure everything by human rule and standard. But I now find you running into all the topics of the greatest libertines and infidels, and betraying that holy cause which you seemingly espoused. Are you secretly, then, a more dangerous enemy than Cleanthes himself?

And are you so late in perceiving it? replied Cleanthes. Believe me, Demea, your friend Philo, from the

beginning, has been amusing himself at both our expense; and it must be confessed that the injudicious reasoning of our vulgar theology has given him but too just a handle of ridicule. The total infirmity of human reason, the absolute incomprehensibility of the Divine Nature, the great and universal misery, and still greater wickedness of men — these are strange topics, surely, to be so fondly cherished by orthodox divines and doctors. In ages of stupidity and ignorance, indeed, these principles may safely be espoused; and perhaps no views of things are more proper to promote superstition than such as encourage the blind amazement, the diffidence, and melancholy of mankind. But at present... .

Blame not so much, interposed Philo, the ignorance of these reverend gentlemen. They know how to change their style with the times. Formerly, it was a most popular theological topic to maintain that human life was vanity and misery, and to exaggerate all the ills and pains which are incident to men. But of late years, divines, we find, begin to retract this position and maintain, though still with some hesitation, that there are more goods than evils, more pleasures than pains, even in this life. When religion stood entirely upon temper and education, it was thought proper to encourage melancholy; as indeed, mankind never have recourse to superior powers so readily as in that disposition. But as men have now learned to form principles and to draw consequences, it is necessary to change the batteries, and to make use of such arguments as will endure at least some scrutiny and examination. This variation is the same (and from the same causes) with that which I formerly remarked with regard to scepticism.

Thus Philo continued to the last his spirit of opposition, and his censure of established opinions. But I could observe that Demea did not at all relish the latter part of the discourse; and he took occasion soon after, on some pretence or other, to leave the company.

Part XII

After Demea's departure, Cleanthes and Philo continued the conversation in the following manner. Our friend, I am afraid, said Cleanthes, will have little inclination to revive this topic of discourse while you are in company; and to tell the truth, Philo, I should rather wish to reason with either of you apart on a subject so sublime and interesting. Your spirit of controversy, joined to your abhorrence of vulgar superstition, carries you strange lengths when engaged in an argument; and there is nothing so sacred and venerable, even in your own eyes, which you spare on that occasion.

I must confess, replied Philo, that I am less cautious on the subject of Natural Religion than on any other; both because I know that I can never, on that head, corrupt the principles of any man of common sense and because no one, I am confident, in whose eyes I appear a man of common sense will ever mistake my intentions. You, in particular, Cleanthes, with whom I live in unreserved intimacy; you are sensible that, notwithstanding the freedom of my conversation and my love of singular arguments, no one has a deeper sense of religion impressed on his mind, or pays more profound adoration to the Divine Being, as he discovers himself to reason in the inexplicable contrivance and artifice of nature. A purpose, an intention, a design strikes everywhere the most careless, the most stupid thinker; and no man can be so hardened in absurd systems as at all times to reject it. *That nature does nothing in vain* is a maxim established in all the schools, merely from the contemplation of the works of nature, without any religious purpose; and, from a firm conviction of its truth, an anatomist who had observed a new organ or canal would never be satisfied till he had also discovered its use and intention. One great foundation of the Copernican system is the maxim *that nature acts by the simplest methods, and chooses the most proper means to any end*; and astronomers often, without thinking of it, lay this strong foundation of piety and religion. The same thing is observable in other parts of philosophy; and thus all the sciences almost lead us insensibly to acknowledge a first intelligent Author; and their authority is often so much the greater as they do not directly profess that intention.

It is with pleasure I hear Galen⁴³ reason concerning the structure of the human body. The anatomy of a man, says he, discovers above 600 different muscles; and whoever duly considers these will find that, in each of them, nature must have adjusted at least ten different circumstances in order to attain the end which she proposed: proper figure, just magnitude, right disposition of the several ends, upper and lower position of the whole, the due insertion of the several nerves, veins, and arteries; so that, in the muscles alone, above 6000 several views and intentions must have been formed and executed. The bones he calculates to be 284; the distinct purposes aimed at in the structure of each, above forty. What a prodigious display of artifice, even in these simple and homogeneous parts! But if we consider the skin, ligaments, vessels, glandules, humors, the several limbs and members of the body, how must our astonishment rise upon us, in proportion to the number and intricacy of the parts so artificially adjusted! The further we advance in these researches, we discover new scenes of art and wisdom; but descry still, at a distance, further scenes beyond our reach; in the fine internal structure of the parts, in the economy of the brain, in the fabric of the seminal vessels. All these artifices are repeated in every different species of animal, with wonderful variety, and with exact propriety, suited to the different intentions of nature in framing each species. And if the infidelity of Galen, even when these natural sciences were still imperfect, could not withstand such striking appearances, to what pitch of pertinacious obstinacy must a philosopher in this age have attained who can now doubt of a Supreme Intelligence!

Could I meet with one of this species (who, I thank God, are very rare), I would ask him: Supposing there were a God who did not discover himself immediately to our senses, were it possible for him to give stronger proofs of his existence than what appear on the whole face of nature? What indeed could such a Divine Being do but copy the present economy of things, render many of his artifices so plain that no stupidity could mistake them, afford glimpses of still greater artifices which demonstrate his prodigious superiority above our narrow apprehensions, and conceal altogether a great many from such imperfect creatures? Now, according to all rules of just reasoning, every fact must pass for undisputed when it is supported by all the arguments which its nature admits of, even though these arguments be not, in themselves, very numerous or forcible: How much more in the present case where no human imagination can compute their number, and no understanding estimate their cogency.

I shall further add, said Cleanthes, to what you have so well urged, that one great advantage of the principle of theism is that it is the only system of cosmogony which can be rendered intelligible and complete, and yet can throughout preserve a strong analogy to what we every day see and experience in the world. The comparison of the universe to a machine of human contrivance is so obvious and natural, and is justified by so many instances of order and design in nature, that it must immediately strike all unprejudiced apprehensions

and procure universal approbation. Whoever attempts to weaken this theory cannot pretend to succeed by establishing in its place any other that is precise and determinate: It is sufficient for him if he start doubts and difficulties; and, by remote and abstract views of things reach that suspense of judgment which is here the utmost boundary of his wishes. But, besides that this state of mind is in itself unsatisfactory, it can never be steadily maintained against such striking appearances as continually engage us into the religious hypothesis. A false, absurd system, human nature, from the force of prejudice, is capable of adhering to with obstinacy and perseverance; but no system at all, in opposition to a theory supported by strong and obvious reason, by natural propensity, and by early education, I think it absolutely impossible to maintain or defend.

So little, replied Philo, do I esteem this suspense of judgment in the present case to be possible that I am apt to suspect there enters somewhat of a dispute of words into this controversy, more than is usually imagined. That the works of nature bear a great analogy to the productions of art is evident; and, according to all the rules of good reasoning, we ought to infer, if we argue at all concerning them, that their causes have a proportional analogy. But as there are also considerable differences, we have reason to suppose a proportional difference in the causes, and, in particular, ought to attribute a much higher degree of power and energy to the supreme cause than any we have ever observed in mankind. Here, then, the existence of a *Deity* is plainly ascertained by reason; and if we make it a question whether, on account of these analogies, we can properly call him a *mind* or *intelligence*, notwithstanding the vast difference which may reasonably be supposed between him and human minds; what is this but a mere verbal controversy? No man can deny the analogies between the effects: to restrain ourselves from inquiring concerning the causes is scarcely possible. From this inquiry the legitimate conclusion is that the causes have also an analogy; and if we are not contented with calling the first and supreme cause a *God* or *Deity*, but desire to vary the expression, what can we call him but *Mind* or *Thought*, to which he is justly supposed to bear a considerable resemblance?

All men of sound reason are disgusted with verbal disputes, which abound so much in philosophical and theological inquiries; and it is found that the only remedy for this abuse must arise from clear definitions, from the precision of those ideas which enter into any argument, and from the strict and uniform use of those terms which are employed. But there is a species of controversy which, from the very nature of language and of human ideas, is involved in perpetual ambiguity, and can never, by any precaution or any definitions, be able to reach a reasonable certainty or precision. These are the controversies concerning the degrees of any quality or circumstance. Men may argue to all eternity whether Hannibal⁴⁴ be a great, or a very great, or a superlatively great man, what degree of beauty Cleopatra⁴⁵ possessed, what epithet of praise Livy or Thucydides⁴⁶ is entitled to, without bringing the controversy to any determination. The disputants may here agree in their sense and differ in the terms, or *vice versa*, yet never be able to define their terms so as to enter into each other's meaning; because the degrees of these qualities are not, like quantity or number, susceptible of any exact mensuration, which may be the standard in the controversy. That the dispute concerning theism is of this nature, and consequently is merely verbal, or, perhaps, if possible, still more incurably ambiguous, will appear upon the slightest inquiry. I ask the theist if he does not allow that there is a great and immeasurable, because incomprehensible, difference between the *human* and the *divine* mind: The more pious he is, the more readily will he assent to the affirmative, and the more will he be disposed to magnify the difference; he will even assert that the difference is of a nature which cannot be too much magnified. I next turn to the atheist, who, I assert, is only nominally so and can never possibly be in earnest, and I ask him whether, from the coherence and apparent sympathy in all the parts of this world, there be not a certain degree of analogy among all the operations of nature, in every situation and in every age; whether the rotting of a turnip, the generation of an animal, and the structure of human thought, be not energies that probably bear some remote analogy to each other. It is impossible he can deny it: He will readily acknowledge it. Having obtained this concession, I push him still further in his retreat, and I ask him if it be not probable that the principle which first arranged and still maintains order in this universe bears not also some remote inconceivable analogy to the other operations of nature and, among the rest, to the economy of human mind and thought. However reluctant, he must give his assent. Where then, cry I to both these antagonists, is the subject of your dispute? The theist allows that the original intelligence is very different from human reason; the atheist allows that the original principle of order bears some remote analogy to it. Will you quarrel, Gentlemen, about the degrees, and enter into a controversy which admits not of any precise meaning, nor consequently of any determination? If you should be so obstinate, I should not be surprised to find you insensibly change sides; while the theist, on the one hand, exaggerates the dissimilarity between the Supreme Being and frail, imperfect, variable, fleeting, and mortal creatures; and the atheist, on the other, magnifies the analogy among all the operations of nature, in every period, every situation, and every position. Consider then where the real point of controversy lies; and if you cannot lay aside your disputes, endeavor, at least, to cure

yourselves of your animosity.

And here I must also acknowledge, Cleanthes, that, as the works of nature have a much greater analogy to the effects of *our* art and contrivance than to those of *our* benevolence and justice, we have reason to infer that the natural attributes of the Deity have a greater resemblance to those of men than his moral have to human virtues. But what is the consequence? Nothing but this, that the moral qualities of man are more defective in their kind than his natural abilities. For, as the Supreme Being is allowed to be absolutely and entirely perfect, whatever differs most from him departs the farthest from the supreme standard of rectitude and perfection.⁴⁷

These, Cleanthes, are my unfeigned sentiments on this subject; and these sentiments, you know, I have ever cherished and maintained. But in proportion to my veneration for true religion is my abhorrence of vulgar superstitions; and I indulge a peculiar pleasure, I confess, in pushing such principles sometimes into absurdity, sometimes into impiety. And you are sensible that all bigots, notwithstanding their great aversion to the latter above the former, are commonly equally guilty of both.

My inclination, replied Cleanthes, lies, I own, a contrary way. Religion, however corrupted, is still better than no religion at all. The doctrine of a future state is so strong and necessary a security to morals that we never ought to abandon or neglect it. For if finite and temporary rewards and punishments have so great an effect, as we daily find, how much greater must be expected from such as are infinite and eternal?

How happens it then, said Philo, if vulgar superstition be so salutary to society, that all history abounds so much with accounts of its pernicious consequences on public affairs? Factions, civil wars, persecutions, subversions of government, oppression, slavery—these are the dismal consequences which always attend its prevalence over the minds of men. If the religious spirit be ever mentioned in any historical narration, we are sure to meet afterwards with a detail of the miseries which attend it. And no period of time can be happier or more prosperous than those in which it is never regarded or heard of.

The reason of this observation, replied Cleanthes, is obvious. The proper office of religion is to regulate the hearts of men, humanize their conduct, infuse the spirit of temperance, order, and obedience; and, as its operation is silent and only enforces the motives of morality and justice, it is in danger of being overlooked and confounded with these other motives. When it distinguishes itself, and acts as a separate principle over men, it has departed from its proper sphere and has become only a cover to faction and ambition.

And so will all religion, said Philo, except the philosophical and rational kind. Your reasonings are more easily eluded than my facts. The inference is not just — because finite and temporary rewards and punishments have so great influence that therefore such as are infinite and eternal must have so much greater. Consider, I beseech you, the attachment which we have to present things, and the little concern which we discover for objects so remote and uncertain. When divines are declaiming against the common behavior and conduct of the world, they always represent this principle as the strongest imaginable (which indeed it is), and describe almost all human kind as lying under the influence of it, and sunk into the deepest lethargy and unconcern about their religious interests. Yet these same divines, when they refute their speculative antagonists, suppose the motives of religion to be so powerful that, without them, it were impossible for civil society to subsist; nor are they ashamed of so palpable a contradiction. It is certain, from experience, that the smallest grain of natural honesty and benevolence has more effect on men's conduct than the most pompous views suggested by theological theories and systems. A man's natural inclination works incessantly upon him; it is forever present to the mind, and mingles itself with every view and consideration; whereas religious motives, where they act at all, operate only by starts and bounds; and it is scarcely possible for them to become altogether habitual to the mind. The force of the greatest gravity, say the philosophers, is infinitely small, in comparison of that of the least impulse, yet it is certain that the smallest gravity will, in the end, prevail above a great impulse because no strokes or blows can be repeated with such constancy as attraction and gravitation.

Another advantage of inclination: It engages on its side all the wit and ingenuity of the mind, and, when set in opposition to religious principles, seeks every method and art of eluding them; in which it is almost always successful. Who can explain the heart of man, or account for those strange salvos and excuses with which people satisfy themselves when they follow their inclinations in opposition to their religious duty? This is well understood in the world; and none but fools ever repose less trust in a man because they hear that, from study and philosophy, he has entertained some speculative doubts with regard to theological subjects. And when we have to do with a man who makes a great profession of religion and devotion, has this any other effect upon several who pass for prudent than to put them on their guard, lest they be cheated and deceived by him?

We must further consider that philosophers, who cultivate reason and reflection, stand less in need of such motives to keep them under the restraint of morals; and that the vulgar, who alone may need them, are utterly

incapable of so pure a religion as represents the Deity to be pleased with nothing but virtue in human behavior. The recommendations to the Divinity are generally supposed to be either frivolous observances or rapturous ecstasies or a bigoted credulity. We need not run back into antiquity or wander into remote regions to find instances of this degeneracy. Amongst ourselves, some have been guilty of that atrociousness, unknown to the Egyptian and Grecian superstitions, of declaiming, in express terms, against morality, and representing it as a sure forfeiture of the divine favor if the least trust or reliance be laid upon it.

But even though superstition or enthusiasm should not put itself in direct opposition to morality, the very diverting of the attention, the raising up a new and frivolous species of merit, the preposterous distribution which it makes of praise and blame, must have the most pernicious consequences, and weaken extremely men's attachment to the natural motives of justice and humanity.

Such a principle of action likewise, not being any of the familiar motives of human conduct, acts only by intervals on the temper, and must be roused by continual efforts in order to render the pious zealot satisfied with his own conduct and make him fulfil his devotional task. Many religious exercises are entered into with seeming fervor where the heart, at the time, feels cold and languid. A habit of dissimulation is by degrees contracted, and fraud and falsehood become the predominant principle. Hence the reason of that vulgar observation that the highest zeal in religion and the deepest hypocrisy, so far from being inconsistent, are often or commonly united in the same individual character.

The bad effects of such habits, even in common life, are easily imagined; but, where the interests of religion are concerned, no morality can be forcible enough to bind the enthusiastic zealot. The sacredness of the cause sanctifies every measure which can be made use of to promote it.

The steady attention alone to so important an interest as that of eternal salvation is apt to extinguish the benevolent affections, and beget a narrow, contracted selfishness. And when such a temper is encouraged, it easily eludes all the general precepts of charity and benevolence.

Thus the motives of vulgar superstition have no great influence on general conduct, nor is their operation favorable to morality, in the instances where they predominate.

Is there any maxim in politics more certain and infallible than that both the number and authority of priests should be confined within very narrow limits, and that the civil magistrate ought, for ever, to keep his *fasces* and *axes*⁴⁸ from such dangerous hands? But if the spirit of popular religion were so salutary to society, a contrary maxim ought to prevail. The greater number of priests and their greater authority and riches will always augment the religious spirit. And though the priests have the guidance of this spirit, why may we not expect a superior sanctity of life and greater benevolence and moderation from persons who are set apart for religion, who are continually inculcating it upon others, and who must themselves imbibe a greater share of it? Whence comes it then that, in fact, the utmost a wise magistrate can propose with regard to popular religions is, as far as possible, to make a saving game of it, and to prevent their pernicious consequences with regard to society? Every expedient which he tries for so humble a purpose is surrounded with inconveniences. If he admits only one religion among his subjects, he must sacrifice, to an uncertain prospect of tranquillity, every consideration of public liberty, science, reason, industry, and even his own independence. If he gives indulgence to several sects, which is the wiser maxim, he must preserve a very philosophical indifference to all of them and carefully restrain the pretensions of the prevailing sect; otherwise he can expect nothing but endless disputes, quarrels, factions, persecutions, and civil commotions.

True religion, I allow, has no such pernicious consequences; but we must treat of religion as it has commonly been found in the world, nor have I anything to do with that speculative tenet of theism which, as it is a species of philosophy, must partake of the beneficial influence of that principle, and, at the same time, must lie under a like inconvenience of being always confined to very few persons.

Oaths are requisite in all courts of judicature, but it is a question whether their authority arises from any popular religion. It is the solemnity and importance of the occasion, the regard to reputation, and the reflecting on the general interests of society, which are the chief restraints upon mankind. Customhouse oaths and political oaths are but little regarded even by some who pretend to principles of honesty and religion; and a Quaker's asseveration is with us justly put upon the same footing with the oath of any other person. I know that Polybius⁴⁹ ascribes the infamy of Greek faith to the prevalence of the Epicurean philosophy; but I know also that Punic faith had as bad a reputation in ancient times as Irish evidence has in modern, though we cannot account for these vulgar observations by the same reason. Not to mention that Greek faith was infamous before the rise of the Epicurean philosophy; and Euripides,⁵⁰ in a passage which I shall point out to you, has glanced a remarkable stroke of satire against his nation, with regard to this circumstance.

Take care, Philo, replied Cleanthes, take care; push not matters too far, allow not your zeal against false religion to undermine your veneration for the true. Forfeit not this principle — the chief, the only great comfort in life and our principal support amidst all the attacks of adverse fortune. The most agreeable reflection which it is possible for human imagination to suggest is that of genuine theism, which represents us as the workmanship of a Being perfectly good, wise, and powerful; who created us for happiness; and who, having implanted in us immeasurable desires of good, will prolong our existence to all eternity, and will transfer us into an infinite variety of scenes, in order to satisfy those desires and render our felicity complete and durable. Next to such a Being himself (if comparison be allowed), the happiest lot which we can imagine is that of being under his guardianship and protection.

These appearances, said Philo, are most engaging and alluring; and, with regard to the true philosopher, they are more than appearances. But it happens here, as in the former case, that, with regard to the greater part of mankind, the appearances are deceitful, and that the terrors of religion commonly prevail above its comforts.

It is allowed that men never have recourse to devotion so readily as when dejected with grief or depressed with sickness. Is not this a proof that the religious spirit is not so nearly allied to joy as to sorrow?

But men, when afflicted, find consolation in religion, replied Cleanthes. Sometimes, said Philo; but it is natural to imagine that they will form a notion of those unknown beings, suitable to the present gloom and melancholy of their temper, when they betake themselves to the contemplation of them. Accordingly, we find the tremendous images to predominate in all religions, and we ourselves, after having employed the most exalted expression in our descriptions of the Deity, fall into the flattest contradiction in affirming that the damned are infinitely superior in number to the elect.

I shall venture to affirm that there never was a popular religion which represented the state of departed souls in such a light as would render it eligible for human kind that there should be such a state. These fine models of religion are the mere product of philosophy. For as death lies between the eye and the prospect of futurity, that event is so shocking to nature that it must throw a gloom on all the regions which lie beyond it; and suggest to the generality of mankind the idea of Cerberus⁵¹ and Furies, devils, and torrents of fire and brimstone.

It is true, both fear and hope enter into religion because both these passions, at different times, agitate the human mind, and each of them forms a species of divinity suitable to itself. But when a man is in a cheerful disposition, he is fit for business, or company, or entertainment of any kind; and he naturally applies himself to these and thinks not of religion. When melancholy and dejected, he has nothing to do but brood upon the terrors of the invisible world, and to plunge himself still deeper in affliction. It may indeed happen that, after he has, in this manner, engraved the religious opinions deep into his thought and imagination, there may arrive a change of health or circumstances which may restore his good humor and, raising cheerful prospects of futurity, make him run into the other extreme of joy and triumph. But still it must be acknowledged that, as terror is the primary principle of religion, it is the passion which always predominates in it, and admits but of short intervals of pleasure.

Not to mention that these fits of excessive, enthusiastic joy, by exhausting the spirits, always prepare the way for equal fits of superstitious terror and dejection, nor is there any state of mind so happy as the calm and equable. But this state it is impossible to support where a man thinks that he lies in such profound darkness and uncertainty, between an eternity of happiness and an eternity of misery. No wonder that such an opinion disjoins the ordinary frame of mind and throws it into the utmost confusion. And though that opinion is seldom so steady in its operation as to influence all the actions; yet it is apt to make a considerable breach in the temper, and to produce that gloom and melancholy so remarkable in all devout people.

It is contrary to common sense to entertain apprehensions or terrors upon account of any opinion whatsoever, or to imagine that we run any risk hereafter, by the freest use of our reason. Such a sentiment implies both an *absurdity* and an *inconsistency*. It is an absurdity to believe that the Deity has human passions, and one of the lowest human passions, a restless appetite for applause. It is an inconsistency to believe that, since the Deity has this human passion, he has not others also; and, in particular, a disregard to the opinions of creatures so much inferior.

To know God, says Seneca,⁵² *is to worship him*. All other worship is indeed absurd, superstitious, and even impious. It degrades him to the low condition of mankind, who are delighted with entreaty, solicitation, presents, and flattery. Yet is this impiety the smallest of which superstition is guilty. Commonly, it depresses the Deity far below the condition of mankind, and represents him as a capricious demon who exercises his power without reason and without humanity! And were that Divine Being disposed to be offended at the vices

and follies of silly mortals, who are his own workmanship, ill would it surely fare with the votaries of most popular superstitions. Nor would any of human race merit his *favor* but a very few, the philosophical theists, who entertain or rather indeed endeavor to entertain suitable notions of his divine perfections. As the only persons entitled to his *compassion* and *indulgence* would be the philosophical sceptics, a sect almost equally rare, who, from a natural diffidence of their own capacity, suspend or endeavor to suspend all judgment with regard to such sublime and such extraordinary subjects.

If the whole of natural theology, as some people seem to maintain, resolves itself into one simple, though somewhat ambiguous, at least undefined, proposition, *That the cause or causes of order in the universe probably bear some remote analogy to human intelligence* — if this proposition be not capable of extension, variation, or more particular explication; if it affords no inference that affects human life, or can be the source of any action or forbearance; and if the analogy, imperfect as it is, can be carried no further than to the human intelligence, and cannot be transferred, with any appearance of probability, to the other qualities of the mind; if this really be the case, what can the most inquisitive, contemplative, and religious man do more than give a plain, philosophical assent to the proposition, as often as it occurs, and believe that the arguments on which it is established exceed the objections which lie against it? Some astonishment, indeed, will naturally arise from the greatness of the object: Some melancholy from its obscurity: Some contempt of human reason that it can give no solution more satisfactory with regard to so extraordinary and magnificent a question. But believe me, Cleanthes, the most natural sentiment which a well-disposed mind will feel on this occasion is a longing desire and expectation that heaven would be pleased to dissipate, at least alleviate, this profound ignorance by affording some more particular revelation to mankind, and making discoveries of the nature, attributes, and operations of the divine object of our faith. A person, seasoned with a just sense of the imperfections of natural reason, will fly to revealed truth with the greatest avidity; while the haughty dogmatist, persuaded that he can erect a complete system of theology by the mere help of philosophy, disdains any further aid and rejects this adventitious instructor. To be a philosophical sceptic is, in a man of letters, the first and most essential step towards being a sound, believing Christian — a proposition which I would willingly recommend to the attention of Pamphilus; and I hope Cleanthes will forgive me for interposing so far in the education and instruction of his pupil.

Cleanthes and Philo pursued not this conversation much further; and as nothing ever made greater impression on me than all the reasonings of that day, so I confess that, upon a serious review of the whole, I cannot but think that Philo's principles are more probable than Demea's, but that those of Cleanthes approach still nearer to the truth.

1. Chrysippus *apud* Plut., *De repug. Stoicorum*. [Chrysippus (c. 279–206 B.C.), a Greek philosopher, is said to have been one of the greatest logicians of ancient times.— S.M.C.]

Basic to the Manichaean outlook is the doctrine that the universe is the scene of an eternal struggle between two antagonistic powers, Light and Darkness (or Good and Evil).]
43. *De Formatione Foetus*. [Galen (c. 130–c. 200) was a Greek physicist and devotee of philosophy who wrote prolifically, most notably in the fields of anatomy and physiology, and served at the court of Marcus Aurelius, regarding whom see Hume’s *Enquiry*, n.44.]
44. [Hannibal (247–c. 183 B.C.) was the general of Carthage, who invaded Rome during the Second Punic War.]
45. [Cleopatra (69–30 B.C.) was the queen of Egypt renowned for her charm.]
46. [Thucydides (c. 460–400 b.c.) was the noted Greek historian who authored the *History of the Peloponnesian War*.]
47. It seems evident that the dispute between the sceptics and dogmatists is entirely verbal, or, at least, regards only the degrees of doubt and assurance which we ought to indulge with regard to all reasoning; and such disputes are commonly, at the bottom, verbal and admit not of any precise determination. No philosophical dogmatist denies that there are difficulties both with regard to the senses and to all science, and that these difficulties are, in a regular, logical method, absolutely insolvable. No sceptic denies that we lie under an absolute necessity,

notwithstanding these difficulties, of thinking, and believing, and reasoning, with regard to all kinds of subjects, and even of frequently assenting with confidence and security. The only difference, then, between these sects, if they merit that name, is that the sceptic, from habit, caprice, or inclination, insists most on the difficulties, the dogmatist, for like reasons, on the necessity.

48. [Rods and axes, a Roman symbol of authority.]

51. [According to Greek mythology, Cerberus was the monstrous dog that guarded the entrance to the underworld.]

52. [Lucius Annaeus Seneca (c. 4/1 B.C.–A.D. 65), born in Cordoba, Spain, was a Stoic philosopher who tutored the young future Roman emperor Nero (37–68) and became his political advisor, although later, having left the court, Seneca was accused of conspiracy against the emperor and forced to commit suicide.]

Immanuel Kant

Born in Königsburg, East Prussia, Immanuel Kant (1724–1804) is widely regarded as the most important figure in philosophy after Aristotle. His novel approaches to questions of knowledge, metaphysics, morality, art, politics, science, and mathematics have dominated the discussions of many subsequent generations. This influence has sometimes produced intellectual rebellion, only to be followed a generation or two later by another “back to Kant” movement.

Although the *Critique of Pure Reason* (reprinted here in part) is famous for being difficult to read, its central topics can be captured in two questions: What can we know and how can we know it? What can't we know and why can't we know these things? Kant's highly original answer to the first question is best understood in the context of his empiricist predecessors. The empiricists claimed that all knowledge came from the senses: Nothing is in the mind that was not first in the senses. Kant's rationalist predecessor Leibniz had offered an important modification of this position: Nothing is in the mind that was not first in the senses, except the mind itself. In a sense, Kant's view is a detailed extension of this cryptic claim from Leibniz. Kant regarded knowledge as the joint product of sensory evidence and the mind's ways of combining those data into usable form.

To illustrate Kant's view, consider three highly general claims: “All external objects are in space,” “All mental states must belong to some subject,” and “All events have causes.” He agrees with the empiricists that all knowledge has to originate in the evidence of the senses. If all knowledge has to come from the senses, however, then how can anyone ever amass enough evidence to show that all objects are in [one] space? Kant's novel theory is that the claim is true because it reflects the mind's ways of handling sensory data. When given sensory data, the mind produces representations of objects arrayed in an all-comprehending Euclidean space. With this theory, he is in a position to explain the unusual status of mathematical truths. Like Descartes, he believes that mathematical claims such as “the shortest distance between two points is a straight line” are necessarily true. In contrast to Descartes, he does not believe that this status is due to their being known by some mysterious process of intellectual insight. Rather, mathematical claims are necessarily true of the objects that we perceive, because of the way in which we represent them in perception. He also argues that unless objects were represented in this way it would be impossible to keep track of them, and so to have any knowledge of them.

Kant offers a similar explanation for the other two examples. Although none of his predecessors or contemporaries (except Hume) doubted that different mental states were properties of a single mental subject, they were hard-pressed to explain why this is so. Locke created a problem in separating the identity of the human being from that of the moral person. The identity of a human being through time would be carried by his body. If, as Locke argued, a moral person could survive a change of bodies, then her identity as a person cannot be a matter of bodily continuity. What then makes you the same mind through time? This problem was pressing, because most agreed with Descartes' view that each person is certain of her existence as a thinker.

Kant's answer is that your different thoughts are necessarily connected with one another. For example, if you can recognize chartreuse objects, then at some time you must have perceived similar objects and been told the name of the color. If you know that Washington was the first U.S. president, then you must have learned it—even if you cannot remember when. Kant's argument is that insofar as we think of ourselves as having any knowledge, then we must understand our different mental states as necessarily connected to each other and so as belonging to a single cognitive (if not moral) subject. Again, we do not arrive at the view that all mental states belong to some subject by carrying out the impossible task of checking every case. Rather, our minds are so constituted that they expect to find such connections across mental states and, when they do, they declare the states to be states of a single mind.

Let's consider, finally, the case of causation. Hume argued that there was no way to show that every event must have a cause. Kant accepts Hume's point that this claim cannot be established empirically. Again, however, he believes that he can demonstrate that the claim is necessarily true, by showing that the mind cannot make any sense of the data it receives unless it interprets those data as representing causally interacting objects. In sum, Kant argues that the mind must understand its own states as necessarily connected and external objects as causally interacting in a single space if it is to have any knowledge of such objects.

Kant's answer to the second, negative, question is that we cannot know the traditional claims of

metaphysics except in the manner just illustrated—by showing that they express conditions that are necessary for cognition from sensory data. He argues in particular that we cannot answer three central metaphysical questions either through the methods of metaphysics or through his own new approach: Are humans free? Does God exist? Is the soul immortal? Given this result, he maintains that these questions do not belong in metaphysics, but should be relocated in a different area—ethics. Because his contemporaries had difficulty following the twists and turns of the *Critiques* arguments, he offered a more reader-friendly version, the *Prolegomena*, presented here in its entirety.

Both the *Critique of Practical Reason* and the more widely read *Grounding for the Metaphysics of Morals* (reprinted here) try to establish the practical or moral need for assuming freedom of the will, immortality and the existence of God. They also offer a moral theory that is a major player in contemporary debates. Through Socratic questioning, the *Grounding* tries to get readers to see that their own moral views are that an action is permissible/obligatory/forbidden for one if and only if it is permissible/obligatory/forbidden for all. It also argues that the most basic value for any rational moral agent is the value of a person. In the end, all moral action is a matter of respecting the humanity in yourself and in others.

Religion within the Bounds of Mere Reason traces some of the implications of basing belief in God on moral rather than metaphysical considerations. *Perpetual Peace* argues that a lasting peace requires the formation of a defensive league of nations that could rebuff attacks by aggressors.

Faul Guyer, ed., *The Cambridge Companion to Kant* (Cambridge: Cambridge University Press, 1992) contains broad and clear essays on many of Kant's central themes. Patricia Kitcher, ed., *Kant's Critique of Pure Reason* (Lanham, Md.: Rowman & Littlefield, 1998) is a collection of recent essays on that book; Paul Guyer, ed., *Kant's Groundwork of the Metaphysics of Morals* (Lanham, Md.: Rowman & Littlefield, 1998) is a collection of recent essays on the *Grounding*. Allen W. Wood, *Kant* (Hoboken, N.J.: Wiley-Blackwell, 2005) provides a brief but comprehensive account of Kant's major theories. Onora [O'Neill] Nell, *Acting on Principle* (Columbia University Press, 1975), Onora O'Neill, *Constructions of Reason* (New York: Cambridge University Press, 1990), Christine Korsgaard, *Creating the Kingdom of Ends* (Cambridge: Cambridge University Press, 1996), and Barbara Herman, *The Practice of Moral Judgment* (Cambridge, Mass.: Harvard University Press, 1993) are useful book-length treatments of Kant's ethics.

Patricia Kitcher

*Prolegomena to Any Future Metaphysics**

PREFACE

These *Prolegomena* are not for the use of pupils but of [255] future teachers, and even the latter should not expect that they will be serviceable for the systematic exposition of a ready-made science, but merely for the discovery of the science itself.

There are scholars for whom the history of philosophy (both ancient and modern) is philosophy itself; for these the present *Prolegomena* are not written. They must wait until those who endeavor to draw from the fountain of reason itself have completed their work; it will then be the turn of such scholars to inform the world of what has been done. Unfortunately, nothing can be said which, in their opinion, has not been said before, and truly the same prophecy applies to all future time; for since the human reason has for many centuries speculated upon innumerable objects in various ways, it is hardly to be expected that we should not be able to discover analogies for every new idea among the old sayings of past ages.

My object is to persuade all those who think metaphysics worth studying that it is absolutely necessary to pause a moment and, disregarding all that has been done, to propose first the preliminary question, "Whether such a thing as metaphysics be at all possible?"

If it is a science, how does it happen that it cannot, like other sciences, obtain universal and permanent [256] recognition? If not, how can it maintain its pretensions and keep the human understanding in suspense with hopes never ceasing, yet never fulfilled? Whether then we demonstrate our knowledge or our ignorance in this field, we must come once and for all to a definite conclusion respecting the nature of this so-called science, which cannot possibly remain on its present footing. It seems almost ridiculous, while every other science is continually advancing, that in this, which pretends to be wisdom incarnate, for whose oracle every one inquires, we should constantly move around the same spot, without gaining a single step. And so its supporters having melted away, we do not find that men who are confident of their ability to shine in other sciences venture their reputation here, where everybody, however ignorant in other matters, presumes to deliver a final verdict, inasmuch as in this domain there is as yet no standard weight and measure to distinguish soundness from shallow talk.

After all, it is nothing extraordinary in the elaboration of a science, when men begin to wonder how far it has advanced, that the question should at last occur as to whether and how in general such a science is possible? Human reason so delights in constructions that it has several times built up a tower and then razed it to examine the nature of the foundation. It is never too late to become reasonable and wise; but if the insight comes late, there is always more difficulty in starting the change.

The question whether a science be possible presupposes a doubt as to its actuality. But such a doubt offends the man whose entire goods may perhaps consist in this supposed jewel; hence he who raises the doubt must expect opposition from all sides. Some, in the proud consciousness of their possessions, which are ancient and therefore considered legitimate, will take their metaphysical compendia in their hands and look down on him with contempt; others who never see anything except it be identical with what they have somewhere else seen before will not understand him, and everything will remain for a time as if nothing had happened to excite the concern or the hope for an impending change.

Nevertheless, I venture to predict that the independent reader of these *Prolegomena* will not only doubt his previous science, but ultimately be fully persuaded [257] that it cannot exist unless the demands here stated on which its possibility depends be satisfied; and, as this has never been done, that there is, as yet, no such thing as metaphysics. But as it can never cease to be in demand¹ — since the interests of human reason in general are intimately interwoven with it—he must confess that a radical reform, or rather a rebirth of the science according to a new plan, is unavoidable, however much men may struggle against it for a while.

Since the *Essays* of Locke and Leibniz, or rather since the origin of metaphysics so far as we know its history, nothing has ever happened which could have been more decisive to its fate than the attack made upon

it by David Hume. He threw no light on this kind of knowledge; but he certainly struck a spark from which light might have been obtained, had it caught some inflammable substance and had its smouldering fire been carefully nursed and developed.

Hume started mainly from a single but important concept in metaphysics, namely, that of the connection of cause and effect (including its derivative concepts of force and action, etc.). He challenged reason, which pretends to have given birth to this concept of herself, to answer him by what right she thinks anything could be so constituted that if that thing be posited, something else also must necessarily be posited; for this is the meaning of the concept of cause. He demonstrated irrefutably that it was entirely impossible for reason to think *a priori* and by means of concepts such a combination as involves necessity. We cannot at all see why, in consequence of the existence of one thing, another must necessarily exist, or how the concept of such a combination can arise *a priori*. Hence he inferred that reason was altogether deluded with reference to this concept, which she erroneously considered as one of her children, whereas in reality it was nothing but a bastard of imagination, impregnated by experience, which subsumed certain representations [258] under the law of association, and mistook a subjective necessity (custom) for an objective necessity arising from insight. Hence he inferred that reason had no power to think such connections, even in general, because her concepts would then be purely fictitious and all her pretended *a priori* cognitions nothing but common experiences marked with a false stamp. This is as much as to say that there is not, and cannot be, any such thing as metaphysics at all.²

However hasty and mistaken Hume's conclusion may appear, it was at least founded upon investigation, and this investigation deserved the concentrated attention of the brighter spirits of his day as well as determined efforts on their part to discover, if possible, a happier solution of the problem in the sense proposed by him, all of which would have speedily resulted in a complete reform of the science.

But Hume suffered the usual misfortune of metaphysicians, of not being understood. It is positively painful to see how utterly his opponents, Reid, Oswald, Beattie, and lastly Priestley, missed the point of the problem; for while they were ever taking for granted that which he doubted, and demonstrating with zeal and often with impudence that which he never thought of doubting, they so misconstrued his valuable suggestion that everything remained in its old condition, as if nothing had happened. The question was not whether the concept of cause was right, useful, and even indispensable for our knowledge of nature, for this Hume had never doubted; but whether that concept could be thought by reason [259] *a priori*, and consequently whether it possessed an inner truth, independent of all experience, implying a more widely extended usefulness, not limited merely to objects of experience. This was Hume's problem. It was a question concerning the *origin* of the concept, not concerning its indispensability in use. Were the former decided, the conditions of its use and the sphere of its valid application would have been determined as a matter of course.

But to satisfy the conditions of the problem, the opponents of the great thinker should have penetrated very deeply into the nature of reason, so far as it is concerned with pure thought—a task which did not suit them. They found a more convenient method of being defiant without any insight, viz., the appeal to *common sense*. It is indeed a great gift of heaven to possess right or (as they now call it) plain common sense. But this common sense must be shown in deeds by well-considered and reasonable thoughts and words, not by appealing to it as an oracle when no rational justification of oneself can be advanced. To appeal to common sense when insight and science fail, and no sooner—this is one of the subtle discoveries of modern times, by means of which the most superficial ranter can safely enter the lists with the most thorough thinker and hold his own. But as long as a particle of insight remains, no one would think of having recourse to this subterfuge. Seen in a clear light, it is but an appeal to the opinion of the multitude, of whose applause the philosopher is ashamed, while the popular charlatan glories and confides in it. I should think that Hume might fairly have laid as much claim to common sense as Beattie and, in addition, to a critical reason (such as the latter did not possess), which keeps common sense in check and prevents it from speculating, or, if speculations are under discussion, restrains the desire to decide because it cannot satisfy itself concerning its own principles. By this means alone can common sense remain sound. Chisels and hammers may suffice to work a piece of wood, but for etching we require an etcher's needle. Thus common sense and speculative understanding are both useful, but each in [260] its own way: the former in judgments which apply immediately to experience; the latter when we judge universally from mere concepts, as in metaphysics, where sound common sense, so called in spite of the inappropriateness of the word, has no right to judge at all.

I openly confess that my remembering David Hume was the very thing which many years ago first interrupted my dogmatic slumber and gave my investigations in the field of speculative philosophy a quite new direction. I was far from following him in the conclusions to which he arrived by considering, not the whole of his problem, but a part, which by itself can give us no information. If we start from a well-founded, but

undeveloped, thought which another has bequeathed to us, we may well hope by continued reflection to advance further than the acute man to whom we owe the first spark of light.

So I tried first whether Hume's objection could not be put into a general form, and soon found that the concept of the connection of cause and effect was by no means the only concept by which the understanding thinks the connection of things *a priori*, but rather that metaphysics consists altogether of such concepts. I sought to ascertain their number; and when I had satisfactorily succeeded in this by starting from a single principle, I proceeded to the deduction of these concepts, which I was now certain were not derived from experience, as Hume had tried, but sprang from the pure understanding. This deduction (which seemed impossible to my acute predecessor and had never even occurred to anyone else, though no one had hesitated to use the concepts without investigating the basis of their objective validity) was the most difficult task ever undertaken in the service of metaphysics; and the worst was that metaphysics, such as it then existed, could not assist me in the least because this deduction alone can render metaphysics possible. But as soon as I had succeeded in solving Hume's problem, not merely in a particular case, but with respect to the whole faculty of pure reason, I could [261] proceed safely, though slowly, to determine the whole sphere of pure reason completely and from universal principles, in its boundaries as well as in its contents. This was required for metaphysics in order to construct its system according to a sure plan.

But I fear that the working out of Hume's problem in its widest extent (namely, my *Critique of Pure Reason*) will fare as the problem itself fared when first proposed. It will be misjudged because it is misunderstood, and misunderstood because men choose to skim through the book and not to think through it—a disagreeable task, because the work is dry, obscure, opposed to all ordinary notions, and moreover long-winded. Now I confess that I did not expect to hear from philosophers complaints of want of popularity, entertainment, and facility when the existence of a highly prized and indispensable cognition is at stake, which cannot be established otherwise than by the strictest rules of scholarly precision. Popularity may follow, but is inadmissible at the beginning. Yet as regards a certain obscurity, arising particularly from the diffuseness of the plan, owing to which the principal points of the investigation are easily lost sight of, the complaint is just, and I intend to remove it by the present *Prolegomena*.

The first-mentioned work, which discusses the pure faculty of reason in its whole extent and bounds, will remain the foundation, to which the *Prolegomena*, as a preliminary exercise, refer; for that critique must exist as a science, systematic and complete as to its smallest parts, before we can think of letting metaphysics appear on the scene, or even have the most distant hope of so doing.

We have been long accustomed to seeing antiquated knowledge produced as new by taking it out of its former context, and fitting it into a systematic dress [262] of any fancy pattern under new titles. Most readers will set out by expecting nothing else from the *Critique*; but these *Prolegomena* may persuade him that it is a perfectly new science, of which no one has ever even thought, the very idea of which was unknown, and for which nothing hitherto accomplished can be of the smallest use, except it be the suggestion of Hume's doubts. Yet even he did not suspect such a formal science, but ran his ship ashore, for safety's sake, landing on skepticism, there to let it lie and rot; whereas my object is rather to give it a pilot who, by means of safe navigational principles drawn from a knowledge of the globe and provided with a complete chart and compass, may steer the ship safely whither he listeth.

If in a new science that is wholly isolated and unique in its kind we started with the prejudice that we can judge of things by means of would-be knowledge previously acquired, even though this is precisely what has first to be called in question; then we should only fancy we saw everywhere what we had already known, because the expressions have a similar sound. Yet everything would appear utterly metamorphosed, senseless, and unintelligible, because we should have as a foundation our own thoughts, made by long habit a second nature, instead of the author's. However, the longwindedness of the work, so far as it depends on the science itself and not on the exposition, its consequent unavoidable dryness, and its scholastic precision are qualities which can only benefit the science, though they may discredit the book.

Few writers are gifted with the subtlety and, at the same time, with the grace of David Hume, or with the depth, as well as the elegance of, Moses Mendelssohn. Yet I flatter myself that I might have made my own exposition popular, if my object had been merely to sketch out a plan and leave its completion to others, instead of having my heart in the welfare of the science to which I had devoted myself so long; in truth, it required no little constancy, and even self-denial, to postpone the sweets of an immediate success to the prospect of a slower, but more lasting, reputation.

Making plans is often the occupation of an opulent and boastful mind, which thus obtains the reputation of a creative genius by demanding what it cannot itself supply, by censuring what it cannot [263] improve, and by proposing what it knows not where to find. And yet something more should belong to a sound plan of a

general critique of pure reason than mere conjectures, if this plan is to be other than the usual declamations of pious aspirations. But pure reason is a sphere so separate and self-contained that we cannot touch a part without affecting all the rest. We can therefore do nothing without first determining the position of each part and its relation to the rest. For inasmuch as our judgment cannot be corrected by anything outside of pure reason, so the validity and use of every part depends upon the relation in which it stands to all the rest within the domain of reason, just as in the structure of an organized body the end of each member can only be deduced from the full conception of the whole. It may, then, be said of such a critique that it is never trustworthy except it be perfectly complete, down to the smallest elements of pure reason. In the sphere of this faculty you can determine either everything or nothing.

But although a mere sketch preceding the *Critique of Pure Reason* would be unintelligible, unreliable, and useless, it is all the more useful as a sequel which enables us to grasp the whole, to examine in detail the chief points of importance in the science, and to improve in many respects our exposition, as compared with the first execution of the work.

That work being completed, I offer here such a plan which is sketched out after an analytical method, while the *Critique* itself had to be executed in the synthetical style, in order that the science may present all its articulations, as the structure of a peculiar cognitive faculty, in their natural combination. But should any reader find this plan, which I publish as the *Prolegomena to Any Future Metaphysics*, still obscure, let him consider that not everyone is bound to study metaphysics, that many minds will succeed very well in the exact and even in deep sciences more closely allied to intuition while they cannot succeed in investigations [264] dealing exclusively with abstract concepts. In such cases men should apply their talents to other subjects. But he who undertakes to judge or, still more, to construct a system of metaphysics must satisfy the demands here made, either by adopting my solution or by thoroughly refuting it and substituting another. To evade it is impossible. In conclusion, let it be remembered that this much-abused obscurity (frequently serving as a mere pretext under which people hide their own indolence or dullness) has its uses, since all who in other sciences observe a judicious silence speak authoritatively in metaphysics and make bold decisions, because their ignorance is not here contrasted with the knowledge of others. Yet it does contrast with sound critical principles, which we may therefore commend in the words of Virgil:

*Ignavum, fucos, pecus a praesepeibus arcent.*³

PROLEGOMENA

Preamble on the Peculiarities of All Metaphysical Cognition

§1. OF THE SOURCES OF METAPHYSICS

If it becomes desirable to present any cognition as science, it will be necessary first to determine exactly its differentia, which no other science has in common with it and which constitutes its peculiarity; otherwise the boundaries of all sciences become confused, and none of them can be treated thoroughly according to its nature.

The peculiar features of a science may consist of a simple difference of object, or of the sources of cognition, or of the kind of cognition, or perhaps of all three conjointly. On these features, therefore, depends the idea of a possible science and its territory.

First, as concerns the sources of metaphysical cognition, its very concept implies that they cannot be empirical. Its principles (including not only its basic propositions but also its basic concepts) must never be derived from experience. It must not be physical but metaphysical knowledge, i.e., knowledge lying beyond experience. It can therefore have for its basis neither external experience, which is the source of physics proper, nor internal, which is the basis of empirical psychology. It is therefore *a priori* cognition, coming from pure understanding and pure reason. [266]

But so far metaphysics would not be distinguishable from pure mathematics; it must therefore be called pure philosophical cognition; and for the meaning of this term I refer to the *Critique of Pure Reason* ("Methodology," Chap. I, Sec. 1), where the distinction between these two employments of reason is sufficiently explained. So much for the sources of metaphysical cognition.

§2. CONCERNING THE KIND OF COGNITION WHICH CAN ALONE BE CALLED METAPHYSICAL

a. Of the Distinction between Analytic and Synthetic Judgments in General—The peculiarity of its sources demands that metaphysical cognition must consist of nothing but *a priori* judgments. But whatever be their origin or their logical form, there is a distinction in judgments, as to their content, according to which they are either merely *explicative*, adding nothing to the content of the cognition, or *ampliative*, increasing the given cognition: the former may be called *analytic*, the latter *synthetic*, judgments.

Analytic judgments express nothing in the predicate but what has been already actually thought in the concept of the subject, though not so clearly and with the same consciousness. If I say: "All bodies are extended," I have not amplified in the least my concept of body, but have only analyzed it, as extension was really thought to belong to that concept before the judgment was made, though it was not expressed; this judgment is therefore analytic. [267] On the other hand, this judgment, "All bodies have weight," contains in its predicate something not actually thought in the universal concept of body; it amplifies my knowledge by adding something to my concept, and must therefore be called synthetic.

b. The Common Principle of All Analytic Judgments Is That of Contradiction.—All analytic judgments depend wholly on the principle of contradiction, and are in their nature *a priori* cognitions, whether the concepts that supply them with matter be empirical or not. For the predicate of an affirmative analytic judgment is already thought in the concept of the subject, of which it cannot be denied without contradiction. In the same way its opposite is necessarily denied of the subject in an analytic, but negative, judgment, by the same principle of contradiction. Such is the case of the judgments: "All bodies are extended," and "No bodies are unextended (i.e., simple)."

For this very reason all analytic judgments are *a priori* even when the concepts are empirical, as, for example, "Gold is a yellow metal"; for to know this I require no experience beyond my concept of gold, which contained the thought that this body is yellow and metal. It is, in fact, this thought that constituted my concept; and I need only analyze it, without looking beyond it elsewhere.

c. Synthetic Judgments Require a Different Principle from That of Contradiction.—There are synthetic *a posteriori* judgments of empirical origin; but there are also others which are certain *a priori*, and which spring from pure understanding and reason. Yet they both agree in this, that they cannot possibly spring from the principle of analysis, namely, the principle of contradiction, alone, but require another quite different principle. But whatever principle they may be deduced from, they must be subject to the principle of contradiction, which must never be violated, even though everything cannot be deduced from it. I shall first

classify synthetic judgments.

1. *Judgments of Experience* are always synthetic. For it would be absurd to base an analytic judgment on [268] experience, as our concept suffices for the purpose without requiring any testimony from experience. That a body is extended is a judgment which holds *a priori*, and is not a judgment of experience. For before appealing to experience, we already have all the conditions for the judgment in the concept, from which we have then but to elicit the predicate according to the principle of contradiction, and thereby to become conscious of the necessity of the judgment, which experience could not at all teach us.

2. *Mathematical Judgments* are all synthetic. This fact seems hitherto to have altogether escaped the observation of those who have analyzed human reason; it even seems directly opposed to all their conjectures, though it is incontestably certain and most important in its consequences. For as it was found that the conclusions of mathematicians all proceed according to the principle of contradiction (as is demanded by all apodeictic certainty), men persuaded themselves that the fundamental propositions were known from the principle of contradiction. This was a great mistake, for a synthetic proposition can indeed be comprehended according to the principle of contradiction, but only by presupposing another synthetic proposition from which it follows, but never in and by itself.

First of all, we must observe that properly mathematical propositions are always judgments *a priori*, and not empirical, because they carry with them necessity, which cannot be obtained from experience. But if this be not conceded to me, very well; I shall confine my assertion to *pure mathematics*, the very concept of which implies that it contains pure *a priori* and not empirical cognition.

It might at first be thought that the proposition $7 + 5 = 12$ is a mere analytic judgment, following from the concept of the sum of seven and five, according to the principle of contradiction. But on closer examination it appears that the concept of the sum of $7 + 5$ contains merely their union in a single number, without its being at all thought what the particular number is that unites them. The concept of twelve is by no means thought by merely thinking of the combination of seven and five; and, analyze this possible sum [269] as we may, we shall not discover twelve in the concept. We must go beyond these concepts by calling to our aid some intuition corresponding to one of them, i.e., either our five fingers or five points (as Segner⁴ has it in his *Arithmetic*); and we must add successively the units of the five given in the intuition to the concept of seven. Hence our concept is really amplified by the proposition $7 + 5 = 12$, and we add to the first concept a second one not thought in it. Arithmetical judgments are therefore synthetic, and the more plainly according as we take larger numbers; for in such cases it is clear that, however closely we analyze our concepts without calling intuition to our aid, we can never find the sum by such mere analysis.

All principles of geometry are no less synthetic. That a straight line is the shortest path between two points is a synthetic proposition. For my concept of straight contains nothing of quantity, but only a quality. The concept of the shortest is therefore altogether additional and cannot be obtained by any analysis of the concept of the straight line. Here, too, intuition must come to aid us. It alone makes the synthesis possible.

(Some other principles, assumed by geometers, are indeed actually analytic and depend on the principle of contradiction; but they only serve, as identical propositions, as a method of concatenation, and not as principles, e.g., $a = a$, the whole is equal to itself, or $a + b \gg a$, the whole is greater than its part. And yet even these, though they are recognized as valid from mere concepts, are only admitted in mathematics because they can be presented in some intuition.)

What actually makes us believe that the predicate of such apodeictic judgments is already contained in our concept, and that the judgment is therefore analytic, is the duplicity of the expression. We must think a certain predicate as joined to a given concept, and this necessity inheres in the concepts themselves. But the question is not what we must join in thought *to* the given concept, but what we actually think together with and in it, though obscurely; and so it is manifest that the predicate belongs to this concept necessarily indeed, yet not directly but indirectly by means of a necessarily present intuition.⁵

The essential and distinguishing feature of pure [272] mathematical cognition among all other *a priori* cognitions is that it cannot at all proceed from concepts, but only by means of the construction of concepts (see *Critique of Pure Reason*, "Methodology," Chap. I, Sect. 1). As therefore in its judgments it must proceed beyond the concept to that which its corresponding intuition contains, these judgments neither can, nor ought to arise analytically, by dissecting the concept, but are all synthetic.

I cannot refrain from pointing out the disadvantage resulting to philosophy from the neglect of this easy and apparently insignificant observation. Hume, feeling the call (which is worthy of a philosopher) to cast his eye over the whole field of *a priori* cognitions in which human understanding claims such mighty possessions, heedlessly severed from it a whole, and indeed its most valuable, province, viz., pure mathematics. For he

imagined that its nature, or, so to speak, the constitution of this province, depended on totally different principles, namely, on the principle of contradiction alone, and although he did not divide judgments in this manner formally and universally and did not use the same terminology as I have done here, what he said was equivalent to this: that pure mathematics contains only analytic, but metaphysics synthetic, *a priori* judgments. In this, however, he was greatly mistaken, and the mistake had a decidedly injurious effect upon his whole conception. But for this, he would have extended his question concerning the origin of our synthetic judgments far beyond the metaphysical concept of causality and included in it the possibility of mathematics *a priori* also; for this latter he must have assumed to be equally synthetic. And then he could not have based his metaphysical judgments on mere experience without subjecting the axioms of mathematics equally to experience, a thing which he was far too acute to do. The good company into which metaphysics would thus have been brought would have saved it from the danger of a contemptuous ill-treatment; for the thrust intended for it must have reached mathematics, which was not and could not have been Hume's intention. Thus that acute man would have been led into considerations which must needs be similar to those that now occupy us, but which would have gained inestimably from his intimitably elegant style.

[3.] *Metaphysical Judgments*, properly so-called, are all synthetic. We must distinguish judgments belonging to metaphysics from metaphysical judgments properly so-called. Many of the former are analytic, but they only afford the means to metaphysical judgments, which are the whole aim of the science and which are always synthetic. For if there be concepts belonging to metaphysics (as, for example, that of substance), the judgments springing from simple analysis of them also belong to metaphysics, as, for example, substance is that which only exists as subject, etc. By means of several such analytic judgments we seek to arrive at the definition of a concept. But as the analysis of a pure concept of the understanding (such as metaphysics contains) does not proceed in any different manner from the dissection of any other, even empirical, concepts, not belonging to metaphysics (such as, air is an elastic fluid, the elasticity of which is not destroyed by any known degree of cold), it follows that the concept indeed, but not the analytic judgment, is properly metaphysical. This science has something special and peculiar to itself in the production of its *a priori* cognitions, which must therefore be distinguished from the features it has in common with other rational knowledge. Thus the judgment that all the substance in things is permanent is a synthetic and properly metaphysical judgment.

If the *a priori* concepts which constitute the materials and building blocks of metaphysics have first been collected according to fixed principles, then their analysis will be of great value. It might be taught as a particular part (as a *philosophia definitiva*), containing nothing but analytic judgments pertaining to [274] metaphysics, and could be treated separately from the synthetic which constitute metaphysics proper. For indeed these analyzes are not elsewhere of much value except in metaphysics, i.e., as regards the synthetic judgments which are to be generated out of these previously analyzed concepts.

The conclusion drawn in this section then is that metaphysics is properly concerned with synthetic propositions *a priori*, and these alone constitute its end, for which it indeed requires various dissections of its concepts, viz., analytic judgments, but wherein the procedure is not different from that in every other kind of cognition, in which we merely seek to render our concepts distinct by analysis. But the generation of a *a priori* cognition by intuition as well as by concepts, in fine, of synthetic propositions *a priori* in philosophical cognition, constitutes the essential content of metaphysics.

§3. A REMARK ON THE GENERAL DIVISION OF [270] JUDGMENTS INTO ANALYTIC AND SYNTHETIC

This division is indispensable as concerns the critique of human understanding and therefore deserves to be classical in it, though otherwise it is of little use. But this is the reason why dogmatic philosophers, who always seek the sources of metaphysical judgments in metaphysics itself and not outside of it in the pure laws of reason generally, altogether neglected this apparently obvious distinction. Thus the celebrated Wolff and his acute follower Baumgarten came to seek the proof of the principle of sufficient reason, which is clearly synthetic, in the principle of contradiction. In Locke's *Essay*, however, I find an indication of my division. For in the fourth book (chap. iii, § 9, seq.), having discussed the various connections of representations in judgments, and their sources, one of which he makes "identity or contradiction" (analytic judgments) and another the coexistence of representations in a subject (synthetic judgments), he confesses (§ 10) that our (*a priori*) knowledge of the latter is very narrow and almost nothing. But in his remarks on this species of cognition, there is so little of what is definite and reduced to rules that we cannot wonder if no one, not even Hume, was led to make investigations concerning judgments of this kind. For such universal and yet determinate principles are not easily learned from other men who have only had them obscurely in their minds. One must hit on them first by one's own reflection; then one finds them elsewhere, where one could

not possibly have found them at first because the authors themselves did not know that such an idea lay at the basis of their observations. Men who never think independently have nevertheless the acuteness to discover everything, after it has been once shown them, in what was said long since, though no one could ever see it there before.

§ 4. THE GENERAL QUESTION OF THE PROLEGOMENA: IS METAPHYSICS AT ALL POSSIBLE?

Were a metaphysics that could maintain its place as a science really in existence, were we able to say: here is metaphysics, learn it, and it will convince you irresistibly and irrevocably of its truth, then the above question would be pointless, and there would only remain that other question (which would rather be a test of our acuteness than a proof of the existence of the thing itself): how is the science possible, and how does reason come to attain it? But human reason has not been so fortunate in this case. There is no single book to which you can point, as you do to Euclid, and say: this is metaphysics; here you may find the noblest aim of this science, namely, the knowledge of a highest being, and of a future existence, proved from principles of pure reason. We can be shown indeed many judgments, apodeictically certain, and never questioned; but these are all analytic, and rather concern the materials and the scaffolding for metaphysics than the extension of knowledge, which is our proper object in studying it (§ 2). Even supposing you point to synthetic judgments (such as the principles of sufficient reason, which you have never proved, as you ought to, from pure reason *a priori*, though we gladly concede its truth), you lapse, when you try to use them for your principal purpose, into such inadmissible and uncertain assertions that in all ages one metaphysics has contradicted another, either in its assertions or their proofs, and thus has itself destroyed its own claim to lasting assent. Nay, the very attempts to set up such a science are the main cause of the early appearance of skepticism, a way of thinking in which reason treats itself with such violence that it could never have arisen save from complete despair of ever satisfying our most important aspirations. For long before men began to inquire into nature methodically, they consulted abstract reason, which had to some extent been exercised by means of ordinary experience; for reason is ever present, while laws of nature must usually be discovered with labor. So metaphysics floated to the surface, like foam, which dissolved the moment it was scooped off. But immediately there appeared a new supply on the surface, to be ever eagerly gathered up by some; while others, instead of seeking in the depths the cause of the phenomenon, thought they showed their wisdom by ridiculing the idle labor of their neighbors.

Weary therefore of dogmatism, which teaches us nothing, and of skepticism, which does not even promise us anything, not even to rest in permitted ignorance; disquieted by the importance of knowledge so much needed; and, lastly, rendered suspicious by long experience of all knowledge which we believe we possess or which offers itself under the title of pure reason—we have left but one critical question upon whose answer depends our future conduct, viz., *is metaphysics at all possible?* But this question must be answered not by skeptical objections to the asseverations of some actual system of metaphysics (for we do not as yet admit such a thing to exist), but from the conception, as yet only problematic, of a science of this sort.

In the *Critique of Pure Reason* I have treated this question synthetically, by making inquiries into pure reason itself and endeavoring in this source to determine the elements as well as the laws of its pure use according to principles. The task is difficult and requires a resolute reader to penetrate by degrees into a system based on no data except reason itself, and which therefore seeks, without resting upon any fact, to unfold knowledge from its original germs. These *Prolegomena*, however, are designed for preparatory exercises; they are intended to point out what must be done in order to make a science actual if it is possible, rather than to expound it. They must therefore [275] rest upon something already known as trustworthy, from which we can set out with confidence and ascend to sources as yet unknown, the discovery of which will not only explain to us what we knew but exhibit a sphere of many cognitions which all spring from the same sources. The method of such *Prolegomena*, especially of those designed as a preparation for future metaphysics, is consequently analytical.

But it happens, fortunately, that though we cannot assume metaphysics to be an actual science, we can say with confidence that certain pure *a priori* synthetic cognitions are actual and given, namely, pure mathematics and pure physics; for both contain propositions which are everywhere recognized as apodeictically certain, partly by mere reason, partly by universal agreement from experience, and yet as independent of experience. We have therefore some, at least uncontested, synthetic knowledge *a priori*, and need not ask *whether* it be possible (for it is actual) but *how* it is possible, in order that we may deduce from the principle which makes the given knowledge possible the possibility of all the rest.

§ 5. THE GENERAL PROBLEM: HOW IS COGNITION FROM PURE REASON POSSIBLE?

We have above learned the significant distinction between analytic and synthetic judgments. The possibility of analytic propositions was easily comprehended, being entirely founded on the principle of contradiction. The possibility of synthetic *a posteriori* judgments, of those which are gathered from experience, also requires no special explanation; for experience is nothing but a continual joining together (synthesis) of perceptions. There remain therefore only synthetic propositions *a priori*, of which the possibility must be sought or investigated, because they must depend upon other principles than that of contradiction.

But here we need not first establish the possibility of [276] such propositions so as to ask whether they are possible. For there are enough of them which indeed are of undoubted certainty, and as our present method is analytical, we shall start from the fact that such synthetic but purely rational cognition actually exists; but we must now inquire into the ground of this possibility and ask *how* such cognition is possible, in order that we may, from the principles of its possibility, be enabled to determine the conditions of its use, its sphere, and its limits. The proper problem upon which all depends, when expressed with scholastic precision, is therefore:

How are synthetic propositions *a priori* possible?

For the sake of popularity I have above expressed this problem somewhat differently, as an inquiry into purely rational cognition, which I could do for once without detriment to the desired insight, because, as we have only to do here with metaphysics and its sources, the reader will, I hope, after the foregoing remarks, keep in mind that when we speak of purely rational cognition we do not mean analytic but synthetic cognition.⁶

Metaphysics stands or falls with the solution of this [277] problem; its very existence depends upon it. Let anyone make metaphysical assertions with ever so much plausibility, let him overwhelm us with conclusions; but if he has not first been able to answer this question satisfactorily, I have the right to say: this is all vain, baseless philosophy and false wisdom. You speak through pure reason and claim, as it were, to create cognitions *a priori* not only by dissecting given concepts, but also by asserting connections which do not rest upon the principle of contradiction, and which you believe you conceive quite independently of all experience; how do you arrive at this, and how will you justify such pretensions? An appeal to the consent of the common sense of mankind cannot be allowed, for that is a witness whose authority depends merely upon rumor. Says Horace:

*Quodcunque ostendis mihi sic, incredulus odi.*⁷

The answer to this question is as indispensable as it is difficult; and though the principal reason that it was not attempted long ago is that the possibility of the question never occurred to anybody, there is yet another reason, viz., that a satisfactory answer to this one question requires a much more persistent, profound, and painstaking reflection than the most diffuse work on metaphysics, which on its first appearance promised immortality to its author. And every intelligent reader, when he carefully reflects what this problem requires, must at first be struck with its difficulty, and would regard it as insoluble and even impossible did there not actually exist pure synthetic cognitions *a priori*. This actually happened to David Hume, though he did not conceive the question in its entire universality as is done here and as must be done, if the answer is to be decisive for all metaphysics. For how is it possible, says that acute man, that when a concept is given me I can go beyond it and connect with it another which is not contained in it, in such a manner as if the latter *necessarily* belonged to the former? Nothing but experience can furnish us with such connections (thus he concluded from the difficulty which he took to be an impossibility), and all that vaunted necessity or, what is the same thing, all cognition assumed to be *a priori* is nothing but a long habit of accepting something as true, and hence of mistaking subjective necessity for objective.

Should my reader complain of the difficulty and the trouble which I occasion him in the solution of [278] this problem, he is at liberty to solve it himself in an easier way. Perhaps he will then feel under obligation to the person who has undertaken for him a labor of so profound research and will rather be surprised at the facility with which, considering the nature of the subject, the solution has been attained. Yet it has cost years of work to solve the problem in its whole universality (using the term in the mathematical sense, viz., for that which is sufficient for all cases), and finally to exhibit it in the analytical form, as the reader will find it here.

All metaphysicians are therefore solemnly and legally suspended from their occupations until they shall have satisfactorily answered the question: *How are synthetic cognitions a priori possible?* For the answer contains the only credentials which they must show when they have anything to offer us in the name of pure reason. But if they do not possess these credentials, they can expect nothing else of reasonable people, who have been

deceived so often, than to be dismissed without further ado.

If they, on the other hand, desire to carry on their business, not as a science, but as an art of wholesome persuasion suitable for the common sense of man, they cannot in fairness be prevented from pursuing this trade. They will then speak the modest language of a rational belief; they will grant that they are not allowed even to conjecture, far less to know, anything which lies beyond the bounds of all possible experience, but only to assume (not for speculative use, which they must abandon, but for practical use only) the existence of something that is possible and even indispensable for the guidance of the understanding and of the will in life. In this manner alone can they be called useful and wise men, and the more so as they renounce the title of metaphysicians. For the latter profess to be speculative philosophers; and since, when judgments *a priori* are under discussion, poor probabilities [279] cannot be admitted (for what is declared to be known *a priori* is thereby announced as necessary), such men cannot be permitted to play with conjectures, but their assertions must be either science or else nothing at all.

It may be said that the entire transcendental philosophy, which necessarily precedes all metaphysics, is nothing but the complete solution of the problem here propounded, in systematic order and completeness, and that we have hitherto never had any transcendental philosophy. For what goes by its name is properly a part of metaphysics, whereas the former science has first to settle the possibility of the latter and must therefore precede all metaphysics. And it is not surprising that when a whole science, deprived of all help from other sciences and consequently in itself quite new, is required to answer a single question satisfactorily, we should find the answer troublesome and difficult, nay, even shrouded in obscurity.

As we now proceed to this solution according to the analytical method, in which we assume that such cognitions from pure reason usually exist, we can only appeal to two sciences of theoretical cognition (which alone is under consideration here), namely, pure mathematics and pure natural science. For these alone can exhibit to us objects in intuition and consequently (if there should occur in them a cognition *a priori*) can show the truth or conformity of the cognition to the object *in concreto*, that is, its actuality, from which we could proceed to the ground of its possibility by the analytical method. This facilitates our work greatly, for here universal considerations are not only applied to facts, but even start from them, while in a synthetic procedure they must strictly be derived *in abstracto* from concepts.

But in order to ascend from these actual and, at the same time, well-grounded pure cognitions *a priori* to a possible cognition of the kind that we are seeking, viz., to metaphysics as a science, we must comprehend that which occasions it, namely, the mere natural (though not above suspicion as to its truth) cognition *a priori* which lies at the foundation of that science, the elaboration of which without any critical investigation of its possibility is commonly called metaphysics. In a word, we must comprehend the natural conditions of such a science as a part of our inquiry, [280] and thus the transcendental problem will be gradually answered by a division into four questions:

1. *How is pure mathematics possible?*
2. *How is pure natural science possible?*
3. *How is metaphysics in general possible?*
4. *How is metaphysics as a science possible?*

It may be seen that the solution of these problems, though chiefly designed to exhibit the essential content of the *Critique*, has yet something peculiar, which for itself alone deserves attention. This is the search for the sources of given sciences in reason itself, so that its faculty of knowing something *a priori* may by its own deeds be investigated and measured. By this procedure these sciences gain, if not with regard to their contents, yet as to their proper use; and while they throw light on the higher question concerning their common origin, they give, at the same time, an occasion for better explaining their own nature.

FIRST PART OF THE MAIN TRANSCENDENTAL QUESTION

How Is Pure Mathematics Possible?

§ 6. Here is a great and established branch of knowledge, encompassing even now a wonderfully large domain and promising an unlimited extension in the future, and carrying with it thoroughly apodeictical certainty, i.e., absolute necessity, which therefore rests upon no empirical grounds. Consequently, it is a pure product of reason, and moreover is thoroughly synthetic. [Here the question arises:] “How then is it possible for human reason to produce such cognition entirely *a priori*?” Does not this faculty [which produces mathematics], as it neither is nor can be based upon experience, presuppose some ground of cognition *a priori*, which lies deeply hidden but which might reveal itself by these its effects, if their first beginnings were but diligently ferreted out?

§ 7. But we find that all mathematical cognition [281] has this peculiarity: it must first exhibit its concept in intuition, and do so *a priori*, in an intuition that is not empirical but pure. Without this mathematics cannot take a single step, hence its judgments are always *intuitive*; whereas philosophy must be satisfied with *discursive* judgments from mere concepts, and though it may illustrate its apodeictic doctrines through intuition, can never derive them from it. This observation on the nature of mathematics gives us a clue to the first and highest condition of its possibility, which is that some pure intuition must form its basis, in which all its concepts can be exhibited or constructed, *in concreto* and yet *a priori*.⁸ If we can discover this pure intuition and its possibility, we may thence easily explain how synthetic propositions *a priori* are possible in pure mathematics, and consequently how this science itself is possible. For just as empirical intuition [viz., sense-perception] enables us without difficulty to enlarge the concept which we frame of an object of intuition by new predicates which intuition itself presents synthetically in experience, so pure intuition also does likewise, only with this difference: that in the latter case the synthetic judgment is *a priori* certain and apodeictic, in the former only *a posteriori* and empirically certain, because the *a posteriori* case contains only that which occurs in contingent empirical intuition, but the *a priori* case contains that which must necessarily be discovered in pure intuition. Here intuition, being an intuition *a priori*, is inseparably joined with the concept before all experience or particular perception.

§ 8. But with this step our perplexity seems rather to increase than to lessen. For the question now is, “How is it possible to intuit anything *a priori*?” An intuition [282] is such a representation as would immediately depend upon the presence of the object. Hence it seems impossible to intuit anything *a priori* originally, because intuition would in that event have to take place without either a former or a present object to refer to, and hence could not be intuition. Concepts indeed are such that we can easily form some of them *a priori*, viz., such as contain nothing but the thought of an object in general; and we need not find ourselves in an immediate relation to the object. Take, for instance, the concepts of quantity, of cause, etc. But even these require, in order to be meaningful and significant, certain concrete use — that is, an application to some intuition by which an object of them is given us. But how can the intuition of the object precede the object itself?

§ 9. If our intuition had to be of such a nature as to represent things as they are in themselves, there would not be any intuition *a priori*, but intuition would be always empirical. For I can only know what is contained in the object in itself if it is present and given to me. It is indeed even then inconceivable how the intuition of a present thing should make me know this thing as it is in itself, as its properties cannot migrate into my faculty of representation. But even if this possibility be granted, an intuition of that sort would not take place *a priori*, that is, before the object were presented to me; for without this latter fact no ground of a relation between my representation and the object can be conceived, unless it rested on inspiration. Therefore in one way only can my intuition anticipate the actuality of the object, and be a cognition *a priori*, viz., *if my intuition contains nothing but the form of sensibility, which in me as subject precedes all the actual impressions through which I am affected by objects*. For that objects of sense can only be intuited according to this form of sensibility I can know *a priori*. Hence it follows that propositions which concern this form of sensuous intuition only are possible and valid for objects of the senses; as also, conversely, that intuitions which are possible *a priori* can never concern any other things than objects of our senses.

§ 10. Accordingly, it is only the form of sensuous [283] intuition by which we can intuit things *a priori*, but by which we can know objects only as they *appear* to us (to our senses), not as they are in themselves; and this assumption is absolutely necessary if synthetic propositions *a priori* be granted as possible or if, in case

they actually occur, their possibility is to be conceived and determined beforehand.

Now, the intuitions which pure mathematics lay at the foundation of all its cognitions and judgments which appear at once apodeictic and necessary are space and time. For mathematics must first present all its concepts in intuition, and pure mathematics in pure intuition, i.e., it must construct them. If it proceeded in any other way, it would be impossible to make a single step; for mathematics proceeds, not analytically by dissection of concepts, but synthetically, and if pure intuition be wanting there is nothing in which the matter for synthetic judgments *a priori* can be given. Geometry is based upon the pure intuition of space. Arithmetic attains its concepts of numbers by the successive addition of units in time, and pure mechanics especially can attain its concepts of motion only by employing the representation of time. Both representations, however, are merely intuitions; for if we omit from the empirical intuitions of bodies and their alterations (motion) everything empirical, i.e., belonging to sensation, space and time still remain, and are therefore pure intuitions that lie *a priori* at the basis of the empirical. Hence they can never be omitted, but at the same time, by their being pure intuitions *a priori*, they prove that they are mere forms of our sensibility, which must precede all empirical intuition, i.e., perception of actual objects, and in conformity with which objects can be known *a priori* but only as they appear to us.

§ 11. The problem of the present section is therefore solved. Pure mathematics, as synthetic cognition *a priori*, is possible only by referring to no other [284] objects than those of the senses. At the basis of their empirical intuition lies a pure intuition (of space and time), which is *a priori*. This is possible because the latter intuition is nothing but the mere form of sensibility, which precedes the actual appearance of the objects, since in fact it makes them possible. Yet this faculty of intuiting *a priori* concerns not the matter of the appearance (that is, the sensation in it, for this constitutes what is empirical), but its form, viz., space and time. Should any man venture to doubt that both are not determinations of things in themselves but are merely determinations of their relation to sensibility, I should be glad to know how it can be possible to know *a priori* how their intuition will be characterized before we have any acquaintance with them and before they are presented to us. Such, however, is the case with space and time. But this is quite conceivable as soon as both count for nothing more than formal conditions of our sensibility, while the objects count merely as appearance; for then the form of the appearance, i.e., pure intuition, can by all means be represented as proceeding from ourselves, that is, *a priori*.

§ 12. In order to add something by way of illustration and confirmation, we need only watch the ordinary and unavoidably necessary procedure of geometers. All proofs of the complete congruence of two given figures (where the one can in every respect be substituted for the other) ultimately come down to the fact that they may be made to coincide. This is evidently nothing but a synthetic proposition resting upon immediate intuition; and this intuition must be pure and given *a priori*, else the proposition could not hold as apodeictically certain but would have empirical certainty only. In that case it could only be said that it is always found to be so and holds good only as far as our perception reaches. That complete space (which is not itself the boundary of another space) has three dimensions and that space in general cannot have more is based on the proposition that not more [285] than three lines can intersect at right angles in one point. This proposition cannot at all be shown from concepts, but rests immediately on intuition, and indeed on pure intuition *a priori* because it is apodeictically certain. That we can require a line to be drawn to infinity (*in indefinitum*) or that a series of changes (for example, spaces traversed by motion) shall be infinitely continued presupposes a representation of space and time, which can only attach to intuition, namely, so far as it in itself is bounded by nothing, for from concepts it could never be inferred. Consequently, the basis of mathematics actually is pure intuitions, which make its synthetic and apodeictically valid propositions possible. Hence our transcendental deduction of the concepts of space and of time explains at the same time the possibility of pure mathematics. Without some such deduction its truth may be granted, but its existence could by no means be understood, and we must assume “that everything which can be given to our senses (to the external senses in space and to the internal sense in time) is intuited by us as it appears to us, not as it is in itself.”

§ 13. Those who cannot yet rid themselves of the notion that space and time are actual qualities inherent in things in themselves may exercise their acumen on the following paradox. When they have in vain attempted its solution and are free from prejudices at least for a few moments, they will suspect that the reduction of space and time to mere forms of our sensuous intuition may perhaps be well founded.

If two things are quite equal in all respects as much as can be ascertained by all means possible, quantitatively and qualitatively, it must follow that the one can in all cases and under all circumstances replace the other, and this substitution would not occasion the least recognizable difference. This in fact is true of plane figures in geometry; but some spherical figures exhibit, notwithstanding a complete internal agreement, such a difference in their external relation that the one figure cannot possibly be put in the place of the other.

For instance, two spherical triangles on opposite hemispheres which have an arc of the equator [286] as their common base may be quite equal, both as regards sides and angles, so that nothing is to be found in either, if it be described for itself alone and completed, that would not equally be applicable to both; and yet the one cannot be put in the place of the other (on the opposite hemisphere). Here, then, is an internal difference between the two triangles; this difference our understanding cannot show to be internal but only manifests itself by external relations in space. But I shall adduce examples, taken from common life, that are more obvious still.

What can be more similar in every respect and in every part more alike to my hand and to my ear than their images in a mirror? And yet I cannot put such a hand as is seen in the mirror in the place of its original, for if this is a right hand, that in the mirror is a left one, and the image or reflection of the right ear is a left one, which never can serve as a substitute for the other. There are in this case no internal differences which our understanding could determine by thinking alone. Yet the differences are internal as the senses teach, for, notwithstanding their complete equality and similarity, the left hand cannot be enclosed in the same bounds as the right one (they are not congruent); the glove of one hand cannot be used for the other. What is the solution? These objects are not representations of things as they are in themselves, and as some pure understanding would cognize them, but sensuous intuitions, that is, appearances, whose possibility rests upon the relation of certain things unknown in themselves to something else, viz., to our sensibility. Space is the form of the external intuition of this sensibility, and the internal determination of any space is possible only by the determination of its external relation to the whole of space, of which it is a part (in other words, by its relation to external sense). That is to say, the part is possible only through the whole, which is never the case with things in themselves as objects of the mere understanding, but can well be the case with mere appearances. Hence the difference between similar and equal things which are not congruent (for instance, helices winding in opposite ways), cannot be made intelligible by any concept, but only by the relation to the right and the left hands, which immediately refers to intuition.

REMARK I

Pure mathematics, and especially pure geometry, can [287] only have objective reality on condition that it refers merely to objects of sense. But in regard to the latter the principle holds good that our sense representation is not a representation of things in themselves, but of the way in which they appear to us. Hence it follows that the propositions of geometry are not determinations of a mere creation of our poetic imagination, which could therefore not be referred with assurance to actual objects; but rather that they are necessarily valid of space, and consequently of all that may be found in space, because space is nothing but the form of all external appearances, and it is this form alone in which objects of sense can be given to us. Sensibility, the form of which is the basis of geometry, is that upon which the possibility of external appearance depends. Therefore these appearances can never contain anything but what geometry prescribes to them. It would be quite otherwise if the senses were so constituted as to represent objects as they are in themselves. For then it would not by any means follow from the representation of space, which with all its properties serves the geometer as an *a priori* foundation, that this foundation together with what is inferred from it must be so in nature. The space of the geometer would be considered a mere fiction, and it would not be credited with objective validity because we cannot see how things must of necessity agree with an image of them which we make spontaneously and previous to our acquaintance with them. But if this image, or rather this formal intuition, is the essential property of our sensibility by means of which alone objects are given to us, and if this sensibility represents not things in themselves but their appearances, then we shall easily comprehend, and at the same time indisputably prove, that all external objects of our world of sense must necessarily coincide in the most rigorous way with the propositions of geometry. This is so because sensibility by means of its form of external intuition (space), with which the geometer is concerned, makes those objects possible as mere appearances. It will always remain a remarkable phenomenon in the history of philosophy that there was a time when even mathematicians who at the same time were philosophers began to doubt, not [288] of the correctness of their geometrical propositions so far as they merely concerned space, but of their objective validity and the applicability to nature of this concept itself and all its geometrical determinations. They showed much concern whether a line in nature might not consist of physical points, and consequently that true space in the object might consist of simple parts, while the space which the geometer has in his mind cannot be such. They did not recognize that this thought space renders possible the physical space, i.e., the extension of matter itself, and that this pure space is not at all a quality of things in themselves but a form of our sensuous faculty of representation, and that furthermore all objects in space are mere appearances, i.e., not things in themselves but representations of our sensuous intuition. But such is the case, for the space of the

geometer is exactly the form of sensuous intuition which we find *a priori* in us, and contains the ground of the possibility of all external appearances (according to their form); and the latter must necessarily and most precisely agree with the propositions of the geometer, which he draws not from any fictitious concept but from the subjective basis of all external appearances, viz., sensibility itself. In this and no other way can geometry be made secure as to the undoubted objective reality of its propositions against all the chicaneries of a shallow metaphysics, however strange this may seem to a metaphysics that does not go back to the sources of its concepts.

REMARK II

Whatever is given us as object must be given us in intuition. All our intuition, however, takes place only by means of the senses, the understanding intuits nothing but only reflects. And as we have just shown that the senses never and in no manner enable us to know things in themselves, but only their appearances, which are mere representations of the sensibility, we conclude that “all bodies, together with the space in which they are, must be considered nothing but mere representations in us, and exist nowhere but in our thoughts.” Now is not this manifest idealism?

Idealism consists in the assertion that there are none but thinking beings; all other things which we believe are perceived in intuitions are nothing but [289] representations in the thinking beings, to which no object external to them in fact corresponds. On the contrary, I say that things as objects of our senses existing outside us are given, but we know nothing of what they may be in themselves, knowing only their appearances, i.e., the representations which they cause in us by affecting our senses. Consequently, I grant by all means that there are bodies without us, that is, things which, though quite unknown to us as to what they are in themselves, we yet know by the representations which their influence on our sensibility procures us, and which we call bodies. This word merely means the appearance of the thing, which is unknown to us but is not therefore less real. Can this be termed idealism? It is the very contrary.

Long before Locke’s time, but assuredly since him, it has been generally assumed and granted without detriment to the actual existence of external things that many of their predicates may be said to belong, not to the things in themselves, but to their appearances, and to have no proper existence outside our representation. Heat, color, and taste, for instance, are of this kind. Now, if I go further and, for weighty reasons, rank as mere appearances also the remaining qualities of bodies, which are called primary—such as extension, place, and, in general, space, with all that which belongs to it (impenetrability or materiality, shape, etc.)—no one in the least can adduce the reason of its being inadmissible. As little as the man who admits colors not to be properties of the object in itself but only to be modifications of the sense of sight should on that account be called an idealist, so little can my doctrine be named idealistic merely because I find that more, nay, *all the properties which constitute the intuition of a body belong merely to its appearance*. The existence of the thing that appears is thereby not destroyed, as in genuine idealism, but it is only shown that we cannot possibly know it by the senses as it is in itself.

I should be glad to know what my assertions must be in order to avoid all idealism. Undoubtedly, I should say that the representation of space is not only perfectly conformable to the relation which our sensibility has to objects—that I have said—but [290] that it is completely like the object—an assertion in which I can find as little meaning as if I said that the sensation of red has a similarity to the property of cinnabar which excites this sensation in me.

REMARK III

Hence we may at once dismiss as easily foreseen but futile objection, “that by our admitting the ideality of space and of time the whole sensible world would be turned into mere illusion.” After all philosophical insight into the nature of sensuous cognition was spoiled by making the sensibility merely a confused mode of representation, according to which we still know things as they are, but without being able to reduce everything in this our representation to a clear consciousness; whereas on the contrary proof is offered by us that sensibility consists, not in this logical distinction of clearness and obscurity, but in the genetic one of the origin of cognition itself. For sensuous perception represents things not at all as they are, but only the mode in which they affect our senses; and consequently by sensuous perception appearances only, and not things themselves, are given to the understanding for reflection. After this necessary correction, an objection rises from an unpardonable and almost intentional misconception, as if my doctrine turned all the things of the world of sense into mere illusion.

When an appearance is given us, we are still quite free as to how we should judge the matter. The

appearance depends upon the senses, but the judgment upon the understanding; and the only question is whether in the determination of the object there is truth or not. But the difference between truth and dreaming is not ascertained by the nature of the representations which are referred to objects (for they are the same in both cases), but by their connection according to those rules which determine the coherence of the representations in the concept of an object, and by ascertaining whether they can subsist together in experience or not. And it is not the fault of the appearances if our cognition takes illusion for truth, i.e., if [291] the intuition, by which an object is given us, is taken for the concept of the thing or even of its existence, which the understanding only can think. The senses represent to us the paths of the planets as now progressive, now retrogressive; and herein is neither falsehood nor truth, because as long as we hold this to be nothing but appearance we do not judge of the objective nature of their motion. But as a false judgment may easily arise when the understanding is not on its guard against this subjective mode of representation being considered objective, we say they appear to move backward; it is not the senses however which must be charged with the illusion, but the understanding, whose province alone it is to make an objective judgment on appearances.

Thus, even if we did not at all reflect on the origin of our representations, whenever we connect our intuitions of sense (whatever they may contain) in space and in time, according to the rules of the coherence of all cognition in experience, illusion or truth will arise according as we are negligent or careful. It is merely a question of the use of sensuous representations in the understanding, and not of their origin. In the same way, if I consider all the representations of the senses, together with their form, space and time, to be nothing but appearances, and space and time to be a mere form of the sensibility, which is not to be met with in objects out of it, and if I make use of these representations in reference to possible experience only, there is nothing in my regarding them as appearances that can lead astray or cause illusion. For all that, they can correctly cohere according to rules of truth in experience. Thus all the propositions of geometry hold good of space as well as of all the objects of the senses, consequently, of all possible experience, whether I consider space as a mere form of the sensibility or as something adhering to the things themselves. In the former case, however, I comprehend how I can know *a priori* these propositions concerning all the objects of external intuition. Otherwise, everything else as regards all possible experience remains just as if I had not departed from the ordinary view.

But if I venture to go beyond all possible experience with my concepts of space and time, which I cannot refrain from doing if I proclaim them qualities [292] inherent in things in themselves (for what should prevent me from letting them hold good of the same things, even though my senses might be different, and unsuited to them?), then a grave error may arise due to illusion, in which I proclaim to be universally valid what is merely a subjective condition of the intuition of things and certain only for all objects of sense, viz., for all possible experience; I would refer this condition to things in themselves, and not limit it to the conditions of experience.

My doctrine of the ideality of space and of time, therefore, far from reducing the whole sensible world to mere illusion, is the only means of securing the application of one of the most important cognitions (that which mathematics propounds *a priori*) to actual objects and of preventing its being regarded as mere illusion. For without this observation it would be quite impossible to make out whether the intuitions of space and time, which we borrow from no experience and which yet lie in our representation *a priori*, are not mere phantasms of our brain to which no objects correspond, at least not adequately; and, consequently, whether we have been able to show geometry's unquestionable validity with regard to all the objects of the sensible world just because they are mere appearances.

Secondly, though these my principles make appearances of the representations of the senses, they are so far from turning the truth of experience into mere illusion that they are rather the only means of preventing the transcendental illusion, by which metaphysics has been deceived hitherto and misled into childish efforts of catching at bubbles, because appearances, which are mere representations, were taken for things in themselves. Here originated the remarkable event of the antinomy of reason, which I shall mention later on and which is cancelled by the single observation that appearance, as long as it is employed in experience, produces truth, but the moment it transgresses the bounds of experience, and consequently becomes transcendent, produces nothing but illusion [see §§ 50–54 below].

Inasmuch, therefore, as I leave to things as we obtain them by the senses their actuality and only limit our sensuous intuition of these things to this—that it [293] represents in no respect, not even in the pure intuitions of space and of time, anything more than mere appearance of those things, but never their constitution in themselves—so is this position of mine not a sweeping illusion invented by me for nature. My protestation, too, against all charges of idealism is so valid and clear as even to seem superfluous, were there

not incompetent judges who, while they would have an old name for every deviation from their perverse though common opinion and never judge of the spirit of philosophic nomenclature, but cling to the letter only, are ready to put their own conceits in the place of well-defined concepts, and thereby deform and distort them. I have myself given this my theory the name of transcendental idealism, but that cannot authorize anyone to confound it either with the empirical idealism of Descartes (indeed, his was only an insoluble problem, owing to which he thought every one at liberty to deny the existence of the corporeal world because it could never be proved satisfactorily), or with the mystical and visionary idealism of Berkeley (against which and other similar phantasms, our *Critique* contains the proper antidote). My idealism concerns not the existence of things (the doubting of which, however, constitutes idealism in the ordinary sense), since it never came into my head to doubt it; but it concerns the sensuous representation of things, to which space and time especially belong. Regarding space and time and, consequently, regarding all appearances in general, I have only shown that they are neither things (but are mere modes of representation) nor are they determinations belonging to things in themselves. But the word “transcendental,” which for me never means a reference of our cognition to things, but only to our faculty of cognition, was meant to obviate this misconception. Yet rather than give further occasion to it by this word, I now retract it and desire this idealism of mine to be called “critical.” But if it be really an objectionable idealism to convert actual things (not appearances) into mere representations, by what name shall we call that which, conversely, [294] changes mere representations into things? It may, I think, be called *dreaming* idealism, in contradistinction to the former, which may be called *visionary* idealism, both of which are to be refuted by my transcendental, or better, *critical* idealism.

SECOND PART OF THE MAIN TRANSCENDENTAL QUESTION

How Is Pure Natural Science Possible?

§ 14. *Nature* is the *existence* of things, so far as it is determined according to universal laws. Should nature signify the existence of things in themselves, we could never cognize it either *a priori* or *a posteriori*. Not *a priori*, for how can we know what belongs to things in themselves, since this never can be done by the dissection of our concepts (in analytic judgments)? For I do not want to know what is contained in my concept of a thing (for that belongs to its logical being), but what in the actuality of the thing is superadded to my concept and by what the thing itself is determined in its existence outside the concept. My understanding and the conditions on which alone it can connect the determinations of things in their existence do not prescribe any rule to things in themselves; these do not conform to my understanding, but it would have to conform to them; they would therefore have to be first given to me in order to gather these determinations from them, wherefore they would not be cognized *a priori*.

A cognition of the nature of things in themselves *a posteriori* would be equally impossible. For if experience is to teach us laws to which the existence of things is subject, these laws, if they refer to things in themselves, would have to refer to them of necessity even outside our experience. But experience teaches us what exists and how it exists, but never that it must necessarily exist so and not otherwise. Experience therefore can never teach us the nature of things in themselves.

§ 15. We nevertheless actually possess a pure natural science in which are propounded, *a priori* and [295] with all the necessity requisite to apodeictic propositions, laws to which nature is subject. I need only call to witness that propaedeutic to natural knowledge which, under the title of universal natural science,⁹ precedes all physics (which is founded upon empirical principles). In it we have mathematics applied to appearances, and also merely discursive principles (from concepts),¹⁰ which constitute the philosophical part of the pure cognition of nature. But there is much in it which is not quite pure and independent of empirical sources, such as the concept of *motion*, that of *impenetrability* (upon which the empirical concept of matter rests), that of *inertia*, and many others, which prevent its being called a quite pure [transcendental] natural science. Besides, it only refers to objects of the external senses, and therefore does not give an example of a universal natural science in the strict sense; for such a science must bring nature in general, whether it regards the object of the external senses or that of the internal sense (the object of physics as well as psychology), under universal laws. But among the principles of this universal physics there are a few which actually have the required universality; for instance, the propositions that “substance is permanent,” and that “every event is determined by a cause according to constant laws,” etc. These are actually universal laws of nature, which subsist completely *a priori*. There is then in fact a pure [transcendental] natural science, and the question arises: how is it possible?

§ 16. The word *nature* assumes yet another meaning, which determines the object, whereas in the former sense it only denotes the conformity to law of the determinations of the existence of things generally. Nature considered *materialiter* is the *totality of all objects of experience*. And with this only are we now concerned; for, besides, things which can never be objects of experience, if they were to be cognized as to their nature, would oblige us to have recourse to concepts whose meaning could never be given *in concreto* (by any example of possible experience). Consequently, we would have to form for ourselves a list of concepts of their nature, the reality whereof [i.e., whether they actually referred to objects or were mere creations of [296] thought] could never be determined. The cognition of what cannot be an object of experience would be hyperphysical, and with things hyperphysical we are here not concerned, but only with the cognition of nature, the actuality of which can be confirmed by experience, though this cognition is possible *a priori* and precedes all experience.

§ 17. The formal aspect of nature in this narrower sense is therefore the conformity to law of all the objects of experience and, so far as it is cognized *a priori*, their necessary conformity. But it has just been shown that the laws of nature can never be cognized *a priori* in objects so far as they are considered, not in reference to possible experience, but as things in themselves. And our inquiry here extends, not to things in themselves (the properties of which we pass by), but to things as objects of possible experience, and the totality of these is properly what we here call nature. And now I ask, when the possibility of cognition of nature *a priori* is in question, whether it is better to arrange the problem thus: how can we cognize *a priori* that things as objects of experience necessarily conform to law? or thus: how is it possible to cognize *a priori* the necessary conformity to law of experience itself as regards all its objects generally?

Closely considered, the solution of the question represented in either way amounts, with regard to the pure cognition of nature (which is the point of the question at issue), entirely to the same thing. For the subjective

laws, under which alone an empirical cognition of things is possible, hold good of these things as objects of possible experience (not as things in themselves, which are not considered here). Either of the following statements means quite the same: a judgment of perception can never rank as experience without the law that, whenever an event is observed, it is always referred to some antecedent, which it follows according to a universal rule; or else, everything of which experience teaches that it happens must have a cause.

It is, however, more convenient to choose the first [297] formula. For we can *a priori* and before all given objects have a cognition of those conditions on which alone experience of them is possible, but never of the laws to which things may in themselves be subject, without reference to possible experience. We cannot, therefore, study the nature of things *a priori* otherwise than by investigating the conditions and the universal (though subjective) laws, under which alone such a cognition as experience (as to mere form) is possible, and we determine accordingly the possibility of things as objects of experience. For if I should choose the second formula and seek the *a priori* conditions under which nature as an object of experience is possible, I might easily fall into error and fancy that I was speaking of nature as a thing in itself, and then move around in endless circles, in a vain search for laws concerning things of which nothing is given me.

Accordingly, we shall here be concerned merely with experience and the universal conditions of its possibility, which are given *a priori*. Thence we shall determine nature as the whole object of all possible experience. I think it will be understood that I here do not mean the rules of the observation of a nature that is already given, for these already presuppose experience. I do not mean how (through experience) we can study the laws of nature; for these would not then be laws *a priori* and would yield us no pure natural science; but [I mean to ask] how the conditions *a priori* of the possibility of experience are at the same time the sources from which all the universal laws of nature must be derived.

§ 18. In the first place we must state that while all judgments of experience are empirical (i.e., have their ground in immediate sense-perception), yet conversely, all empirical judgments are not therefore judgments of experience; but, besides the empirical, and in general besides what is given to sensuous intuition, special concepts must yet be superadded—concepts which have their origin quite *a priori* in the pure understanding, and under which every perception must be first of all subsumed and then by their means changed into experience.

Empirical judgments, so far as they have objective [298] validity, are *judgments of experience*; but those which are only subjectively valid I name mere *judgments of perception*. The latter require no pure concept of the understanding, but only the logical connection of perception in a thinking subject. But the former always require, besides the representation of the sensuous intuition, special *concepts originally generated in the understanding*, which make the judgment of experience objectively valid.

All our judgments are at first merely judgments of perception; they hold good only for us (i.e., for our subject), and we do not until afterward give them a new reference (to an object) and want that they shall always hold good for us and in the same way for everybody else; for if a judgment agrees with an object, all judgments concerning the same object must likewise agree with one another, and thus the objective validity of the judgment of experience signifies nothing else than its necessary universal validity. And, conversely, if we have reason to hold a judgment to be necessarily universally valid (which never rests on perception, but on the pure concept of the understanding under which the perception is subsumed), we must consider it to be objective also, that is, that it expresses not merely a reference of our perception to a subject, but a quality of the object. For there would be no reason for the judgments of other men necessarily to agree with mine, if it were not the unity of the object to which they all refer and with which they accord; hence they must all agree with one another.

§ 19. Therefore objective validity and necessary universal validity (for everybody) are equivalent concepts, and though we do not know the object in itself, yet when we consider a judgment as universally valid, and hence necessary, we understand it thereby to have objective validity. By this judgment we cognize the object (though it remains unknown as it is in itself) by the universally valid and necessary connection of the given perceptions. As this is the case with all objects of sense, judgments of experience take their [299] objective validity, not from the immediate cognition of the object (which is impossible), but merely from the condition of universal validity of empirical judgments, which, as already said, never rests upon empirical or, in short, sensuous conditions, but upon a pure concept of the understanding. The object in itself always remains unknown; but when by the concept of the understanding the connection of the representations of the object, which are given by the object to our sensibility, is determined as universally valid, the object is determined by this relation, and the judgment is objective.

To illustrate the matter: when we say, “The room is warm, sugar sweet, and wormwood nasty,”¹¹ we have

only subjectively valid judgments. I do not at all expect that I or any other person shall always find it as I now do; each of these sentences only expresses a reference of two sensations to the same subject, i.e., myself, and that only in my present state of perception; consequently, they are not intended to be valid of the object. Such are judgments of perception. Judgments of experience are of quite a different nature. What experience teaches me under certain circumstances, it must always teach me and everybody; and its validity is not limited to the subject nor to its state at a particular time. Hence I pronounce all such judgments as being objectively valid. For instance, when I say the air is elastic, this judgment is as yet a judgment of perception only—I do nothing but refer two sensations in my senses to one another. But if I would have it called a judgment of experience, I require this connection to stand under a condition which makes it universally valid. I desire therefore that I and everybody else should always necessarily connect the same perceptions under the same circumstances.

§ 20. We must therefore analyze experience in general [300] in order to see what is contained in this product of the senses and of the understanding, and how the judgment of experience itself is possible. The foundation is the intuition of which I become conscious, i.e., perception (*perceptio*), which pertains merely to the senses. But in the next place, there is judging (which belongs only to the understanding). But this judging may be twofold: first, I may merely compare perceptions and connect them in a consciousness of my state; or, secondly, I may connect them in consciousness in general. The former judgment is merely a judgment of perception and is of subjective validity only; it is merely a connection of perceptions in my mental state, without reference to the object. Hence it is not, as is commonly imagined, enough for experience to compare perceptions and connect them in consciousness through judgment; there arises no universal validity and necessity, by virtue of which alone consciousness can become objectively valid and be called experience.

Quite another judgment therefore is required before perception can become experience. The given intuition must be subsumed under a concept which determines the form of judging in general with regard to the intuition, connects the empirical consciousness of the intuition in consciousness in general, and thereby procures universal validity for empirical judgments. A concept of this nature is a pure *a priori* concept of the understanding, which does nothing but determine for an intuition the general way in which it can be used for judging. Let the concept be that of cause; then it determines the intuition which is subsumed under it, e.g., that of air, with regard to judging in general, viz., the concept of air as regards its expansion serves in the relation of antecedent to consequent in a hypothetical judgment. The concept of cause accordingly is a pure concept of the understanding, which is totally disparate from all possible perception and only serves to determine the representation contained under it with regard to judging in general, and so to make a universally valid judgment possible.

Before, therefore, a judgment of perception can [301] become a judgment of experience, it is requisite that the perception should be subsumed under some such concept of the understanding; for instance, air belongs under the concept of cause, which determines our judgment about it with regard to its expansion as hypothetical.¹² Thereby the expansion of the air is represented, not as merely belonging to the perception of the air in my present state or in several states of mine, or in the state of perception of others, but as belonging to it necessarily. The judgment that air is elastic becomes universally valid and a judgment of experience only because certain judgments precede it which subsume the intuition of air under the concepts of cause and effect; and they thereby determine the perceptions, not merely as regards one another in me, but as regards the form of judging in general (which is here hypothetical), and in this way they render the empirical judgment universally valid.

If all our synthetic judgments are analyzed so far as they are objectively valid, it will be found that they never consist of mere intuitions connected only (as is commonly supposed) by comparison into a judgment; but that they would be impossible were not a pure concept of the understanding superadded to the concepts abstracted from intuition, under which pure concept these latter concepts are subsumed and in this manner only combined into an objectively valid judgment. Even the judgments of pure mathematics in their simplest axioms are not exempt from this condition. The principle that a straight line is the shortest distance between two points presupposes that the line is subsumed under the concept of quantity, which certainly is no mere intuition but has its seat in the understanding alone and serves to determine the intuition (of the line) with regard to the judgments which may be made about it in respect to the quantity, [302] that is, to plurality (as *judica pluraliva*)¹³ For under them it is understood that in a given intuition there is contained a plurality of homogeneous parts.

§ 21. To prove, then, the possibility of experience so far as it rests upon pure *a priori* concepts of the understanding, we must first represent what belongs to judgments in general and the various moments (functions) of the understanding in them, in a complete table. For the pure concepts of the understanding must run parallel to these moments, inasmuch as such concepts are nothing more than concepts of intuitions

in general, so far as these are determined by one or other of these moments of judging, in themselves, i.e., necessarily and universally. Hereby also the *a priori* principles of the possibility of all experience, as objectively valid empirical cognition, will be precisely determined. For they are nothing but propositions which subsume all perception (conformably to certain universal conditions of intuition) under those pure concepts of the understanding.

LOGICAL TABLE OF JUDGMENTS

	1	2
	<i>As to Quantity</i>	<i>As to Quality</i>
	Universal	Affirmative
	Particular	Negative
	Singular	Infinite
	3	4
303	<i>As to Relation</i>	<i>As to Modality</i>
	Categorical	Problematic
	Hypothetical	Assertoric
	Disjunctive	Apodeictic

TRANSCENDENTAL TABLE OF THE CONCEPTS OF THE UNDERSTANDING

	1	2
	<i>As to Quantity</i>	<i>As to Quality</i>
	Unity (Measure)	Reality
	Plurality (Quantity)	Negation
	Totality (Whole)	Limitation

	Community	Necessity

PURE PHYSIOLOGICAL¹⁴ TABLE OF THE UNIVERSAL PRINCIPLES OF NATURAL SCIENCE

	1	2
	Axioms of Intuition	Anticipations of Perception
	3	4
	Analogies of Experience	Postulates of Empirical Thought in General

§ 21a. In order to comprise the whole matter in [304] one idea, it is first necessary to remind the reader that we are discussing, not the origin of experience, but what lies in experience. The former pertains to empirical psychology and would even then never be adequately developed without the latter, which belongs to the critique of cognition, and particularly of the understanding.

Experience consists of intuitions, which belong to the sensibility, and of judgments, which are entirely a work of the understanding. But the judgments which the understanding makes entirely out of sensuous intuitions are far from being judgments of experience. For in the one case the judgment connects only the perceptions as they are given in sensuous intuition, while in the other the judgments must express what experience in general and not what the mere perception (which possesses only subjective validity) contains. The judgment of experience must therefore add to the sensuous intuition and its logical connection in a judgment (after it has been rendered universal by comparison) something that determines the synthetic judgment as necessary and therefore as universally valid. This can be nothing but that concept which represents the intuition as determined in itself with regard to one form of judgment rather than another, viz., a concept of that synthetic unity of intuitions which can only be represented by a given logical function of judgments.

§ 22. The sum of the matter is this: the business of the senses is to intuit, that of the understanding is to think. But thinking is uniting representations in a consciousness. This unification originates either merely relative to the subject and is contingent and subjective, or it happens absolutely and is necessary or objective. The uniting of representations in a consciousness is judgment. Thinking therefore is the same as judging, or referring representations to judgments in general. Hence judgments are either merely subjective when representations are referred to a consciousness [305] in one subject only and are united in it, or they are objective when they are united in a consciousness in general, that is, necessarily. The logical moments of all judgments are so many possible ways of uniting representations in consciousness. But if they serve as concepts, they are concepts of the necessary unification of representations in a consciousness and so are principles of objectively valid judgments. This uniting in a consciousness is either analytic by identity, or synthetic by the combination and addition of various representations one to another. Experience consists in the synthetic connection of appearances (perceptions) in consciousness, so far as this connection is necessary. Hence the pure concepts of the understanding are those under which all perceptions must first be subsumed before they can serve for judgments of experience, in which the synthetic unity of the perceptions is represented as necessary and universally valid.¹⁵

§ 23. Judgments, when considered merely as the condition of the unification of given representations in a consciousness, are rules. These rules, so far as they represent the unification as necessary, are rules *a priori*, and so far as they cannot be deduced from higher rules, are principles. But in regard to the possibility of all experience, merely in relation to the form of thinking in it, no conditions of judgments of experience are higher than those which bring the [306] phenomena, according to the different form of their intuition, under pure concepts of the understanding, and render the empirical judgments objectively valid. These are therefore the *a priori* principles of possible experience.

The principles of possible experience are then at the same time universal laws of nature, which can be cognized *a priori*. And thus the problem in our second question: How is pure natural science possible? is solved. For the systematization which is required for the form of a science is to be met with in perfection here, because, beyond the above-mentioned formal conditions of all judgments in general and of all rules in general, that are offered in logic, no others are possible, and these constitute a logical system. The concepts grounded thereupon, which contain the *a priori* conditions of all synthetic and necessary judgments, accordingly constitute a transcendental system. Finally, the principles by means of which all appearances are subsumed under these concepts constitute a physiological system, that is, a system of nature, which precedes all empirical cognition of nature, first makes it possible, and hence may in strictness be called the universal and pure natural science.

§ 24. The first¹⁶ of the physiological principles¹⁷ subsumes all appearances, as intuitions in space and time, under the concept of *quantity*, and is so far a principle of the application of mathematics to experience. The second¹⁸ subsumes the strictly empirical element, viz., sensation, which denotes the real in intuitions, not indeed directly under the concept of *quantity*, because sensation is not an intuition that *contains* either space or time, though it puts the object corresponding to sensation in both space and time. But still there is between reality (sense-representation) and zero, or total lack of intuition in time, a difference which has a quantity. For between any given degree of light and darkness, between any degree of heat and complete cold, between any degree of weight and absolute lightness, between any [307] degree of occupied space and of totally empty space, ever smaller degrees can be thought, just as even between consciousness and total unconsciousness (psychological darkness) ever smaller degrees obtain. Hence there is no perception that can show an absolute absence; for instance, no psychological darkness that cannot be regarded as a consciousness only surpassed by a stronger consciousness. This occurs in all cases of sensation; and so the understanding can anticipate sensations, which constitute the peculiar quality of empirical representations (appearances), by means of the principle that they all have a degree, consequently, that what is real in all appearance has a degree. Here is the second application of mathematics (*mathesis intensorum*) to natural science.

§ 25. As regards the relation of appearances merely with a view to their existence, the determination is not mathematical but dynamical, and can never be objectively valid and fit for experience, if it does not come under *a priori* principles¹⁹ by which the cognition of experience relative to appearances first becomes possible. Hence appearances must be subsumed under the concept of substance, which as a concept of the thing itself is the foundation of all determination of existence; or, secondly—so far as a succession is found among appearances, that is, an event—under the concept of an effect with reference to cause; or, lastly—so far as coexistence is to be known objectively, that is, by a judgment of experience—under the concept of community (action and reaction). Thus *a priori* principles form the basis of objectively valid, though empirical, judgments

—that is, of the possibility of experience so far as it must connect objects as existing in nature. These principles are properly the laws of nature, which may be called dynamical.

Finally²⁰ the cognition of the agreement and connection, not only of appearances among themselves in experience, but of their relation to experience in general, belongs to judgments of experience. This relation [308] contains either their agreement with the formal conditions which the understanding cognizes, or their coherence with the material of the senses and of perception, or combines both into one concept and consequently contains possibility, actuality, and necessity according to universal laws of nature. This would constitute the physiological doctrine of method (distinction between truth and hypotheses, and the bounds of the reliability of the latter).

§ 26. The third table of principles drawn from the nature of the understanding itself according to the critical method shows an inherent perfection, which raises it far above every other table which has hitherto, though in vain, been tried or may yet be tried by analyzing the objects themselves dogmatically. It exhibits all synthetic *a priori* principles completely and according to one principle, viz., the faculty of judging in general, which constitutes the essence of experience as regards the understanding, so that we can be certain that there are no more such principles. This affords a satisfaction such as can never be attained by the dogmatic method. Yet this is not all; there is a still greater merit in it.

We must carefully bear in mind the ground of proof which shows the possibility of this cognition *a priori* and, at the same time, limits all such principles to a condition which must never be lost sight of, if they are not to be misunderstood and extended in use beyond what is allowed by the original sense which the understanding places in them. This limit is that they contain nothing but the conditions of possible experience in general so far as it is subjected to laws *a priori*. Consequently, I do not say that things *in themselves* possess a quantity, that their reality possesses a degree, their existence a connection of accidents in a substance, etc. This nobody can prove, because such a synthetic connection from mere concepts, without any reference to sensuous intuition on the one side or connection of such intuition in a possible experience on the other, is absolutely impossible. The essential limitation of the concepts in these principles, then, is that all things stand necessarily *a priori* under the aforementioned conditions only as *objects of experience*.

Hence there follows, secondly, a specifically peculiar mode of proof of these principles; they are not directly referred to appearances and to their relation, [309] but to the possibility of experience, of which appearances constitute the matter only, not the form. Thus they are referred to objectively and universally valid synthetic propositions, in which we distinguish judgments of experience from those of perception. This takes place because appearances, as mere intuitions *occupying a part of space and time*, come under the concept of quantity, which synthetically unites their multiplicity *a priori* according to rules. Again, insofar as the perception contains, besides intuition, sensation, and between the latter and nothing (i.e., the total disappearance of sensation), there is an ever-decreasing transition, it is apparent that the real in appearances must have a degree, so far as it (viz., the sensation) *does not itself occupy any part of space or of time*.²¹ Still the transition to sensation from empty time or empty space is only possible in time. Consequently, although sensation, as the quality of empirical intuition in respect of its specific difference from other sensations, can never be cognized *a priori*, yet it can, in a possible experience in general, as a quantity of perception be intensively distinguished from every other similar perception. Hence the application of mathematics to nature, as regards the sensuous intuition by which nature is given to us, is first made possible and determined.

Above all, the reader must pay attention to the mode of proof of the principles which occur under the title of Analogies of Experience. For these do not refer to the generation of intuitions, as do the principles of applying mathematics to natural science in [310] general, but to the connection of their existence in experience; and this can be nothing but the determination of their existence in time according to necessary laws, under which alone the connection is objectively valid and thus becomes experience. The proof, therefore, does not turn on the synthetic unity in the connection of things in themselves, but merely of perceptions, and of these, not in regard to their content, but to the determination of time and of the relation of their existence in it according to universal laws. If the empirical determination in relative time is indeed to be objectively valid (i.e., experience), these universal laws thus contain the necessity of the determination of existence in time generally (viz., according to a rule of the understanding *a priori*). Since these are prolegomena I cannot further descant on the subject, but my reader (who has probably long been accustomed to consider experience as a mere empirical synthesis of perceptions, and hence has not considered that it goes much beyond them since it imparts to empirical judgments universal validity, and for that purpose requires a pure and *a priori* unity of the understanding) is recommended to pay special attention to this distinction of experience from a mere aggregate of perceptions and to judge the mode of proof from this point of view.

§ 27. Now we are prepared to remove Hume's doubt. He justly maintains that we cannot comprehend by reason the possibility of causality, that is, of the reference of the existence of one thing to the existence of another which is necessitated by the former. I add that we comprehend just as little the concept of subsistence, that is, the necessity that at the foundation of the existence of things there lies a subject which cannot itself be a predicate of any other thing; nay, we cannot even form a concept of the possibility of such a thing (though we can point out examples of its use in experience). The very same incomprehensibility affects the community of things, as we cannot comprehend how from the state of one thing an inference to the state of quite another thing beyond it, and *vice versa*, can be drawn, and how substances which have each their own separate existence should depend upon one another necessarily. But I am very [311] far from holding these concepts to be derived merely from experience, and the necessity represented in them to be fictitious and a mere illusion produced in us by long habit. On the contrary, I have amply shown that they and the principles derived from them are firmly established *a priori* before all experience and have their undoubted objective rightness, though only with regard to experience.

§ 28. Though I have no conception of such a connection of things in themselves, how they can either exist as substances, or act as causes, or stand in community with others (as parts of a real whole) and I can just as little think such properties in appearances as such (because those concepts contain nothing that lies in the appearances, but only what the understanding alone must think), we have yet a concept of such a connection of representations in our understanding and in judgments generally. This is the concept that representations belong in one sort of judgments as subject in relation to predicates; in another as ground in relation to consequent; and, in a third, as parts which constitute together a total possible cognition. Further we know *a priori* that without considering the representation of an object as determined with regard to one or the other of these moments, we can have no valid cognition of the object; and, if we should occupy ourselves with the object in itself, there is not a single possible attribute by which I could know that it is determined with regard to one or the other of these moments, that is, belonged under the concept of substance, or of cause, or (in relation to other substances) of community, for I have no conception of the possibility of such a connection of existence. But the question is not how things in themselves but how the empirical cognition of things is determined, as regards the above moments of judgments in general, that is, how things, as objects of experience, can and must be subsumed under these concepts of the understanding. And then it is clear that I completely comprehend, not only the possibility, but also the necessity, of subsuming all appearances under these concepts, that is, of using them as principles of the possibility of experience.

[312] § 29. In order to put to a test Hume's problematic concept (his *crux metaphysicorum*), the concept of cause, we have, in the first place, given *a priori* by means of logic the form of a conditional judgment in general, i.e., we have one given cognition as antecedent and another as consequent. But it is possible that in perception we may meet with a rule of relation which runs thus: that a certain appearance is constantly followed by another (though not conversely); and this is a case for me to use the hypothetical judgment and, for instance, to say that if the sun shines long enough upon a body it grows warm. Here there is indeed as yet no necessity of connection, or concept of cause. But I proceed and say that if this proposition, which is merely a subjective connection of perceptions, is to be a judgment of experience, it must be regarded as necessary and universally valid. Such a proposition would be that the sun is by its light the cause of heat. The empirical rule is now considered as a law, and as valid not merely of appearances but valid of them for the purposes of a possible experience which requires universal and therefore necessarily valid rules. I therefore easily comprehend the concept of cause as a concept necessarily belonging to the mere form of experience, and its possibility as a synthetic unification of perceptions in a consciousness in general; but I do not at all comprehend the possibility of a thing in general as a cause, inasmuch as the concept of cause denotes a condition not at all belonging to things, but to experience. For experience can only be an objectively valid cognition of appearances and of their succession, only so far as the antecedent appearances can be conjoined with the consequent ones according to the rule of hypothetical judgments.

§ 30. Hence if the pure concepts of the understanding try to go beyond objects of experience and be referred to things in themselves (*noumena*), they have no meaning whatever. They serve, as it were, only to spell out appearances, so that we may be able to read them as experience. The principles which arise from their reference to the sensible world only serve [313] our understanding for use in experience. Beyond this they are arbitrary combinations without objective reality; and we can neither cognize their possibility *a priori*, nor verify their reference to objects, let alone make such reference understandable, by any example, because examples can only be borrowed from some possible experience, and consequently the objects of these concepts can be found nowhere but in a possible experience.

This complete (though to its originator unexpected) solution of Hume's problem rescues for the pure

concepts of the understanding their *a priori* origin and for the universal laws of nature their validity as laws of the understanding, yet in such a way as to limit their use to experience, because their possibility depends solely on the reference of the understanding to experience, but with a completely reversed mode of connection which never occurred to Hume: they are not derived from experience, but experience is derived from them.

This is, therefore, the result of all our foregoing inquiries: “All synthetic principles *a priori* are nothing more than principles of possible experience” and can never be referred to things in themselves, but only to appearances as objects of experience. And hence pure mathematics as well as pure natural science can never be referred to anything more than mere appearances, and can only represent either that which makes experience in general possible, or else that which, as it is derived from these principles, must always be capable of being represented in some possible experience.

§ 31. And thus we have at last something determinate upon which to depend in all metaphysical enterprises, which have hitherto, boldly enough but always at random, attempted everything without discrimination. That the goal of their exertions should be set up so close struck neither the dogmatic thinkers nor those who, confident in their supposed sound common sense, started with concepts and principles of pure reason (which were legitimate and natural, but destined [314] for mere empirical use) in search of insights for which they neither knew nor could know any determinate bounds, because they had never reflected nor were able to reflect on the nature or even on the possibility of such a pure understanding.

Many a naturalist of pure reason (by which I mean the man who believes he can decide in matters of metaphysics without any science) may pretend that he, long ago, by the prophetic spirit of his sound sense, not only suspected but knew and comprehended what is here propounded with so much ado, or, if he likes, with prolix and pedantic pomp: “that with all our reason we can never reach beyond the field of experience.” But when he is questioned about his rational principles individually, he must grant that there are many of them which he has not taken from experience and which are therefore independent of it and valid *a priori*. How then and on what grounds will he restrain both himself and the dogmatist, who makes use of these concepts and principles beyond all possible experience because they are recognized to be independent of it? And even he, this adept in sound sense, in spite of all his assumed and cheaply acquired wisdom, is not exempt from wandering inadvertently beyond objects of experience into the field of chimeras. He is often deeply enough involved in them, though in announcing everything as mere probability, rational conjecture, or analogy, he gives by his popular language a color to his groundless pretensions.

§ 32. Since the oldest days of philosophy, inquirers into pure reason have thought that, besides the things of sense, or appearances (*phenomena*), which make up the sensible world, there were certain beings of the understanding (*noumena*), which should constitute an intelligible world. And as appearance and illusion were by those men identified (a thing which we may well excuse in an undeveloped epoch) actuality was only conceded to the beings of the understanding.

And we indeed, rightly considering objects of sense as mere appearances, confess thereby that they [315] are based upon a thing in itself, though we know not this thing as it is in itself but only know its appearances, viz., the way in which our senses are affected by this unknown something. The understanding therefore, by assuming appearances, grants also the existence of things in themselves, and thus far we may say that the representation of such things as are the basis of appearances, consequently of mere beings of the understanding, is not only admissible but unavoidable.

Our critical deduction by no means excludes things of that sort (*noumena*), but rather limits the principles of the Aesthetic²² in such a way that they shall not extend to all things (as everything would then be turned into mere appearance) but that they shall hold good only of objects of possible experience. Hereby, then, beings of the understanding are admitted, but with the inculcation of this rule which admits of no exception: that we neither know nor can know anything determinate whatever about these pure beings of the understanding, because our pure concepts of the understanding as well as our pure intuitions extend to nothing but objects of possible experience, consequently to mere things of sense; and as soon as we leave this sphere, these concepts retain no meaning whatever.

§ 33. There is indeed something seductive in our pure concepts of the understanding which tempts us to a transcendent use—a use which transcends all possible experience. Not only are our concepts of substance, of power, of action, of reality, and others, quite independent of experience, containing nothing of sense appearance, and so apparently applicable to things in themselves (*noumena*), but, what strengthens this conjecture, they contain a necessity of determination in themselves, which experience never attains. The concept of cause contains a rule according to which one state follows another necessarily; but experience can only show us that one state of things often or, at most, commonly follows another, and therefore affords

neither strict universality nor necessity.

Hence concepts of the understanding seem to have a deeper meaning and content than can be exhausted by their merely empirical use, and so the understanding [316] inadvertently adds for itself to the house of experience a much more extensive wing which it fills with nothing but beings of thought, without ever observing that it has transgressed with its otherwise legitimate concepts the bounds of their use.

§ 34. Two important and even indispensable, though very dry, investigations therefore became indispensable in the *Critique of Pure Reason* [viz., the two chapters “The Schematism of the Pure Concepts of the Understanding” and “The Ground of the Distinction of All Objects in General into Phenomena and Noumena”]. In the former there is shown that the senses furnish, not the pure concepts of the understanding *in concreto*, but only the schema for their use, and that the object conformable to it occurs only in experience (as the product of the understanding from materials of sensibility). In the latter there is shown that, although our pure concepts of the understanding and our principles are independent of experience, and despite the apparently greater sphere of their use, still nothing whatever can be thought by them beyond the field of experience, because they can do nothing but merely determine the logical form of the judgment with regard to given intuitions. But as there is no intuition at all beyond the field of sensibility, these pure concepts, since they cannot possibly be exhibited *in concreto*, are void of all meaning; consequently all these *noumena*, together with their sum total, the intelligible world,²³ are nothing but representations of a problem, the object of which in itself is quite possible but the solution, from the nature of our understanding, totally impossible. For our understanding is not a faculty of intuition but of the connection of given intuitions in an experience. Experience must therefore contain all the objects for our [317] concepts; but beyond it no concepts have any meaning, since no intuition can be subsumed under them.

§ 35. The imagination may perhaps be forgiven for occasional vagaries and for not keeping carefully within the limits of experience, since it gains life and vigor by such flights and since it is always easier to moderate its boldness than to stimulate its languor. But the understanding which ought to *think* can never be forgiven for indulging in vagaries; for we depend upon it alone for assistance to set bounds, when necessary, to the vagaries of the imagination.

But the understanding begins its aberrations very innocently and modestly. It first discerns the elementary cognitions which inhere in it prior to all experience, but yet must always have their application in experience. It gradually drops these limits; and what is there to prevent it, inasmuch as it has quite freely derived its principles from itself? And then it proceeds first to newly thought out forces in nature, then to beings outside nature—in short, to a world for whose construction the materials cannot be wanting, because fertile fiction furnishes them abundantly, and though not confirmed is yet never refuted by experience. This is the reason why young thinkers are so partial to metaphysics in the truly dogmatical manner, and often sacrifice to it their time and their talents, which might be otherwise better employed.

But there is no use in trying to moderate these fruitless endeavors of pure reason by all manner of cautions as to the difficulties of solving questions so occult, by complaints of the limits of our reason, and by degrading our assertions into mere conjectures. For if their impossibility is not distinctly shown, and reason’s knowledge of itself does not become a true science, in which the field of its right use is distinguished, so to say, with geometrical certainty from that of its worthless and idle use, these fruitless efforts will never be entirely abandoned.

§ 36. *How is nature itself possible?* This question— [318] the highest point that transcendental philosophy can ever reach, and to which, as its boundary and completion, it must proceed—properly contains two questions.

FIRST: How is nature possible in general in the *material* sense, i.e., according to intuition, as the totality of appearances; how are space, time, and that which fills both — the object of sensation — possible in general? The answer is: by means of the constitution of our sensibility, according to which it is in its special way affected by objects which are in themselves unknown to it and totally distinct from those appearances. This answer is given in the *Critique* itself in the Transcendental Aesthetic, and in these *Prolegomena* by the solution of the first main question.

SECONDLY: How is nature possible in the *formal* sense, as the totality of the rules under which all appearances must come in order to be thought as connected in an experience? The answer must be this: it is only possible by means of the constitution of our understanding, according to which all those representations of sensibility are necessarily referred to a consciousness, and by which the peculiar way in which we think (viz., by rules) and hence experience also are possible, but must be clearly distinguished from an insight into the objects in themselves. This answer is given in the *Critique* itself in the Transcendental Logic, and in these

Prolegomena in the course of the solution of the second main question.

But how this peculiar property of our sensibility itself is possible, or that of our understanding and of the apperception which is necessarily its basis and also that of all thinking, cannot be further analyzed or answered, because it is of them that we are in need for all our answers and for all our thinking about objects.

There are many laws of nature which we can only know by means of experience; but conformity to law [319] in the connection of appearances, i.e., nature in general, we cannot discover by any experience, because experience itself requires laws which are *a priori* at the basis of its possibility.

The possibility of experience in general is therefore at the same time the universal law of nature, and the principles of experience are the very laws of nature. For we know nature as nothing but the totality of appearances, i.e., of representations in us; and hence we can only derive the law of their connection from the principles of their connection in us, that is, from the conditions of their necessary unification in a consciousness, which constitutes the possibility of experience.

Even the main proposition expounded throughout this section — that universal laws of nature can be cognized *a priori*—leads of itself to the proposition that the highest legislation of nature must lie in ourselves, i.e., in our understanding; and that we must not seek the universal laws of nature in nature by means of experience, but conversely must seek nature, as to its universal conformity to law, in the conditions of the possibility of experience, which lie in our sensibility and in our understanding. For how would it otherwise be possible to know *a priori* these laws, as they are not rules of analytic cognition but truly synthetic extensions of it? Such a necessary agreement of the principles of possible experience with the laws of the possibility of nature can only proceed from one of two reasons: either these laws are drawn from nature by means of experience, or conversely nature is derived from the laws of the possibility of experience in general and is quite the same as the mere universal conformity to law of the latter. The former is self-contradictory, for the universal laws of nature can and must be cognized *a priori* (that is, independent of all experience) and be the foundation of all empirical use of the understanding; the latter alternative therefore alone remains.²⁴

But we must distinguish the empirical laws of nature, which always presuppose particular perceptions, [320] from the pure or universal laws of nature, which, without being based on particular perceptions, contain merely the conditions of their necessary unification in experience. With regard to the latter, nature and possible experience are quite the same, and as the conformity to law in the latter depends upon the necessary connection of appearances in experience (without which we cannot cognize any object whatever in the sensible world), consequently upon the original laws of the understanding, it seems at first strange, but is not the less certain, to say: *the understanding does not derive its laws (a priori) from, but prescribes them to, nature.*

§ 37. We shall illustrate this seemingly bold proposition by an example, which will show that laws which we discover in objects of sensuous intuition (especially when these laws are cognized as necessary) are already held by us to be such as have been placed there by the understanding, in spite of their being similar in all points to the laws of nature which we ascribe to experience.

§ 38. If we consider the properties of the circle, by which this figure at once combines into a universal rule so many arbitrary determinations of the space in it, we cannot avoid attributing a nature to this geometrical thing. Two lines, for example, which intersect each other and the circle, however they may be drawn, are always divided so that the rectangle constructed with the segments of the one is equal to that constructed with the segments of the other. The question now is: Does this law lie in the circle or in the understanding? That is, does this figure, independently of the understanding, contain in itself the ground of the law; or does the understanding, having [321] constructed according to its concepts (of the equality of the radii) the figure itself, introduce into it this law of the chords intersecting in geometrical proportion? When we follow the proofs of this law, we soon perceive that it can only be derived from the condition on which the understanding founds the construction of this figure, viz., the equality of the radii. But if we enlarge this concept to pursue further the unity of manifold properties of geometrical figures under common laws and consider the circle as a conic section, which of course is subject to the same fundamental conditions of construction as other conic sections, we shall find that all the chords which intersect within the circle, ellipse, parabola, and hyperbola always intersect so that the rectangles of their segments are not indeed equal but always bear a constant ratio to one another. If we proceed still further to the fundamental doctrines of physical astronomy, we find a physical law of reciprocal attraction extending over the whole material nature, the rule of which is that it decreases inversely as the square of the distance from each attracting point, just as the spherical surfaces through which this force diffuses itself increase; and this law seems to be necessarily inherent in the very nature of things, so that it is usually propounded as cognizable *a priori*. Simple as the sources of this law are, merely resting upon the relation of spherical surfaces of different radii, its consequence is so excellent with

regard to the variety and regularity of its agreement that not only are all possible orbits of the celestial bodies conic sections, but such a relation of these orbits to each other results that no other law of attraction than that of the inverse square of the distance can be thought as fit for a cosmical system.

Here, accordingly, is nature resting on laws which the understanding cognizes *a priori*, and chiefly from universal principles of the determination of space. Now I ask: do the laws of nature lie in space, and does the understanding learn them by merely endeavoring to find out the enormous wealth of meaning that lies in space; or do they inhere in the understanding and in the way in which it determines space according to the conditions of the synthetic unity in which its concepts are all centered? Space is something so uniform and as to all particular properties so indeterminate that we should certainly not seek a store of laws of nature in it. Whereas that which determines space [322] to assume the form of a circle, or the figures of a cone and a sphere is the understanding, so far as it contains the ground of the unity of their constructions. The mere universal form of intuition, called space, must therefore be the substratum of all intuitions determinable to particular objects; and in it, of course, the condition of the possibility and of the variety of these intuitions lies. But the unity of the objects is entirely determined by the understanding, and according to conditions which lie in its own nature; and thus the understanding is the origin of the universal order of nature, in that it comprehends all appearances under its own laws and thereby brings about, in an *a priori* way, experience (as to its form), by means of which whatever is to be cognized only by experience is necessarily subjected to its laws. For we are not concerned with the nature of things in themselves, which is independent of the conditions both of our sensibility and our understanding, but with nature as an object of possible experience; and in this case the understanding, because it makes experience possible, thereby insists that the sensuous world is either not an object of experience at all, or else is nature.

APPENDIX TO PURE NATURAL SCIENCE

§ 39. *Of the system of the categories.* There can be nothing more desirable to a philosopher than to be able to derive the scattered multiplicity of the concepts or the principles which had occurred to him in concrete use from a principle *a priori*, and to unite everything in this way in one cognition. He formerly only believed that those things which remained after a certain abstraction, and seemed by comparison among one another to constitute a particular kind of cognitions, were completely collected; but this was only an *aggregate*. Now he knows that just so many, neither more nor less, can constitute this kind of cognition, and perceives the necessity of his division; this constitutes comprehension. And only now has he attained a *system*.

To search in our ordinary knowledge for the concepts which do not rest upon particular experience and yet occur in all knowledge from experience, [323] of which they constitute as it were the mere form of connection, presupposes neither greater reflection nor deeper insight than to detect in a language the rules of the actual use of words generally and thus to collect elements for a grammar (in fact both inquiries are very closely related), even though we are not able to give a reason why each language has just this and no other formal constitution, and still less why exactly so many, neither more nor less, of such formal determinations in general can be found in it.

Aristotle collected ten pure elementary concepts under the name of categories.²⁵ To these, which were also called predicaments, he found himself obliged afterward to add five post-predicaments,²⁶ some of which however (*prius*, *simul*, and *motus*) are contained in the former; but this rhapsody must be considered (and commended) as a mere hint for future inquiries, not as a regularly worked out idea, and hence it has, in the present more advanced state of philosophy, been rejected as quite useless.

After long reflection on the pure elements of human knowledge (those which contain nothing empirical), I at last succeeded in distinguishing with certainty and in separating the pure elementary concepts of sensibility (space and time) from those of the understanding. Thus the 7th, 8th, and 9th categories had to be excluded from the old list. And the others were of no service to me because there was no principle on which the understanding could be fully mapped out and all the functions, whence its pure concepts arise, determined exhaustively and with precision.

But in order to discover such a principle, I looked about for an act of the understanding which comprises all the rest and is differentiated only by various modifications or moments, in bringing the manifold of representation under the unity of thinking in general. I found this act of the understanding to consist in judging. Here, then, the labors of the logicians were ready at hand, though not yet quite free from defects; and with this help I was enabled to exhibit a complete table of the pure functions of the understanding, [324] which were however undetermined in regard to any object. I finally referred these functions of judging to objects in general, or rather to the condition of determining judgments as objectively valid; and so there arose

the pure concepts of the understanding, concerning which I could make certain that these, and this exact number only, constitute our whole cognition of things from pure understanding. I was justified in calling them by their old name of *categories*, while I reserved for myself the liberty of adding, under the title of *predicables*, a complete list of all the concepts deducible from them by combinations, whether among themselves, or with the pure form of the appearance, i.e., space or time, or with its matter, so far as it is not yet empirically determined (viz., the object of sensation in general), as soon as a system of transcendental philosophy should be completed, with the construction of which I was engaged in the *Critique of Pure Reason* itself.

Now the essential point in this system of categories, which distinguishes it from the old rhapsody (which proceeded without any principle) and for which point alone this system deserves to be considered as philosophy, consists in this: that, by means of it, the true meaning of the pure concepts of the understanding and the condition of their use could be exactly determined. For here it became obvious that they are themselves nothing but logical functions, and as such do not constitute the least concept of an object in itself, but require some sensuous intuitions as a basis. These concepts, therefore, only serve to determine empirical judgments (which are otherwise undetermined and indifferent with respect to all functions of judging) as regards these functions, thereby procuring them universal validity, and by means of them, making judgments of experience in general possible.

Such an insight into the nature of the categories, which limits them at the same time to use merely in experience, never occurred either to their first author, or to any of his successors; but without this insight (which exactly depends upon their derivation or deduction), they are quite useless and only a miserable list of names, without explanation or rule for their use. Had the ancients ever conceived such a notion, doubtless the whole study of pure rational knowledge, [325] which under the name of metaphysics has for centuries spoiled many a sound mind, would have reached us in quite another shape and would have enlightened the human understanding instead of actually exhausting it in obscure and vain subtleties and rendering it useless for true science.

This system of categories makes all treatment of every object of pure reason itself systematic, and affords a direction or clue how and through what points of inquiry any metaphysical consideration must proceed in order to be complete; for it exhausts all the moments of the understanding, under which every other concept must be brought. In like manner the table of principles has been formulated, the completeness of which we can only vouch for by the system of the categories. Even in the division of the concepts which are to go beyond the physiological application of the understanding,²⁷ it is still the same clue, which, as it must always be determined *a priori* by the same fixed points of the human understanding, always forms a closed circle. There is no doubt that the object of a pure concept, either of the understanding or of reason, so far as it is to be estimated philosophically and on *a priori* principles, can in this way be completely cognized. I could not therefore omit to make use of this clue with regard to one of the most abstract ontological divisions, viz., the various distinctions of the concepts of something and of nothing, and to construct accordingly²⁸ a regular and necessary table of their divisions.²⁹

And this system, like every other true one founded on a universal principle, shows its inestimable usefulness [326] in that it excludes all foreign concepts which might otherwise intrude among the pure concepts of the understanding, and determines the place of every cognition. Those concepts, which under the name of *concepts of reflection* have been likewise arranged in a table according to the clue of the categories, intrude into ontology without having any privilege or legitimate claim to be among the pure concepts of the understanding. The latter are concepts of connection, and thereby of the objects themselves, whereas the former are only concepts of a mere comparison of concepts already given, and therefore are of quite another nature and use. By my systematic division³⁰ they are saved from this confusion. But the utility of this separate table of the categories will be still more obvious when, as will soon happen, we separate the table of the transcendental concepts of reason from the concepts of the understanding. The concepts of reason being of quite another nature and origin, their table must have quite another form from that of the concepts of understanding. This so necessary separation has never yet been made in any system of metaphysics, where as a rule, these ideas of reason are all mixed up with the concepts of the understanding, like children belonging to one family—a confusion that was unavoidable in the absence of a definite system of categories.

6. It is unavoidable that as knowledge advances certain expressions which have become classical after having been used since the infancy of science will be found inadequate and unsuitable, and a newer and more appropriate application of the terms will give rise to confusion. [This is the case with the term "analytic."] The analytical method, insofar as it is opposed to the synthetical, is very different from an aggregate of analytic propositions. It signifies only that we start from what is sought, as if it were given, and ascend to the only conditions under which it is possible. In this method we often use nothing but synthetic propositions, as in mathematical analysis, and it were better to term it the regressive method, in contradistinction to the synthetic or progressive. A principal part of logic too is distinguished by the name of analytic, which here signifies the logic of truth in contrast to dialectic, without considering whether the cognitions belonging to it are analytic or synthetic.

8. [See *Critique of Pure Reason*, B 741.]
9. [Contained in Kant's *Metaphysical Foundations of Natural Science* (1786).]
10. [Rather than intuitive principles, like mathematics.]
11. I freely grant that these examples do not represent such judgments of perception as ever could become judgments of experience, even though a concept of the understanding were superadded, because they refer merely to feeling, which everybody knows to be merely subjective and which, of course, can never be attributed to the object and, consequently, never can become objective. I only wished to give here an example of a judgment that is merely subjectively valid, containing no ground for necessary universal validity and thereby for a relation to the object. An example of the judgments of perception which become judgments of experience by superadded concepts of the understanding will be given in the next note.]
12. As an easier example, we may take the following: when the sun shines on the stone, it grows warm. This judgment, however often I and others may have perceived it, is a mere judgment of perception and contains no necessity; perceptions are only usually conjoined in this manner. But if I say: the sun warms the stone, I add to the perception a concept of the understanding, viz., that of cause, which necessarily connects with the concept of sunshine that of heat, and the synthetic judgment becomes of necessity universally valid, viz., objective, and is converted from a perception into experience.
13. This name seems preferable to the term *particularia*, which is used for these judgments in logic. For the latter already contains the thought that they are not universal. But when I start from unity (in singular judgments) and proceed to totality, I must not [even indirectly and negatively] include any reference to totality. I think plurality merely without totality, and not the exclusion of totality. This is necessary, if the logical moments are to underlie the pure concepts of the understanding. In logical usage one may leave things as they were.
14. [See last sentence of § 23.]
15. But how does the proposition that judgments of experience contain necessity in the synthesis of perceptions agree with my statement so often before inculcated that experience, as cognition *a posteriori*, can afford contingent judgments only? When I say that experience teaches me something, I mean only the perception that lies in experience—for example, that heat always follows the shining of the sun on a stone; consequently, the proposition of experience is always so far contingent. That this heat necessarily follows the shining of the sun is contained indeed in the judgment of experience (by means of the concept of cause), yet is a fact not learned by experience; for, conversely, experience is first of all generated by this addition of the concept of the understanding (of cause) to perception. How perception attains this addition may be seen by referring in the *Critique* itself to the section on the transcendental faculty of judgment, B 176 *et seq.*
16. The three following paragraphs will hardly be understood unless reference be made to what the *Critique* itself says on the subject of the principles; they will, however, be of service in giving a general view of the principles, and in fixing the attention on the main moments. [See *Critique*, B 187–294.]
17. [The Axioms of Intuition. See *Critique*, B 202–207.]
18. [The Anticipations of Perception. See *ibid.*, B 207–218.]

20. [The Postulates of Empirical Thought. See *ibid.*, B 265–294.]
21. Heat and light are in a small space just as large, as to degree, as in a large one; in like manner the internal representations, pain,

consciousness in general, whether they last a short or a long time, need not vary as to the degree. Hence the quantity is here in a point and in a moment just as great as in any space or time, however great. Degrees are thus quantities not in intuition but in mere sensation (or the quantity of the content of an intuition). Hence they can only be estimated quantitatively by the relation of 1 to 0, viz., by their capability of decreasing by infinite intermediate degrees to disappearance, or of increasing from naught through infinite gradations to a determinate sensation in a certain time. *Quantitas qualitatis est gradus* [the quantity of quality is degree].

22. [The principles of sensibility (space and time). See *Critique of Pure Reason*, B33–B 73.]

23. We speak of the “intelligible world,” not (as the usual expression is) “intellectual world.” For cognitions are intellectual through the understanding and refer to our world of sense also, but objects, insofar as they can be represented merely by the understanding, and to which none of our sensible intuitions can refer, are termed “intelligible.” But as some possible intuition must correspond to every object, we would have to think an understanding that intuits things immediately; but of such we have not the least concept, nor of beings of the understanding to which it should be applied.

24. Crusius alone thought of a compromise: that a spirit who can neither err nor deceive implanted these laws in us originally. But since false principles often intrude themselves, as indeed the very system of this man shows in not a few examples, we are involved in difficulties as to the use of such a principle in the absence of sure criteria to distinguish the genuine origin from the spurious, for we never can know certainly what the spirit of truth or the father of lies may have instilled into us.

25. 1. *Substantia*. 2. *Qualitas*. 3. *Quantitas*. 4. *Relatio*. 5. *Actio*. 6. *Passio*. 7. *Quando*. 8. *Ubi*. 9. *Situs*. 10. *Habitus*.

27. [Cf. *Critique of Pure Reason*, B 402 and B 442–443.]

28. [Cf. *ibid.* B 348.]

29. On the table of the categories many neat observations may be made, for instance: (1) that the third arises from the first and the second, joined in one concept; (2) that in those of quantity and of quality there is merely a progress from unity to totality or from something to nothing (for this purpose the categories of quality must stand thus: reality, limitation, total negation), without *correlata* or *opposita*, whereas those of relation and of modality have them; (3) that, as in logic categorical judgments are the basis of all others, so the category of substance is the basis of all concepts of actual things; (4) that, as modality in a judgment is not a distinct predicate, so by the modal concepts a determination is not superadded to things, etc. Such observations are of great use. If we, besides, enumerate all the predicables, which we can find pretty completely in any good ontology (for example, Baumgarten’s), and arrange them in classes under the categories, in which operation we must not neglect to add as complete a dissection of all these concepts as possible, there will then arise a merely analytic part of metaphysics, which does not contain a single synthetic proposition and might precede the second (the synthetic), and would, by its precision and completeness, be not only useful, but, in virtue of its system, be even to some extent elegant.

30. [See *Critique of Pure Reason*, B 316.]

THIRD PART OF THE MAIN [327] TRANSCENDENTAL QUESTION

How Is Metaphysics in General Possible?

§ 40. Pure mathematics and pure natural science had no need for such a deduction (as has been made for both) for the sake of their own safety and certainty. For the former rests upon its own evidence, and the latter (though sprung from pure sources of the understanding) upon experience and its thorough confirmation. Pure natural science cannot altogether refuse and dispense with the testimony of experience; hence with all its certainty it can never, as philosophy, rival mathematics. Both sciences therefore stood in need of this inquiry, not for themselves, but for the sake of another science, namely, metaphysics.

Metaphysics has to do not only with concepts of nature, which always find their application in experience, but also with pure rational concepts, which never can be given in any possible experience whatsoever. Consequently, the objective reality of these concepts (viz., that they are not mere chimeras) and also the truth or falsity of metaphysical assertions cannot be discovered or confirmed by any experience. This part of metaphysics, however, is precisely what constitutes its essential end, to which the rest is only a means, and thus this science is in need of such a deduction for its own sake. The third question now proposed relates therefore, as it were, to the root and peculiarity of metaphysics, i.e., the occupation of reason merely with itself and the supposed knowledge of objects arising immediately from this brooding over its own concepts, without requiring experience or indeed being able to reach that knowledge through experience.³¹

Without solving this question, reason will never be satisfied. The empirical use to which reason limits the pure understanding does not fully satisfy reason's own [328] proper destination. Every single experience is only a part of the whole sphere of its domain, but the absolute totality of all possible experience is itself not experience. Yet it is a necessary problem for reason, the mere representation of which requires concepts quite different from other pure concepts of the understanding, whose use is only immanent, i.e., refers to experience so far as it can be given. Whereas the concepts of reason aim at the completeness, i.e., the collective unity of all possible experience, and thereby go beyond every given experience. Thus they become *transcendent*.

As the understanding stands in need of categories for experience, reason contains in itself the ground of ideas, by which I mean necessary concepts whose object *cannot* be given in any experience. The latter are inherent in the nature of reason, as the former are in that of the understanding. While the ideas carry with them an illusion likely to mislead, this illusion is unavoidable though it certainly can be kept from misleading us.

Since all illusion consists in holding the subjective ground of our judgments to be objective, a self-knowledge of pure reason in its transcendent (hyperbolic) use is the only safeguard against the aberrations into which reason falls when it mistakes its destination, and transcendently refers to the object in itself that which only concerns reason's own subject and its guidance in all immanent use.

§ 41. The distinction of *ideas*, i.e., of pure concepts of reason, from the categories, or pure concepts of the understanding, as cognitions of a quite different species, origin, and use is so important a point in founding a science which is to contain the system of [329] all these *a priori* cognitions that, without this distinction, metaphysics is absolutely impossible or is at best a random, bungling attempt to build a castle in the air without a knowledge of the materials or of their fitness for one purpose or another. Had the *Critique of Pure Reason* done nothing but first point out this distinction, it would thereby have contributed more to clear up our conception of, and to guide our inquiry in, the field of metaphysics than all the vain efforts which have hitherto been made to satisfy the transcendent problems of pure reason; for one never even suspected that he was in quite another field from that of the understanding, and hence that he was classing concepts of the understanding and those of reason together, as if they were of the same kind.

§ 42. All pure cognitions of the understanding have the feature that the concepts can be given in experience, and the principles can be confirmed by it; whereas the transcendent cognitions of reason cannot either, as ideas, be given in experience or, as propositions, ever be confirmed or refuted by it. Hence whatever errors may slip in unawares can only be discovered by pure reason itself—a discovery of much difficulty, because this very reason naturally becomes dialectical by means of its ideas; and this unavoidable illusion cannot be limited by any objective and dogmatic inquiries into things, but only by a subjective investigation of reason itself as a source of ideas.

§ 43. In the *Critique of Pure Reason* it was always my greatest care to endeavor, not only carefully to distinguish the several kinds of cognition, but to derive concepts belonging to each one of them from their common source. I did this in order that by knowing whence they originated, I might determine their use with safety and also have the invaluable, but never previously anticipated, advantage of knowing the [330] completeness of my enumeration, classification, and specification of concepts *a priori*, and of knowing it according to principles. Without this, metaphysics is mere rhapsody, in which no one knows whether he has enough or whether and where something is still wanting. We can indeed have this advantage only in pure philosophy, but of this philosophy it constitutes the very essence.

As I had found the origin of the categories in the four logical functions of all judgments of the understanding, it was quite natural to seek the origin of the ideas in the three functions of syllogisms. For as soon as these pure concepts of reason (the transcendental ideas) are given, they could hardly, except they be held innate, be found anywhere else than in the same activity of reason, which, so far as it regards mere form, constitutes the logical element of syllogisms; but, so far as it represents judgments of the understanding as determined with respect to one or another form *a priori*, constitutes transcendental concepts of pure reason.

The formal difference of syllogisms makes their division into categorical, hypothetical, and disjunctive necessary. The concepts of reason founded on them contain therefore, first, the idea of the complete subject (the substantial); secondly, the idea of the complete series of conditions; thirdly, the determination of all concepts in the idea of a complete complex of that which is possible.³² The first idea is psychological, the second cosmological, the third theological; and, as all three give occasion to dialectic, yet each in its own way, the division of the whole dialectic of pure reason into its paralogism, its antimony, and its ideal was arranged accordingly. Through this derivation we may feel assured that all the claims of pure reason are completely represented and that none can be wanting, because the faculty of reason itself, whence they all take their origin, is thereby completely surveyed.

§ 44. In these general considerations it is also remarkable that the ideas of reason, unlike the categories, [331] are of no service to the use of our understanding in experience, but quite dispensable, and become even an impediment to the maxims of a rational cognition of nature. Yet in another aspect still to be determined they are necessary. Whether the soul is or is not a simple substance is of no consequence to us in the explanation of its phenomena. For we cannot render the concept of a simple being understandable sensuously and concretely by any possible experience. The concept is therefore quite void as regards all hoped-for insight into the cause of appearances and cannot at all serve as a principle of the explanation of that which internal or external experience supplies. Likewise the cosmological ideas of the beginning of the world or of its eternity (*a parte ante*) cannot be of any service to us for the explanation of any event in the world itself. And finally we must, according to a right maxim of the philosophy of nature, refrain from all explanation of the design of nature as being drawn from the will of a Supreme Being, because this would not be natural philosophy but an admission that we have come to the end of it. The use of these ideas, therefore, is quite different from that of those categories by which (and by the principles built upon which) experience itself first becomes possible. But our laborious analytic of the understanding would be superfluous if we had nothing else in view than the mere cognition of nature as it can be given in experience; for reason does its work, both in mathematics and in natural science, quite safely and well without any of this subtle deduction. Therefore our critique of the understanding combines with the ideas of pure reason for a purpose which lies beyond the empirical use of the understanding; but we have above declared the use of the understanding in this respect to be totally inadmissible and without any object or meaning. Yet there must be a harmony between the nature of reason and that of the understanding, and the former must contribute to the perfection of the latter and cannot possibly upset it.

The solution of this question is as follows. Pure reason [332] does not in its ideas point to particular objects which lie beyond the field of experience, but only requires completeness of the use of the understanding in the complex of experience. But this completeness can be a completeness of principles only, not of intuitions and of objects. In order, however, to represent the ideas definitely, reason conceives them after the fashion of the cognition of an object. This cognition is, as far as these rules are concerned, completely determined; but the object is only an idea invented for the purpose of bringing the cognition of the understanding as near as possible to the completeness indicated by that idea.

PREFATORY REMARK TO THE DIALECTIC OF PURE REASON

§ 45. We have above shown in §§ 33 and 34 that the purity of the categories from all admixture of sensuous determinations may mislead reason into extending their use beyond all experience to things in themselves; for

though these categories themselves find no intuition which can give them meaning or sense *in concreto*, they, as mere logical functions, can represent a thing in general, but not give by themselves alone a determinate concept of anything. Such hyperbolic objects are distinguished by the appellation of *noumena*, or pure beings of the understanding (or better, beings of thought)—such as, for example, “substance,” but conceived without permanence in time; or “cause,” but not acting in time, etc. Here predicates that only serve to make the conformity-to-law of experience possible are applied to these concepts, and yet they are deprived of all the conditions of intuition on which alone experience is possible, and so these concepts lose all significance.

There is no danger, however, of the understanding spontaneously making an excursion so very wantonly beyond its own bounds into the field of the mere beings of thought, unless being impelled by alien laws. But when reason, which cannot be fully satisfied with any empirical use of the rules of the understanding, as being always conditioned, requires a completion of this chain of conditions, then the understanding is forced out of its sphere. And then reason partly represents objects of experience in a series so extended that [333] no experience can grasp it, partly even (with a view to complete the series) it seeks entirely beyond experience *noumena*, to which it can attach that chain; and so, having at last escaped from the conditions of experience, reason makes its hold complete. These are then the transcendental ideas, which, (though in accord with the true but hidden ends of the natural determination of our reason) may aim, not at extravagant concepts, but at an unbounded extension of their empirical use, yet seduce the understanding by an unavoidable illusion to a transcendent use, which, though deceitful, cannot be restrained within the bounds of experience by any resolution, but only by scientific instruction and with much difficulty.

I. THE PSYCHOLOGICAL IDEAS³³

§ 46. People have long since observed that in all substances the subject proper, that which remains after all the accidents (as predicates) are abstracted, hence the substantial itself, remains unknown, and various complaints have been made concerning these limits to our insight. But it will be well to consider that the human understanding is not to be blamed for its inability to know the substance of things, i.e., to determine it by itself, but rather for demanding to cognize it determinately as though it were a given object, it being a mere idea. Pure reason requires us to seek for every predicate of a thing its own subject, and for this subject, which is itself necessarily nothing but a predicate, its subject, and so on indefinitely (or as far as we can reach). But hence it follows that we must not hold anything at which we can arrive to be an ultimate subject, and that substance itself never can be thought by our understanding, however deep we may penetrate, even if all nature were unveiled to us. For the specific nature of our understanding consists in thinking everything discursively, i.e., by concepts, and so by mere predicates, to which, therefore, the absolute subject must always be wanting. Hence all the real properties by which we cognize bodies are mere accidents, not even excepting impenetrability, which we can only represent to ourselves as the effect [334] of a force for which the subject is unknown to us.

Now we appear to have this substance in the consciousness of ourselves (in the thinking subject), and indeed in an immediate intuition; for all the predicates of an internal sense refer to the *ego*, as a subject, and I cannot conceive myself as the predicate of any other subject. Hence completeness in the reference of the given concepts as predicates to a subject—not merely an idea, but an object—that is, the *absolute subject* itself, seems to be given in experience. But this expectation is disappointed. For the ego is not a concept,³⁴ but only the indication of the object of the internal sense, so far as we cognize it by no further predicate. Consequently, it cannot be itself a predicate of any other thing; but just as little can it be a determinate concept of an absolute subject, but is, as in all other cases, only the reference of the internal phenomena to their unknown subject. Yet this idea (which serves very well as a regulative principle totally to destroy all materialistic explanations of the internal phenomena of the soul) occasions by a very natural misunderstanding a very specious argument, which infers the nature of the soul from this supposed cognition of the substance of our thinking being. This argument is specious insofar as the knowledge of this substance falls quite without the complex of experience.

§ 47. But though we may call this thinking self (the soul) substance, as being the ultimate subject of thinking which cannot be further represented as the predicate of another thing, it remains quite empty and inconsequential if permanence—the quality which renders the concept of substances in experience fruitful — cannot be proved of it.

But permanence can never be proved of the concept [335] of a substance as a thing in itself, but only for the purposes of experience. This is sufficiently shown by the first Analogy of Experience,³⁵ and whoever will not yield to this proof may try for himself whether he can succeed in proving, from the concept of a subject which does not exist itself as the predicate of another thing, that its existence is thoroughly permanent and

that it cannot either in itself or by any natural cause come into being or pass out of it. These synthetic *a priori* propositions can never be proved in themselves, but only in reference to things as objects of possible experience.

§ 48. If, therefore, from the concept of the soul as a substance we would infer its permanence, this can hold good as regards possible experience only, not of the soul as a thing in itself and beyond all possible experience. Now life is the subjective condition of all our possible experience; consequently we can only infer the permanence of the soul in life, for the death of man is the end of all the experience that concerns the soul as an object of experience, except the contrary be proved—which is the very question in hand. The permanence of the soul can therefore only be proved (and no one cares for that) during the life of man, but not, as we desire to do, after death. This is so because the concept of substance, insofar as it is to be considered as necessarily combined with the concept of permanence, can be so combined only according to the principles of possible experience, and therefore for the purposes of experience only.³⁶

§ 49. That there is something real outside us which [336] not only corresponds but must correspond to our external perceptions can likewise be proved to be, not a connection of things in themselves, but for the sake of experience. This means that there is something empirical, i.e., some appearance in space outside us, that admits of a satisfactory proof; for we have nothing to do with other objects than those which belong to possible experience, because objects which cannot be given us in any experience are nothing for us. Empirically outside me is that which is intuited in space; and space, together with all the appearances which it contains, belongs to the representations whose connection, according to laws of experience, proves their objective truth, just as the connection of the appearances of the internal sense proves the actuality of my soul (as an object of the internal sense). By means of external experience I am conscious of the actuality of bodies as external appearances in space, in the same manner as by means of internal experience I am conscious of the existence of my soul in time; but this soul is cognized only as an object of the internal sense by appearances that constitute an internal state and of which the being in itself, which forms the basis of these appearances, is unknown. Cartesian idealism therefore does nothing but distinguish external experience [337] from dreaming and the conformity to law (as a criterion of its truth) of the former from the irregularity and the false illusion of the latter. In both it presupposes space and time as conditions of the existence of objects, and it only inquires whether the objects of the external senses which we, when awake, put in space, are as actually to be found in it as the object of the internal sense, the soul, is in time; that is, whether experience carries with it sure criteria to distinguish it from imagination. This doubt, however, may easily be disposed of, and we always do so in common life by investigating the connection of appearances in both space and time according to universal laws of experience; and we cannot doubt, when the representation of external things throughout agrees therewith, that they constitute truthful experience. Material idealism, in which appearances are considered as such only according to their connection in experience may accordingly be very easily refuted; and it is just as sure an experience that bodies exist outside us (in space) as that I myself exist according to the representation of the internal sense (in time), for the concept “outside us” only signifies existence in space. However, as the ego in the proposition “I am” means not only the object of internal intuition (in time) but the subject of consciousness, just as body means not only external intuition (in space) but the thing in itself which is the basis of this appearance, then the question whether bodies (as appearances of the external sense) exist as bodies in nature apart from my thoughts may without any hesitation be denied. But the question whether I myself as an appearance of the internal sense (the soul according to empirical psychology) exist apart from my faculty of representation in time is an exactly similar question and must likewise be answered in the negative. And in this manner everything, when it is reduced to its true meaning, is decided and certain. The formal (which I have also called transcendental) actually abolishes the material, or Cartesian, idealism. For if space be nothing but a form of my sensibility, it is as a representation in me just as actual as I myself am, and nothing but the empirical truth of the appearances in it remains for consideration. But if this is not the case, if space and the appearances in it are something existing outside us, then all the criteria of experience outside our perception can never prove the actuality of these objects outside us.

II. THE COSMOLOGICAL IDEAS³⁷ [338]

§ 50. This product of pure reason in its transcendent use is its most remarkable phenomenon. It serves as a very powerful agent to rouse philosophy from its dogmatic slumber and to stimulate it to the arduous task of undertaking a criticism of reason itself.

I term this idea cosmological because it always takes its object only from the sensible world and does not need any other world than that whose object is given to sense; consequently, it remains in this respect in its

native home, does not become transcendent, and is therefore so far not an idea; whereas to conceive the soul as a simple substance, on the contrary, means to conceive such an object (the simple) as cannot be presented to the senses. Notwithstanding, the cosmological idea extends the connection of the conditioned with its condition (whether mathematical or dynamical) so far that experience never can keep up with it. It is therefore with regard to this point always an idea, whose object never can be adequately given in any experience.

§ 51. In the first place, the use of a system of categories becomes here so obvious and unmistakable that, even if there were not several other proofs of it, this alone would sufficiently prove it indispensable in the system of pure reason. There are only four such transcendent ideas, as many as there are classes of categories; in each of which, however, they refer only to the absolute completeness of the series of the conditions for a given condition. In conformity with these cosmological ideas, there are only four kinds of dialectical assertions of pure reason, which, being dialectical, prove that to each of them, on equally specious principles [339] of pure reason, a contradictory assertion stands opposed. As all the metaphysical art of the most subtle distinction cannot prevent this opposition, it compels the philosopher to recur to the first sources of pure reason itself. This antinomy, not arbitrarily invented but founded in the nature of human reason, and hence unavoidable and never ceasing, contains the following four theses together with their antitheses:

1

Thesis

The world has, as to time and space, a beginning (limit).

Antithesis

The world is, as to time and space, infinite.

2

Thesis

Everything in the world is constituted out of the simple.

Antithesis

There is nothing simple, but everything is composite.

3

Thesis

There are in the world causes through freedom.

Antithesis

There is no freedom, but all is nature.

4

Thesis

In the series of world-causes there is some necessary being.

Antithesis

There is nothing necessary in the world, but in this series all is contingent.

§ 52a. Here is the most singular phenomenon of human reason, no other instance of which can be shown in its any other use. If we, as is commonly done, represent to ourselves the appearance of the sensible world as things in themselves, if we assume the principles of their combination as principles universally valid of things in themselves and not merely of experience, as is usually, nay, without our *Critique*, unavoidably done, there arises an unexpected conflict which never can be removed in the common dogmatic way; because the thesis, as well as the antithesis, can be shown by equally clear, evident, and irresistible proofs—for I pledge myself as to the correctness of all these proofs—and reason therefore perceives that it is divided against itself, a state at which the skeptic rejoices, but which must make the critical philosopher pause and feel ill at ease.

§ 52b. We may blunder in various ways in metaphysics without any fear of being detected in falsehood. [340] For we never can be refuted by experience if we but avoid self-contradiction, which in synthetic though purely fictitious propositions may be done whenever the concepts which we connect are mere ideas that cannot be given (as regards their whole content) in experience. For how can we make out by experience whether the world is from eternity or had a beginning, whether matter is infinitely divisible or consists of simple parts? Such concepts cannot be given in any experience, however extensive, and consequently the falsehood either of the affirmative or the negative proposition cannot be discovered by this touchstone.

The only possible way in which reason could have revealed unintentionally its secret dialectic, falsely announced as dogmatics, would be when it were made to ground an assertion upon a universally admitted

principle and to deduce the exact contrary with the greatest accuracy of inference from another which is equally granted. This is actually here the case with regard to four natural ideas of reason, whence four assertions on the one side and as many counter-assertions on the other arise, each consistently following from universally acknowledged principles. Thus they reveal, by the use of these principles, the dialectical illusion of pure reason, which would otherwise forever remain concealed.

This is therefore a decisive experiment, which must necessarily expose any error lying hidden in the [341] assumptions of reason.³⁸ Contradictory propositions cannot both be false, unless the concept lying at the ground of both of them is self-contradictory; for example, the propositions, “A square circle is round,” and “A square circle is not round,” are both false. For, as to the former, it is false that the circle is round because it is quadrangular; and it is likewise false that it is not round, i.e., angular, because it is a circle. For the logical criterion of the impossibility of a concept consists in this, that if we presuppose it, two contradictory propositions both become false; consequently, as no middle between them is conceivable, nothing at all is thought by that concept.

§ 52c. The first two antinomies, which I call mathematical because they are concerned with the addition or division of the homogeneous, are founded on such a contradictory concept; and hence I explain how it happens that both the thesis and antithesis of the two are false.

When I speak of objects in time and in space, it is not of things in themselves, of which I know nothing, but of things in appearance, i.e., of experience, as a particular way of cognizing objects which is only afforded to man. I must not say of that which I think in time or in space, that in itself, and independent of these my thoughts, it exists in space and in time, for in that case I would contradict myself, because space and time, together with the appearances in them, are nothing existing in themselves and outside of my representations [342], but are themselves only modes of representation, and it is palpably contradictory to say that a mere mode of representation exists outside our representation. Objects of the senses therefore exist only in experience, whereas to give them a self-subsisting existence apart from experience or prior to it is merely to represent to ourselves that experience actually exists apart from experience or prior to it.

Now if I ask about the magnitude of the world, as to space and time, it is equally impossible, with regard to all my concepts, to declare it infinite or to declare it finite. For neither assertion can be contained in experience, because experience either of an infinite space or of an infinite time elapsed, or again, of the boundary of the world by an empty space or by an antecedent empty time, is impossible; these are mere ideas. This magnitude of the world, be it determined in either way, would therefore have to exist in the world itself apart from all experience. But this contradicts the concept of a world of sense, which is merely a complex of the appearances whose existence and connection occur only in our representations, i.e., in experience; since this latter is not an object in itself but a mere mode of representation. Hence it follows that, as the concept of an absolutely existing world of sense is self-contradictory, the solution of the problem concerning its magnitude, whether attempted affirmatively or negatively, is always false.

The same holds of the second antinomy, which relates to the division of appearances. For these are mere representations; and the parts exist merely in their representation, consequently in the division (i.e., in a possible experience where they are given) and the division reaches only as far as such experience reaches. To assume that an appearance, e.g., that of a body, contains in itself before all experience all the parts which any possible experience can ever reach is to impute to a mere appearance, which can exist only in experience, an existence previous to experience. In other words, it would mean that mere representations exist before they can be found in our faculty of representation. Such an assertion is self-contradictory, as also every solution of our misunderstood problem, whether we maintain that bodies in themselves consist of an infinite number of parts or of a finite number of simple parts.

§ 53. In the first (the mathematical) class of antinomies [343] the falsehood of the presupposition consists in representing in one concept something self-contradictory as if it were compatible (i.e., an appearance as an object in itself). But as to the second (the dynamical) class of antinomies, the falsehood of the presupposition consists in representing as contradictory what is compatible. Consequently, whereas in the first case the opposed assertions were both false, in this case, on the other hand, where they are opposed to one another by mere misunderstanding, they may both be true.

Any mathematical connection necessarily presupposes homogeneity of what is connected (in the concept of magnitude), while the dynamical one by no means requires this. When we have to deal with extended magnitudes, all the parts must be homogeneous with one another and with the whole. But in the connection of cause and effect homogeneity may indeed likewise be found but is not necessary, for the concept of causality (by means of which something is posited through something else quite different from it) does not in the least

require it.

If the objects of the world of sense are taken for things in themselves and the above-mentioned laws of nature for the laws of things in themselves, the contradiction would be unavoidable. So also, if the subject of freedom were, like other objects, represented as mere appearance, the contradiction would be just as unavoidable; for the same predicate would at once be affirmed and denied of the same kind of object in the same sense. But if natural necessity is referred merely to appearances and freedom merely to things in themselves, no contradiction arises if we at the same time assume or admit both kinds of causality, however difficult or impossible it may be to make the latter kind conceivable.

In appearance every effect is an event, or something that happens in time; the effect must, according to the universal law of nature, be preceded by a determination of the causality of its cause (a state of the cause) on which the effect follows according to a constant law. But this determination of the cause to causal action must likewise be something that takes place or happens; the cause must have begun to act, otherwise no succession between it and the effect [344] could be thought. Otherwise the effect, as well as the causality of the cause, would have always existed. Therefore the determination of the cause to act must also have originated among appearances and must consequently, just like its effect, be an event, which must again have its cause, and so on; hence natural necessity must be the condition according to which efficient causes are determined. Whereas if freedom is to be a property of certain causes of appearances, it must, as regards the latter as events, be a faculty of starting them spontaneously, i.e., without the causality of the cause itself needing to begin and hence needing no other ground to determine its beginning. But then the cause, as to its causality, must not stand under time-determinations of its state, i.e., it cannot be an appearance, and must be considered a thing in itself, while only its effects would be appearances.³⁹ If without contradiction we can think of the beings of understanding as exercising such an influence on appearances, then natural necessity will attach to all connections of cause and effect in the sensuous world, though, on the other hand, freedom can be granted to the cause which is itself not an appearance (but the foundation of appearance). Nature and freedom therefore can without contradiction be attributed to the very same thing, but in different relations—on one side as an appearance, on the other as a thing in itself.

We have in us a faculty which not only stands in connection with its subjective determining grounds that are the natural causes of its actions and is so far [345] the faculty of a being that itself belongs to appearances, but is also related to objective grounds that are only ideas so far as they can determine this faculty; this connection is expressed by *ought*. This faculty is called *reason*, and, so far as we consider a being (man) entirely according to this objectively determinable reason, he cannot be considered as a being of sense; but, rather, this property is that of a thing in itself, and we cannot comprehend the possibility of this property—I mean how the *ought* (which might never yet have taken place) should determine its activity and could become the cause of actions whose effect is an appearance in the sensible world. Yet the causality of reason would be freedom with regard to the effects in the sensuous world, so far as we can consider *objective grounds*, which are themselves ideas, as their determinants. For its action in that case would not depend upon subjective conditions, consequently not upon those of time, and of course not upon the law of nature which serves to determine them, because grounds of reason give the rule universally to actions, according to principles, without influence of the circumstances of either time or place.

What I adduce here is merely meant as an example to make the thing intelligible, and does not necessarily belong to our problem, which must be decided from mere concepts independently of the properties which we meet in the actual world.

Now I may say without contradiction that all the actions of rational beings, so far as they are appearances (encountered in some experience), are subject to the necessity of nature; but the same actions, as regards merely the rational subject and its faculty of acting according to mere reason, are free. For what is required for the necessity of nature? Nothing more than the determinability of every event in the world of sense according to constant laws, i.e., a reference to cause in the appearance; in this process the thing in itself as its foundation and its causality remain unknown. But, I say, the law of nature remains, whether the rational being is the cause of the effects in the sensuous world from reason, i.e., through freedom, or whether it does not determine [346] them on grounds of reason. For if the former is the case, the action is performed according to maxims, the effect of which as appearance is always conformable to constant laws; if the latter is the case, and the action not performed on principles of reason, it is subject to the empirical laws of sensibility, and in both cases the effects are connected according to constant laws; more than this we do not require or know concerning natural necessity. But in the former case reason is the cause of these laws of nature, and therefore free; in the latter, the effects follow according to mere natural laws of sensibility, because reason does not influence it; but reason itself is not determined on that account by the sensibility (which is impossible) and is therefore free in

this case too. Freedom is therefore no hindrance to natural law in appearances; neither does this law abrogate the freedom of the practical use of reason, which is connected with things in themselves as determining grounds.

Thus practical freedom, viz., the freedom in which reason possesses causality according to objectively determining grounds, is rescued; and yet natural necessity is not in the least curtailed with regard to the very same effects, as appearances. The same remarks will serve to explain what we had to say concerning transcendental freedom and its compatibility with natural necessity (in the same subject, but not taken in one and the same reference). For, as to this, every beginning of the action of a being from objective causes regarded as determining grounds is always a first beginning, though the same action is in the series of appearances only a subordinate beginning, which must be preceded by a state of the cause which determines it and is itself determined in the same manner by another immediately preceding. Thus we are able, in rational beings, or in beings generally so far as their causality is determined in them as things in themselves, to think of a faculty of beginning of themselves a series of states without falling into contradiction with the laws of nature. For the relation of the action to objective grounds of reason is not a time-relation; in this case that which determines the causality does not precede in time the action, because such determining grounds represent, not a reference to objects of sense, e.g., to causes in the appearances, but to determining causes as things in themselves, which do not stand under conditions of time. And in this way the action, with regard to the causality of reason, can be considered as a first beginning, while in respect to the series of appearances as a merely [347] subordinate beginning. We may therefore without contradiction consider it in the former aspect as free, but in the latter (insofar as it is merely appearance) as subject to natural necessity.

As to the fourth antinomy, it is solved in the same way as the conflict of reason with itself in the third. For, provided the cause *in* the appearance is distinguished from the cause *of* the appearances (so far as it can be thought as a thing in itself), both propositions are perfectly reconcilable: the one, that there is nowhere in the sensuous world a cause (according to similar laws of causality) whose existence is absolutely necessary; the other, that this world is nevertheless connected with a necessary being as its cause (but of another kind and according to another law). The incompatibility of these two propositions rests entirely upon the misunderstanding of extending what is valid merely of appearances to things in themselves and in general of mixing both in one concept.

§ 54. This, then, is the exposition, and this is the solution of the whole antinomy in which reason finds itself involved in the application of its principles to the sensible world. The former alone (the mere exposition) would be a considerable service in the cause of our knowledge of human reason, even though the solution might fail to fully satisfy the reader, who has here to combat a natural illusion which has been but recently exposed to him and which he had hitherto always regarded as true. For one result at least is unavoidable. As it is quite impossible to prevent this conflict of reason with itself—so long as the objects of the sensible world are taken for things in themselves and not for mere appearances, which they are in fact—the reader is thereby compelled to examine over again the deduction of all our *a priori* cognition and the proof which I have given of my deduction in order to come to a decision on the question. This is all I require at present; for when in this occupation he shall have thought himself deep enough into the nature of pure reason, those concepts by which [348] alone the solution of the conflict of reason is possible will become sufficiently familiar to him. Without this preparation I cannot expect an unreserved assent even from the most attentive reader.

III. THE THEOLOGICAL IDEA⁴⁰

§ 55. The third transcendental idea, which affords material for the most important but, if pursued only speculatively, transcendent and thereby dialectical use of reason, is the ideal of pure reason. Reason in this case does not, as with the psychological and the cosmological ideas, start from experience and err by exaggerating its grounds in striving to attain, if possible, the absolute completeness of their series. Rather, it totally breaks with experience and from mere concepts of what constitutes the absolute completeness of a thing in general (hence by means of the idea of a most perfect primal being) proceeds to determine the possibility and therefore the actuality of all other things. And so the mere presupposition of a being which, although not in the series of experiences is thought for the purposes of experience and for the sake of conceiving its connection, order, and unity, i.e., the idea, is more easily distinguished from the concept of the understanding here than in the former cases. Hence we can easily expose the dialectical illusion which arises from our making the subjective conditions of our thinking objective conditions of objects themselves, and from making an hypothesis necessary for the satisfaction of our reason into a dogma. As the observations of the *Critique* on the pretensions of transcendental theology are intelligible, clear, and decisive, I have nothing more to add on the

subject.

GENERAL REMARK ON THE TRANSCENDENTAL IDEAS

§ 56. The objects which are given us by experience are in many respects inconceivable, and many questions to which the law of nature leads us when carried [349] beyond a certain point (though still quite conformably to the laws of nature) admit of no answer, as, for example, the question as to why material objects attract one another? But if we entirely quit nature or, in pursuing its combinations, exceed all possible experience, and so enter the realm of mere ideas, we cannot then say that the object is inconceivable and that the nature of things proposes to us insoluble problems. For we are not then concerned with nature or with given objects at all, but with mere concepts which have their origin solely in our reason, and with mere beings of thought; and all the problems that arise from our concepts of them must be solved, because of course reason can and must give a full account of its own procedure.⁴¹ As the psychological, cosmological, and theological ideas are nothing but pure concepts of reason, which cannot be given in any experience, the questions which reason asks us about them are put to us, not by the objects, but by mere maxims of our reason for the sake of its own satisfaction. They must all be capable of satisfactory answers, which are provided by showing that they are principles which bring our use of the understanding into thorough agreement, completeness, and synthetical unity, and that they thus hold good of experience only, but of experience as a whole. Although an absolute whole of experience is impossible, the idea of a whole of cognition according to principles in general must impart to our knowledge a peculiar kind of unity, that of a system, without which [350] it is nothing but piece work and cannot be used for the highest purpose (which is always only the system of all purposes); I do not here refer only to the practical, but also to the highest purpose of the speculative use of reason.

The transcendental ideas therefore express the peculiar application of reason as a principle of systematic unity in the use of the understanding. Yet if we assume this unity of the mode of cognition to pertain to the object of cognition, if we regard that which is merely *regulative* to be *constitutive*, and if we persuade ourselves that we can by means of these ideas enlarge our cognition transcendently or far beyond all possible experience, while it only serves to render experience within itself as nearly complete as possible, i.e., to limit its progress by nothing that cannot belong to experience—if we do all this, then we suffer from a mere misunderstanding in our estimate of the proper application of our reason and of its principles and suffer from a dialectic which confuses the empirical use of reason and also sets reason at variance with itself.

CONCLUSION

On the Determination of the Bounds of Pure Reason

§ 57. The clearest arguments having been adduced, it would be absurd for us to hope that we can know more of any object than belongs to the possible experience of it or lay claim to the least knowledge of how anything not assumed to be an object of possible experience is determined according to the constitution that it has in itself. For how could we determine anything in this way, since time, space, and all the concepts of the understanding, and still more all the concepts formed by empirical intuition (or perception) in the sensible world have and can have no other use than to make experience possible? And if this condition is omitted from the pure concepts of the understanding, they do not determine any object and have no meaning whatever.

But it would be, on the other hand, a still greater absurdity if we conceded no things in themselves or declared our experience to be the only possible mode [351] of knowing things, our intuition of them in space and in time to be the only possible intuition, our discursive understanding to be the archetype of every possible understanding, and to have the principles of the possibility of experience taken for universal conditions of things in themselves.

Our principles, which limit the use of reason to possible experience, might in this way become transcendent and the limits of our reason be set up as limits of the possibility of things in themselves (as Hume's *Dialogues*⁴² may illustrate) if a careful critique did not guard the bounds of our reason with respect to its empirical use and set a limit to its pretensions. Skepticism originally arose from metaphysics and its lawless dialectic. At first it might, merely to favor the empirical use of reason, announce everything that transcends this use as worthless and deceitful; but by and by, when it was perceived that the very same principles that are used in experience insensibly and apparently with the same right led still further than experience extends, then men began to doubt even the propositions of experience. But here there is no danger, for common sense will doubtless always assert its rights. A certain confusion, however, arose in science, which cannot determine how far reason is to be trusted, and why only so far and no further; and this confusion can only be cleared up and all future relapses obviated by a formal determination, on principle, of the boundary of the use of our reason.

We cannot indeed, beyond all possible experience, form a definite notion of what things in themselves may be. Yet we are not at liberty to abstain entirely from inquiring into them; for experience never satisfies reason fully but, in answering questions, refers us further and further back and leaves us dissatisfied with regard to their complete solution. This anyone may gather from the dialectic of pure reason, which therefore has its good subjective grounds. Having acquired, as regards the nature of our soul, a clear [352] conception of the subject, and having come to the conviction that its appearances cannot be explained materialistically, who can refrain from asking what the soul really is and, if no concept of experience suffices for the purpose, from accounting for it by a concept of reason (that of a simple immaterial being), though we cannot by any means prove its objective reality? Who can satisfy himself with mere empirical knowledge in all the cosmological questions of the duration and of the magnitude of the world, of freedom or of natural necessity, since every answer given on principles of experience begets a fresh question, which likewise requires its answer and thereby clearly shows the insufficiency of all physical modes of explanation to satisfy reason? Finally, who does not see in the thoroughgoing contingency and dependence of all his thoughts and assumptions on mere principles of experience the impossibility of stopping there? And who does not feel himself compelled, notwithstanding all interdictions against losing himself in transcendent ideas, to seek rest and contentment, beyond all the concepts which he can vindicate by experience, in the concept of a being, the possibility of which cannot be conceived but at the same time cannot be refuted, because it relates to a mere being of the understanding and without it reason must needs remain forever dissatisfied?

Bounds (in extended beings) always presuppose a space existing outside a certain definite place and inclosing it; limits do not require this, but are mere negations which affect a quantity so far as it is not absolutely complete. But our reason, as it were, sees in its surroundings a space for the cognition of things in themselves though we can never have determinate concepts of them and are limited to appearances only.

As long as the cognition of reason is homogeneous, determinate bounds to it cannot be thought. In mathematics and natural science human reason admits of limits but not of bounds, viz., that something indeed lies outside it, at which it can never arrive, but not that it will at any point find completion in its internal progress. The enlarging of insights in mathematics and the possibility of new discoveries are infinite; and the same is the case with the discovery of new properties of nature, of new forces and laws, by continued experience and its rational unification. But limits [353] cannot fail to be seen here; for mathematics refers to

appearances only, and what cannot be an object of sensuous intuition (such as the concepts of metaphysics and of morals) lies entirely without its sphere. It can never lead to them, but neither does it require them. There is therefore a continuous progress and approach to these sciences; and there is, as it were, a point or line of contact. Natural science will never reveal to us the internal constitution of things, which, though not appearance, yet can serve as the ultimate ground for explaining appearances. Nor does that science need this for its physical explanations. Nay, even if such grounds should be offered from other sources (for instance, the influence of immaterial beings), they must be rejected and not used in the progress of its explanations. For these explanations must only be grounded upon that which as an object of sense can belong to experience and be brought into connection with our actual perceptions according to empirical laws.

But metaphysics leads us toward bounds in the dialectical attempts of pure reason (not undertaken arbitrarily or wantonly, but stimulated thereto by the nature of reason itself). And the transcendental ideas, as they do not admit of evasion and yet are never capable of realization, serve to point out to us actually not only the bounds of the use of pure reason, but also the way to determine them. Such is the end and the use of this natural predisposition of our reason, which has brought forth metaphysics as its favorite child, whose generation, like every other in the world, is not to be ascribed to blind chance but to an original germ, wisely organized for great ends. For metaphysics, in its fundamental features, perhaps more than any other science, is placed in us by nature itself and cannot be considered the production of an arbitrary choice or casual enlargement in the progress of experience from which it is quite disparate.

Reason with all its concepts and laws of the understanding, which are adequate to it for empirical use, i.e., within the sensible world, finds for itself no satisfaction because ever-recurring questions deprive us of all hope of their complete solution. The transcendental ideas, which have that completion in view, are such problems of reason. But it sees clearly that the [354] sensible world cannot contain this completion; neither, consequently, can all the concepts which serve merely for understanding the world of sense, e.g., space and time, and whatever we have adduced under the name of pure concepts of the understanding. The sensible world is nothing but a chain of appearances connected according to universal laws; it has therefore no subsistence by itself; it is not the thing in itself, and consequently must point to that which contains the basis of this appearance, to beings which cannot be cognized merely as appearances, but as things in themselves. In the cognition of them alone can reason hope to satisfy its desire for completeness in proceeding from the conditioned to its conditions.

We have above (§§ 33, 34) indicated the limits of reason with regard to all cognition of mere beings of thought. Now, since the transcendental ideas have urged us to approach them and thus have led us, as it were, to the spot where the occupied space (viz., experience) touches the void (that of which we can know nothing, viz., *noumena*), we can determine the bounds of pure reason. For in all bounds there is something positive (e.g., a surface is the boundary of corporeal space, and is therefore itself a space; a line is a space, which is the boundary of the surface, a point the boundary of the line, but yet always a place in space), whereas limits contain mere negations. The limits pointed out in those paragraphs are not enough after we have discovered that beyond them there still lies something (though we can never cognize what it is in itself). For the question now is, What is the attitude of our reason in this connection of what we know with what we do not, and never shall, know? This is an actual connection of a known thing with one quite unknown (and which will always remain so), and though what is unknown should not become the least more known—which we cannot even hope—yet the notion of this connection must be definite, and capable of being rendered distinct.

We must therefore think an immaterial being, a world of understanding, and a Supreme Being (all mere *noumena*), because in them only, as things in themselves, reason finds that completion and satisfaction, [355] which it can never hope for in the derivation of appearances from their homogeneous grounds, and because these actually have reference to something distinct from them (and totally heterogeneous), as appearances always presuppose an object in itself and therefore suggest its existence whether we can know more of it or not.

But as we can never cognize these beings of understanding as they are in themselves, that is, determinately, yet must assume them as regards the sensible world and connect them with it by reason, we are at least able to think this connection by means of such concepts as express their relation to the world of sense. Yet if we represent to ourselves a being of the understanding by nothing but pure concepts of the understanding, we then indeed represent nothing determinate to ourselves, and consequently our concept has no significance; but if we think of it by properties borrowed from the sensible world, then it is no longer a being of understanding but is conceived as a phenomenon and belongs to the sensible world. Let us take an instance from the concept of the Supreme Being.

The deistic concept is quite a pure concept of reason, but represents only a thing containing all realities,

without being able to determine any one of them; because for that purpose an example must be taken from the world of sense, in which case I should have an object of sense only, not something quite heterogeneous which can never be an object of sense. Suppose I attribute to the Supreme Being understanding, for instance; I have no concept of an understanding other than my own, one that must receive its intuitions by the senses and which is occupied in bringing them under rules of the unity of consciousness. Then the elements of my concept would always lie in the appearance; I should, however, by the insufficiency of the appearances be required to go beyond them to the concept of a being which neither depends upon appearances nor is bound up with them as conditions of its determination. But if I separate understanding from sensibility to obtain a pure understanding, then nothing remains but the mere form of thinking without intuition, by which form alone I can cognize nothing determinate and consequently no object. For that purpose I should have to think another understanding, such as would intuit its objects but of which I have not the least concept, because the human understanding is discursive, and can cognize only by means of general concepts. And the very same difficulties [356] arise if we attribute a will to the Supreme Being; for I have this concept only by drawing it from my inner experience, and therefore from my dependence for satisfaction upon objects whose existence I require; and so the concept rests upon sensibility, which is wholly incompatible with the pure concept of the Supreme Being.

Hume's objections to deism are weak, and affect only the proofs, and not the deistic assertion itself. But as regards theism, which depends on a stricter determination of the concept of the Supreme Being, which in deism is merely transcendent, they are very strong and, as this concept is formed, in certain (in fact in all common) cases irrefutable. Hume always insists that by the mere concept of an original being to which we apply only ontological predicates (eternity, omnipresence, omnipotence) we think nothing determinate, and that properties which can yield a concept *in concreto* must be superadded. He insists also that it is not enough to say that it is cause, but we must explain the nature of its causality, e.g., that of an understanding and of a will. He then begins his attacks on the essential point itself, i.e., theism, as he had previously directed his battery only against the proofs of deism, an attack which is not very dangerous to it in its consequences. All his dangerous arguments refer to anthropomorphism, which he holds to be inseparable from theism and to make it contradictory in itself; but if the former can be abandoned, the latter must vanish with it and nothing remain but deism, of which nothing can come, which is of no value and which cannot serve as any foundation to religion or morals. If this anthropomorphism were really unavoidable, no proofs whatever of the existence of a Supreme Being, even were they all granted, could determine for us the concept of this Being without involving us in contradictions.

If we connect with the command to avoid all transcendent judgments of pure reason the command (which apparently conflicts with it) to proceed to concepts that lie beyond the field of its immanent (empirical) use, we discover that both can subsist together, but only at the boundary of all permitted use of reason. [357] For this boundary belongs to the field of experience as well as to that of the beings of thought, and we are thereby taught how these remarkable ideas serve merely for marking the bounds of human reason. On the one hand, they give warning not boundlessly to extend cognition by experience, as if nothing but world remained for us to cognize, and yet, on the other hand, not to transgress the bounds of experience and to think of judging about things beyond them as things in themselves.

But we stop at this boundary if we limit our judgment merely to the relation which the world may have to a being whose very concept lies beyond all the cognition which we can attain within the world. For we then do not attribute to the Supreme Being any of the properties in themselves by which we represent objects of experience, and thereby avoid *dogmatic* anthropomorphism; but we attribute them to his relation to the world and allow ourselves a *symbolic* anthropomorphism, which in fact concerns language only and not the object itself.

If I say that we are compelled to consider the world *as if* it were the work of a Supreme Understanding and Will, I really say nothing more than that a watch, a ship, a regiment bears the same relation to the watchmaker, the shipbuilder, the commanding officer as the world of sense (or whatever constitutes the substratum of this complex of appearances) does to the unknown, which I do not hereby cognize as it is in itself but as it is for me, i.e., in relation to the world of which I am a part.

§ 58. Such a cognition is one of analogy and does not signify (as is commonly understood) an imperfect similarity of two things, but a perfect similarity of relations between two quite dissimilar things.⁴³ By means [358] of this analogy, however, there remains a concept of the Supreme Being sufficiently determined *for us*, though we have left out everything that could determine it absolutely and *in itself*; for we determine it as regards the world and therefore as regards ourselves, and more do we not require. The attacks which Hume makes upon those who would determine this concept absolutely, by taking the materials for so doing from

themselves and the world, do not affect us; and he cannot object to us that we have nothing left if we take away the objective anthropomorphism from our concept of the Supreme Being.

For let us assume at the outset (as Hume in his *Dialogues* makes Philo grant Cleanthes), as a necessary hypothesis, the deistic concept of the First Being, in which this Being is thought by the mere ontological predicates of substance, of cause, etc. This must be done because reason, actuated in the sensible world by mere conditions which are themselves in turn always conditioned, cannot otherwise have any satisfaction; and it therefore can be done without falling into anthropomorphism (which transfers predicates from the world of sense to a being quite distinct from the world) because those predicates are mere categories which, though they do not give a determinate concept of this being, yet give a concept not limited to any conditions of sensibility. Thus nothing can prevent our predicating of this being a causality through reason with regard to the world, and thus passing to [359] theism, without being obliged to attribute to this being itself this kind of reason, as a property inhering in it. For as to the former, the only possible way of pushing the use of reason (as regards all possible experience in complete harmony with itself) in the world of sense to the highest point is to assume a supreme reason as a cause of all the connections in the world. Such a principle must be quite advantageous to reason and can hurt it nowhere in its application to nature. As to the latter, reason is thereby not transferred as a property to the First Being in itself, but only to its relation to the world of sense, and so anthropomorphism is entirely avoided. For nothing is considered here but the cause of the rational form which is found everywhere in the world, and reason is attributed to the Supreme Being so far as it contains the ground of this rational form in the world, but according to analogy only, i.e., so far as this expression shows merely the relation which the Supreme Cause, unknown to us, has to the world in order to determine everything in it conformably to reason in the highest degree. We are thereby kept from using reason as an attribute in order to think God, but not kept from thinking the world in such a manner as is necessary to have the greatest possible use of reason within it according to principle. We thereby acknowledge that the Supreme Being is quite inscrutable and even unthinkable in any determinate way as to what it is in itself. We are thereby kept, on the one hand, from making a transcendent use of the concepts which we have of reason as an efficient cause (by means of the will), in order to determine the Divine Nature by properties which are only borrowed from human nature, and from losing ourselves in gross and extravagant concepts; and, on the other hand, from deluging the contemplation of the world with hyperphysical modes of explanation according to our concepts of human reason which we transfer to God, and so from losing for this contemplation its proper role, according to which it should be a rational study of mere nature and not a presumptuous derivation of its appearances from a Supreme Reason. The expression suited to our feeble concepts is that we conceive the world *as if* it came, regarding its existence and its inner determination, from a Supreme Reason. By this conception we both cognize the constitution which belongs to the world itself without pretending to determine the nature of its cause in itself, and we transfer the ground of this constitution (of the rational form of the world) to the *relation* of the Supreme Cause to the world, without [360] finding the world sufficient by itself for that purpose.⁴⁴

Thus the difficulties which seem to oppose theism disappear by combining with Hume's principle, "not to carry the use of reason dogmatically beyond the field of all possible experience," this other principle, which he quite overlooked, "not to consider the field of experience as one which bounds itself in the eyes of our reason." The *Critique of Pure Reason* here points out the true mean between dogmatism, which Hume combats, and skepticism, which he would substitute for it—a mean which is not like other means that we find advisable to determine for ourselves as it were mechanically (by adopting something from one side and something from the other), and by which nobody is taught a better way, but such a one as can be exactly determined on principles.

§ 59. At the beginning of this note I made use of the metaphor of a boundary in order to establish the limits of reason in regard to its suitable use. The world of sense contains merely appearances, which are not things in themselves; but the understanding must assume these latter ones, viz., *noumena*, because it knows the objects of experience to be mere appearances. In our reason both are comprised together, and the question is, How does reason proceed to set boundaries to the understanding as regards both these fields? Experience, which contains all that belongs to the sensible world, does not bound itself; it only proceeds in every case from the conditioned to some other equally conditioned thing. Its boundary must [361] lie quite without it, and this is the field of the pure beings of the understanding. But this field, so far as the determination of the nature of these beings is concerned, is an empty space for us; and if dogmatically determined concepts are being considered, we cannot pass beyond the field of possible experience. But as a boundary is itself something positive, which belongs to what lies within as well as to the space that lies without the given complex, it is still an actual positive cognition which reason only acquires by enlarging itself to this boundary, yet without

attempting to pass it because it there finds itself in the presence of an empty space in which it can think forms of things but not things themselves. But the setting of a boundary to the field of experience by something which is otherwise unknown to reason, is still a cognition which belongs to it even at this point, and by which it is neither confined within the sensible nor strays beyond the sensible, but only limits itself, as befits the knowledge of a boundary, to the relation between what lies beyond it and what is contained within it.

Natural theology is such a concept at the boundary of human reason, being constrained to look beyond this boundary to the idea of a Supreme Being (and, for practical purposes, to that of an intelligible world also), not in order to determine anything relatively to this mere being of the understanding, which lies beyond the world of sense, but in order to guide the use of reason within the world of sense according to principles of the greatest possible (theoretical as well as practical) unity. For this purpose reason makes use of the reference of the world of sense to an independent reason as the cause of all that world's connections. Thereby reason does not merely invent a being, but, as beyond the sensible world there must be something that can be thought only by the pure understanding, reason determines that something in this particular way, though only of course according to analogy.

And thus there remains our original proposition, which is the result of the whole *Critique*: "that reason by all its *a priori* principles never teaches us anything more than objects of possible experience, and even of these nothing more than can be cognized in experience." But this limitation does not prevent reason from leading us to the objective boundary of experience, viz., to the reference to something which is not itself an object of experience but must be the highest ground of all experience. Reason does not, however, teach us anything concerning the thing in itself; [362] it only instructs us as regards its own complete and highest use in the field of possible experience. But this is all that can be reasonably desired in the present case, and with it we have cause to be satisfied.

§ 60. Thus we have fully exhibited metaphysics according to its subjective possibility, as it is actually given in the natural predisposition of human reason and in that which constitutes the essential end of its pursuit. We have found that this merely natural use of such a predisposition of our reason, if no discipline arising only from a scientific critique bridles and sets limits to it, involves us in transcendent dialectical inferences, that are in part merely illusory and in part even self-contradictory, and that this fallacious metaphysics is not only unnecessary as regards the promotion of our knowledge of nature but even disadvantageous to it. There yet remains a problem worthy of inquiry, which is to find out the natural ends intended by this disposition to transcendent concepts in our reason, because everything that lies in nature must be originally intended for some useful purpose.

Such an inquiry is of a doubtful nature, and I acknowledge that what I can say about it is conjecture only, like every speculation about the first ends of nature. This conjecture may be allowed to me in this case alone, because the question does not concern the objective validity of metaphysical judgments but our natural predisposition to them, and therefore does not belong to the system of metaphysics but to anthropology.

When I compare all the transcendental ideas, the totality of which constitutes the particular problem of natural pure reason, compelling it to quit the mere contemplation of nature, to transcend all possible experience, and in this endeavor to produce the thing (be it knowledge or fiction) called metaphysics; I think I perceive that the aim of this natural tendency is to free our concepts from the fetters of experience and from the limits of the mere contemplation of nature so far as at least to open to us a field containing mere objects for the pure understanding which [363] no sensibility can reach, not indeed for the purpose of speculatively occupying ourselves with them (for there we can find no ground to stand on), but in order that practical principles might find some such scope for their necessary expectation and hope and might expand to the universality which reason unavoidably requires from a moral point of view.

So I find that the psychological idea (however little it may reveal to me the nature of the human soul, which is elevated above all concepts of experience) shows the insufficiency of these concepts plainly enough and thereby deters me from materialism, a psychological concept which is unfit for any explanation of nature and which in addition confines reason in practical respects. The cosmological ideas, by the obvious insufficiency of all possible cognition of nature to satisfy reason in its legitimate inquiry, serve in the same manner to keep us from naturalism, which asserts nature to be sufficient for itself. Finally, all natural necessity in the sensible world is conditional, as it always presupposes the dependence of things upon others, and unconditional necessity must be sought only in the unity of a cause different from the world of sense. But as the causality of this cause, in its turn, were it merely nature, could never render the existence of the contingent (as is consequent) comprehensible, reason frees itself by means of the theological idea from fatalism (both as a blind natural necessity in the coherence of nature itself, without a first principle, and as a blind causality of this principle itself) and leads to the concept of a cause possessing freedom and hence of a Supreme

Intelligence. Thus the transcendental ideas serve, if not to instruct us positively, at least to destroy the impudent and restrictive assertions of materialism, of naturalism, and of fatalism, and thus to afford scope for the moral ideas beyond the field of speculation. These considerations, I should think, explain in some measure the natural predisposition of which I spoke.

The practical value which a merely speculative science may have lies outside the bounds of this science, and can therefore be considered as a scholium merely, and like all scholia does not form part of the science itself. This application, however, surely lies within the bounds of philosophy, especially of philosophy drawn from the pure sources of reason, where its speculative use in metaphysics must necessarily be at one with its practical use in morals. Hence the unavoidable dialectic of pure reason, considered in metaphysics as a natural tendency, deserves to [364] be explained not as a mere illusion, which is to be removed, but also, if possible, as a natural provision as regards its end, though this task, a work of supererogation, cannot justly be assigned to metaphysics proper.

The solutions of these questions which are treated in the *Critique*⁴⁵ should be considered a second scholium, which, however, has a greater affinity with the subject of metaphysics. For there certain rational principles are expounded which determine *a priori* the order of nature or rather of the understanding, which seeks nature's laws through experience. They seem to be constitutive and legislative with regard to experience, though they spring from mere reason, which cannot be considered, like the understanding, as a principle of possible experience. Now whether or not this harmony rests upon the fact that, just as nature does not inhere in appearances or in their source (the sensibility) itself, but only in the relation of the latter to the understanding, so also a thoroughgoing unity in the use of the understanding to bring about an entirety of all possible experience (in a system) can only belong to the understanding when in relation to reason, with the result that experience is in this way mediately subordinate to the legislation of reason: this question may be discussed by those who desire to trace the nature of reason even beyond its use in metaphysics into the general principles for making systematic a history of nature in general. I have presented this task as important, but not attempted its solution in the book itself.⁴⁶

[365] And thus I conclude the analytical solution of the main question which I had proposed: "How is metaphysics in general possible?" by ascending from the data of its actual use, at least in its consequences, to the grounds of its possibility.

SOLUTION OF THE GENERAL QUESTION OF THE PROLEGOMENA

"How Is Metaphysics Possible as Science?"

Metaphysics, as a natural disposition of reason, is actual; but if considered by itself alone (as the analytical solution of the third principal question showed), it is dialectical and illusory. If we think of taking principles from it, and in using them follow the natural, but on that account not less false, illusion, we can never produce science, but only a vain dialectical art, in which one school may outdo another but none can ever acquire a just and lasting approbation.

In order that as a science metaphysics may be entitled to claim, not mere fallacious plausibility, but insight and conviction, a critique of reason must itself exhibit the whole stock of *a priori* concepts, their division according to their various sources (sensibility, understanding, and reason), together with a complete table of them, the analysis of all these concepts, with all their consequences and especially the possibility of synthetic cognition *a priori* by means of the deduction of these concepts, the principles and bounds of their use, all in a complete system. Critique, therefore, and critique alone contains in itself the whole well-proved and well-tested plan, and even all the means required to establish metaphysics as a science; by other ways and means it is impossible. The question here, therefore, is not so much how this performance is possible as how to set it going and induce men of clear heads to quit their hitherto perverted and fruitless cultivation for one that will not deceive, and how such a union for the common end may best be directed.

This much is certain: whoever has once tasted critique will be ever after disgusted with all dogmatical [366] twaddle which he formerly put up with because his reason had to have something and could find nothing better for its support. Critique stands in the same relation to the common metaphysics of the schools as chemistry does to alchemy, or as astronomy to the astrology of the fortune teller. I pledge myself that nobody who has thought through and grasped the principles of critique, even only in these *Prolegomena*, will ever return to that old and sophistical pseudoscience; but he will, rather, with a certain delight look forward to a metaphysics which is now indeed in his power, requiring no more preparatory discoveries, and now at last affording permanent satisfaction to reason. For here is an advantage upon which, of all possible sciences, metaphysics alone can with certainty reckon: that it can be brought to such completion and fixity as to require no further change or be capable of any augmentation by new discoveries, because here reason has the sources of its knowledge in itself, not in objects and their observation, by which its stock of knowledge could be further increased. When, therefore, it has exhibited the fundamental laws of its faculty completely and so determinately as to avoid all misunderstanding, there remains nothing more for pure reason to cognize *a priori*; nay, there is even no ground to raise further questions. The sure prospect of knowledge so determinate and so compact has a peculiar charm, even though we should set aside all its advantages, of which I shall hereafter speak.

All false art, all vain wisdom, lasts its time but finally destroys itself, and its highest culture is also the epoch of its decay. That this time is come for metaphysics appears from the state into which it has fallen among all learned nations, despite all the zeal with which other sciences of every kind are prosecuted. The old arrangement of our university studies still preserves its shadow; now and then an academy of science tempts men by offering prizes to write essays on it, but it is no longer numbered among sound sciences; and let anyone judge for himself how a sophisticated man, if he were called a great metaphysician, would receive the compliment, which may be well meant but is scarcely envied by anybody.

[367] Yet, though the period of the downfall of all dogmatic metaphysics has undoubtedly arrived, we are yet far from being able to say that the period of its regeneration is come by means of a thorough and complete critique of reason. All transitions from an inclination to its contrary pass through the stage of indifference, and this moment is the most dangerous for an author but, in my opinion, the most favorable for the science. For when party spirit has died out by a total dissolution of former connections, minds are in the best state to listen to several proposals for an organization according to a new plan.

When I say that I hope these *Prolegomena* will excite investigation in the field of critique and afford a new and promising object to sustain the general spirit of philosophy, which seems on its speculative side to want sustenance, I can imagine beforehand that everyone whom the thorny paths of my *Critique* have tried and put out of humor will ask me upon what I found this hope. My answer is: upon the irresistible law of necessity.

That the human spirit will ever give up metaphysical researches is as little to be expected as that we should prefer to give up breathing altogether, in order to avoid inhaling impure air. There will, therefore, always be metaphysics in the world; nay, everyone, especially every reflective man, will have it and, for want of a

recognized standard, will shape it for himself after his own pattern. What has hitherto been called metaphysics cannot satisfy any critical mind, but to forego it entirely is impossible; therefore a critique of pure reason itself must now be attempted or, if one exists, investigated and brought to the full test, because there is no other means of supplying this pressing want which is something more than mere thirst for knowledge.

Ever since I have come to know critique, whenever I finish reading a book of metaphysical contents which, by the determination of its concepts, by variety, [368] order, and an easy style, was not only entertaining but also helpful, I cannot help asking "Has this author indeed advanced metaphysics a single step?" The learned men whose works have been useful to me in other respects and always contributed to the culture of my mental powers will, I hope, forgive me for saying that I have never been able to find either their essays or my own less important ones (though self-love may recommend them to me) to have advanced the science of metaphysics in the least, and why? Here is the very obvious reason: metaphysics did not then exist as a science, nor can it be gathered piecemeal; but its germ must be fully preformed in critique. But in order to prevent all misconception, we must remember what has already been said—that by the analytic treatment of our concepts the understanding gains indeed a great deal, but the science (of metaphysics) is thereby not in the least advanced because these analyzes of concepts are nothing but the materials from which the intention is to carpenter our science. Let the concepts of substance and of accident be ever so well analyzed and determined; all this is very well as a preparation for some future use. But if we cannot prove that in all which exists the substance endures and only the accidents vary, our science is not the least advanced by all our analyzes. Metaphysics has hitherto never been able to prove *a priori* either this proposition or that of sufficient reason, still less any more complex theorem such as belongs to psychology or cosmology, or indeed any synthetic proposition. By all its analyzing, therefore, nothing is affected, nothing obtained or forwarded; and the science, after all this bustle and noise, still remains as it was in the days of Aristotle, though far better preparations were made for it than of old if only the clue to synthetic cognitions had been discovered.

If anyone thinks himself offended, he is at liberty to refute my charge by producing a single synthetic proposition belonging to metaphysics which he would prove dogmatically *a priori*; for until he has actually performed this feat, I shall not grant that he has truly advanced the science, even though this proposition should be sufficiently confirmed by common experience. No demand can be more moderate [369] or more equitable and, in the (inevitably certain) event of its nonperformance, no assertion more just than that hitherto metaphysics has never existed as a science.

But there are two things which, in case the challenge be accepted, I must deprecate: first, trifling about probability and conjecture, which are suited as little to metaphysics as to geometry; and secondly, a decision by means of the magic wand of so-called sound common sense, which does not convince everyone but accommodates itself to personal peculiarities.

For as to the former, nothing can be more absurd than in metaphysics, a philosophy from pure reason, to try to ground our judgments upon probability and conjecture. Everything that is to be cognized *a priori* is thereby announced as apodeictically certain and must therefore be proved in this way. We might as well try to ground geometry or arithmetic upon conjectures. As to the calculus of probabilities in the latter, it does not contain probable but perfectly certain judgments concerning the degree of the possibility of certain cases under given uniform conditions, which, in the sum of all possible cases, must infallibly happen according to the rule, though it is not sufficiently determined as regards every single instance. Conjectures (by means of induction and analogy) can be suffered in an empirical natural science only, yet even there at least the possibility of what we assume must be quite certain.

The appeal to common sense is even more absurd, when concepts and principles are said to be valid, not insofar as they hold with regard to experience, but outside the conditions of experience. For what is common sense? It is normal good sense, so far as it judges right. What is normal good sense? It is the faculty of the knowledge and use of rules *in concreto*, as distinguished from the speculative understanding, which is a faculty of knowing rules *in abstracto*. Common sense can hardly understand the rule that every event is determined by means of its cause and can never comprehend it thus generally. It therefore demands an example from experience; and when it hears that this rule means nothing but what it always thought [370] when a pane was broken or a kitchen-utensil missing, it then understands the principle and grants it. Common sense, therefore, is only of use so far as it can see its rules (though they actually are *a priori*) confirmed by experience; consequently, to comprehend them *a priori*, or independently of experience, belongs to the speculative understanding and lies quite beyond the horizon of common sense. But the province of metaphysics is entirely confined to the latter kind of knowledge, and it is certainly a bad sign of common sense to appeal to it as a witness, for it cannot here form any opinion whatever, and men look down upon it with contempt until they are in trouble and can find in their speculation neither advice nor help.

It is a common subterfuge of those false friends of common sense (who occasionally prize it highly, but usually despise it) to say that there must surely be at all events some propositions which are immediately certain and of which there is no occasion to give any proof, or even any account at all, because we otherwise could never stop inquiring into the grounds of our judgments. But if we accept the principle of contradiction, which is not sufficient to show the truth of synthetic judgments, they can never adduce, in proof of this privilege, anything else indubitable which they can immediately ascribe to common sense, except mathematical propositions, such as twice two make four, between two points there is but one straight line, etc. But these judgments are radically different from those of metaphysics. For in mathematics I can by thinking construct whatever I represent to myself as possible by a concept: I add to the first two the other two, one by one, and myself make the number four, or I draw in thought from one point to another all manner of lines, equal as well as unequal; yet I can draw one only which is like itself in all its parts. But I cannot, by all my power of thinking, extract from the concept of a thing the concept of something else whose existence is necessarily connected with the former, but I must call upon experience. And though my understanding furnishes me *a priori* (yet only in reference to possible experience) with the concept of such a connection (i.e., causation), I cannot exhibit it *a priori* in intuition, like the concepts of mathematics, [371] and so show its possibility *a priori*. This concept, together with the principles of its application, always requires, if it is to hold *a priori*—as is requisite in metaphysics — a justification and deduction of its possibility, because we cannot otherwise know how far it holds good and whether it can be used in experience only or beyond it also. Therefore in metaphysics, as a speculative science of pure reason, we can never appeal to common sense, but may do so only when (in certain matters) we are forced to surrender it and renounce all pure speculative cognition, which must always be theoretic knowledge, and therefore are forced to forego metaphysics itself and its instruction for the sake of adopting a rational faith which alone may be possible for us, sufficient to our wants, and perhaps even more salutary than knowledge itself. For then the shape of the thing is quite altered. Metaphysics must be science, not only as a whole but in all its parts; otherwise it is nothing at all, because as speculation of pure reason it finds a hold only on universal insights. Beyond its field, however, probability and common sense may be used advantageously and justly, but on quite special principles, the importance of which always depends on their reference to the practical.

This is what I hold myself justified in requiring for the possibility of metaphysics as a science.

APPENDIX

On What Can Be Done to Make

Metaphysics as a Science Actual

Since all the ways heretofore taken have failed to attain the goal, and since without a preceding critique of pure reason it is not likely ever to be attained, the [372] attempt before us has a right to an accurate and careful examination, unless it be thought more advisable to give up all pretensions to metaphysics, to which, if men would but consistently adhere to their purpose, no objection can be made. If we take the course of things as it is, not as it ought to be, there are two sorts of judgments: (1) one a judgment which precedes investigation (in our case one in which the reader from his own metaphysics pronounces judgment on the *Critique of Pure Reason*, which was intended to discuss the very possibility of metaphysics); (2) the other a judgment subsequent to investigation. In the latter, the reader is enabled to ignore for a while the consequences of the critical researches that may be repugnant to his formerly adopted metaphysics, and first examines the grounds whence those consequences are derived. If what common metaphysics propounds were demonstrably certain (like geometry) the former way of judging would hold good. For if the consequences of certain principles are repugnant to established truths, these principles are false and without further inquiry to be repudiated. But if metaphysics does not possess a stock of indisputably certain (synthetic) propositions, and should it even be the case that there are a number of them, which, though among the most plausible, are by their consequences in mutual conflict, and if no sure criterion of the truth of peculiarly metaphysical (synthetic) propositions is to be met with in it, then the former way of judging is not admissible, but the investigation of the principles of the *Critique* must precede all judgments as to its value.

A Specimen of a Judgment about the Critique Prior to Its Examination

Such a judgment is to be found in the *Göttingische gelehrte Anzeigen*, in the supplement to the third part, of January 19, 1782, pages 40 *et seq.*⁴⁷

When an author who is familiar with the subject of his work and endeavors to present his independent reflections in its elaboration falls into the hands of a reviewer who, in his turn, is keen enough to discern the points on which the worth or worthlessness of the books rests, who does not cling to words but goes to the heart of the subject, sifting and testing the principles which the author takes as his point of departure, the severity of the judgment may indeed displease [373] the author, but the public does not care, as it gains thereby. And the author himself may be satisfied at having an opportunity of correcting or explaining his positions at an early date by the examination of a competent judge, in such a manner that if he believes himself fundamentally right, he can remove in time any stumbling-block that might hurt the success of his work.

I find myself, with my reviewer, in quite another position. He seems not to see at all the real matter of the investigation, with which (successfully or unsuccessfully) I have been occupied. It is either impatience at thinking out a lengthy work, or vexation at a threatened reform of a science in which he believed he had brought everything to perfection long ago, or, what I am reluctant to suppose, real narrow-mindedness that prevents him from ever carrying his thoughts beyond his school metaphysics. In short, he passes impatiently in review a long series of propositions, of which, without knowing their premises, one can comprehend nothing, intersperses here and there his censure, the reason of which the reader understands just as little as the propositions against which it is directed; and hence [his report] can neither serve the public nor damage me in the judgment of experts. I should, for these reasons, have passed over this judgment altogether, were it not that it may afford me occasion for some explanations which may in some cases save the readers of these *Prolegomena* from a misconception.

In order to take a position from which my reviewer could most easily set the whole work in a most unfavorable light, without venturing to trouble himself with any special investigation, he begins and ends by saying: "This work is a system of transcendental (or, as he translates it, of higher)⁴⁸ idealism."

A glance at this line soon showed me the sort of [374] criticism that I had to expect, much as though the reviewer were one who had never seen or heard of geometry, having found a Euclid and coming upon various figures in turning over its leaves, were to say, on being asked his opinion of it: "The work is a textbook of drawing; the author introduces a peculiar terminology in order to give dark, incomprehensible directions, which in the end teach nothing more than what everyone can effect by a fair natural accuracy of eye, etc."

Let us see, in the meantime, what sort of an idealism it is that goes through my whole work, although it does not by a long way constitute the soul of the system.

The dictum of all genuine idealists, from the Eleatic school to Bishop Berkeley, is contained in this formula: "All cognition through the senses and experience is nothing but sheer illusion, and only in the ideas of the pure understanding and reason is there truth."

The principle that throughout dominates and determines my idealism is, on the contrary: "All cognition of things merely from pure understanding or pure reason is nothing but sheer illusion, and only in experience is there truth."

But this is directly contrary to idealism proper. How came I then to use this expression for quite an opposite purpose, and how came my reviewer to see it everywhere?

The solution of this difficulty rests on something that could have been very easily understood from the context of the work, if the reader had only desired to do so. Space and time, together with all that they contain, are not things in themselves or their qualities but belong merely to the appearances of the things in themselves; up to this point I am one in confession with the above idealists. But these, and among them more particularly Berkeley, regarded space as a mere empirical representation that, like the appearances it contains, is, together with its determinations, [375] known to us only by means of experience or perception. I, on the contrary, prove in the first place that space (and also time, which Berkeley did not consider) and all its determinations can be cognized *a priori* by us, because, no less than time, it inheres in us as a pure form of our sensibility before all perception of experience and makes possible all intuition of sensibility, and therefore all appearances. It follows from this that, as truth rests on universal and necessary laws as its criteria, experience, according to Berkeley, can have no criteria of truth because its appearances (according to him) have nothing *a priori* at their foundation, whence it follows that experience is nothing but sheer illusion; whereas with us, space and time (in conjunction with the pure concepts of the understanding) prescribe their law *a priori* to all possible experience and, at the same time, afford the certain criterion for distinguishing truth from illusion therein.⁴⁹

My so-called (properly critical) idealism is of quite a special kind, in that it reverses the usual idealism and through my kind all *a priori* cognition, even that of geometry, first receives objective reality, which, without my demonstrated ideality of space and time, could not be maintained by the most zealous realists. This being the state of the case, I could wish, in order to avoid all misunderstanding, to have named this concept of mine otherwise, but to alter it altogether is probably impossible. It may therefore be permitted me in future, as has been above intimated, to term it "formal" or, better still, "critical" idealism, to distinguish it from the dogmatic idealism of Berkeley and from the skeptical idealism of Descartes.

Beyond this, I find nothing remarkable in the judgment [376] of my book. The reviewer makes sweeping criticisms, a mode prudently chosen, since it does not betray one's own knowledge or ignorance; a single thorough criticism in detail, had it touched the main question, as is only fair, would have exposed either my error or my reviewer's measure of insight into this kind of inquiry. It was, moreover, not a badly conceived plan, in order at once to take from readers (who are accustomed to form their conceptions of books from newspaper reports) the desire to read the book itself, to pour out one after the other in one breath a number of propositions which, torn from their connection with their premises and explanations, must necessarily sound senseless, especially considering how antipathetic they are to all school metaphysics; to exhaust the reader's patience *ad nauseam*, and then, having made me acquainted with the lucid proposition that persistent illusion is truth, to conclude with the crude paternal moralization: to what end, then, the quarrel with accepted language; to what end, and whence, the idealistic distinction? A judgment which seeks all that is characteristic of my book, first supposed to be metaphysically heterodox, in a mere innovation of the nomenclature proves clearly that my would-be judge has understood nothing of the subject and, in addition, has not understood himself.⁵⁰

My reviewer speaks like a man who is conscious of important and superior insight which he keeps hidden, for I am aware of nothing recent with respect to metaphysics that could justify his tone. But he is quite wrong to withhold his discoveries from the world, for there are doubtless many who, like myself, have not been able to find in all the fine things that have for long past been written in this department anything that has advanced the science by so much as a finger's [377] breadth. We find indeed the giving a new point to definitions, the supplying of lame proofs with new crutches, the adding to the crazy-quilt of metaphysics fresh patches or changing its pattern; but all this is not what the world requires. The world is tired of metaphysical assertions; what is wanted is the possibility of this science, the sources from which certainty therein can be derived, and certain criteria by which it may distinguish the dialectical illusion of pure reason from truth. To

this the critic seems to possess a key, otherwise he would never have spoken out in such a high tone.

But I am inclined to suspect that no such requirement of the science has ever entered his thoughts, or in that case he would have directed his judgment to this point, and even a mistaken attempt in such an important matter would have won his respect. If that be the case, we are once more good friends. He may penetrate as deeply as he likes into his metaphysics, without anyone hindering him; only as concerns that which lies outside metaphysics, its sources, which are to be found in reason, he cannot form a judgment. That my suspicion is not without foundation is proved by the fact that he does not mention a word about the possibility of synthetic knowledge *a priori*, the special problem upon the solution of which the fate of metaphysics wholly rests and upon which my *Critique* (as well as the present *Prolegomena*) entirely hinges. The idealism he encountered and which he hung upon was only taken up in the doctrine as the sole means of solving the above problem (although it received its confirmation on other grounds), and hence he must have shown either that the above problem does not possess the importance I attribute to it (even in these *Prolegomena*) or that, by my concept of appearances, it is either not solved at all or can be better solved in another way; but I do not find a word of this in the criticism. The reviewer, then, understands nothing of my work and possibly also nothing of the spirit and essential nature of metaphysics itself; and it is not, what I would rather assume, the haste of a reviewer to finish his review, incensed at the labor of plodding through so many obstacles, that threw an unfavorable shadow over the work lying before him and made its fundamental features unrecognizable.

[378] There is a great deal to be done before a learned journal, it matters not with what care its writers may be selected, can maintain its otherwise well-merited reputation in the field of metaphysics as elsewhere. Other sciences and branches of knowledge have their standard. Mathematics has it in itself, history and theology in secular or sacred books, natural science and the art of medicine in mathematics and experience, jurisprudence in law books, and even matters of taste in the examples of the ancients. But for the judgment of the thing called metaphysics, the standard has yet to be found. I have made an attempt to determine it, as well as its use. What is to be done, then, until it be found, when works of this kind have to be judged? If they are of a dogmatic character, one may do what one likes; no one will play the master over others here for long before someone else appears to deal with him in the same manner. If, however, they are critical in character, not indeed with reference to other works but to reason itself, so that the standard of judgment cannot be assumed but has first of all to be sought for, then, though objection and blame may indeed be permitted, yet a certain degree of leniency is indispensable, since the need is common to us all and the lack of the necessary insight makes the high-handed attitude of judge unwarranted.

In order, however, to connect my defense with the interest of the philosophical commonwealth, I propose a test, which must be decisive as to the mode whereby all metaphysical investigations may be directed to their common purpose. This is nothing more than what mathematicians have done in establishing the advantage of their methods by competition. I challenge my critic to demonstrate, as is only just, on *a priori* grounds, in his own way, any single really metaphysical principle asserted by him. Being metaphysical, it must be synthetic and cognized *a priori* from concepts, but it may also be any one of the most indispensable propositions, as, for instance, the principle of the permanence of substance or of the necessary determination of events in the world by their causes. If he cannot do this (silence however is confession), he must admit that, since metaphysics without apodeictic certainty of propositions of this kind is nothing at all, its possibility or impossibility must before all things be established in a critique of [379] pure reason. Thus he is bound either to confess that my principles in the *Critique* are correct, or he must prove their invalidity. But as I can already foresee that, confidently as he has hitherto relied on the certainty of his principles, when it comes to a strict test he will not find a single one in the whole range of metaphysics he can boldly bring forward, I will concede to him an advantageous condition, which can only be expected in such a competition, and will relieve him of the *onus probandi* by laying it on myself.

He finds in these *Prolegomena* and in my *Critique*⁵¹ eight propositions, of which one in each pair contradicts the other, but each of which necessarily belongs to metaphysics, by which it must either be accepted or rejected (although there is not one that has not in its time been accepted by some philosopher). Now he has the liberty of selecting any one of these eight propositions at his pleasure and accepting it without any proof, of which I shall make him a present, but only one (for waste of time will be just as little serviceable to him as to me), and then of attacking my proof of the opposite proposition. If I can save this one and at the same time show that, according to principles which every dogmatic metaphysics must necessarily recognize, the contrary of the proposition adopted by him can be just as clearly proved, it is thereby established that metaphysics has an hereditary failing not to be explained, much less set aside, until we ascend to its birthplace, pure reason itself. And thus my *Critique* must either be accepted or a better one take its place; at least it must

be studied, which is the only thing I now require. If, on the other hand, I cannot save my demonstration, then a synthetic proposition *a priori* from dogmatic principles is to be reckoned to the score of my opponent, and I shall deem my impeachment of ordinary metaphysics unjust and pledge myself to recognize his censure of my *Critique* as justified (although this would not be the consequence by a long way). To this end it would be necessary, it seems to me, that he should step out of his incognito. Otherwise I do not see how it could be avoided that, instead of dealing with one, I should be honored or besieged by several challenges coming [380] from anonymous and unqualified opponents.

Proposals as to an Investigation of the Critique upon Which a Judgment May Follow

I feel obliged to the learned public even for the silence with which it for a long time honored my *Critique*, for this proves at least a postponement of judgment and some supposition that, in a work leaving all beaten tracks and striking out on a new path, in which one cannot at once perhaps so easily find one's way, something may perchance lie from which an important but at present dead branch of human knowledge may derive new life and productiveness. Hence may have originated a solicitude for the as yet tender shoot, lest it be destroyed by a hasty judgment. A specimen of a judgment, delayed for the above reasons, is now before my eye in the *Gothaische gelehrte Zeitung*,⁵² the thoroughness of which (leaving out of account my praise, which might be suspicious) every reader will himself perceive from the clear and unperverted presentation of a fragment of one of the first principles of my work.

Since an extensive structure cannot be judged at once as a whole from a hurried glance, I propose that it be tested piece by piece from its foundation up, and in this, the present *Prolegomena* may be used as a general outline with which the work itself may conveniently be compared. This suggestion, if it were founded on nothing more than my conceit of importance, such as vanity ordinarily attributes to all of one's own productions, would be immodest and would deserve to be rejected with indignation. But now the interests of all speculative philosophy have arrived at the point of total extinction, while human reason hangs upon them with inextinguishable affection; and only after having been endlessly disappointed, does it vainly attempt to change this into indifference.

In our thinking age, it is not to be supposed but that many deserving men would use any good opportunity of working for the common interest of an ever more [381] enlightened reason, if there were only some hope of attaining the goal. Mathematics, natural science, laws, arts, even morality, etc. do not completely fill the soul; there is always a space left over reserved for pure and speculative reason, the emptiness of which prompts us to seek in vagaries, buffooneries, and mysticism for what seems to be employment and entertainment, but what actually is mere pastime undertaken in order to deaden the troublesome voice of reason, which, in accordance with its nature, requires something that can satisfy it and does not merely subserve other ends or the interests of our inclinations. A consideration, therefore, which is concerned only with this extent of reason as it subsists for itself has, as I may reasonably suppose, a great fascination for everyone who has attempted thus to extend his concept, and I may even say a greater fascination than any other theoretical branch of knowledge, for which he would not willingly exchange it because here all other branches of knowledge and even purposes must meet and unite themselves in a whole.

I offer, therefore, these *Prolegomena* as a plan and guide for this investigation, and not the work itself. Although I am even now perfectly satisfied with the latter as far as contents, order, and mode of presentation, and the care that I have expended in weighing and testing every sentence before writing it down are concerned (for it has taken me years to satisfy myself fully, not only as regards the whole, but in some cases even as to the sources of one particular proposition); yet I am not quite satisfied with my exposition in some sections of the Doctrine of Elements,⁵³ as for instance in the deduction of the concepts of the understanding or in the chapter on the paralogisms of pure reason,⁵⁴ because a certain diffuseness takes away from their clearness, and in place of them what is here said in the *Prolegomena* respecting these sections may be made the basis of the test.

It is the boast of the Germans that, where steady and continuous industry are requisite, they can carry things further than other nations. If this opinion be well founded, an opportunity, a task, presents itself; the successful issue of this task can scarcely be doubted and all thinking men can equally take Part In it, though they have hitherto been unsuccessful in accomplishing it and in thus confirming the above good opinion. This is chiefly because the science in question is of such a special kind that it can all at [382] once be brought to completion and to that permanent state beyond which it can never be developed, in the least degree enlarged by later discoveries, or changed if we leave out of account adornment by greater clearness in some places or additional utility for all sorts of purposes. This is an advantage no other science has or can have, because there

is none so completely isolated and independent of others and so exclusively concerned with the faculty of cognition pure and simple. And the present moment seems not to be unfavorable to my expectation; for in Germany no one seems now to know how to occupy himself, apart from the so-called useful sciences, so as to pursue not mere play but a business possessing an enduring purpose.

To discover how the endeavors of the learned may be united in such a purpose I must leave to others. In the meantime, it is not my intention to persuade anyone merely to follow my theses or even to flatter me with the hope that he will do so; but attacks, repetitions, limitations, or confirmation, completion, and extension, as the case may be, should be appended. If the matter be but investigated from its foundation, it cannot fail that a system, albeit not my own, shall be erected that shall be a possession for future generations for which they may have reason to be grateful.

It would lead us too far here to show what kind of metaphysics may be expected when the principles of criticism have been perfected and how, though the old false feathers have been pulled out, it need by no means appear poor and reduced to an insignificant figure but may be in other respects richly and respectably adorned. But other and great uses which would result from such a reform strike one immediately. The ordinary metaphysics had its uses, in that it sought out the elementary concepts of the pure understanding in order to make them clear through analysis and determinate through explications. In this way it was a training for reason, in whatever direction it might be turned. But this was all the good it did. This merit was subsequently destroyed when it favored conceit by venturesome assertions, sophistry by subtle dodges and prettifying, and shallowness by the ease with which it decided the most difficult problems by means of a little school wisdom, which is only the more seductive the more it has the choice, [383] on the one hand, of taking on something of the language of science and, on the other, from that of popular discourse—thus being everything to everybody but in reality being nothing at all. By criticism, however, a standard is given to our judgment whereby knowledge may be with certainty distinguished from pseudo-knowledge and firmly founded, being brought into full operation in metaphysics—a mode of thought extending by degrees its beneficial influence over every other use of reason, at once infusing into it the true philosophical spirit. But the service that metaphysics performs also for theology, by making it independent of the judgment of dogmatic speculation and thereby securing it completely against the attacks of all such opponents, is certainly not to be valued lightly. For ordinary metaphysics, although it promised theology much advantage, could not keep this promise, and by summoning speculative dogmatics to its assistance did nothing but arm enemies against itself. Mysticism, which can prosper in a rationalistic age only when it hides itself behind a system of school metaphysics, under the protection of which it may venture to rave with a semblance of rationality, is driven from theology, its last hiding place, by critical philosophy. Last, but not least, it cannot be otherwise than important to a teacher of metaphysics to be able to say with universal assent that what he expounds is *science*, and that by it actual service will be rendered to the commonweal.

31. If we can say that a science is actual, at least in the idea of all men, as soon as it appears that the problems which lead to it are proposed to everybody by the nature of human reason, and hence that at all times many (though faulty) endeavors are unavoidably made in its behalf; then we are bound to say that metaphysics is subjectively (and indeed necessarily) actual, and then we justly ask how is it (objectively) possible.

32. In disjunctive judgments we consider all possibility as divided in respect to a particular concept. By the ontological principle of the thoroughgoing determination of a thing in general, I understand the principle that either the one or the other of all possible contradictory predicates must be assigned to any object. This is at the same time the principle of all disjunctive judgments, constituting the foundation of the totality of all possibility, and in it the possibility of every object in general is considered as determined. This may serve as a brief explanation of the above proposition: that the activity of reason in disjunctive syllogisms is formally the same as that by which it fashions the idea of a totality of all reality, containing in itself the positive member of all contradictory predicates.

33. [See *Critique of Pure Reason*, "The Paralogisms of Pure Reason," A 341/B 399–A 405/B 432.]

34. Were the representation of the apperception (the ego) a concept by which anything could be thought, it could be used as a predicate of other things or contain predicates in itself. But it is nothing more than the feeling of an existence without the slightest concept and is only the representation of that to which all thinking stands in relation (*relatione accidentis*).

35. [Cf. *Critique*, B 224–232.]

36. It is indeed very remarkable how carelessly metaphysicians have always passed over the principle of the permanence of substances without ever attempting a proof of it; doubtless because they found themselves abandoned by all proofs as soon as they began to deal with the concept of substance. Common sense, which felt distinctly that without this presupposition no union of perceptions in experience is possible, supplied the want by a postulate. From experience itself it never could derive such a principle, partly because material objects (substances) cannot be so traced in all their alterations and dissolutions that the matter can always be found undiminished, partly because the principle contains *necessity*, which is always the sign of an *a priori* principle. People then boldly applied this postulate to the concept of soul as a *substance*, and concluded a necessary

continuance of the soul after the death of man (especially as the simplicity of this substance, which is inferred from the indivisibility of consciousness, secured it from destruction by dissolution). Had they found the genuine source of this principle—a discovery which requires deeper researches than they were ever inclined to make—they would have seen that the law of the permanence of substances finds a place for the purposes of experience only, and hence can hold good of things so far as they are to be cognized and conjoined with others in experience, but never independently of all possible experience, and consequently cannot hold good of the soul after death.

37. [Cf. *Critique*, “The Antinomy of Pure Reason,” B 432–595.]

38. I therefore would be pleased to have the critical reader to devote to this antinomy of pure reason his chief attention, because nature itself seems to have established it with a view to stagger reason in its daring pretensions and to force it to self-examination. For every proof which I have given both of the thesis and the antithesis, I pledge myself to be responsible, and thereby to show the certainty of the inevitable antinomy of reason. When the reader is brought by this curious phenomenon to fall back upon the proof of the presumption upon which it rests, he will feel himself obliged to investigate the ultimate foundation of all the cognition of pure reason with me more thoroughly.

39. The idea of freedom occurs only in the relation of the intellectual, as cause, to the appearance, as effect. Hence we cannot attribute freedom to matter in regard to the incessant action by which it fills its space, though this action takes place from an internal principle. We can likewise find no concept of freedom suitable to purely rational beings, for instance, to God, so far as his action is immanent. For his action, though independent of external determining causes, is determined in his eternal reason, that is, in the divine *nature*. It is only, if *something is to start* by an action, and so the effect occurs in the sequence of time, or in the world of sense (e.g., the beginning of the world), that we can put the question whether the causality of the cause must in its turn have been started or whether the cause can originate an effect without its causality itself beginning. In the former case the concept of this causality is a concept of natural necessity; in the latter, that of freedom. From this the reader will see that as I explained freedom to be the faculty of starting an event spontaneously, I have exactly hit the concept which is the problem of metaphysics.

40. [Cf. *Critique*, “The Ideal of Pure Reason,” B 595–670.]

41. Herr Platner, in his *Aphorisms*, acutely says (§§ 728, 729), “If reason be a criterion, no concept which is incomprehensible to human reason can be possible. Incomprehensibility has place in what is actual only. Here incomprehensibility arises from the insufficiency of the acquired ideas.” It sounds paradoxical, but is otherwise not strange to say that in nature there is much that is incomprehensible (e.g., the faculty of generation); but if we mount still higher and go even beyond nature, everything again becomes conceivable. For we then quit entirely the objects which can be given us and occupy ourselves merely about ideas, in which occupation we can easily conceive the law that reason prescribes by them to the understanding for its use in experience, because the law is reason’s own product.

42. [David Hume, *Dialogues Concerning Natural Religion* (1779).]

43. Thus there is an analogy between the juridical relation of human actions and the mechanical relation of moving forces. I never can do anything to another man without giving him a right to do the same to me on the same conditions; just as no body can act with its moving force on another body without thereby causing the other to react equally against it. Here right and moving force are quite dissimilar things, but in their relations there is complete similarity. By means of such an analogy, I can obtain a relational concept of things which are absolutely unknown to me. For instance, as the promotion of the welfare of children (= a) is to the love of parents (= b), so the welfare of the human species (= c) is to that unknown in God (= x), which we call love; not as if it had the least similarity to any human inclination, but because we can posit its relation to the world to be similar to that which things of the world bear one another. But the relational concept in this case is a mere category, viz., the concept of cause, which has nothing to do with sensibility.

44. I may say that the causality of the Supreme Cause holds the same place with regard to the world that human reason does with regard to its works of art. Here the nature of the Supreme Cause itself remains unknown to me; I only compare its effects (the order of the world), which I know, and their conformity to reason to the effects of human reason, which I also know; and hence I term the former reason, without attributing to it on that account what I understand in man by this term, or attaching to it anything else known to me as its property.

45. [*Critique of Pure Reason*, “The Regulative Employment of the Ideas of Pure Reason,” B 670–696.]

46. Throughout in the *Critique* I never lost sight of the plan not to neglect anything, were it ever so recondite, that could render the inquiry into the nature of pure reason complete. Everybody may afterward carry his researches as far as he pleases, when he has been merely shown what yet remains to be done. This can reasonably be expected of him who has made it his business to survey the whole field, in order to consign it to others for future cultivation and allotment. And to this branch both the scholia belong, which will hardly recommend themselves by their dryness to amateurs, and hence are added here for connoisseurs only.

47. [This review was given by Christian Garve.]

48. By no means “higher.” High towers and metaphysically great men resembling them, around both of which there is commonly much wind, are not for me. My place is the fruitful bathos of experience; and the word “transcendental,” the meaning of which is so often indicated by me but not once grasped by my reviewer (so carelessly has he regarded everything), does not signify something passing beyond all experience but something that indeed precedes it *a priori*, but that is intended simply to make cognition of experience possible. If these concepts overstep experience, their use is termed “transcendent,” which must be distinguished from the immanent use, i.e., use restricted to experience. All misunderstandings of this kind have been sufficiently guarded against in the work itself, but my reviewer found his advantage in misunderstanding me.

49. Idealism proper always has a mystical tendency, and can have no other; but mine is solely designed for the purpose of comprehending the

possibility of our *a priori* cognition of objects of experience, which is a problem never hitherto solved or even suggested. In this way all mystical idealism falls to the ground, for (as may be seen in Plato) it inferred from our cognitions *a priori* (even from those of geometry) another intuition different from that of the senses (namely, an intellectual intuition), because it never occurred to anyone that the senses themselves might intuit *a priori*.

50. The reviewer often fights with his own shadow. When I oppose the truth of experience to dream, he never thinks that I am here speaking simply of the well-known *somnio objective sumto* ["dreams taken objectively" — Christian Wolff's *German Metaphysics*, § 142] of the Wolffian philosophy, which is merely formal, and with which the distinction between sleeping and waking is in no way concerned—a distinction which can indeed have no place in a transcendental philosophy. For the rest, he calls my deduction of the categories and table of the principles of the understanding "common well-known axioms of logic and ontology, expressed in an idealistic manner." The reader need only consult these *Prolegomena* upon this point to convince himself that a more miserable and historically incorrect judgment could hardly be made.

*Critique of Pure Reason**

Preface [*Second Edition*]

Whether someone's treatment of the cognitions pertaining to reason's business does or does not follow the secure path of a science — this we can soon judge from the result. If, after many preparations and arrangements have been made, the treatment falters as soon as it turns to its purpose; or if, in order to reach that purpose, it repeatedly has to retrace its steps and enter upon a different path; or, again, if the various collaborators cannot be brought to agree on the manner in which their common aim is to be achieved — then we may rest assured that such an endeavor is still far from having entered upon the secure path of a science, but is a mere groping about. We shall indeed be rendering a service to reason if we can possibly discover that path, even if we should have to give up as futile much that was included in the purpose which we had previously adopted without deliberation.

Logic [Bviii] has been following that secure path from the earliest times. This is evident from the fact that since *Aristotle* it has not needed to retrace a single step, unless perhaps removing some of its dispensable subtleties, or setting it forth in a more distinct and determinate way, were to be counted as improvements of logic, even though they pertain more to the elegance of that science than to its being secure. Another remarkable fact about logic is that thus far it also has not been able to advance a single step, and hence is to all appearances closed and completed. It is true that some of the more recent [philosophers] have meant to expand logic. Some of them have inserted into it *psychological* chapters on the different cognitive powers (e.g., on our power of imagination, or on ingenuity). Others have inserted *metaphysical* chapters on the origin of cognition, or the origin of the different kinds of certainty according to the difference in the objects (i.e., chapters on idealism, skepticism, etc.). Still others have inserted into logic *anthropological* chapters on prejudices (as well as their causes and remedies). But all these attempts to expand logic are the result of ignorance concerning the peculiar nature of this science. We do not augment sciences, but corrupt them, if we allow their boundaries to overlap. But the boundary of logic is determined quite precisely by the fact that logic is a science that provides nothing but a comprehensive exposition and [Bix] strict proof of the formal rules of all thought. (Such thought may be a priori or empirical, may have any origin or object whatsoever, and may encounter in our minds obstacles that are accidental or natural.)

That logic has been so successful in following the secure path of a science is an advantage that it owes entirely to its limitations. They entitle it, even obligate it, to abstract from all objects of cognition and their differences; hence in logic the understanding deals with nothing more than itself and its form. Reason naturally had to find it far more difficult to enter upon the secure path of science when dealing not just with itself, but also with objects. By the same token, logic is a propaedeutic and forms, as it were, only the vestibule of the sciences; and when knowledge is at issue, while for the judging of such knowledge we do indeed presuppose a logic, yet for its acquisition we must look to what are called sciences properly and objectively.

Now insofar as there is to be reason in these sciences, something in them must be cognized a priori. Moreover, reason's cognition can be referred to the object of that cognition in two ways: either in order merely to *determine* the object and its concept (which [Bx] must be supplied from elsewhere), or in order to *make it actual* as well. The first is reason's *theoretical*, the second its *practical cognition*. In both the pure part, i.e., the part in which reason determines its object entirely a priori, must be set forth all by itself beforehand, no matter how much or how little it may contain. We must not mix with this part what comes from other sources. For we follow bad economic procedures if we blindly spend what comes in and are afterwards unable, when the procedure falters, to distinguish which part of the income can support the expenditure and which must be cut from it.

Two [sciences involving] theoretical cognitions by reason are to determine their *objects* a priori: they are *mathematics* and *physics*. In mathematics this determination is to be entirely pure; in physics it is to be at least

partly pure, but to some extent also in accordance with sources of cognition other than reason.

Mathematics has been following the secure path of a science since the earliest times to which the history of human reason extends; it did so already among that admirable people, the Greeks. But we must not think that it was as easy for mathematics to [Bxi] hit upon that royal road — or, rather, to build it on its own — as it was for logic, where reason deals only with itself. Rather, I believe that for a long time (above all, it was still so among the Egyptians) mathematics did no more than grope about, and that its transformation into a science was due to a *revolution* brought about by the fortunate idea that occurred to one man during an experiment. From that time onward, the route that mathematics had to take could no longer be missed, and the secure path of a science had been entered upon and traced out for all time and to an infinite distance. This revolution in the way of thinking was much more important than the discovery of the passage around the celebrated Cape.¹ Its history, and that of the fortunate man who brought this revolution about, is lost to us. But *Diogenes Laërtius*² always names the reputed authors of even the minutest elements of geometrical demonstration, elements that in ordinary people's judgment do not even stand in need of proof; and Diogenes hands down to us a story concerning the change that was brought about by the first indication of this new path's discovery. This story shows that the memory of this change must have seemed exceedingly important to mathematicians, and thus became indelible. When the *isosceles triangle* was first demonstrated, something dawned on the man who did so. (He may have been called *Thales*,³ or by some other name.) He found that what he [Bxii] needed to do was not to investigate what he saw in the figure, nor — for that matter — to investigate the mere concept of that figure, and to let that inform him, as it were, of the figure's properties. He found, rather, that he must bring out (by constructing the figure) the properties that the figure had by virtue of what he himself was, according to concepts, thinking into it a priori and exhibiting. And he found that in order for him to know anything a priori and with certainty about the figure, he must attribute to this thing nothing but what follows necessarily from what he has himself put into it in accordance with his concept.

Natural science took much longer to hit upon the high road of science. For only about a century and a half have passed since the ingenious *Bacon*, Baron Verulam,⁴ made the proposal that partly prompted this road's discovery, and partly—insofar as some were already on the trail of this discovery—invigorated it further. This discovery, too, can be explained only by a sudden revolution in people's way of thinking. I shall here take account of natural science only insofar as it is founded on *empirical* principles.

Something dawned on all investigators of nature when *Galileo* let balls, of a weight chosen by himself, roll down his inclined plane; or when *Torricelli*⁵ made the air carry a weight that he had judged beforehand to be equal to the weight of a water column known to [Bxiii] him; or when, in more recent times, *Stahl*⁶ converted metals into calx and that in turn into metal, by withdrawing something⁷ from the metals and then restoring it to them.⁸ What all these investigators of nature comprehended⁹ was that reason has insight only into what it itself produces according to its own plan; and that reason must not allow nature by itself to keep it in leading strings, as it were, but reason must — using principles that underlie its judgments — proceed according to constant laws and compel nature to answer reason's own questions. For otherwise our observations, made without following any plan outlined in advance, are contingent, i.e., they have no coherence at all in terms of a necessary law—even though such a law is what reason seeks and requires. When approaching nature, reason must hold in one hand its principles, in terms of which alone concordant appearances can count as laws, and in the other hand the experiment that it has devised in terms of those principles. Thus reason must indeed approach nature in order to be instructed by it; yet it must do so not in the capacity of a pupil who lets the teacher tell him whatever the teacher wants, but in the capacity of an appointed judge who compels the witnesses to answer the question that he puts to them. Thus even [Bxiv] physics owes that very advantageous revolution in its way of thinking to this idea: the idea that we must, in accordance with what reason itself puts into nature, seek in nature (not attribute to it fictitiously) whatever reason must learn from nature and would know nothing of on its own. This is what put natural science, for the very first time, on the secure path of a science, after it had for so many centuries been nothing more than a mere groping about.

Metaphysics is a speculative cognition by reason that is wholly isolated and rises entirely above being instructed by experience. It is cognition through mere concepts (not, like mathematics, cognition through the application of concepts to intuition), so that here reason is to be its own pupil. But although metaphysics is older than all the other sciences, and would endure even if all the others were to be engulfed utterly in the abyss of an all-annihilating barbarism, fate thus far has not favored it to the point of enabling it to enter upon the secure path of a science. For in metaphysics reason continually falters, even when the laws into which it seeks to gain (as it pretends) a priori insight are those that are confirmed by the commonest experience.

Countless times, in metaphysics, we have to retrace our steps, because we find that our path does not lead us where we want to go. As regards agreement in the assertions made by its [Bxxv] devotees, metaphysics is very far indeed from such agreement. It is, rather, a combat arena which seems to be destined quite specifically for practicing one's powers in mock combat, and in which not one fighter has ever been able to gain even the smallest territory and to base upon his victory a lasting possession. There can be no doubt, therefore, that the procedure of metaphysics has thus far been a mere groping about, and—worst of all—a groping about among mere concepts.

Why is it, then, that in metaphysics we have thus far been unable to find the secure path of science? Might this path be impossible here? Why, then, has nature inflicted on reason, as one of reason's most important concerns, the restless endeavor to discover that path? What is more: how little cause have we to place confidence in our reason, when in one of the most important matters where we desire knowledge reason not merely forsakes us, but puts us off with mere pretenses and in the end betrays us! Or if we have only missed the path thus far, what indication do we have that if we renew our search, we may hope to be more fortunate than others before us have been?

I would think that the examples of mathematics and natural science, which have become what they [Bxxvi] now are by a revolution accomplished all at once, are sufficiently remarkable to [suggest that we should] reflect on the essential component in that revolution, viz., the transformation of the way of thinking that became so advantageous for them; and as far as is permitted by the fact that they, as rational cognitions, are analogous to metaphysics, we should [there] imitate them with regard to that transformation, at least by way of an experiment. Thus far it has been assumed that all our cognition must conform to objects. On that presupposition, however, all our attempts to establish something about them a priori, by means of concepts through which our cognition would be expanded, have come to nothing. Let us, therefore, try to find out by experiment whether we shall not make better progress in the problems of metaphysics if we assume that objects must conform to our cognition. — This assumption already agrees better with the demanded possibility of an a priori cognition of objects — i.e., a cognition that is to ascertain something about them before they are given to us. The situation here is the same as was that of *Copernicus* when he first thought of explaining the motions of celestial bodies.¹⁰ Having found it difficult to make progress there when he assumed that the entire host of stars revolved around the spectator, he tried to find out by experiment whether he might not be more successful if he had the spectator revolve and the stars remain at rest. Now, we can try a similar experiment in metaphysics, [Bxxvii] with regard to our *intuition* of objects. If our intuition had to conform to the character of its objects, then I do not see how we could know anything a priori about that character. But I can quite readily conceive of this possibility if the object (as object of the senses) conforms to the character of our power of intuition. However, if these intuitions are to become cognitions, I cannot remain with them but must refer them, as presentations, to something or other as their object, and must determine this object by means of them. [Since for this determination I require concepts, I must make one of two assumptions.] I can assume that the *concepts* by means of which I bring about this determination likewise conform to the object;¹¹ and in that case I am again in the same perplexity as to how I can know anything a priori about that object. Or else I assume that the objects, or—what amounts to the same¹² — the *experience* in which alone they (as objects that are given to us) can be cognized, conform to those concepts. On this latter assumption, I immediately see an easier way out. For experience is itself a way of cognizing for which I need understanding. But understanding has its rule, a rule that I must presuppose within me even before objects are given to me, and hence must presuppose a priori; and that rule is expressed in a priori concepts. Hence all objects of experience must necessarily conform [Bxxviii] to these concepts and agree with them. Afterwards, however, we must also consider objects insofar as they can merely be thought, though thought necessarily, but cannot at all be given in experience (at least not in the way in which reason thinks them). Our attempts to think these objects (for they must surely be thinkable) will afterwards provide us with a splendid touchstone of what we are adopting as the changed method in our way of thinking, viz., that all we cognize a priori about things is what we ourselves put into them.¹³

This experiment is as successful as was desired. It promises that metaphysics will be on the secure path of a science in its first part, viz., the part where it deals with those a priori concepts for which corresponding [Bxxix] objects adequate to these concepts can be given in experience. For on the changed way of thinking we can quite readily explain how a priori cognition is possible; what is more, we can provide satisfactory proofs for the laws that lie a priori at the basis of nature considered as the sum of objects of experience. Neither of these accomplishments was possible on the kind of procedure used thus far. On the other hand, this deduction — provided in the first part of metaphysics — of our power to cognize a priori¹⁴ produces a disturbing result that

seems highly detrimental to the whole purpose of metaphysics as dealt with in the second part: viz., that with this power to cognize a priori we shall never be able to go beyond the boundary of possible experience, [Bxx] even though doing so is precisely the most essential concern of this science. Yet this very [situation permits] the experiment that will countercheck the truth of the result that we obtained from the first assessment of our a priori rational cognition: viz., that our rational cognition applies only to appearances, and leaves the thing in itself uncognized by us, even though inherently actual. For what necessarily impels us to go beyond the boundary of experience and of all appearances is the *unconditioned* that reason demands in things in themselves; reason — necessarily and quite rightfully — demands this unconditioned for everything conditioned, thus demanding that the series of conditions be completed by means of that unconditioned. Suppose, now, we find that the unconditioned *cannot be thought at all without contradiction* if we assume that our experiential cognition conforms to objects as things in themselves, yet that *the contradiction vanishes* if we assume that our presentation of things, as these are given to us, does not conform to them as things in themselves, but that these objects are, rather, appearances that conform to our way of presenting. Suppose that we find, consequently, that the unconditioned is not to be met with in things insofar as we are acquainted with them (i.e., insofar as they are given to us), but is to be met with in them [only] insofar as we are not acquainted with them, viz., insofar as they are things in themselves. If this is what we find, it will show that what we assumed initially only by way of an experiment¹⁵ does in fact [Bxxi] have a foundation.¹⁶ Now, once we have denied that speculative reason can make any progress in that realm of the suprasensible,¹⁷ we still have an option available to us. We can try to discover whether perhaps in reason's practical cognition data can be found that would allow us to determine reason's transcendent concept of the unconditioned.¹⁸ Perhaps in this way our a priori cognition, though one that is possible only from a practical point of view, would still allow us to get beyond the boundary of all possible experience, as is the wish of metaphysics. Moreover, when we follow this kind of procedure,¹⁹ still speculative reason has at least provided us with room for such an expansion [of our cognition], even if it had to leave that room empty. And hence there is as yet nothing to keep us from filling in that room, if we can, with practical *data* of reason; indeed, reason summons us to do so.²⁰ [Bxxii]

The task, then, of this critique of pure speculative reason consists in the described attempt to transform the procedure previously followed in metaphysics, by subjecting metaphysics to a complete revolution, thus following the example set by the geometers and investigators of nature. The critique is a treatise on the method [of the science of metaphysics], not a system of the science itself. Yet it does set down the [Bxxiii] entire outline of metaphysics, including the bounds of this science as well as its entire internal structure. For pure speculative reason has a twofold peculiarity. First, it both can and ought to measure what its own ability is according to the different ways in which it selects objects for its thought. For in a priori cognition nothing can be attributed to objects except what the thinking subject takes from itself. Second, pure speculative reason also can and ought to enumerate completely and on its own the various ways it has of posing problems to itself, and thus to set down in advance the entire outline for a system of metaphysics. For, as regards its cognitive principles, it is an entirely separate, self-subsistent unity in which, as in an organized body, each member exists for the sake of all the others, and all exist for the sake of each one. In this unity no principle can safely be taken in *one* reference unless we have also investigated it in [its] *thoroughgoing* reference to our entire pure use of reason. But [as a consequence of this unity of pure speculative reason] metaphysics is also exceptionally fortunate in a way that is denied to all other rational sciences dealing with objects (as distinguished from *logic*, which deals only with the form of thought as such): Once metaphysics has been brought by this critique onto the secure path of a science, it is able to encompass completely the entire realm of the cognitions pertaining to it. Hence it can complete its work [Bxxiv] and put it aside for the use of posterity, as capital that can never be increased. What enables metaphysics to complete its work is that it deals merely with principles, and with the restrictions on their use as determined by these principles themselves. Moreover, being a basic science, it is also obligated to achieve this completeness; regarding metaphysics we must be able to say: *nil actum reputans, si quid superesset agendum*.²¹

But, it will be asked, what sort of treasure is this that we mean to bequeath to posterity, in leaving them a metaphysics that has been purified by critique, though thereby also made durable? A cursory survey of this work will leave one with the impression that such a metaphysics benefits us only *negatively*, viz., by instructing us that in [using] speculative reason we must never venture beyond the boundary of experience; and this instruction is indeed its primary benefit. But this benefit becomes *positive* as soon as we become aware that the principles with which speculative reason ventures beyond its boundary do not in fact *expand* our use of reason; they unfailingly *narrow* it, as we find when we examine them more closely. For these principles, which

properly pertain to sensibility, do actually threaten²² to expand the bounds of sensibility until they include everything, thus threatening [Bxxv] even to displace the pure (practical) use of reason. Hence a critique that restricts speculative reason is, to that extent, indeed *negative*. But because, by doing so, the critique also removes an obstacle that restricts — or even threatens to annihilate — the practical use of reason, its benefit is in fact *positive* and very important. We see this as soon as we become convinced that there is a use of pure reason which is practical and absolutely necessary (viz., its moral use). When used practically, pure reason inevitably expands and reaches beyond the bounds of sensibility; and although it does not require for this any help from speculative pure reason, it must still be assured against interference from it in order not to fall into contradiction with itself. To deny that this service rendered by the critique has a *positive* benefit would be like saying that the police provides no positive benefit; after all, one might say, the main task of the police is only to put a stop to the violence on whose account citizens must fear each other, in order that everyone may carry on his business calmly and safely. Now in the analytic part of the critique I shall prove that space and time are only forms of our sensible intuition and hence are only conditions of the existence of things as appearances, and that, furthermore, we have no concepts of understanding, and hence [Bxxvi] also no elements whatever for the cognition of things, except insofar as intuition can be given corresponding to these concepts. That will prove, consequently, that we cannot have [speculative] cognition of any object as thing in itself, but can have such cognition only insofar as the object is one of sensible intuition, i.e., an appearance. And from this it does indeed follow that any possible speculative cognition of reason is restricted to mere objects of *experience*. On the other hand, it must be noted carefully that this [conclusion] is always subject to this reservation: that we must be able at least to *think*, even if not [speculatively] *cognize*, the same objects also as things in themselves.²³ For otherwise an absurd proposition would follow, [Bxxvii] viz., that there is appearance without anything that appears. Now let us suppose that the distinction, necessitated by our critique, between objects of experience and these same objects as things in themselves, had not been made at all. In that case the principle of causality, and hence nature's mechanism as governing the determination of [the exercise of] that causality, would definitely have to hold for all things as such²⁴ [construed] as efficient causes. Hence I could not, without manifest contradiction, say of the same being, for example the human soul, that its will is free and yet is subject to natural necessity, i.e., not free. For I would be taking the soul *in the same sense* in the two propositions, viz., as a thing as such (thing in itself); nor, without prior critique, could I help taking it so. Suppose, on the other hand, that the *Critique* is not in error when it teaches us to take the object in *two different senses*, viz., as appearance and as thing in itself: and that the deduction of the *Critique's* concepts of understanding is correct, so that the principle of causality applies to things only in the first sense, viz., insofar as they are objects of experience, but that these same objects are not subject to that principle when taken in the second sense.²⁵ On these suppositions, no contradiction arises when we [Bxxviii] think the same will in both these ways: in its appearance (i.e., in its visible acts), as conforming necessarily to natural law and as to that extent *not free*; yet on the other hand, *qua* belonging to a thing in itself,²⁶ as not subject to that law, and hence as *free*. Now as regards my soul when considered from this second standpoint, I cannot *cognize* it through any [use of] speculative reason (let alone through empirical observation); nor, therefore, can I in this way cognize freedom as the property of a being to which I attribute effects in the world of sense. For otherwise I would have to cognize such a being as a being determined with regard to its existence and yet as not determined in time (which is impossible, because I cannot base such a concept on any intuition). Nevertheless, [although I cannot in this way cognize my freedom,] I can still *think* freedom. I.e., at least my presentation of freedom contains no contradiction, if we make our critical distinction between the two ways of presenting (sensible and intellectual), and restrict accordingly the pure concepts of understanding and hence also the principles that flow from them. Now let us suppose that morality necessarily presupposes freedom (in the strictest sense) as a property of our will; for morality adduces a priori, as *data* of reason, original practical principles residing in reason, and these principles [Bxxix] would be absolutely impossible without the presupposition of freedom. But then suppose that speculative reason had proved that freedom cannot be thought at all.²⁷ In that case the moral presupposition²⁸ would have to yield to the other [supposition].²⁹ For this other [supposition]'s opposite involves a manifest contradiction³⁰ (whereas the opposite of freedom and morality involves no contradiction, unless freedom has already been presupposed).³¹ Hence *freedom*, and with it morality, would have to give way to the *mechanism of nature*. But in fact the situation is different. All I need for morality is that freedom does not contradict itself and hence can at least be thought; I do not need to have any further insight into it. In other words, all I need is that freedom [in my act] puts no obstacle whatever in the way of the natural mechanism [that governs] the same act (when the act is taken in a different reference). Thus the doctrine of morality maintains its own place, and so does natural science. But this would not have happened if the critique had not instructed us beforehand about our unavoidable ignorance regarding things in

themselves, restricting to mere appearances what we can *cognize* theoretically. This same exposition of the positive benefit found in critical principles of pure reason can be produced again in regard to the concept of *God* and of the *simple nature* of our *soul*; but for the sake of brevity I shall omit it. Thus³² I cannot even *assume God, freedom, and immortality*, [as I must] for [Bxxx] the sake of the necessary practical use of my reason, if I do not at the same time *deprive* speculative reason of its pretensions to transcendent insight. For in order to reach *God, freedom, and immortality*, speculative reason must use principles that in fact extend merely to objects of possible experience; and when these principles are nonetheless applied to something that cannot be an object of experience, they actually do always transform it into an appearance, and thus they declare all *practical expansion* of reason to be impossible. I therefore had to annul *knowledge* in order to make room for *faith*. And the true source of all the lack of faith which conflicts with morality — and is always highly dogmatic — is dogmatism in metaphysics, i.e., the prejudice according to which we can make progress in metaphysics without a [prior] critique of pure reason.

Although, therefore, it cannot be difficult to leave to posterity the bequest of a metaphysics drawn up systematically in accordance with a critique of pure reason, yet such a metaphysics is a gift that is not to be despised. For consider merely how reason is cultivated generally by pursuing the secure path of a science, as compared to its baseless groping and careless roaming-about when there is no critique. Consider [Bxxxi] also our youth with their desire for knowledge, who can then make better use of their time than they can under the usual dogmatism. That dogmatism encourages them quite early and strongly to reason with ease about things of which they understand nothing and into which, moreover, neither they nor anyone else in the world will ever have any insight. It may even encourage them to seek to invent new ideas and opinions and thus to neglect the study of well-founded sciences. Above all, however, [we see the value of] such a metaphysics if we take into account the inestimable advantage of putting an end, for all future time, to all objections against morality and religion, and of doing so in the *Socratic* manner, viz., by the clearest proof of the opponents' ignorance. For there has always been some metaphysics in the world; and some metaphysics will presumably continue to be found in it, but with it also a dialectic of pure reason, because a dialectic is natural to pure reason. Hence the primary and most important concern of philosophy is to deprive metaphysics, once and for all, of its detrimental influence, by obstructing the source of its errors.

Despite this important change in the realm of the sciences and the *loss* that speculative reason must suffer in what it has thus far imagined to be its possession, [Bxxxii] the situation remains entirely as favorable as ever with regard to the universal human concern, and with regard to the benefit that the world has thus far obtained from the teachings of pure reason. The loss affects only the *monopoly of the schools*; in no way does it affect the *interests of the people*. Let me ask the most adamant dogmatist whether any of the following proofs have ever been able, after emerging from the schools, to reach the public and exert the slightest influence on its conviction: the one that proves our soul's continuance after death from the simplicity of substance; or the one that proves the freedom of the will as opposed to universal mechanism by means of subtle but ineffectual distinctions between subjective and objective practical necessity; or the one that proves the existence of *God* from the concept of a maximally real being ([or] from the contingency of what is changeable and the necessity of a prime mover). I take it that these proofs have never reached the public and influenced it in that way; nor can they ever be expected to do so, because the common human understanding is unfit for such subtle speculation. Rather, the conviction spreading to the public, insofar as it rests on rational grounds, has had to arise from quite different causes. As regards the soul's continuance after death, the hope for a *future life* arose solely from a predisposition discernible to every human being in his [own] nature, viz., the inability ever to be satisfied by what is temporal (and thus is inadequate for the predispositions of his whole vocation). As regards the freedom of the will, the consciousness of *freedom* arose from nothing but the clear exhibition of duties in their opposition to all claims of the inclinations. Finally, as regards the [Bxxxiii] existence of *God*, the faith in [the existence of] a wise and great *author of the world* arose solely from the splendid order, beauty, and provisions manifested everywhere in nature. Indeed, not only does this possession [of convictions held by the public] remain undisturbed, but it even gains further authority through what the schools are [here] being told: viz., that on a point dealing with the universal human concern they should not claim to have a higher and more extensive insight than that which can be attained just as readily by the great multitude (most worthy of our respect); and that they should therefore confine themselves solely to the cultivation of these universally comprehensible and for moral aims sufficient bases of proof. Hence the change³³ affects merely the arrogant claims of the schools, who would like to be considered in these matters (as they are rightly considered in many other matters) as the sole experts and guardians for truths whose key they keep to themselves, telling the public only how to use them (*quod mecum nescit, solus vult scire videri*).³⁴ On the other hand, a more legitimate claim of the speculative philosopher [Bxxxiv] is nonetheless being taken care of here. He remains always the

exclusive trustee of a science that is useful to the public without its knowing this: viz., the critique of reason. For that critique can never become popular; nor does it need to be. For just as finely spun arguments for useful truths never make it into the heads of the people, so do the equally subtle objections against those arguments never occur to them. The school, on the other hand, inevitably gets involved in both the arguments and the objections, as does anyone who advances to [the point where he can] speculate. Hence the school is obligated to investigate thoroughly the rights of speculative reason, in order to forestall once and for all the scandal that sooner or later must become apparent, even to the people, from [all] the controversies — the controversies in which, when there is no critique, metaphysicians (and, as such, finally also the clergy) inevitably become entangled, and which thereafter even corrupt their teachings. Solely by means of critique can we cut off, at the very root, *materialism*, *fatalism*, *atheism*, freethinking *lack of faith*, *fanaticism*, and *superstition*, which can become harmful universally; and, finally, also *idealism* and *skepticism*, which are dangerous mainly to the schools and cannot [Bxxxv] easily cross over to the public. If governments do indeed think it proper to occupy themselves with the concerns of scholars, they should promote the freedom for such critique, by which alone the works of reason can be put on a firm footing. Promoting such freedom would conform much better to their wise care for both sciences and people than does supporting the ridiculous despotism of the schools. The schools raise a loud cry about danger to the public if one tears up the webs they have spun, even though in fact the public has never taken notice of these webs and hence can never feel the loss of them.

Critique does not stand in contrast to the *dogmatic procedure* that reason follows in its pure cognitions; for that procedure is science (and science must always be dogmatic, i.e., it must always do strict proofs from secure a priori principles). Rather, critique stands in contrast to *dogmatism*. Dogmatism is the pretension that we can make progress³⁵ by means of no more than a pure cognition from concepts (i.e., philosophical cognition) in accordance with principles — such concepts and principles as reason has been using for a long time—without inquiring into the manner and the right by which reason has arrived at them. Hence dogmatism is the dogmatic procedure followed by reason *without prior critique of its own ability*. The contrast, therefore, is not one that is meant to support [Bxxxvi] a garrulous shallowness with claims to the name of popularity; let alone one to support skepticism, which makes short work of all metaphysics. Rather, critique is the preliminary operation necessary for promoting a metaphysics that is well-founded and [thus] a science. Such a metaphysics must necessarily be carried out dogmatically, and systematically according to the strictest demand, and hence carried out in a way that complies with school standards (rather than in a popular way). For this demand cannot be remitted because metaphysics promises to carry out its task entirely a priori, and therefore to the complete satisfaction of speculative reason. Hence in carrying out some day the plan prescribed by the critique, i.e., in [composing] the future system of metaphysics, we shall have to follow the strict method of the illustrious *Wolff*, the greatest among all the dogmatic philosophers.³⁶ He was first to provide the example (through which he became the originator of the — not yet extinct— spirit of thoroughness in Germany) as to how one is to take the secure path of a science: viz., by establishing principles in a law-governed way, determining concepts distinctly, trying for strictness in proofs, and avoiding bold leaps in inferences. He was, by the same token, superbly suited to transfer into that secure state such a science as metaphysics is— provided it had occurred to him to prepare the ground in advance by a critique of the organ,³⁷ viz., pure [Bxxxvii] reason itself. His failure to do so must be imputed not so much to him as rather to the dogmatic way of thinking [characteristic] of his age; and for this failure neither the philosophers of his own period, nor those of all the previous ones, have any [grounds] to reproach one another. Those who reject *Wolff's* method and yet simultaneously also the procedure of the critique of pure reason can have in mind nothing but [the aim of] shaking off the fetters of *Science* altogether, thus converting work into play, certainty into opinion, and philosophy into philodoxy.³⁸

As regards this second edition, I wanted, as is proper, to seize this opportunity in order to remedy as much as possible any difficulties and obscurity, from which many of the misinterpretations may have arisen that acute men—perhaps not without my fault—have hit upon in judging this book. I have not found anything to change in the propositions themselves and in the bases used for proving them, nor in the form and completeness of the plan. This is due partly to the long examination to which I had subjected them before submitting the book to the public, and partly to the character of the matter itself, i.e., the nature of a pure speculative reason. For pure speculative reason has a true structure. In such a structure everything is an organ, i.e., everything is there for the sake of each member, and each individual member is [Bxxxviii] there for the sake of all, and hence even the slightest defect,³⁹ whether it be a mistake (error) or an omission, must inevitably betray itself when we use that plan or system. I hope, moreover, that this system will continue to maintain itself in this unchangeable state. What entitles me to this confidence is not self-conceit, but merely the fact that this [unchangeable state of the system] is evident from the following experiment: We obtain the

same result whether we proceed from the minutest elements all the way to the whole of pure reason, or proceed backward to each part when starting from the whole (for this whole also is given by itself, through reason's final aim in the practical sphere); and the result is the same because any attempt to alter even the smallest Part Immediately gives rise to contradictions, not merely in the system, but in human reason in general. On the other hand, much remains to be done as regards the [manner of] *exposition*, and in this regard I have tried to make improvements by providing this new edition. Some of these improvements are meant to remedy the misunderstanding concerning the Aesthetic, especially the concept of time; others, the obscurity in the deduction of the concepts of understanding. Yet other improvements are meant to remedy the supposed lack of sufficient evidence in the proofs of the principles of pure understanding; and others still, finally, to remedy the misinterpretation of the paralogisms advanced against rational psychology. That is how far the alterations extend that I have made in the manner of exposition. (I.e., they extend only to [Bxxxix] the end of the first chapter of the Transcendental [Bxl] Dialectic.)⁴⁰ I did not extend them further because there was not enough time, and also because with regard to the remainder I had not come upon any misunderstanding by competent and impartial critics. [Bxli] Although I cannot name these critics and praise them [Bxlii] as they deserve, they will doubtless find on their own the places where I have taken their suggestions into account.⁴¹ The improvements do, however, involve a small loss for the reader, a loss that I could not prevent without making the book rather too voluminous: I had to omit or abbreviate various materials that, while not required essentially for the completeness of the whole, will yet be missed by many readers as possibly useful for some other aim. I had to do this in order to make room for my new exposition, which, as I hope, is more comprehensible now. Basically, my exposition changes absolutely nothing in the propositions or even in the bases used for proving them. But now and then the way in which it departs from my previous method of setting forth the material is such that I could not have accomplished this exposition by means of mere interpolations. I hope that this small loss, which anyone who so wishes can make up anyway by comparing this edition with the first one, is more than made up by the fact that the new version is more comprehensible. I have been pleased and gratified by what I have seen in various published writings (including reviews of some books, as well as separate treatises). I saw there that the spirit of thoroughness in Germany has not faded away, but has only been drowned out for a short time by the tone in vogue, whereby people employ in their thinking a [Bxlili] freedom that befits [only] a genius. And I saw that courageous and bright minds have gained mastery of my *Critique* despite its thorny paths — paths that lead to a science of pure reason which complies with school standards, but which as such is the only science that lasts, and hence is exceedingly necessary. These worthy men have that happy combination of thorough insight with a talent for lucid exposition (the very talent that I am not aware of in myself), and I leave it to them to perfect my treatment of the material, which here and there may still be deficient as regards lucidity of exposition. For although there is in this case no danger of my being refuted, there certainly is a danger of my not being understood. As for myself, although I shall from now on be unable to enter into controversy, I shall pay careful attention to all suggestions, whether from friends or opponents, in order to use them in the future when I carry out the system of metaphysics in accordance with this propaedeutic. In the course of these labors, I have advanced considerably in age (this month I reach my sixty-fourth year). I must therefore spend my time frugally, if I want to carry out my plan of providing the metaphysics both of nature and of morals, and thus confirm the correctness of my critique of both speculative and practical reason. Hence I must rely on the help of those worthy men who have made this work their own, expecting them to clear up the [Bxliv] obscurities in it that could hardly have been avoided initially, as well as to defend it as a whole. Any philosophical treatise can be tweaked in individual places (for it cannot come forward in all the armor worn by mathematical treatises), while yet the structure of the system, considered as a unity, is not in the slightest danger. Few people have the intellectual agility to survey such a system when it is new, but fewer still have the inclination to do so, because they find all innovation inconvenient. Again, in any work that for the most part uses language freely, we can easily dig up seeming contradictions if we tear individual passages from their contexts and compare them with one another. In the eyes of those who rely on the judgment of others, such seeming contradictions cast an unfavorable light on the work; but they are quite easily resolved by someone who has gained command of the idea as a whole. Moreover, if a theory is internally stable, then any action and reaction that initially portend great danger will in time serve only to smooth away the theory's unevenness; and in a short time they will even provide the theory with the requisite elegance, if those who deal with it are men of impartiality, insight, and true popularity.

Konigsberg, in the month of April, 1787.

[B1] Introduction [Second Edition]

I. ON THE DISTINCTION BETWEEN PURE AND EMPIRICAL COGNITION

There can be no doubt that all our cognition begins with experience. For what else might rouse our cognitive power to its operation if objects stirring our senses did not do so? In part these objects by themselves bring about presentations. In part they set in motion our understanding's activity, by which it compares these presentations, connects or separates them, and thus processes the raw material of sense impressions into a cognition of objects that is called experience. *In terms of time*, therefore, no cognition in us precedes experience, and all our cognition begins with experience.

But even though all our cognition starts **with** experience, that does not mean that all of it arises **from** experience. For it might well be that even our experiential cognition is composite, consisting of what we receive through impressions and what our own cognitive power supplies from itself (sense impressions merely prompting it to do so). If our cognitive power does make such an addition, we may not be able to distinguish it from that basic material until long [B2] practice has made us attentive to it and skilled in separating it from the basic material.

This question, then, whether there is such a cognition that is independent of experience and even of all impressions of the senses, is one that cannot be disposed of as soon as it comes to light, but that at least still needs closer investigation. Such cognitions are called *a priori cognitions*; they are distinguished from empirical cognitions, whose sources are *a posteriori*, namely, in experience.

But that expression, [viz., *a priori*,] is not yet determinate enough to indicate adequately the full meaning of the question just posed. For it is customary, I suppose, to say of much cognition derived from experiential sources that we can or do partake of it *a priori*. We say this because we derive the cognition not directly from experience but from a universal rule, even though that rule itself was indeed borrowed by us from experience. Thus if someone has undermined the foundation of his house, we say that he could have known *a priori* that the house would cave in, i.e., he did not have to wait for the experience of its actually caving in. And yet he could not have known this completely *a priori*. For he did first have to find out through experience that bodies have weight and hence fall when their support is withdrawn.

In what follows, therefore, we shall mean by *a priori* cognitions not those that occur independently of this [B3] or that experience, but those that occur *absolutely* independently of all experience. They contrast with empirical cognitions, which are those that are possible only *a posteriori*, i.e., through experience. But we call *a priori* cognitions *pure* if nothing empirical whatsoever is mixed in with them. Thus, e.g., the proposition, Every change has its cause, is an *a priori* proposition; yet it is not pure, because change is a concept that can be obtained only from experience.

II. WE ARE IN POSSESSION OF CERTAIN A PRIORI COGNITIONS, AND EVEN COMMON

UNDERSTANDING IS NEVER WITHOUT THEM

What matters here is that we find a characteristic by which we can safely distinguish a pure cognition from empirical ones. Now, experience does indeed teach us that something is thus or thus, but not that it cannot be otherwise. **First**, then, if we find a proposition such that in thinking it we think at the same time its *necessity*, then it is an *a priori* judgment; and if, in addition, it is not derived from any proposition except one that itself has the validity of a necessary proposition, then it is absolutely *a priori*. **Second**, experience never provides its judgments with true or strict *universality*, but only (through induction) with assumed and comparative universality; hence [there] we should, properly speaking, say [merely] that as far as we have [B4] observed until now, no exception is to be found to this or that rule. If, therefore, a judgment is thought with strict universality, i.e., thought in such a way that no exception whatever is allowed as possible, then the judgment is not derived from experience, but is valid absolutely *a priori*. Hence empirical universality is only [the result of] our choosing to upgrade validity from one that holds in most cases to one that holds in all, as, e.g., in the proposition, all bodies have weight. But when universality is strict and belongs to a judgment essentially, then it points to a special cognitive source for the judgment, viz., a power of a *a priori* cognition. Hence necessity and strict universality are safe indicators of a *a priori* cognition, and they do moreover belong together inseparably. It is nevertheless advisable to make separate use of the two criteria, even though each is infallible by itself. For, in using them, there are times when showing the empirical limitedness of a cognition is easier than showing the contingency of the judgments based on it; and there are times when showing the unlimited universality

that we attribute to a judgment is more convincing than is showing the judgment's necessity.

Now, it is easy to show that in human cognition there actually are such judgments [as we are looking for, viz.], judgments that are necessary and in the strictest sense universal, and hence are pure a priori judgments. If we want an example from the sciences, we need only [B5] look to all the propositions of mathematics; if we want one from the most ordinary use of understanding, then we can use the proposition that all change must have a cause. Indeed, in this latter proposition the very concept of a cause so manifestly contains the concept of a necessity in [the cause's] connection with an effect, and of a strict universality of the rule [governing that connection], that the concept of a cause would get lost entirely if we derived it as *Hume* did: viz., from a repeated association of what happens with what precedes, and from our resulting habit⁴² of connecting presentations (hence from a merely subjective necessity). But we do not need such examples⁴³ in order to prove that pure a priori principles actual[ly exist] in our cognition. We could, alternatively, establish that these principles are indispensable for the possibility of experience as such, and hence establish [their existence] a priori. For where might even experience get its certainty if all the rules by which it proceeds were always in turn⁴⁴ empirical and hence contingent, so that they could hardly be considered first principles? But here we may settle for having established as a matter of fact [that there is a] pure use of our cognitive power, and to have established what its indicators are. However, we can see such an a priori origin not merely in judgments, but even in some concepts. If from your experiential concept of a *body* you gradually omit everything that is empirical in a body — the color, the hardness or softness, the weight, even the impenetrability—there yet remains the *space* that was occupied by the body (which has now entirely vanished), and this space you cannot omit [from the [B6] concept]. Similarly, if from your empirical concept of any object whatever, corporeal or incorporeal, you omit all properties that experience has taught you, you still cannot take away from the concept the property through which you think the object either as a *substance* or as *attaching* to a substance (even though this concept of substance is more determinate than that of an object as such).⁴⁵ Hence you must, won over by the necessity with which this concept of substance forces itself upon you, admit that this concept resides a priori in your cognitive power.

III. PHILOSOPHY NEEDS A SCIENCE THAT WILL DETERMINE THE POSSIBILITY, THE PRINCIPLES, AND THE RANGE OF ALL A PRIORI COGNITIONS

Much more significant yet than all the preceding⁴⁶ is the fact that there are certain cognitions that [not only extend to but] even leave the realm of all possible experiences. These cognitions, by means of concepts to which no corresponding object can be given in experience at all, appear to expand the range of our judgments beyond all bounds of experience.

And precisely in these latter cognitions, which go beyond the world of sense, where experience cannot provide us with any guide or correction, reside our [B7] reason's inquiries. We regard these inquiries as far superior in importance, and their final aim as much more sublime, than anything that our understanding can learn in the realm of appearances. Indeed, we would sooner dare anything, even at the risk of error, than give up such treasured inquiries [into the unavoidable problems of reason], whether on the ground that they are precarious somehow, or from disdain and indifference. These unavoidable problems of reason themselves are *God, freedom, and immortality*. But the science whose final aim, involving the science's entire apparatus, is in fact directed solely at solving these problems is called *metaphysics*. Initially, the procedure of metaphysics is *dogmatic*: i.e., [metaphysics], without first examining whether reason is capable or incapable of so great an enterprise, confidently undertakes to carry it out.

Now, suppose that we had just left the terrain of experience. Would we immediately erect an edifice by means of what cognitions we have, though we do not know from where? Would we erect it on credit, i.e., on principles whose origin is unfamiliar to us? It does seem natural that we would not, but that we would first seek assurance through careful inquiries that the foundation had been laid. In other words, it does seem natural that we would, rather, long since have raised the question as to just how our understanding could arrive at all these a priori cognitions, and what might be their range, validity, and value. And in fact nothing would be more natural, if by the term *natural* we mean what properly and reasonably [B8] ought to happen. If, on the other hand, we mean by this term what usually happens, then nothing is more natural and comprehensible than the fact that for a long time this inquiry had to remain unperformed. For, one part of these [a priori] cognitions, viz., the mathematical ones, possess long-standing reliability, and thereby raise favorable expectations concerning other [a priori] cognitions as well, even though these may be of a quite different nature. Moreover, once we are beyond the sphere of experience, we are assured of not being refuted

by experience. The appeal of expanding our cognitions is so great that nothing but hitting upon a clear contradiction can stop our progress. On the other hand, we can avoid such contradiction by merely being cautious in our inventions — even though they remain nonetheless inventions. Mathematics provides us with a splendid example of how much we can achieve, independently of experience, in a priori cognition. Now, it is true that mathematics deals with objects and cognitions only to the extent that they can be exhibited in intuition. But this detail is easily overlooked because that intuition can itself be given a priori and hence is rarely distinguished from a mere pure concept. Captivated by such a proof of reason's might, our urge to expand [our cognitions] sees no boundaries. When the light dove parts the air in free flight and feels the air's resistance, it might come to think that it would do much better still in space devoid of air. In the [B9] same way *Plato* left the world of sense because it sets such narrow limits to our understanding; on the wings of the ideas, he ventured beyond that world and into the empty space of pure understanding. He did not notice that with all his efforts he made no headway. He failed to make headway because he had no resting point against which—as a foothold, as it were—he might brace himself and apply his forces in order to set the understanding in motion. But [Plato is no exception]: it is human reason's usual fate, in speculation, to finish its edifice as soon as possible, and not to inquire until afterwards whether a good foundation has in fact been laid for it. Then all sorts of rationalizations are hunted up in order to reassure us that the edifice is sturdy, or, preferably, even to reject altogether so late and risky an examination of it. But what keeps us, while we are building, free from all anxiety and suspicion, and flatters us with a seeming thoroughness, is the following. A large part—perhaps the largest—of our reason's business consists in dissecting what concepts of objects we already have. This [procedure] supplies us with a multitude of cognitions. And although these cognitions are nothing more than clarifications or elucidations of what has already been thought in our concepts (although thought as yet in a confused way), they are yet rated equal to new insights at least in form, even though in matter or content they do not expand the concepts we have [B10] but only spell them out. Now since this procedure yields actual a priori cognition that progresses in a safe and useful way, reason uses this pretense, though without itself noticing this, to lay claim surreptitiously to assertions of a quite different kind. In these assertions, reason adds to given concepts others quite foreign to them, doing so moreover a priori. Yet how reason arrived at these concepts is not known; indeed, such a question is not even thought of. Hence I shall deal at the very outset with the distinction between these two kinds of cognition.

IV. ON THE DISTINCTION BETWEEN ANALYTIC AND SYNTHETIC JUDGMENTS

In all judgments in which we think the relation of a subject to the predicate (I here consider affirmative judgments only, because the application to negative judgments is easy afterwards), this relation is possible in two ways. Either the predicate B belongs to the subject A as something that is (covertly) contained in this concept A; or B, though connected with concept A, lies quite outside it. In the first case I call the judgment *analytic*; in the second, *synthetic*. Hence (affirmative) analytic judgments are those in which the predicate's connection with the subject is thought by [thinking] identity, whereas those judgments in which this connection is thought without [thinking] [B11] identity are to be called synthetic. Analytic judgments could also be called *elucidatory*. For they do not through the predicate add anything to the concept of the subject; rather, they only dissect the concept, breaking it up into its component concepts which had already been thought in it (although thought confusedly). Synthetic judgments, on the other hand, could also be called *expansive*. For they do add to the concept of the subject a predicate that had not been thought in that concept at all and could not have been extracted from it by any dissection. For example, if I say: All bodies are extended — then this is an analytic judgment. For I do not need to go beyond the concept that I link with the word body in order to find that extension is connected with it. All I need to do in order to find this predicate in the concept is to dissect the concept, i.e., become conscious of the manifold that I always think in it. Hence the judgment is analytic. By contrast, if I say: All bodies are heavy—then the predicate is something quite different from what I think in the mere concept of a body as such. Hence adding such a predicate yields a synthetic judgment.

Experiential judgments, as such, are one and all synthetic. For to base an analytic judgment on experience would be absurd, because in its case I can formulate my judgment without going outside my concept, and hence do not need for it any testimony of experience. Thus the [analytic] proposition that bodies are extended is one that holds a priori and is not an experiential judgment. For before I turn to experience, [B12] I already have in the concept [of body] all the conditions required for my judgment. I have only to extract from it, in accordance with the principle of contradiction, the predicate [of extension]; in doing so, I can at the same time become conscious of the judgment's necessity, of which experience would not even inform me. On the other hand, though in the concept of a body as such I do not at all include the predicate of heaviness, yet the

concept designates an object of experience by means of part of this experience; hence I can [synthetically] add to this part further parts, of the same experience, in addition to those that belonged to the concept of a body as such. I can begin by cognizing the concept of a body *analytically* through the characteristics of extension, impenetrability, shape, etc., all of which are thought in this concept. But then I expand my cognition: by looking back to the experience from which I have abstracted this concept of body, I also find heaviness to be always connected with the above characteristics; and so I add it, as a predicate, to that concept *synthetically*. Hence experience is what makes possible the synthesis of the predicate of heaviness with the concept of body. For although neither of the two concepts is contained in the other, yet they belong to each other, though only contingently, as parts of a whole; that whole is experience, which is itself a synthetic combination of intuitions.

In synthetic judgments that are a priori, however, this remedy⁴⁷ is entirely lacking. If I am to go beyond [B13] the concept A in order to cognize another concept B as combined with it, I rely on something that makes the synthesis possible: what is that something, considering that here I do not have the advantage of looking around for it in the realm of experience? Take the proposition: Everything that happens has its cause. — In the concept of something that happens I do indeed think an existence preceded by a time, etc., and from this one can obtain analytic judgments. But the concept of a cause lies quite outside that earlier concept and indicates something different from what happens; hence it is not part of what is contained in this latter presentation. In speaking generally of what happens, how can I say about it something quite different from it, and cognize as belonging to it—indeed, belonging to it necessarily—the concept of cause, even though this concept is not contained in the concept of what happens? What is here the unknown = X on which the understanding relies when it believes that it discovers, outside the concept A, a predicate B that is foreign to concept A but that the understanding considers nonetheless to be connected with that concept? This unknown cannot be experience. For in adding the presentation of cause to the presentation of what happens, the above principle does so not only with greater universality than experience can provide, but also with the necessity's being expressed; hence it does so entirely a priori and on the basis of mere concepts. Now, on such synthetic, i.e., expansive, principles depends the whole final aim of our speculative a priori cognition. For, analytic principles are indeed [B14] exceedingly important and needed, but only for attaining that distinctness in concepts which is required for a secure and extensive synthesis that, as such, will actually be a new acquisition [of cognition].

V. ALL THEORETICAL SCIENCES OF REASON CONTAIN SYNTHETIC A PRIORI JUDGMENTS AS PRINCIPLES

I. Mathematical judgments are one and all synthetic. Although this proposition is incontestably certain and has very important consequences, it seems thus far to have escaped the notice of those who have analyzed human reason; indeed, it seems to be directly opposed to all their conjectures. For they found that all the inferences made by mathematicians proceed (as the nature of all apodeictic certainty requires) according to the principle of contradiction; and thus they came to be persuaded that the principle of contradiction is also the basis on which we recognize the principles [of mathematics]. In this they were mistaken. For though we can indeed gain insight into a synthetic proposition according to the principle of contradiction, we can never do so [by considering] that proposition by itself, but can do so only by presupposing another synthetic proposition from which it can be deduced.

We must note, first of all, that mathematical propositions, properly so called, are always a priori judgments rather than empirical ones; for they carry with them necessity, which we could never glean from experience. But if anyone refuses to grant that all [B15] such propositions are a priori—all right: then I restrict my assertion to *pure mathematics*, in the very concept of which is implied that it contains not empirical but only pure a priori cognition.

It is true that one might at first think that the proposition $7+5=12$ is a merely analytic one that follows, by the principle of contradiction, from the concept of a sum of seven and five. Yet if we look more closely, we find that the concept of the sum of 7 and 5 contains nothing more than the union of the two numbers into one; but in [thinking] that union we are not thinking in any way at all what that single number is that unites the two. In thinking merely that union of seven and five, I have by no means already thought the concept of twelve; and no matter how long I dissect my concept of such a possible sum, still I shall never find in it that twelve. We must go beyond these concepts and avail ourselves of the intuition corresponding to one of the two: e.g., our five fingers, or (as *Segner* does in his *Arithmetic*)⁴⁸ five dots. In this way we must gradually add, to the concept of seven, the units of the five given in intuition. For I start by taking the number 7. Then, for the concept of the 5, I avail myself of the fingers of my hand as intuition. Thus, in that image of mine, I

gradually add to the number 7 the units that I [B16] previously gathered together in order to make up the number 5. In this way I see the number 12 arise. That 5 *were to be added* to 7, this I had indeed already thought in the concept of a sum = 7 + 5, but not that this sum is equal to the number 12. Arithmetic propositions are therefore always synthetic. We become aware of this all the more distinctly if we take larger numbers. For then it is very evident that, no matter how much we twist and turn our concepts, we can never find the [number of the] sum by merely dissecting our concepts, i.e., without availing ourselves of intuition.

Just as little are any principles of pure geometry analytic. That the straight line between two points is the shortest is a synthetic proposition. For my concept of *straight* contains nothing about magnitude, but contains only a quality. Therefore the concept of shortest is entirely added to the concept of a straight line and cannot be extracted from it by any dissection. Hence we must here avail ourselves of intuition; only by means of it is the synthesis possible.

It is true that a few propositions presupposed by geometers are actually analytic and based on the principle of contradiction. But, like identical propositions, [B17] they serve not as principles but only [as links in] the chain of method. Examples are $a = a$; the whole is equal to itself; or $(a + b) > a$, i.e., the whole is greater than its part. And yet even these principles, although they hold according to mere concepts, are admitted in mathematics only because they can be exhibited in intuition. [As for mathematics generally,] what commonly leads us to believe that the predicate of its apodeictic judgments is contained in our very concept, and that the judgment is therefore analytic, is merely the ambiguity with which we express ourselves. For we say that we *are to* add in thought a certain predicate to a given concept, and this necessity adheres indeed to the very concepts. But here the question is not what we *are to* add in thought to the given concept, but what we *actually* think in the concept, even if only obscurely; and there we find that, although the predicate does indeed adhere necessarily to such concepts, yet it does so not as something thought in the concept itself, but by means of an intuition that must be added to the concept.

2. *Natural science (physica) contains synthetic a priori judgments as principles.* Let me cite as examples just a few propositions: e.g., the proposition that in all changes in the corporeal world the quantity of matter remains unchanged; or the proposition that in all communication of motion, action and reaction must always be equal to each other. Both propositions are clearly not only necessary, and hence of a priori [B18] origin, but also synthetic. For in the concept of matter I do not think permanence, but think merely the matter's being present in space insofar as it occupies space. Hence I do actually go beyond the concept of matter, in order to add to it a priori in thought something that I have not thought *in it*. Hence the proposition is thought not analytically but synthetically and yet a priori, and the same occurs in the remaining propositions of the pure part of natural science.

3. *Metaphysics is to contain synthetic a priori cognitions.* This holds even if metaphysics is viewed as a science that thus far has merely been attempted, but that because of the nature of human reason is nonetheless indispensable. Metaphysics is not at all concerned merely to dissect concepts of things that we frame a priori, and thereby to elucidate them analytically. Rather, in metaphysics we want to expand our a priori cognition. In order to do this, we must use principles which go beyond the given concept and which add to it something that was not contained in it; and, by means of such synthetic a priori judgments, we must presumably go so far beyond such concepts that even experience⁴⁹ can no longer follow us; as in the proposition: The world must have a first beginning— and others like that. And hence metaphysics consists, at least *in terms of its purpose*, of nothing but synthetic a priori propositions.

VI. THE GENERAL PROBLEM OF PURE REASON [B19]

Much is gained already when we can bring a multitude of inquiries under the formula of a single problem. For we thereby facilitate not only our own business by defining it precisely, but also — for anyone else who wants to examine it—the judgment as to whether or not we have carried out our project adequately. Now the proper problem of pure reason is contained in this question:

How are synthetic judgments possible a priori?

That metaphysics has thus far remained in such a shaky state of uncertainty and contradictions is attributable to a sole cause: the fact that this problem, and perhaps even the distinction between *analytic* and *synthetic* judgments, has not previously occurred to anyone.⁵⁰ Whether metaphysics stands or falls depends on the solution of this problem, or on an adequate proof that the possibility which metaphysics demands to see explained⁵¹ does not exist at all. *David Hume* at least came closer to this problem than any other philosopher.

Yet he did not think of it nearly determinately enough and in its universality, but merely remained with the synthetic proposition about the connection of an effect with its causes (*principium* [B20] *causalitatis*).⁵² He believed he had discovered that such a proposition is quite impossible a priori. Thus, according to his conclusions, everything that we call metaphysics would amount to no more than the delusion of a supposed rational insight into what in fact is merely borrowed from experience and has, through habit, acquired a seeming necessity. This assertion, which destroys all pure philosophy, would never have entered Hume's mind if he had envisaged our problem in its universality. For he would then have seen that by his argument there could be no pure mathematics either, since it certainly does contain synthetic a priori propositions: and from such an assertion his good sense would surely have saved him.

In solving the above problem we solve at the same time another one, concerning the possibility of the pure use of reason in establishing and carrying out all sciences that contain theoretical a priori cognition of objects; i.e., we also answer these questions:

How is pure mathematics possible?

How is pure natural science possible?

Since these sciences are actually given [as existent], it is surely proper for us to ask **how** they are possible; for that they must be possible is proved by their being actual.⁵³ As regards *metaphysics*, however, there are [B21] grounds on which everyone must doubt its possibility: its progress thus far has been poor; and thus far not a single metaphysics has been put forth of which we can say, as far as the essential purpose of metaphysics is concerned, that it is actually at hand.

Yet in a certain sense this *kind of cognition* must likewise be regarded as given; and although metaphysics is not actual as a science, yet it is actual as a natural predisposition (i.e., as a *metaphysica naturalis*).⁵⁴ For human reason, impelled by its own need rather than moved by the mere vanity of gaining a lot of knowledge, proceeds irresistibly to such questions as cannot be answered by any experiential use of reason and any principles taken from such use. And thus all human beings, once their reason has expanded to [the point where it can] speculate, actually have always had in them, and always will have in them, some metaphysics. Now concerning it, too, there is this question:

How is metaphysics as a natural [B22] predisposition possible?

i.e., how, from the nature of universal human reason, do the questions arise that pure reason poses to itself and is impelled, by its own need, to answer as best it can?

Thus far, however, all attempts to answer these natural questions — e.g., whether the world has a beginning or has been there from eternity, etc. — have met with unavoidable contradictions. Hence we cannot settle for our mere natural predisposition for metaphysics, i.e., our pure power of reason itself, even though some metaphysics or other (whichever it might be) always arises from it. Rather, it must be possible, by means of this predisposition⁵⁵ to attain certainty either concerning our knowledge or lack of knowledge of the objects [of metaphysics], i.e., either concerning a decision about the objects that its questions deal with, or certainty concerning the ability or inability of reason to make judgments about these objects. In other words, it must be possible to expand our pure reason in a reliable way, or to set for it limits that are determinate and safe. This last question, which flows from the general problem above,⁵⁶ may rightly be stated thus:

How is metaphysics as science possible?

Ultimately, therefore, critique of pure reason leads necessarily to science; the dogmatic use of pure reason without critique, on the other hand, to baseless assertions [B23] that can always be opposed by others that seem equally plausible, and hence to *skepticism*.

This science, moreover, cannot be overly, forbiddingly voluminous. For it deals not with objects of reason, which are infinitely diverse, but merely with [reason] itself. [Here reason] deals with problems that issue entirely from its own womb; they are posed to it not by the nature of things distinct from it, but by its own nature. And thus, once it has become completely acquainted with its own ability regarding the objects that it may encounter in experience, reason must find it easy to determine, completely and safely, the range and the bounds of its use [when] attempted beyond all bounds of experience.

Hence all attempts that have been made thus far to bring a metaphysics about *dogmatically* can and must be regarded as if they had never occurred. For whatever is analytic in one metaphysics or another, i.e., is mere

dissection of the concepts residing a priori in our reason, is only a prearrangement for metaphysics proper, and is not yet its purpose at all. That purpose is to expand our a priori cognition synthetically, and for this purpose the dissection of reason's a priori concepts is useless. For it shows merely what is contained in these concepts; it does not show how we arrive at such concepts a priori, so that we could then also determine the valid use of such concepts in regard to the objects of all cognition [B24] generally. Nor do we need much self-denial to give up all these claims;⁵⁷ for every metaphysics put forth thus far has long since been deprived of its reputation by the fact that it gave rise to undeniable, and in the dogmatic procedure indeed unavoidable, contradictions of reason with itself. A different treatment, completely opposite to the one used thus far, must be given to metaphysics—a science, indispensable to human reason, whose every new shoot can indeed be lopped off but whose root cannot be eradicated. We shall need more perseverance in order to keep from being deterred—either from within by the difficulty of this science or from without by people's resistance to it — from thus finally bringing it to a prosperous and fruitful growth.

VII. IDEA AND DIVISION OF A SPECIAL SCIENCE UNDER THE NAME OF CRITIQUE OF PURE REASON

From all of the above we arrive at the idea of a special science that may be called the *critique of pure reason*. For reason is the power that provides us with the *principles* of a priori cognition. Hence pure reason is that reason which contains the principles for cognizing something absolutely a priori. An *organon* of pure reason would be the sum of those principles by which [B25] all pure a priori cognitions can be acquired and actually brought about. Comprehensive application of such an organon would furnish us with a system of pure reason. Such a system, however, is a tall order; and it remains to be seen whether indeed an expansion of our cognition is possible here at all, and in what cases it is possible. Hence a science that merely judges pure reason, its sources, and its bounds may be regarded as the *propaedeutic* to the system of pure reason. Such a propaedeutic would have to be called not a *doctrine* but only a *critique* of pure reason. Its benefit, in regard to speculation, would actually only be negative. For such a critique would serve only to purify our reason, not to expand it, and would keep our reason free from errors, which is a very great gain already. I call *transcendental* all cognition that deals not so much with objects as rather with our way of cognizing objects in general insofar as that way of cognizing is to be possible a priori. A *system* of such concepts⁵⁸ would be called *transcendental philosophy*. But, once again, this [system of] transcendental philosophy is too much for us as yet, here at the beginning. For since such a science would have to contain both analytic cognition and synthetic a priori cognition, in their completeness, it has too broad a range as far as our aim is concerned. For we need to carry the analysis only as far as it is indispensably necessary for gaining insight, in their entire range, into the principles of a priori synthesis, which is all that we [B26] are concerned with. What we are now dealing with is [not such a science, but only] this inquiry, which properly speaking can be called only a transcendental critique, not a doctrine. For its aim is not to expand the cognitions themselves, but only to correct them; and it is to serve as the touchstone of the value, or lack of value, of all a priori cognitions. Accordingly, such a critique is a preparation; if possible, for an organon of those [cognitions]; or, should the [attempt to produce an] organon be unsuccessful, at least for a canon of them. Such a canon would, at any rate, some day allow us to exhibit, analytically as well as synthetically, the complete system of the philosophy of pure reason, whether that system were to consist in expanding the cognition of pure reason or merely in setting boundaries for it. That such a system is possible — and, indeed, that it cannot be overly wide-ranging, so that we may hope to complete it entirely—can be gathered even in advance from the following: What here constitutes the object⁵⁹ is not the nature of things, which is inexhaustible, but the understanding that makes judgments about the nature of things, and even this understanding, again, only in regard to its a priori cognition. Moreover, the understanding's supply of a priori cognition cannot be hidden from us, because, after all, we need not search for it outside the understanding; and we may indeed suppose that supply to be small enough in order for us to record it completely, judge it for its value or lack of value, and make a correct assessment of it. [B27] [But my readers must not expect to find in this critique more than the mentioned preparation.] Still less must they expect here a critique of books and systems of pure reason, but should expect the critique of our power of pure reason itself. Only if we use that critique as our basis do we have a reliable touchstone for assessing the philosophical content of old and new works in this field. Without such critique, unqualified historians and judges pass judgment on other people's baseless assertions by means of their own, which are just as baseless.

Transcendental philosophy is the idea of a science for which the critique of pure reason is to outline the entire plan *architectonically*, i.e., from principles, with full guarantee of the completeness and reliability of all the components that make up this edifice. Transcendental philosophy is the system of all principles of pure reason. That this critique is not itself already called transcendental philosophy is due solely to this: in order for

this critique to be a complete system, it would have to include a comprehensive analysis of the whole of human a priori cognition. Now, it is indeed true that our critique must also put before us a complete enumeration of all the root concepts that make up that pure cognition. Yet the critique refrains, and properly so, from providing either the comprehensive analysis of these concepts themselves, or the complete review of the concepts derived from them. [There are two reasons for this.] First, this dissection of concepts would not serve our purpose; for it lacks [B28] that precariousness which we find in synthesis, [the precariousness] on account of which the whole critique is in fact there. Second, taking on the responsibility for the completeness of such an analysis and derivation (a responsibility from which we could, after all, have been exempted in view of our aim) would go against the unity of our plan. On the other hand, this completeness in the dissection of the a priori concepts yet to be supplied, as well as in the derivation [of other concepts] from them, can easily be added later: provided that first of all these [concepts] are there, as comprehensive principles of synthesis, and nothing is lacking as regards this essential aim.⁶⁰

Accordingly, the critique of pure reason [in a way] includes everything that makes up transcendental philosophy; it is the complete idea of transcendental philosophy. But the critique is not yet that science itself, because it carries the analysis [of a priori concepts] only as far as is required for making a complete judgment about synthetic a priori cognition.

The foremost goal in dividing such a science is this: no concepts whatever containing anything empirical must enter into this science; or, differently put, the goal is that the a priori cognition in it be completely pure.⁶¹ Hence, although the supreme principles and basic concepts of morality are a priori cognitions, they still do not belong in transcendental philosophy. For [B29] they do of necessity also bring [empirical concepts] into the formulation of the system of pure morality:⁶² viz., the concepts of pleasure and displeasure, of desires and inclinations, etc., all of which are of empirical origin. Although the supreme principles and basic concepts of morality do not lay these empirical concepts themselves at the basis of their precepts, they must still bring in such pleasure and displeasure, desires and inclinations, etc. in [formulating] the concept of duty: viz., as an obstacle to be overcome, or as a stimulus that is not to be turned into a motive. Hence transcendental philosophy is a philosophy of merely speculative pure reason. For everything practical, insofar as it contains incentives, refers to feelings, and these belong to the empirical sources of cognition.

If, then, the division of the science being set forth here is to be performed in terms of the general viewpoint of a system as such, then this science must contain in the first place a *doctrine of elements*, and in the second a *doctrine of method*, of pure reason. Each of these two main parts would be subdivided; but the bases on which that subdivision would be made cannot yet be set forth here. Only this much seems to be needed here by way of introduction or advance notice: Human cognition has two stems, viz., *sensibility* and *understanding*, which perhaps spring from a common root, though one unknown to us. Through sensibility objects are *given* to us; through understanding they are *thought*. Now if sensibility were to contain a priori presentations constituting the [B30] condition under which objects are given to us, it would to that extent belong to transcendental philosophy. And since the conditions under which alone the objects of human cognition are given to us precede the conditions under which these objects are thought, the transcendental doctrine of sense⁶³ would have to belong to the *first* part of the science of elements.

Transcendental Doctrine of Elements

PART I TRANSCENDENTAL AESTHETIC §1

In whatever way and by whatever means a cognition may refer to objects, still *intuition* is that by which a cognition refers to objects directly, and at which all thought aims as a means.⁶⁴ Intuition, however, takes place only insofar as the object is given to us; but that, in turn, is possible only—for us human beings, at any rate—by the mind's being affected by the object in a certain manner. The capacity (a receptivity) to acquire presentations as a result of the way in which we are affected by objects is called **sensibility**. Hence by means of sensibility objects are *given* to us, and it alone supplies us with *intuitions*. Through understanding, on the other hand, objects are thought, and from it arise concepts. But all thought must, by means of certain characteristics, refer ultimately to intuitions, whether it does so straightforwardly (directe) or circuitously (indirecte); and hence it must, in us [human beings], refer ultimately to sensibility, because no object can be given to us in any other manner than through sensibility.

The effect of an object on our capacity for presentation, insofar as we are affected by the object, is *sensation*. Intuition that refers to the object through sensation is called *empirical* intuition. The undetermined object of an empirical intuition is called *appearance*.

Whatever in an appearance corresponds to sensation I call its *matter*; but whatever in an appearance brings about the fact that the manifold of the appearance can be ordered in certain relations I call the *form* of appearance. Now, that in which alone sensations can be ordered and put into a certain form cannot itself be sensation again. Therefore, although the matter of all appearance is given to us only a posteriori, the form of all appearance must altogether lie ready for the sensations a priori in the mind; and hence that form must be capable of being examined apart from all sensation.

All presentations in which nothing is found that belongs to sensation I call *pure* (in the transcendental sense of the term). Accordingly, the pure form of sensible intuitions generally, in which everything manifold in experience is intuited in certain relations, will be found in the mind a priori. This pure form of sensibility will also itself be called *pure intuition*. Thus, if from the presentation of a body I separate what the understanding thinks in it, such as substance, force, divisibility, etc., and if I similarly separate from it what belongs to sensation in it, such as impenetrability, hardness, color, etc., I am still left with something from this empirical intuition, namely, extension and shape. These belong to pure intuition, which, even if there is no actual object of the senses or of sensation, has its place in the mind a priori, as a mere form of sensibility.

There must, therefore, be a science of all principles of a priori sensibility. I call such a science *transcendental aesthetic*. It constitutes the first part of the transcendental doctrine of elements, and stands in contrast to that [part of the] transcendental doctrine of elements which contains the principles of pure thought and is called transcendental logic.

Hence in the transcendental aesthetic we shall, first of all, *isolate* sensibility, by separating from it everything that the understanding through its concepts thinks [in connection] with it, so that nothing other than empirical intuition will remain.⁶⁵ Second, we shall also segregate from sensibility everything that belongs to sensation, so that nothing will remain but pure intuition and the mere form of appearances, which is all that sensibility can supply a priori. In the course of that inquiry it will be found that there are two pure forms of sensible intuition, which are principles for a priori cognition: viz., space and time. We now proceed to the task of examining these.

[B37] TRANSCENDENTAL AESTHETIC

Section I Space

§2

METAPHYSICAL EXPOSITION⁶⁶ OF THIS CONCEPT

By means of outer sense (a property of our mind) we present objects as outside us, and present them one and all in space. In space their shape, magnitude, and relation to one another are determined or determinable. By means of inner sense the mind intuits itself, or its inner state. Although inner sense provides no intuition of the soul itself as an object, yet there is a determinate form under which alone [as condition] we can intuit the soul's inner state. [That form is time.] Thus everything belonging to our inner determinations is presented in relations of time. Time cannot be intuited outwardly, any more than space can be intuited as something within us. What, then, are space and time? Are they actual beings? Are they only determinations of things, or, for that matter, relations among them? If so, are they at least determinations or relations that would belong to things intrinsically also, i.e., even if these things were not intuited? Or are they determinations and relations that adhere only to the form of the intuition and hence to the subjective character of our mind, so that apart from [B38] that character these predicates cannot be ascribed to any thing at all? In order to inform ourselves on these points, let us first of all give an exposition of the concept of space. Now, by *exposition* (*expositio*) I mean clear (even if not comprehensive) presentation of what belongs to a concept; and such exposition is *metaphysical* if it contains what exhibits the concept as *given a priori*.

1. Space is not an empirical concept that has been abstracted from outer experiences. For the presentation of space must already lie at the basis in order for certain sensations to be referred to something outside me (i.e., referred to something in a location of space other than the location in which I am). And it must similarly already lie at the basis in order for me to be able to present [the objects of] these sensations as outside and *alongside* one another, and hence to present them not only as different but as being in different locations. Accordingly, the presentation of space cannot be one that we take from the relations of outer appearance by means of experience; rather, only through the presentation of space is that outer experience possible in the first place.

2. Space is a necessary a priori presentation that underlies all outer intuitions. We can never have a presentation of there being no space, even though we are quite able to think of there being no objects [B39] encountered in it. Hence space must be regarded as the condition for the possibility of appearances, and not as a determination dependent on them. Space is an a priori presentation that necessarily underlies outer appearances.

3. Space is not a discursive or, as we say, universal concept of things as such; rather, it is a pure intuition. For, first, we can present only one space; and when we speak of many spaces, we mean by that only parts of one and the same unique space. Nor, second, can these parts precede the one all-encompassing space, as its constituents, as it were (from which it can be assembled); rather, they can be thought only as *in it*. Space is essentially one; the manifold in it, and hence also the universal concept of spaces as such, rests solely on [our bringing in] limitations. It follows from this that, as far as space is concerned, an a priori intuition of it (i.e., one that is not empirical) underlies all concepts of space. By the same token, no geometric principles — e.g., the principle that in a triangle two sides together are greater than the third — are ever derived from universal concepts of *line* and *triangle*; rather, they are all derived from intuition, and are derived from it moreover a priori, with apodeictic certainty.

4. We present space as an infinite *given* magnitude. Now it is true that every concept must be thought as [b40] a presentation that is contained in an infinite multitude of different possible presentations (as their common characteristic) and hence the concept contains these presentations *under itself*. But no concept, as such, can be thought as containing an infinite multitude of presentations *within itself*. Yet that is how we think space (for all parts of space, *ad infinitum*, are simultaneous). Therefore the original presentation of space is an a priori *intuition*, not a *concept*.⁶⁷

TRANSCENDENTAL EXPOSITION OF THE CONCEPT OF SPACE

By a *transcendental exposition* I mean the explication of a concept as a principle that permits insight into the possibility of other synthetic a priori cognitions. Such explication requires (1) that cognitions of that sort do actually flow from the given concept, and (2) that these cognitions are possible only on the presupposition of a given way of explicating that concept.

Geometry is a science that determines the properties of space synthetically and yet a priori. What, then, must the presentation of space be in order for such cognition of space to be possible? Space must originally be intuition. For from a mere concept one [B41] cannot obtain propositions that go beyond the concept; but we do obtain such propositions in geometry (Introduction, V). This intuition must, however, be encountered in us a priori, i.e., prior to any perception of an object; hence this intuition must be pure rather than empirical. For geometric propositions are one and all apodeictic, i.e., linked with the consciousness of their necessity—e.g., the proposition that space has only three dimensions. But propositions of that sort cannot be empirical judgments or judgments of experience; nor can they be inferred from such judgments (Introduction, II).

How, then, can the mind have an outer intuition which precedes the objects themselves, and in which the concept of these objects can be determined a priori? Obviously, this can be so only insofar as this intuition resides merely in the subject, as the subject's formal character of being affected by objects and of thereby acquiring from them *direct presentation*, i.e., *intuition*, and hence only as form of outer *sense* in general.

Our explication of the concept of space is, therefore, the only one that makes comprehensible the *possibility of geometry* as a [kind of] synthetic a priori cognition. Any way of explicating the concept that fails to make this possibility comprehensible, even if it should otherwise seem to have some similarity to ours, can be distinguished from it most safely by these criteria.⁶⁸

CONCLUSIONS FROM THE ABOVE CONCEPTS [B42]

(a) Space represents no property whatever of any things in themselves, nor does it represent things in themselves in their relation to one another.⁶⁹ That is, space represents no determination of such things, no determination that adheres to objects themselves and that would remain even if we abstracted from all subjective conditions of intuition. For determinations, whether absolute or relative, cannot be intuited prior to the existence of the things to which they belong, and hence cannot be intuited a priori.

(b) Space is nothing but the mere form of all appearances of outer senses; i.e., it is the subjective condition of sensibility under which alone outer intuition is possible for us. Now, the subject's receptivity for being affected by objects precedes necessarily all intuitions of these objects. Thus we can understand how the form of all appearances can be given in the mind prior to all actual perceptions, and hence given a priori; and we can understand how this form, as a pure intuition in which all objects must be determined, can contain, prior to all experience, principles for the relations among these objects.

Only from the human standpoint, therefore, can we speak of space, of extended beings, etc. If we depart from the subjective condition under which alone we can — viz., as far as we may be affected by objects — acquire outer intuition, then the presentation [B43] of space means nothing whatsoever. This predicate is ascribed to things only insofar as they appear to us, i.e., only insofar as they are objects of sensibility. The constant form of this receptivity which we call sensibility is a necessary condition of all relations in which objects are intuited as outside us; and if we abstract from these objects, then the form of that receptivity is a pure intuition that bears the name of space. We cannot make the special conditions of sensibility to be conditions of the possibility of things, but only of the possibility of their appearances. Hence we can indeed say that space encompasses all things that appear to us externally, but not that it encompasses all things in themselves, intuited or not, or intuited by whatever subject. For we can make no judgment at all about the intuitions of other thinking beings, as to whether they are tied to the same conditions that limit our intuition and that are valid for us universally. If the limitation on a judgment is added to the concept of the subject [term], then the judgment holds unconditionally. The proposition, All things are side by side in space, holds under the limitation: if these things are taken as objects of our sensible intuition. If I here add the condition to the concept and say, All things considered as outer appearances are side by side in space, then this rule holds universally and without limitation. Accordingly, our exposition [B44] teaches that space is *real* (i.e., objectively valid) in regard to everything that we can encounter externally as object, but teaches at the same time that

space is *ideal* in regard to things when reason considers them in themselves, i.e., without taking into account the character of our sensibility. Hence we assert that space is *empirically real* (as regards all possible outer experience), despite asserting that space is *transcendentally ideal*, i.e., that it is nothing as soon as we omit [that space is] the condition of the possibility of all experience and suppose space to be something underlying things in themselves.

Besides space, on the other hand, no other subjective presentation that is referred to something external could be called an a priori objective presentation. For from none of them can we derive synthetic a priori propositions, as we can from intuition in space (§3). Hence, strictly speaking, ideality does not apply to them, even though they agree with the presentation of space inasmuch as they belong merely to the subjective character of the kind of sense involved. They may belong, e.g., to the sense of sight, of hearing, or of touch, by [being] sensations of colors, sounds, or heat. Yet because they are mere sensations rather than intuitions, they do not allow us to cognize any object at all, let alone a priori.

The only aim of this comment is to forestall an error: it might occur to someone to illustrate the [B45] ideality of space asserted above by means of examples such as colors or taste, etc. These are thoroughly insufficient for this, because they are rightly regarded not as properties of things, but merely as changes in ourselves as subjects, changes that may even be different in different people. For in this case, something that originally is itself only appearance — e.g., a rose—counts as a thing in itself in the empirical meaning of this expression, a thing in itself that in regard to color can nonetheless appear differently to every eye. The transcendental concept of appearances in space, on the other hand, is a critical reminder. It reminds us that nothing whatever that is intuited in space is a thing in itself, and that space is not a form of things, one that might belong to them as they are in themselves. Rather, what we call external objects are nothing but mere presentations of our sensibility. The form of this sensibility is space; but its true correlate, i.e., the thing in itself, is not cognized at all through these presentations, and cannot be. Nor, on the other hand, is the thing in itself ever at issue in experience.

[*B46*] TRANSCENDENTAL AESTHETIC

Section II Time

§4

METAPHYSICAL EXPOSITION OF THE CONCEPT OF TIME

1. Time is not an empirical concept that has been abstracted from any experience. For simultaneity or succession would not even enter our perception if the presentation of time did not underlie them a priori. Only on the presupposition of this presentation can we present this and that as being at one and the same time (simultaneously) or at different times (sequentially).

2. Time is a necessary presentation that underlies all intuitions. As regards appearances in general, we cannot annul time itself, though we can quite readily remove appearances from time. Hence time is given a priori. All actuality of appearances is possible only in time. Appearances, one and all, may go away; but time itself (as the universal condition of their possibility) cannot be annulled.

[B47] 3. This a priori necessity, moreover, is the basis for the possibility of apodeictic principles about relations of time, or for the possibility of axioms about time in general. Time has only one dimension; different times are not simultaneous but sequential (just as different spaces are not sequential but simultaneous). These principles cannot be obtained from experience. For experience would provide neither strict universality nor apodeictic certainty; we could say only that common perception teaches us that it is so, but not that it must be so. These principles hold as rules under which alone experiences are possible at all; and they instruct us prior to experience, not through it.

4. Time is not a discursive or, as it is called, universal concept; rather it is a pure form of sensible intuition. Different times are only parts of one and the same time; and the kind of presentation that can be given only through a single object is intuition. Moreover, the proposition that different times cannot be simultaneous could not be derived from a universal concept. The proposition is synthetic, and [therefore] cannot arise from concepts alone. Hence it is contained directly in the intuition and presentation of time.

5. To say that time is infinite means nothing more than that any determinate magnitude of time is possible [B48] only through limitations [put] on a single underlying time. Hence the original presentation *time* must be given as unlimited. But if something is such that its parts themselves and any magnitude of an object in it can be presented determinately only through limitation, then the whole presentation of it cannot be given through concepts (for they contain only partial presentations), but any such presentation must be based on direct intuition.

§5

TRANSCENDENTAL EXPOSITION OF THE CONCEPT OF TIME

I may refer for this exposition to No. 3, where, for the sake of brevity, I put among the items of the metaphysical exposition what in fact is transcendental. Let me add here that the concept of change, and with it the concept of motion (as change of place), is possible only through and in the presentation of time; and that if this presentation were not (inner) a priori intuition, no concept whatsoever could make comprehensible the possibility of a change, i.e., of a combination, in one and the same object, of contradictory opposed predicates (e.g., one and the same thing's being in a place and not being in that same place). Only in time can both of two contradictorily opposed determinations be met with in one thing: [B49] viz., *sequentially*. Hence our concept of time explains the possibility of all that synthetic a priori cognition which is set forth by the — quite fertile — general theory of motion.

CONCLUSIONS FROM THESE CONCEPTS

(a) Time is not something that is self-subsistent or that attaches to things as an objective determination, and that hence would remain if one abstracted from all subjective conditions of our intuition of it. For if time were self-sufficient, then it would be something that without there being an actual object would yet be actual.⁷⁰ But if, on the second alternative, time were a determination or order attaching to things themselves,⁷¹ then it could not precede the objects as their condition, and could not a priori be cognized through synthetic propositions and intuited. But this a priori cognition and intuition can take place quite readily if time is nothing but the subjective condition under which alone any intuition can take place in us. For in that case this form of inner intuition can be presented prior to the objects, and hence presented a priori.

(b) Time is nothing but the form of inner sense, i.e., of the intuiting we do of ourselves and of our inner state. For time cannot be a determination of [B50] outer appearances, [because] it does not belong to any shape or position, etc., but rather determines the relation of presentations in our inner state. And precisely because this inner intuition gives us no shape, do we try to make up for this deficiency by means of analogies. We present time sequence by a line progressing *ad infinitum*, a line in which the manifold constitutes a series of only one dimension. And from the properties of that line we infer all the properties of time, except for the one difference that the parts of the line are simultaneous whereas the parts of time are always sequential. This fact, moreover, that all relations of time can be expressed by means of outer intuition, shows that the presentation of time is itself intuition.

(c) Time is the formal a priori condition of all appearances generally. Space is the pure form of all outer appearances; as such it is limited, as an a priori condition, to just outer appearances. But all presentations, whether or not they have outer things as their objects, do yet in themselves, as determinations of the mind, belong to our inner state; and this inner state is subject to the formal condition of inner intuition, and hence to the condition of time. Therefore time is an a priori condition of all appearance generally: it is the direct condition of inner appearances (of our souls), and precisely thereby also, indirectly, [B51] a condition of outer appearances. If I can say a priori that all outer appearances are in space and are determined a priori according to spatial relations, then the principle of inner sense allows me to say, quite universally, that all appearances generally, i.e., all objects of the senses, are in time and stand necessarily in relations of time.

If we take objects as they may be in themselves — i.e., if we abstract from the way in which we intuit ourselves inwardly, and in which by means of this intuition we also take into our power of presentation all outer intuitions—then time is nothing. Time has objective validity only with regard to appearances, because these are already things considered as *objects of our senses*. But time is no longer objective if we abstract from the sensibility of our intuition, and hence from the way of presenting peculiar to us, and speak of *things as such*. Hence time is merely a subjective condition of our (human) intuition (an intuition that is always sensible—i.e., inasmuch as we are affected by objects); in itself, i.e., apart from the subject, time is nothing. Nevertheless, time is necessarily objective in regard to all appearances, and hence also in regard to all things that we can encounter in experience. We cannot say that all things [as such] are in time; for in the concept of things as such [B52] we abstract from all ways of intuiting them, while yet this intuition is the very condition under which⁷² time belongs in the presentation of objects. If now we add the condition to the concept, and say that all things as appearances (objects of sensible intuition) are in time, then this principle has all its objective correctness and a priori universality.

Hence the doctrine we are asserting is that time is *empirically real*, i.e., objectively valid in regard to all objects that might ever be given to our senses. And since our intuition is always sensible, no object that is not subject to the condition of time can ever be given to us in experience. On the other hand, we dispute that time has any claim to absolute reality; i.e., we dispute any claim whereby time would, quite without taking into account the form of our sensible intuition, attach to things absolutely, as a condition or property. Nor indeed can such properties, properties belonging to things in themselves, ever be given to us through the senses. In this, then, consists the *transcendental ideality* of time. According to this view,⁷³ if we abstract from the subjective conditions of sensible intuition, then time is nothing, and cannot be included among objects in themselves (apart from their relation to our intuition) either as subsisting [as such [B53] an object] or as inhering [in one]. But this ideality of time is not to be compared, any more than is the ideality of space, with the subreptions of sensations.⁷⁴ For in their case we presuppose that the appearance itself in which these

predicates⁷⁵ [allegedly] inhere has objective reality.⁷⁶ In the case of time, such objective reality is entirely absent,⁷⁷ except insofar as this reality is merely empirical, i.e., except insofar as we regard the object itself as merely appearance. See, on this, the above comment, in SECTION 1.⁷⁸

ELUCIDATION

Against this theory, which grants that time is empirically real but disputes that it is real absolutely and transcendently, I have heard men of insight raise quite unanimously an objection. I gather from this great unanimity that the objection must occur naturally to every reader who is not accustomed to contemplations such as these. The objection is the following. Changes are actual. (This is proved by the variation on the part of our own presentations — even if one were to deny all outer appearances, along with their changes.) Now changes are possible only in time. Therefore time is something actual. There is no difficulty in replying to the objection. I concede the whole argument. Time is indeed something actual, viz., the actual form of inner intuition. It therefore has subjective reality in regard to inner experience; i.e., I [B54] actually have the presentation of time and of my determinations in time. Hence time is to be regarded as actual, though not as an object but as the way of presenting that I myself have as an object. Suppose, on the other hand, that I could intuit myself without being subject to this condition of sensibility, or that another being could so intuit me; in that case the very same determinations that we now present as changes would provide a cognition in which the presentation of time, and hence also that of change, would not occur at all. Hence time retains its empirical reality as condition of all our experiences. Only absolute reality must, by the reasons adduced above, be denied to time. Time is nothing but the form of our inner intuition.⁷⁹ If we take away from time [the qualification that it is] the special condition of our sensibility, then the concept of time vanishes as well; time attaches not to objects themselves, but merely to the subject intuiting them.

But what causes this objection to be raised so unanimously, and raised, moreover, by those who nonetheless cannot think of any plausible objection against [B55] the doctrine that space is ideal, is the following. They had no hope of establishing apodeictically that space is real absolutely; for they are confronted by idealism, according to which the actuality of external objects is incapable of strict proof. By contrast, the actuality of the object of our inner sense (the actuality of myself and of my state) is directly evident through consciousness. External objects might be a mere illusion; but the object of inner sense is, in their opinion, undeniably something actual. They failed to bear in mind, however, that both of them, though their actuality as presentations is indisputable, still belong only to appearance. Appearance always has two sides. One is the side where the object is regarded in itself (without regard to the way in which it is intuited, which is precisely why its character always remains problematic).⁸⁰ The other is the side where we take account of the form of the intuition of this object. This form must be sought not in the object in itself, but in the subject to whom the object appears. Yet this form belongs to the appearance of this object actually and necessarily.

Time and space are, accordingly, two sources of cognition. From these sources we can draw a priori different synthetic cognitions — as is shown above all by the splendid example that pure mathematics provides [B56] in regard to our cognitions of space and its relations. For time and space, taken together, are pure forms of all sensible intuition, and thereby make synthetic propositions possible a priori. But precisely thereby (i.e., by being merely conditions of sensibility), these a priori sources of cognition determine their own bounds; viz., they determine that they apply to objects merely insofar as these are regarded as appearances, but do not exhibit things in themselves. Appearances are the sole realm where these a priori sources of cognition are valid; if we go outside that realm, there is no further objective use that can be made of them. This [limited] reality of space and time leaves the reliability of experiential cognition otherwise untouched; for we have equal certainty in that cognition, whether these forms necessarily attach to things in themselves or only to our intuition of these things. Those, on the other hand, who assert that space and time—whether they assume these as subsistent or as only inherent—are real absolutely must be at variance with the principles of experience itself.⁸¹ For suppose they decide to assume space and time as subsistent (thus taking what is usually the side of the mathematical investigators of nature): then they must assume two eternal and infinite self-subsistent nonentities (space and time), which exist (yet without there being anything actual) only in order to encompass everything actual. Or suppose they assume space and time as only inherent (thus taking the side to which some metaphysical natural scientists belong). Here space and time count for them as relations of appearances (occurring concurrently or sequentially)—relations abstracted from experience but, as thus separated, presented confusedly. If they take this [B57] second side, then they must dispute that the mathematical a priori doctrines are valid for actual things (e.g., things in space), or at least that they are apodeictically certain. For a posteriori there is no such certainty at all. According to this second opinion, the a priori concepts of space and time are only creatures of the imagination, and their source must actually be

sought in experience: the relations⁸² are abstracted from experience; and the imagination has made from them something that, while containing what is universal in these relations, yet cannot occur without the restrictions that nature has connected with them. Those who assume space and time as [real absolutely and] subsistent do gain this much: they make the realm of appearances free⁸³ for mathematical assertions. On the other hand, these very conditions⁸⁴ create great confusion for them when the understanding wants to go beyond the realm of appearances. Those, on the other hand, who assume space and time as [real absolutely but as] only inherent gain on this latter point. I.e., they do not find the presentations of space and time getting in their way when they want to judge objects not as appearances but merely as they relate to the understanding. But they can neither indicate a basis for the possibility of mathematical a priori cognitions (since they lack a true and objectively valid a priori intuition),⁸⁵ nor bring the propositions of experience into necessary agreement with those a priori mathematical assertions. Our theory of the true character of these two original [B58] forms of sensibility provides the remedy for both [sets of] difficulties.

Finally, transcendental aesthetic cannot contain more than these two elements, i.e., space and time. This is evident from the fact that all other concepts belonging to sensibility presuppose something empirical. This holds even for the concept of motion, which unites the two components.⁸⁶ For [the concept of] motion presupposes the perception of something movable.⁸⁷ But in space, considered in itself, there is nothing movable; therefore the movable must be something that we find *in space only through experience*, and hence must be an empirical datum. Similarly, transcendental aesthetic cannot include among its a priori data the concept of change. For time itself does not change; rather, what changes is something that is in time. Therefore the concept of change requires the perception of some existent and of the succession of its determinations; hence it requires experience.

GENERAL COMMENTS ON TRANSCENDENTAL AESTHETIC

I. In order to forestall any misinterpretation of our opinion regarding the basic character of sensible cognition as such, we must first explain as distinctly as possible what that opinion is.

What we have tried to say, then, is the following. All our intuition is nothing but the presentation of appearance. The things that we intuit are not in themselves what we intuit them as being. Nor do their relations in themselves have the character that they appear to us as having. And if we annul ourselves as subject, or even annul only the subjective character of the senses generally, then this entire character of objects and all their relations in space and time — indeed, even space and time themselves — would vanish; being appearances, they cannot exist in themselves, but can exist only in us. What may be the case regarding objects in themselves and apart from all this receptivity of our sensibility remains to us entirely unknown. All we know is the way in which we perceive them. That way is peculiar to us and does not necessarily have to apply to all beings, even though it applies necessarily to all human beings. Solely with [B60] that way of perceiving are we dealing here. Space and time are its pure forms; sensation as such as its matter. Only that way of perceiving can we cognize a priori, i.e., prior to all actual perception, and that is why it is called pure intuition. Sensation, on the other hand, is that component in our cognition on whose account it is called a posteriori cognition, i.e., empirical intuition. The forms [of intuition] attach to our sensibility with absolute necessity, no matter of what kind our sensations may be; the sensations can differ very much. Even if we could bring this institution of ours to the highest degree of distinctness, that would still not get us closer to the character of objects in themselves. For what we would cognize, and cognize completely, would still be only our way of intuiting, i.e., our sensibility; and we would always cognize it only under the conditions attaching to the subject originally: space and time. What objects may be in themselves would still never become known to us, not even through the most enlightened cognition of what alone is given to us, viz., their appearance.

Hence we must reject the view⁸⁸ that our entire sensibility is nothing but our confused presentation of things, a presentation that contains solely what belongs to them in themselves, but contains it only by way of an accumulation of characteristics and partial presentations that we do not consciously discriminate. For this view falsifies the concept of sensibility and of appearance, thus rendering the entire doctrine of sensibility useless and empty. The distinction between an indistinct and a distinct presentation [B61] is merely logical and does not concern the content. No doubt the concept of *rightness* as employed by common sense contains just the same as can be extricated from it by the most subtle speculation, except that in its common and practical use one is not conscious of the diverse presentations contained in that thought. But that does not entitle us to say that the common concept is sensible and contains a mere appearance. For rightness cannot be an appearance at all; rather, its concept lies in the understanding,⁸⁹ and we present by it a character of acts (their moral character) which belongs to them in themselves. On the other hand, when a *body* is presented in intuition, this presentation contains nothing whatever that could belong to an object in itself. It contains, rather, merely the appearance of something, and the way we are affected by that something. This receptivity of our cognitive capacity is called sensibility; and even if we were to see through that appearance and to its very bottom, yet this receptivity remains as different as day and night from cognition of the object in itself.

Hence the philosophy of Leibniz and Wolff, by considering the distinction between what is sensible and what is intellectual as a merely logical one, has imposed an entirely wrong point of view on all investigations about the nature and origin of our cognitions. For plainly the distinction is transcendental, and does not concern merely the forms of these cognitions, [B62] i.e., their distinctness or indistinctness, but concerns their origin and content. Hence sensibility does not merely fail to provide us with a distinct cognition of the character of things in themselves; it provides us with none whatsoever. And once we remove our subjective character, then the presented object, along with the properties contributed to it by sensible intuition, is not to be found anywhere at all; nor can it possibly be found, because this subjective character is precisely what determines the form of that object as appearance.⁹⁰

It is true that we commonly make this distinction about appearances: we distinguish what attaches to their intuition essentially and holds for the sense of every human being in general, from what belongs to that intuition only contingently by being valid only for a special position of this or that sense, or for the special organization of that sense, but not valid for the relation of [the intuition to] sensibility in general. We then speak of the first kind of cognition as presenting the object in itself, and of the second as presenting only its appearance. This distinction, however, is only empirical. If (as is commonly done) we fail to go beyond it and

do not (as we ought to do) regard that empirical intuition in turn as mere appearance, in which nothing whatever belonging to some thing in itself is to be found, then our transcendental distinction is lost. We then believe after all that we cognize [B63] things in themselves, even though in the world of sense, however deeply we explore its objects, we deal with nothing whatever but appearances. Thus it is true, e.g., that when during a rain accompanied by sunshine we see a rainbow, we will call it a mere appearance, while calling the rain the thing in itself. And this is indeed correct, provided that we here take the concept of a thing in itself as meaning only something physical. We then mean by it something that in general experience, and in all its different positions in relation to the senses, is yet determined thus, and not otherwise, in intuition. But suppose that we take this empirical something as such, and that — without being concerned about its being the same for the sense of every human being — we ask whether it presents also an object in itself (not whether it presents the rain drops, for these, as appearances, will already be empirical objects). In that case our question about the presentation's relation to the object is transcendental, and the answer is: Not only are these drops mere appearances; rather, even their round shape, and indeed even the space in which they fall, are nothing in themselves. They are, rather, mere modifications, or foundations, of our sensible intuition. The transcendental object, however, remains unknown to us.

Our second important concern in this transcendental aesthetic is that it should not merely gain some favor as a plausible hypothesis, but should be as certain and indubitable as can possibly be demanded of a theory that is to serve as an organon. In order to make this certainty fully evident, let us select some case that can render the validity of this organon obvious [B64] and can serve to clarify further what has been set forth in §3.

Suppose, then, that space and time are in themselves objective, and are conditions of the possibility of things in themselves. We then find, in the first place, that we encounter a large number of synthetic a priori propositions about both space and time— above all about space, which we shall therefore investigate here as our prime example. The propositions of geometry are cognized synthetically a priori and with apodeictic certainty. And so I ask: From where do you obtain such propositions, and on what does the understanding rely in order to arrive at such absolutely necessary and universally valid truths? There is no other way [to arrive at truths] than through concepts or through intuition. But these concepts and intuitions are both given either a priori or a posteriori. The a posteriori ones, i.e., empirical concepts as well as the empirical intuition on which they are based, can yield only such synthetic propositions as are likewise merely empirical, i.e., propositions of experience. As such, these propositions can never contain necessity and absolute universality; yet these are what characterize all geometric propositions. The first and sole means of arriving at such cognitions is a priori, through mere concepts or through intuitions. From mere concepts, however, we clearly can obtain no [B65] synthetic cognition at all, but only analytic cognition. Just take the proposition that two straight lines cannot enclose any space and hence do not permit [construction of] any figure, and try to derive it from the concept of straight lines and of the number two. Or take the proposition that three straight lines permit [construction of] a figure, and try similarly to derive it from these mere concepts. All your endeavor is futile, and you find yourselves compelled to have recourse to intuition, as indeed geometry always does. Hence you give yourselves an object in intuition. But of which kind is this intuition? Is it a pure a priori intuition or an empirical one? If it were an empirical intuition, then it could never turn into a universally valid proposition, let alone an apodeictic one; for experience can never supply anything like that. Hence you must give your object to yourselves a priori in intuition, and base your synthetic proposition on this object. Now suppose that there did not lie within you a power to intuit a priori; that this subjective condition were not, as regards its form, at the same time the universal a priori condition under which alone the object of this (outer) intuition is itself possible; and that the object (the triangle) were something in itself, even apart from any relation to yourselves as subject. If that were so, how could you say that what necessarily lies in [or belongs to] your subjective conditions for constructing a triangle must also belong necessarily to the triangle itself? For, after all, you could not add to your concepts (of three lines) anything new (the [B66] figure) that would therefore have to be met with necessarily in the object, since this object would be given prior to your cognition rather than through it. Hence you could not synthetically a priori establish anything whatsoever about external objects if space (and similarly time) were not a mere form of your intuition, an intuition that a priori contains conditions under which alone things can be external objects for you — these objects being nothing in themselves, apart from these subjective conditions. Therefore the following is not merely possible—or probable, for that matter — but indubitably certain: Space and time, as the necessary conditions of all (outer and inner) experience, are merely subjective conditions of all our intuition. Hence in relation to these conditions all objects are mere appearances, and are not given to us in this way on their own. And that is why much can be said a priori about these objects as regards their form, but not the least can ever be said about the thing in itself that may underlie these appearances.

II. This theory, according to which both outer and inner sense are ideal and hence all objects of the senses

are mere appearances, can be confirmed superbly by the following observation. Whatever in our cognition belongs to intuition (excluding, therefore, what are not cognitions at all, i.e., both the feeling of pleasure and displeasure and the will) contains nothing but mere relations; of places in an intuition [B67] (extension), of change of places (motion), and of laws according to which this change is determined (motive forces). But what is present in that place, or what effect—besides the change of place—it produces in the things themselves, is not given to us by [what belongs to intuition]. Now through mere relations we do not, of course, cognize a thing in itself. Hence our judgment must surely be this: since through outer sense we are given nothing but mere relational presentations, outer sense can, by the same token, contain in its presentation only the relation of an object to the subject, but not the intrinsic character belonging to the object in itself. The same applies to inner intuition. For not only does the proper material in it, with which we occupy our mind, consist in presentations of *outer senses*; but the time in which we place these presentations, and which itself precedes the consciousness of them in experience and underlies, as formal condition, the way in which we place them within the mind, already contains relations: of succession, of simultaneity, and of what is simultaneous with succession (the permanent). Now, presentation that can precede all acts of thinking anything is intuition; and if this intuition contains nothing but relations then it is the form of intuition. But this form does not present anything except insofar as something is being placed within the mind. Therefore this form [B68] can be nothing but the way in which the mind is affected by its own activity — viz., this placing of its presentation — and hence affected by itself; i.e., it is an inner sense insofar as that sense's form is concerned. Whatever is presented through a sense is, to that extent, always appearance. Hence either we must not grant that there is an inner sense at all; or we must grant that the subject who is the object of this sense can be presented through it only as appearance, and not as he would judge himself if his intuition were self-activity only, i.e., if it were intellectual intuition. What underlies this whole difficulty is this: how can a subject inwardly intuit himself? But this difficulty is shared by every theory. The consciousness of oneself (apperception) is the simple presentation of the I; and if through this consciousness by itself all the manifold in the subject were given *self-actively*, then the inner intuition would be intellectual. But in man this consciousness requires also inner perception of the manifold given in the subject beforehand; and the way in which this manifold is given in the mind— viz., without spontaneity— must, for the sake of marking this distinction, be called sensibility. If the power to become conscious of oneself is to locate (apprehend) what lies in the mind, then it must affect the mind; and only in that way can it produce an intuition of itself. But the form of this intuition lies at the basis [B69] beforehand in the mind; and this form determines, in the presentation of time, the way in which the manifold is [placed] together in the mind. And thus this power does not intuit itself as it would if it presented itself directly and self-actively; rather, it intuits itself according to the way in which it is affected from within, and hence intuits itself as it appears to itself, not as it is.

III. I am saying, then, that the intuition of external objects and the self-intuition of the mind both present these objects and the mind, in space and in time, as they affect our senses, i.e., as they appear. But I do not mean by this that these objects are a mere *illusion*. For when we deal with appearance, the objects, and indeed even the properties that we ascribe to them, are always regarded as something actually given— except that insofar as the object's character depends only on the subject's way of intuiting this given object in its relation to him, we do also distinguish this object as *appearance* from the same object as object *in itself*.⁹¹ Thus when I posit both bodies and my soul as being in accordance with the quality of space and time, as condition of their existence, I do indeed assert that this quality lies in my way of intuiting and not in those objects in themselves. But in asserting this I am not saying that the bodies merely *seem* to be outside me, or that my soul only *seems* to be given in my self-consciousness. It would be my own fault if I turned into mere illusion what I ought to class with appearance.⁹² This is not, however, what happens [B70] if we follow our principle that all our sensible intuitions are ideal. On the contrary: it is when we attribute *objective reality* to those forms of presentation that we cannot prevent everything from being thereby transformed into mere *illusion*. For suppose that we regard space and time as properties that, as far as their very possibility is concerned, must be found in things in themselves. And now reflect on the absurdities in which we then become entangled, inasmuch as [we then have] two infinite things that must not be substances nor anything actually inhering in substances, but that yet must be something existent — indeed, [B71] must be the necessary condition for the existence of all things—and must moreover remain even if all existing things are annulled. If we thus reflect on this supposition, then we can hardly blame the good *Berkeley* for downgrading bodies to mere illusion. Indeed, even our own existence, which would in this way be made dependent on the self-subsistent reality of a nonentity such as time would be, would be transformed along with this time into nothing but illusion — an absurdity of which no one thus far has made himself guilty.

IV. In natural theology we think an object [viz., God] that not only cannot possibly be an object of

intuition for us, but that cannot in any way be an object of sensible intuition even to itself. [When we think of God in this way,] we take great care to remove the conditions of time and space from all his intuition. (All his cognition must be intuition rather than *thought*, which always manifests limits.) But what right do we have to do this if we have beforehand turned space and time into forms of things in themselves—such forms, moreover, as are a priori conditions of the existence of things and hence would remain even if we had annulled the things themselves? For as conditions of all existence in general, they would have to be conditions also of the existence of God. If we are not to make space and time objective [B72] forms of all things, then we are left with only one alternative: we must make them subjective forms of our kind of intuition, inner and outer. Our kind of intuition is called sensible⁹³ because it is *not original*. I.e., it is not such that through this intuition itself the existence of its object is given (the latter being a kind of intuition that, as far as we can see, can belong only to the original being). Rather, our kind of intuition is dependent on the existence of the object, and hence is possible only by the object's affecting the subject's capacity to present.

There is, moreover, no need for us to limit this kind of intuition—intuition in space and time—to the sensibility of man. It may be (though we cannot decide this) that any finite thinking being must necessarily agree with man in this regard. Yet even if this kind of intuition were thus universally valid, it would not therefore cease to be sensibility. It would remain sensibility precisely because it is derivative (*intuitus derivativus*) rather than original (*intuitus originarius*), and hence is not intellectual intuition. For the reason just set forth, intellectual intuition seems to belong solely to the original being, and never to a being that is dependent as regards both its existence and its intuition (an intuition that determines that being's existence by reference to given objects). This last remark, however, must be considered as included in our aesthetic theory only as an illustration, not as a basis of proof.

CONCLUDING THE TRANSCENDENTAL AESTHETIC [b73]

Thus in our pure a priori intuitions, space and time, we now have one of the components required for solving the general problem of transcendental philosophy: *How are synthetic propositions possible a priori?* When in an a priori judgment about space and time we want to go beyond the given concept, we encounter⁹⁴ what cannot be discovered a priori in the given concept, but can indeed be so discovered in the intuition corresponding to that concept and can be combined with it synthetically. Because of this,⁹⁵ however, such judgments can never reach beyond objects of the senses, and can hold only for objects of possible experience.

[B74] *Transcendental Doctrine of Elements*

PART II

TRANSCENDENTAL LOGIC

Introduction Idea of a Transcendental Logic

I

ON LOGIC AS SUCH

Our cognition arises from two basic sources of the mind. The first is [our ability] to receive presentations (and is our receptivity for impressions); the second is our ability to cognize an object through these presentations (and is the spontaneity of concepts).⁹⁶ Through receptivity an object is *given* to us; through spontaneity an object is *thought* in relation to that [given] presentation (which [otherwise]⁹⁷ is a mere determination of the mind). Intuition and concepts, therefore, constitute the elements of all our cognition. Hence neither concepts without an intuition corresponding to them in some way or other, nor intuition without concepts can yield cognition. Both intuition and concepts are either pure or empirical. They are *empirical* if they contain sensation (sensation presupposes the actual presence of the object); they are *pure* if no sensation is mixed in with the presentation.⁹⁸ Sensation may be called the matter of sensible cognition. [B75] Hence pure intuition contains only the form under which something is intuited, and a pure concept contains solely the form of the thought of an object as such. Only pure intuitions or concepts are possible a priori; empirical ones are possible only a posteriori.

Let us give the name *sensibility* to our mind's *receptivity*, [i.e., to its ability] to receive presentations insofar as it is affected in some manner. *Understanding*, on the other hand, is our ability to produce presentations ourselves, i.e., our *spontaneity* of cognition. Our *intuition*, by our very nature, can never be other than *sensible* intuition,⁹⁹ i.e., it contains only the way in which we are affected by objects. *Understanding*, on the other hand, is our ability to *think* the object of sensible intuition. Neither of these properties is to be preferred to the other. Without sensibility no object would be given to us; and without understanding no object would be thought. Thoughts without content are empty; intuitions without concepts are blind. Hence it is just as necessary that we make our concepts sensible (i.e., that we add the object to them in intuition) as it is necessary that we make our intuitions understandable (i.e., that we bring them under concepts). Moreover, this capacity and this ability¹⁰⁰ cannot exchange their functions. The understanding cannot intuit anything,¹⁰¹ and the senses cannot think anything. Only from their union can cognition arise. [B76] This fact, however, must not lead us to confuse their respective contributions;¹⁰² it provides us, rather, with a strong reason for carefully separating and distinguishing sensibility and understanding from each other. Hence we distinguish the science of the rules of sensibility as such, i.e., aesthetic, from the science of the rules of the understanding as such, i.e., logic.

Now logic, in turn, can be done from two points of view, either as logic of the understanding's general use or as logic of its special use. The logic of the understanding's general use contains the absolutely necessary rules of thought without which the understanding cannot be used at all. Hence it deals with the understanding without regard to the difference among the objects to which the understanding may be directed. This logic may be called elementary logic. The logic of the understanding's special use, which may be called the organon of this or that science, contains the rules for thinking correctly about a certain kind of objects. The schools usually make this logic a preface to the sciences, using it as a propaedeutic, even though in terms of the progression of human reason it comes last: reason does not arrive at this logic until long after the science is done and needs only finishing touches that will correct and [B77] perfect it. For if we are to state the rule as to how a [particular] science can be brought about, then the objects of that science must already be familiar to us to a fairly high degree.

Now general logic is either pure or applied logic. In general logic we abstract from all empirical conditions under which we exercise our understanding. We abstract, e.g., from the influence of the senses, from the play of imagination, from the laws of memory, from the force of habit, from inclination, etc.; hence we abstract also from the sources of prejudices, and indeed from all causes generally that give rise, or may be alleged to

give rise, to such and such cognitions. For these empirical conditions concern the understanding only as applied under certain circumstances, and becoming acquainted with these circumstances requires experience. Hence a logic that is *general* but also *pure* deals with nothing but a priori principles. Such a logic is a *canon of understanding* and of reason, but only as regards what is formal in our use of them — i.e., we disregard what the content may be (whether it is empirical or transcendental). A *general logic* is called *applied*, on the other hand, if it is concerned with the rules of the understanding as used under the subjective empirical conditions taught us by psychology. Hence such a logic has empirical principles, although it is general insofar as it deals with our use of the understanding without distinguishing the understanding's objects. That is also the reason why applied general logic is neither a canon of the understanding as such nor an organon [B78] of special sciences, but solely a cathartic for the common understanding.¹⁰³ In general logic, therefore, the part that is to constitute the pure doctrine of reason must be separated entirely from the part that is to constitute applied (though still general) logic. Only the first of these parts¹⁰⁴ is, properly speaking, a science, although it is brief and dry and thus is such as the exposition of a doctrine of the understanding's elements is required to be in order to comply with school standards. In such pure general logic, therefore, the logicians must always have in mind two rules:

1. As general logic, it abstracts from all content of the cognition of understanding and from the difference among the objects of that cognition, and deals with nothing but the mere form of thought.
2. As pure logic, it has no empirical principles. Hence it does not (as people have sometimes come to be persuaded) take anything from psychology; and therefore psychology has no influence whatever on the canon of the understanding. Pure general logic is demonstrated doctrine, and everything in it must be certain completely a priori.

What I call applied logic is a presentation of the understanding and of the rules governing its necessary use *in concreto*, viz., its use under the contingent conditions attaching to the subject, conditions that [B79] can impede or promote this use and that are, one and all, given only empirically. (This definition of applied logic is contrary to the ordinary meaning of the expression, according to which applied logic should contain certain exercises for which pure logic gives the rule.) On my definition, applied logic deals with attention; attention's being impeded and the consequences thereof; the origin of error; the states of doubt, of having scruples, of conviction, etc. Pure general logic relates to applied general logic as pure morality relates to the doctrine proper of virtue. Pure morality contains merely the moral laws of a free will as such; the doctrine of virtue examines these laws as impeded by the feelings, inclinations, and passions to which human beings are more or less subject. The doctrine of virtue can never serve as true and demonstrated science; for, just like applied logic, it requires empirical and psychological principles.

II

ON TRANSCENDENTAL LOGIC

General logic, as we have shown, abstracts from all content of cognition, i.e., from all reference of cognition to its object. It examines only the logical form in the relation that cognitions have to one another, i.e., only the form of thought as such. But (as the Transcendental Aesthetic establishes) there are both pure and empirical intuitions; and hence we might [B80] well find it appropriate to distinguish also between pure and empirical thought of objects. In that case there would be a logic in which we would not abstract from all content of cognition. For a logic containing merely the rules governing the pure thought of an object would only exclude all those cognitions that have empirical content. Such a logic, moreover, would also deal with the origin of our cognitions of objects insofar as that origin cannot be attributed to the objects, whereas general logic has nothing to do with the origin of cognition. Rather, general logic examines presentations, whether these have their basic origin a priori in ourselves, or are given only empirically; and it examines these presentations merely in terms of the laws according to which the understanding, when it thinks, uses them in their relation to one another. Hence general logic deals only with that form of the understanding which can be imparted to the presentations, whatever their origin may be irrespective of that form.

And here I shall make a comment; it extends its influence to all subsequent contemplations, and hence must be remembered carefully. We must not call just any a priori cognition transcendental, but must call transcendental (i.e., concerning the a priori possibility or the a priori use of cognition) only that a priori cognition whereby we cognize that — and how — certain presentations (intuitions or concepts) [B81] are applied, or are possible, simply a priori. Hence neither space nor any a priori geometric determination of it is a transcendental presentation. Rather, we may call transcendental only the cognition that these presentations are not at all of empirical origin, and the possibility whereby they can nonetheless refer a priori to objects of experience. Similarly, the use of space regarding objects in general¹⁰⁵ would also be transcendental. But if the use of space is limited to objects of the senses only, then it is called empirical. The distinction between the transcendental and the empirical belongs, therefore, only to the critique of cognitions, and does not concern the reference of these cognitions to their object.

We shall expect, then, that there may perhaps be concepts referring a priori to objects. Not being pure or sensible intuitions, but being merely acts of pure thought, they would be concepts, but such concepts as originate neither empirically nor aesthetically.¹⁰⁶ In this expectation, then, we frame in advance the idea of a science of pure understanding and of rational cognition, whereby we think objects completely a priori. Such a science would determine the origin, the range, and the objective validity of such rational cognitions. It would have to be called *transcendental logic*. For it deals merely with the laws of understanding and of reason; yet it does so only insofar as this [B82] logic is referred a priori to objects—unlike general logic, which is referred indiscriminately to empirical as well as pure rational cognitions.

III

ON THE DIVISION OF GENERAL LOGIC INTO ANALYTIC AND DIALECTIC

What is truth? is the ancient and famous question with which people meant to drive logicians into a corner, trying to get them to the point where either they must let themselves be caught in a pitiful circle, or they must confess their ignorance and hence admit the futility of their whole art. In asking logicians this question, these people took for granted, and they presupposed, the explication of the name *truth*,¹⁰⁷ viz., that truth is the agreement of cognition with its object. They demanded to know, instead, what is the universal and safe criterion of the truth of any cognition. [They failed to see, however, the absurdity of their own question.]

To know what question one should, reasonably, ask is already a great and necessary proof of one's sagacity and insight. For if the question is in itself absurd and demands answers that are unnecessary, then it not only embarrasses the person raising it, but sometimes has the further disadvantage of misleading the incautious listener: it may prompt him to give [B83] absurd answers and to provide us with the ridiculous spectacle where (as the ancients said) one person milks the ram¹⁰⁸ while the other holds a sieve underneath.

Thus if truth consists in the agreement of a cognition with its object, then this object must here be distinguished from others. For if a cognition does not agree with the object to which it is referred then it is false, even if it contains something that might well hold for other objects. Now a universal criterion of truth would be one that is valid for all cognitions, without distinction of their objects. But while in such a universal criterion of truth we thus abstract from all content of cognition (i.e., from its reference to its object), yet truth concerns this very content. Clearly, therefore, asking questions about a mark for the truth of this content of cognitions is quite impossible and absurd; and hence one cannot possibly give an indicator of truth that is sufficient and yet universal at the same time. Now we have already earlier called the content of a cognition its matter. Hence we shall have to say that no universal indicator can be demanded for the truth of cognition in terms of its matter, because such an indicator would be intrinsically contradictory.

As regards cognition in terms of its mere form (setting aside all content), on the other hand, and thus as regards a logic insofar as it puts forth the universal and [B84] necessary rules of the understanding, it is equally clear that such a logic must in these very rules set down criteria of truth. For whatever contradicts these rules is false, because the understanding is then in conflict with its own universal rules of thought, and hence with itself. These criteria, however, concern only the form of truth, i.e., the truth of thought as such, and are to that extent quite correct. But they are not sufficient. For even if a cognition accorded completely with logical form, i.e., even if it did not contradict itself, it could still contradict its object. Therefore the merely logical criterion of truth, viz., a cognition's agreement with the universal and formal laws of understanding and reason, is indeed the *conditio sine qua non*,¹⁰⁹ and hence the negative condition, of all truth. But logic cannot go any farther than this; it has no touchstone by which it can discover an error that concerns content rather than form.

Now general logic analyzes the whole formal business of understanding and reason into its elements, and exhibits these elements as principles governing all logical judging of our cognition. Hence this part of logic may be called an analytic. This analytic is at least the negative touchstone of truth, precisely because all cognition must first of all be tested and assessed, in terms of its form, by these rules;¹¹⁰ this must be done before we examine these rules themselves in terms of their content in order to establish whether they contain positive truth as regards their [B85] object. On the other hand, the mere form of cognition, however much it may agree with logical laws, is far from being sufficient to establish that a cognition is true objectively (materially). Hence with mere logic no one can venture to make judgments about objects and assert anything about them. Rather, we must first go outside logic to obtain well-based information about objects, in order then to attempt merely employing this information and connecting it in a coherent whole in accordance with logical laws, or — better yet — in order only to test the information by these laws. Yet there is something very tempting about possessing so plausible an art, whereby we give to all our cognitions the form of our understanding—even though we may still be very empty-handed and poor as regards the cognition's content. So great is this temptation that this general logic, which is merely a *canon* for judging, has been used — like an *organon*, as it were—for the actual production of at least deceptive objective assertions, and thus has in fact been misused. Now general logic, when used as supposed organon, is called *dialectic*.

Although the ancients used this name *dialectic*, as standing for a science or art, in quite different senses, still from their actual use of the name we can safely glean that dialectic was for them nothing other than [B86] the *logic of illusion*. I.e., it was the sophistical art of giving an air of truth to one's ignorance, and indeed even

to one's deliberate deceptions; this was done by imitating the method of thoroughness prescribed by logic as such, and by employing the topic of logic¹¹¹ to paint over any empty pretense. Now we may note (as a sure and useful warning) that general logic, when *regarded as an organon*, is always a logic of illusion, i.e., it is always dialectical. For general logic teaches us nothing whatever about the content of cognition; it teaches us merely the formal conditions for the agreement [of cognition] with the understanding, and these conditions are wholly inconsequential otherwise, i.e., as regards the [cognition's] objects. Hence the impudent use of general logic as an instrument (*organon*), in order (at least allegedly) to broaden and expand one's knowledge, comes down to nothing but idle chatter, where anything one wishes is — with some semblance of plausibility — asserted or, for that matter, challenged at will.

Such instruction is in no way compatible with the dignity of philosophy. For this reason the name *dialectic* has been [redefined so that a dialectic is] included with logic as a *critique of dialectical illusion*; and this is how we want it to be understood here as well.

ON THE DIVISION OF TRANSCENDENTAL LOGIC INTO TRANSCENDENTAL ANALYTIC AND DIALECTIC

In a transcendental logic we isolate the understanding (just as in the transcendental aesthetic above we isolated sensibility), and we select from our cognition merely that part of thought which has its origin solely in the understanding. The use of this pure cognition rests on the condition, however, that objects to which it can be applied are given to us in intuition. For without intuition, all our cognition lacks objects, and thus remains completely empty. That part, then, of transcendental logic which sets forth the elements of understanding's pure cognition, as well as the principles without which no object can be thought at all, is transcendental analytic. It is at the same time a logic of truth. For no cognition can contradict it without at the same time losing all content, i.e., all reference to any object, and hence without losing all truth. On the other hand, there is great enticement and temptation to employ these pure cognitions of understanding and these principles by themselves, and to do so even beyond the bounds of experience, even though only experience can provide us with [B88] the matter (objects) to which those pure concepts of understanding can be applied. As a consequence, the understanding runs the risk that, by idly engaging in subtle reasoning, it will put the merely formal principles of pure understanding to a material use, and will make judgments indiscriminately even about objects that are not given, or indeed about objects that perhaps cannot be given in any way at all. Properly, then, transcendental analytic should be only a canon for judging the empirical use.¹¹² Hence we misuse transcendental analytic if we accept it as the organon of a universal and unlimited use, and if with pure understanding alone we venture to judge, assert, and decide anything synthetically about objects as such. Hence¹¹³ the use of pure understanding would then be dialectical. Therefore the second part of transcendental logic must be a critique of this dialectical illusion, and is called transcendental dialectic. It is to be regarded not as an art of dogmatically creating such illusion (an art that is unfortunately quite prevalent in diverse cases of metaphysical jugglery), but as a critique of understanding and reason as regards their hyperphysical use. We need such a critique in order to uncover the deceptive illusion in the baseless pretensions of understanding and reason; and we need it in order to downgrade reason's claim that it discovers and expands [cognition] —which it supposedly accomplishes by merely using transcendental principles — [to the claim that it] merely judges pure understanding and guards it against sophistical deceptions.

TRANSCENDENTAL LOGIC [B89]

Division I

TRANSCENDENTAL ANALYTIC

Transcendental analytic consists in the dissection of our entire a priori cognition into the elements of understanding's pure cognition. The following points are what matters in this dissection: (1) The concepts must be pure rather than empirical. (2) They must belong not to intuition and sensibility, but to thought and understanding. (3) They must be elementary concepts, and must be distinguished carefully from concepts that are either derivative or composed of such elementary concepts. (4) Our table of these concepts must be complete, and the concepts must occupy fully the whole realm of pure understanding. Now, this completeness [characteristic] of a science cannot be assumed reliably by gauging an aggregate of concepts that was brought about merely through trials. Hence this completeness is possible only by means of an *idea of the whole* of understanding's a priori cognition, and through the division, determined by that idea, of the concepts amounting to that cognition; and hence this completeness is possible only through the *coherence* of these concepts *in a system*. Pure understanding differentiates itself fully not only from everything empirical, but even from all sensibility [generally].¹¹⁴ Therefore it is a unity that is self-subsistent, [B90] sufficient to itself, and that cannot be augmented by supplementing it with any extrinsic additions. Hence the sum of pure understanding's cognition will constitute a system that can be encompassed and determined by an idea. The system's completeness and structure can at the same time serve as a touchstone of the correctness and genuineness of whatever components of cognition fit into the system. This entire part of the Transcendental Logic¹¹⁵ consists, however, of two *books*; one of these contains the *concepts*, the other the *principles*, of pure understanding.

TRANSCENDENTAL ANALYTIC

Book I

Analytic of Concepts

By *analytic of concepts* I do not mean the analysis of concepts, i.e., the usual procedure in philosophical inquiries of dissecting already available concepts in terms of their content and bringing them to distinctness; rather, I mean the hitherto rarely attempted *dissection*¹¹⁶ *of the power of understanding itself*. The purpose of this dissection is to explore the possibility of a priori concepts, by locating them solely in the understanding, as their birthplace, and by analyzing the understanding's pure use as such. For this exploration is the proper task of a transcendental philosophy; [B91] the rest¹¹⁷ is the logical treatment of concepts in philosophy generally. Hence we shall trace the pure concepts all the way to their first seeds and predispositions in the human understanding, where these concepts lie prepared until finally, on the occasion of experience, they are developed and are exhibited by that same understanding in their purity, freed from the empirical conditions attaching to them.

Analytic of Concepts

Chapter I

On the Guide for the Discovery of All Pure Concepts of Understanding

When we bring into play a cognitive power, then, depending on the various ways in which we may be prompted to do so, different concepts come to the fore that allow us to recognize this power. These concepts can be collected¹¹⁸ in an essay that will be more or less comprehensive, once the concepts have been observed fairly long or with significant mental acuity. But by this — as it were, mechanical — procedure we can never reliably determine at what point that inquiry will be completed. Moreover, if concepts are discovered only on given occasions, then they reveal themselves in no order or systematic unity; [B92] instead they are ultimately only paired according to similarities, and arranged in series according to the quantity of their content, from the simple concepts on to the more composite. The way in which these series are brought about, despite being methodical in a certain manner, is anything but systematic.

Transcendental philosophy has the advantage, but also the obligation, of locating its concepts according to a principle. For these concepts arise, pure and unmixed, from the understanding, which is an absolute unity; and hence these concepts themselves must cohere with each other according to one concept or idea. Such coherence, however, provides us with a rule by which we can determine a priori the proper place for each pure concept of understanding, and the completeness of all of them taken together— whereas otherwise all of this would be subject to one's own discretion or to chance.

Transcendental Guide for the Discovery of All Pure Concepts of Understanding

Section I On the Understanding's Logical Use As Such

The understanding was explicated merely negatively above, viz., as a non-sensible cognitive power. And since independently of sensibility we cannot partake of any intuition, it follows that the understanding is not a power of intuition. Apart from intuition, however, [B93] there is only one way of cognizing, viz., through concepts. Hence the cognition of any understanding, or at least of the human understanding, is a cognition through concepts; it is not intuitive, but discursive. All our intuitions, as sensible, rest on our being affected; concepts, on the other hand, rest on functions. By *function* I mean the unity of the act of arranging various presentations under one common presentation. Hence concepts¹¹⁹ are based on the spontaneity of thought, whereas sensible intuitions are based on the receptivity for impressions. Now the only use that the understanding can make of these concepts is to judge by means of them. But in such judging, a concept is never referred directly to an object, because the only kind of presentation that deals with its object directly is intuition. Instead the concept is referred directly to some other presentation of the object (whether that presentation be an intuition or itself already a concept). Judgment, therefore, is the indirect cognition of an object, viz., the presentation of a presentation of it. In every judgment there is a concept that [comprises and thus] holds for many [presentations], and, among them, comprises also a given presentation that is referred directly to the object. E.g., in the judgment, *All bodies are divisible*, the concept of the divisible refers to various other concepts; but, among these, it is here referred specifically to the concept of body, and the concept of body is referred in turn to certain appearances that we [B94] encounter. Hence these objects are presented indirectly through the concept of divisibility. Accordingly, all judgments are functions of unity among our presentations. For instead of cognizing the object by means of a direct presentation, we do so by means of a higher presentation comprising both this direct presentation and several other presentations; and we thereby draw many possible cognitions together into one. Now since all acts of the understanding can be reduced to judgments, the *understanding* as such can be presented as a *power of judgment*. For, according to what we said above, the understanding is a power of thought. But thought is cognition through concepts; and concepts, as predicates of possible judgments, refer to some presentation of an as yet undetermined object. Thus the concept of body signifies something—e.g., metal—that can be cognized through that concept. Hence it is a concept only because there are contained under it other presentations by means of which it can refer to objects. Therefore the concept of body is the predicate for a possible judgment, e.g., the judgment that every metal is a body. Therefore we can find all of the functions of the understanding if we can exhibit completely the functions of unity in judgments. This, however, can be accomplished quite readily, as the following section will show.

[Transcendental] Guide for the Discovery of All Pure Concepts [B95] of Understanding

Section II

§9

ON THE UNDERSTANDING'S LOGICAL FUNCTION IN JUDGMENTS

If we abstract from all content of a judgment as such and pay attention only to the mere form of understanding in it, then we find that the function of thought in judgment can be brought under four headings, each containing under it three moments. They can conveniently be presented in the following table.

1		
Quantity of Judgments		
Universal		
Particular		
Singular		
2		3
Quality		Relation
Affirmative		Categorical
Negative		Hypothetical
Infinite		Disjunctive
4		
Modality		
Problematic		
Assertoric		
Apodeictic		

[B96] Since this division departs in some respects, even though not in essential ones, from the customary technical apparatus used by logicians, there will be some point in my offering the following safeguards against the worrisome possibility of its being misunderstood.

1. Logicians are right in saying that, when judgments are used in syllogisms, singular judgments can be treated like universal ones. For precisely because singular judgments have no range at all, any predicate of them cannot be referred to some part of what is contained under the concept of the subject and be excluded from some other part of it. Hence the predicate of a singular judgment holds for the subject concept without exception, just as if this concept were a generally valid¹²⁰ one and the predicate held for the whole denotation within the concept's range. On the other hand, if¹²¹ a singular judgment is compared in terms of quantity with a generally valid one merely as [two kinds of] cognition,¹²² then the singular judgment relates to the generally valid one as unity relates to infinity, and hence is in itself essentially distinct from it. Suppose, therefore, that I assess a singular judgment (*iudicium singulare*) not merely in terms of its intrinsic validity but also as cognition as such, and assess it in terms of the quantity that it has by comparison with other cognitions. In that case the singular judgment is indeed distinct from generally valid judgments (*iudicia communia*); and hence it then deserves a separate place in a complete table of the moments of thought as such (although it does indeed not deserve a separate place in the logic that [B97] is limited to the use of judgments merely in relation to one another).

2. Similarly, in a transcendental logic we must distinguish from *affirmative* judgments [not only negative ones but] also *infinite judgments*, even though in general logic they are rightly included with affirmative ones and do not constitute a separate member in the division of judgments. For general logic abstracts from all content of the predicate (even if the predicate is negative), and has regard only for whether the predicate is being ascribed to the subject or is being opposed to it. But transcendental logic considers the judgment also in terms of what value or content there is in this logical affirmation made by means of a merely negative predicate, and in terms of what gain for cognition as a whole is provided by this affirmation. If in speaking of the soul I had said, It is not mortal, then by this negative judgment I would at least have avoided an error. Now if I say instead, The soul is nonmortal, then I have indeed, in terms of logical form, actually affirmed something; for I have posited the soul in the unlimited range of nonmortal beings. Now what is mortal comprises one part of the whole range of possible beings, and what is nonmortal comprises the other. Hence my proposition¹²³ says nothing more than that the soul is one of the infinite multitude of things that remain if I take away whatever is mortal. But to say that is only to limit the infinite sphere of all that is possible, viz., to limit it to the extent that what is mortal is separated from it and the [B98] soul is posited in the remaining

space of the sphere's range.¹²⁴ But despite this exclusion [of what is mortal from it], this space still remains infinite; and even if we take away from it still more parts, this does not in the least increase the concept of the soul and determine it affirmatively. Hence although such judgments¹²⁵ are infinite as regards logical range, they are actually merely limitive as regards the content of cognition as such. In view of this, they must not be omitted from the transcendental table of all moments of the thought occurring in judgments, because the function that the understanding performs in these infinite judgments may perhaps be important in the realm of the understanding's pure a priori cognition.

3. The following are all the relations of thought in judgments: (a) the relation of the predicate to the subject; (b) the relation of the ground to its consequence; (c) the relation, in a divided cognition, of all of the division's members to one another. In these three kinds of judgments we consider, in relation to one another: in the first kind of judgments, two concepts only; in the second, two judgments; in the third, several judgments. To illustrate the second kind, take a hypothetical proposition: If there is a perfect justice, then the persistently evil person is punished. This proposition in fact contains the relation of two propositions: There is a perfect justice; and, The persistently evil person is punished. Whether these two propositions are in themselves true remains undecided here; only the implication is thought through this hypothetical judgment. Finally, to illustrate the third kind: a [B99] disjunctive judgment contains a relation of two, or of several, propositions to one another. But this relation is not one of sequence. Rather, it is a relation of logical opposition, insofar as the sphere of the one proposition excludes the sphere of the other; yet it is at the same time a relation of community, insofar as the two propositions together occupy the sphere of the proper cognition involved. Hence the relation of the propositions in a disjunctive judgment is a relation of the parts of a cognition's sphere. For the sphere of each part complements the sphere of the other part, to yield the whole sum of the divided cognition. Take this judgment, e.g.: The world exists either through blind chance, or through internal necessity, or through an external cause. Each of these propositions occupies a part of the sphere of possible cognition concerning the existence of a world as such; all of them together occupy the whole sphere. To remove the cognition from one of these spheres means placing it into one of the other spheres; and, on the other hand, to place it into one sphere means to remove it from the others. Hence in a disjunctive judgment there is a certain community of cognitions. This community consists in the fact that the cognitions reciprocally exclude one another, and yet as a *whole* determine thereby the true cognition; for, taken together, they constitute the whole content of a single given cognition. And this, moreover, is all that I here need to point out in view of what follows.

4. The modality of judgments is a very special function of them. What distinguishes this function is the fact that it contributes nothing to the judgment's [B100] content (for besides quantity, quality, and relation there is nothing else to constitute a judgment's content). Rather, modality concerns only the value that the copula has in reference to thought as such. *Problematic* judgments are those where the affirmation or negation is taken as merely *possible* (optional); *assertoric* ones are those where the affirmation or negation is considered as *actual* (true); *apodeictic* ones are those in which it is regarded as *necessary*.¹²⁶ Thus the two judgments (*antecedens* and *consequens*) whose relation constitutes the hypothetical judgment, and similarly the judgments (members of the division) in whose interaction the disjunctive judgment consists, are one and all problematic only. In the above example, the proposition, There is a perfect justice, is not uttered assertorically, but is thought only as an optional judgment, i.e., one that it is possible for someone to assume; only the implication is assertoric. This is also the reason why such optional judgments, even if manifestly false, can still, when taken problematically, be conditions for the cognition of truth. Thus in the disjunctive judgment used above, the judgment *The world exists through blind chance* has only problematic meaning; viz., to the effect that someone might perhaps assume this proposition for an instant. [B101] And yet it serves us in finding the true proposition (just as indicating the wrong road serves us in finding the right one among the number of all the roads that one can take). Hence a problematic proposition is one that expresses only logical possibility (which is not objective possibility). I.e., it expresses a free choosing to let such a proposition stand — a mere electing to admit it into the understanding. An assertoric proposition speaks of logical actuality or truth; thus in a hypothetical syllogism, e.g., the antecedent occurs problematically in the major premise but assertorically in the minor premise. And the assertoric proposition indicates that it is already linked with the understanding in accordance with the understanding's law. An apodeictic proposition thinks the assertoric one as determined by these laws of the understanding themselves, and hence thinks it as maintaining [this or that] a priori; and in this way it expresses logical necessity. Thus everything is incorporated in the understanding by degrees: at first we judge something problematically; then perhaps we also accept it assertorically as true; and finally we maintain it as linked inseparably with the understanding, i.e., as necessary and apodeictic. And hence these three functions of modality may also be called so many moments of thought as such.

[Transcendental] Guide for [B102] the Discovery of All Pure Concepts of Understanding

Section III

§10

ON THE PURE CONCEPTS OF UNDERSTANDING, OR CATEGORIES

General logic, as we have said several times already, abstracts from all content of cognition. It expects presentations to be given to it from somewhere else—no matter where—in order then to transform these presentations into concepts in the first place. This it does analytically. Transcendental logic, on the other hand, has lying before it a manifold of a priori sensibility, offered to it by transcendental aesthetic. Transcendental aesthetic offers it this manifold in order to provide it with a material for the pure concepts of understanding. Without this material, transcendental logic would have no content, and hence would be completely empty. Now space and time contain a manifold of pure a priori intuition. But they belong nonetheless to the conditions of our mind's receptivity under which alone the mind can receive presentations of objects, and which, by the same token, must always affect the concept of these objects. Yet the spontaneity of our thought requires that this manifold, in order to be turned into a cognition, must first be gone through, taken up, and combined in a certain manner. This act I call synthesis.

By *synthesis*, in the most general sense of the term, [B103] I mean the act of putting various presentations with one another and of comprising their manifoldness in one cognition. Such synthesis is *pure* if the manifold is given not empirically but a priori (as is the manifold in space and time). Before any analysis of our presentations can take place, these presentations must first be given, and hence in terms of *content* no concepts can originate analytically. Rather, synthesis of a manifold (whether this manifold is given empirically or a priori) is what first gives rise to a cognition. Although this cognition may still be crude and confused at first and hence may require analysis, yet synthesis is what in fact gathers the elements for cognition and unites them to [form] a certain content. Hence if we want to make a judgment about the first origin of our cognition, then we must first direct our attention to synthesis.

Synthesis as such, as we shall see hereafter, is the mere effect produced by the imagination, which is a blind but indispensable function of the soul without which we would have no cognition whatsoever, but of which we are conscious only very rarely. Bringing this synthesis to *concepts*, on the other hand, is a function belonging to the understanding; and it is through this function that the understanding first provides us with cognition in the proper meaning of the term.

Now *pure synthesis, conceived of generally*, yields [B104] the pure concept of understanding. By pure synthesis I mean the synthesis that rests on a basis of synthetic a priori unity. E.g., our act of counting (as is more noticeable primarily with larger numbers) is a *synthesis according to concepts*, because it is performed according to a common basis of unity (such as the decimal system). Hence under this concept the unity of the manifold's synthesis becomes necessary.

Bringing various presentations *under* a concept (a task dealt with by general logic) is done analytically. But bringing, not presentations but the *pure synthesis* of presentations, *to* concepts is what transcendental logic teaches. The first [thing] that we must be given a priori in order to cognize any object is the *manifold* of pure intuition. The second [thing] is the *synthesis* of this manifold by the imagination. But this synthesis does not yet yield cognition. The third [thing we need] in order to cognize an object that we encounter is the concepts which give *unity* to this pure synthesis and which consist solely in the presentation of this necessary synthetic unity. And these concepts rest on the understanding.

The same function that gives unity to the various presentations *in a judgment* also gives unity to the [B105] mere synthesis of various presentations *in an intuition*. This unity — speaking generally—is called pure concept of understanding. Hence the same understanding—and indeed through the same acts whereby it brought about, in concepts, the logical form of a judgment by means of analytic unity—also brings into its presentations a transcendental content, by means of the synthetic unity of the manifold in intuition as such; and because of this, these presentations are called pure concepts of understanding applying a priori to objects. Bringing such a transcendental content into these presentations is something that general logic cannot accomplish.

Thus there arise precisely as many pure concepts of understanding applying a priori to objects of intuition as such, as in the preceding table there were logical functions involved in all possible judgments. For these functions of the understanding are completely exhaustive and survey its power entirely. Following Aristotle, we shall call these functions *categories*. For our aim is fundamentally the same as his, even though it greatly deviates from his in its execution.

This, then, is the list of all the original pure concepts of synthesis that the understanding contains a priori. Indeed, it is a pure understanding only because of these concepts; for through them alone can it understand something in the manifold of intuition, i.e., think an object of intuition. This division of the categories has been generated systematically from a common principle, viz., our ability to judge (which is equivalent to our ability to think). It has not been generated rhapsodically, by locating pure concepts haphazardly, where [B107] we can never be certain that the enumeration of the concepts is complete. For we then infer the division only by induction, forgetting that in this way we never gain insight into why precisely these concepts, rather than others, reside in the pure understanding. Locating these basic concepts was a project worthy of an acute man like Aristotle. But having no principle,¹²⁷ he snatched them up as he came upon them. He hunted up ten of them at first, and called them *categories* (predicaments).¹²⁸ He later believed that he had discovered five more categories, and added them under the name of postpredicaments.¹²⁹ But his table remained deficient even then. Moreover, we also find in it some modes of pure sensibility (*quando, ubi, situs, and prius, simul*),¹³⁰ as well as an empirical mode (*motus*),¹³¹ none of which belong at all in this register of the root [concepts] of the understanding. Again, derivative concepts (*actio, passio*)¹³² are also included among the original concepts,¹³³ while some of the original concepts¹³⁴ are missing entirely.

TABLE OF CATEGORIES [B106]

1	
OF QUANTITY	
Unity	
Plurality	
Allness	
2	3
OF QUALITY	OF RELATION
Reality	of Inherence and Subsistence
Negation	(<i>substantia et accedens</i>)
Limitation	of Causality and Dependence
	(Cause and Effect)
	of Community (Interaction
	between Agent and Patient)
4	
OF MODALITY	
Possibility—Impossibility	
Existence—Nonexistence	
Necessity—Contingency	

Hence for the sake of [distinguishing] the original concepts we must note also that the categories as the true *root concepts* of pure understanding, have also their equally pure *derivative concepts*. In a complete system of transcendental philosophy these derivative concepts can by no means be omitted. In a merely critical essay on the other hand I can settle for merely mentioning them.

Let [B108] me call these pure but derivative concepts of understanding the *predicables* of pure understanding (in contrast to the predicaments).¹³⁵ Once we have the original and primitive concepts we can easily add the derivative and subsidiary ones and thus depict completely the genealogical tree of pure understanding. Since I am here concerned with the completeness not of the system but only of the principles for a system I am reserving that complementary work for another enterprise.¹³⁶ We can, however, come close to achieving that aim of completing the tree if we pick up a textbook on ontology and subordinate the predicables to the categories: e.g., to the category of causality, the predicables of force, action, undergoing; to the category of community, the predicables of presence, resistance; to the predicaments of modality, the predicables of arising, passing away, change; and so on. When the categories are combined either with the modes of pure sensibility or with one another, they yield a great multitude of derivative a priori concepts. Mentioning these concepts and, if possible, listing them completely would be a useful and not disagreeable endeavor, but one that we can here dispense with.

In this treatise I deliberately refrain from offering definitions of these categories, even though I may

possess them. I shall hereafter dissect the concepts only to a degree adequate for the doctrine of method that I here produce. Whereas definitions of the categories [B109] could rightly be demanded of me in a system of pure reason, here they would only make us lose sight of the main point of the inquiry. For they would give rise to doubts and charges that we may readily relegate to another activity without in any way detracting from our essential aim. Still, from what little I have mentioned about this, we can see distinctly that a complete lexicon with all the requisite explications not only is possible but could easily be brought about. The compartments are now at hand. They only need to be filled in; and a systematic [transcendental] topic, such as the present one, will make it difficult to miss the place where each concept properly belongs, and at the same time will make it easy to notice any place that is still empty.

Concerning this table of categories one can make nice observations that might perhaps have important consequences regarding the scientific form of all rational cognitions. For in the theoretical part of philosophy this table is exceedingly useful — indeed, indispensable — for drawing up completely *the plan for a science as a whole* insofar as this science rests on a priori concepts, and for *dividing* it systematically *according to determinate principles*. This is self-evident already from these facts: The table lists completely all the elementary concepts of understanding; indeed, it contains even the form of a system of them residing in the human understanding. Consequently [B110] the table directs us to all the *moments* of a projected speculative science — indeed, even to their *order*. In fact, a sample of their so directing us has already been provided by me elsewhere. Here now are some of those comments that can be made about the table of categories.

The *first comment* is that this table containing four classes of concepts of understanding can be broken up, initially, into two divisions. The concepts in the first division are directed to objects of intuition (both pure and empirical), while those in the second are directed to the existence of these objects (these objects being referred either to each other or to the understanding).

The first division I would call that of the *mathematical* categories, the second, that of the *dynamical* categories. The first division of categories, as we can see by inspecting the table, has no correlates; only in the second division do we find correlates. This distinction must surely have a basis in the nature of the understanding.

The *second comment* to be made about the table is that the number of categories in each class is equal everywhere, viz., three; this, too, calls for meditation, because normally all a priori division by concepts must be dichotomous. Add to this, moreover, the fact that in each case the third category of the class arises from the combination of the second category with the first of the same class.

Thus [B111] *allness* (totality) is nothing but plurality considered as unity; *limitation* is nothing but reality combined with negation; *community* is the causality of a substance reciprocally determining [and being determined by] another substance; *necessity*, finally, is nothing but the existence that is given through possibility itself. This fact, however, must by no means lead us to think that the third category is a mere derivative concept, rather than a root concept, of pure understanding. For combining the first and second categories, in order to produce the third concept, requires that the understanding perform a special act that is not the same as the act it performs in the case of the first and second concepts. Thus the concept of a *number* (which belongs to the category of allness) is not possible in every case where we have the concepts of multitude and unity (e.g., it is not possible in the presentation of infinity). Again, combining the two concepts of a *cause* and of a *substance* does not yet provide me with an immediate understanding of *influence*, i.e., understanding of how a substance can become the cause of something in another substance. This shows that a special act of the understanding is required;¹³⁷ and thus it is with the remaining classes of categories.

The *third comment* to be made about the table of categories concerns the category of *community*, which is to be found under the third heading. This is the one category whose agreement with the form corresponding [B112] to it in the table of logical functions — viz., the form of a disjunctive judgment — is not so obvious as in the case of the others.

In order to assure ourselves of this agreement, we must note the following: In all disjunctive judgments the sphere (the multitude of everything contained under the judgment) is presented as a whole divided into parts (the subordinate concepts). And because the parts cannot be contained one under another, they are thought as *coordinated* with rather than as *subordinated* to one another, so that they determine one another not *unilaterally* as in a *series*, but *reciprocally* as in an *aggregate* (wherein, when one member of the division is posited, all the rest are excluded, and conversely).

Now a similar connection is thought in [thinking] a *whole of things*. In such a whole, one thing is not *subordinated*, as effect, to another as cause of its existence; rather, it is simultaneously and reciprocally *coordinated* with others, as cause regarding their determination (as, e.g., in a body whose parts reciprocally attract—or, for that matter, repel—one another). This kind of connection is entirely different from the one found in the mere relation of cause to effect (ground to consequence), where the consequence does not in turn reciprocally determine the ground and hence does not together with it constitute a whole (e.g., the world together with its creator does not constitute a whole). When the understanding presents the sphere of a divided concept, it follows a certain procedure; [B113] it observes that same procedure when it thinks a thing as divisible. And in the divided concept the members of the division exclude one another and yet are

combined in one sphere; in the same way, the understanding¹³⁸ presents the thing's parts as being such that while the existence of each part also belongs to it alone (as a substance) to the exclusion of the others, yet the parts are combined in one whole.

§12

In the transcendental philosophy of the ancients, however, we find an additional chapter containing pure concepts of understanding. Although these concepts are not there included among the categories, yet according to the ancients they were to count as a priori concepts of objects. In that case, however, these concepts would in fact increase the number of categories — which cannot be. These additional concepts are set forth in this proposition, so famous among the scholastics: *quodlibet ens est unum verum, bonum*.¹³⁹ Now it is true that the use of this principle turned out to permit only very meager inferences (yielding nothing but tautological propositions); by the same token, in more recent times the principle has come to receive little more than honorable mention in metaphysics. Yet whenever a thought — no matter how empty it seems to be — has maintained itself for such a long time, then it deserves an inquiry into its origin, and entitles us to conjecture that it has its basis in some rule of the understanding that, as often happens, has only been wrongly interpreted. [B114] But in fact these supposedly transcendental predicates of *things* are nothing but logical requirements and criteria for all *cognition* of *things* in general; and they lay at the basis of such cognition the categories of quantity, viz., those of *unity*, *plurality*, and *allness*. These categories, however, should properly be taken materially, as belonging to the possibility of things themselves. Those [philosophers], on the other hand, used them in fact only in their formal meaning, as belonging to the logical demands concerning any cognition; yet, through carelessness, they still turned these criteria of thought into properties of things in themselves. Let me explain. In every cognition there are three components. First, there is *unity* of the concept; we may call it *qualitative unity*, provided that in [thinking] it we think only the unity in the collating of the manifold of cognitions: e.g., the unity of the topic in a play, a speech, or a story. Second, in every cognition there is *truth* as regards the consequences. The more true consequences arise from a given concept, the more indicators there are of its objective reality. We might call this the *qualitative plurality* of the characteristics that belong to a concept as their common ground (rather than are thought, in the concept, as a quantity). Finally, third, in every cognition there is *perfection*; it consists in the fact that the plurality together leads back again to the unity of the concept, and that it agrees fully with this and with no other concept. This perfection may be [B115] called *qualitative completeness* (totality). This shows that these logical criteria for the possibility of cognition as such only transform the three categories of quantity. In these categories, the unity in the production of the quantum must be assumed as homogeneous throughout. Here, however, they are only transformed, in order to connect components of cognition—even *heterogeneous* ones—in one consciousness, using as principle for this connection the quality of a cognition. Thus the criterion for the possibility of a concept (rather than for the possibility of the concept's object) is the concept's definition; in it the *unity* of the concept, the *truth* of everything that may be derived from it initially, and finally the *completeness* of what has been extracted from it constitute what the whole concept requires for its construction. Or, again, the *criterion of a hypothesis* is the understandability of the assumed *basis of explanation*, or, i.e.: its *unity* (without an auxiliary hypothesis); the *truth* of the consequences derivable from it (their agreement with one another and with experience); and, finally, the *completeness* of the basis for the explanation of these consequences—which means that these consequences point back to no more and no less than was assumed in the hypothesis, and that they analytically a posteriori bring back and agree with what was thought synthetically a priori in the hypothesis. Therefore by adding the concepts of unity, truth, and perfection to the transcendental table of categories we do not at all complement that table— as if perhaps it were deficient. Rather, while setting aside entirely the relation of these concepts to objects [B116] ¹⁴⁰ we bring the procedure used with these concepts under general logical rules governing the agreement of cognition with itself.

Analytic of Concepts

Chapter II

On the Deduction of the Pure Concept of Understanding

Section I

§13

ON THE PRINCIPLES OF A TRANSCENDENTAL DEDUCTION AS SUCH

When teachers of law talk about rights and claims, they distinguish in a legal action the question regarding what is legal (*quid iuris*) from the question concerning fact (*quid facti*), and they demand proof of both.¹⁴¹ The first proof, which is to establish the right, or for that matter the legal entitlement, they call the *deduction*. [This term also applies to philosophy.] We employ a multitude of empirical concepts without being challenged by anyone. And we consider ourselves justified, even without having offered a deduction, to assign to these empirical concepts a meaning [B117] and imagined signification, because we always have experience available to us to prove their objective reality. But there are also concepts that we usurp, as, e.g., *fortune*, *fate*. And although these concepts run loose, with our almost universal forbearance, yet they are sometimes confronted by the question [of their legality], *quid iuris*. This question then leaves us in considerable perplexity regarding the deduction¹⁴² of these concepts; for neither from experience nor from reason can we adduce any distinct legal basis from which the right to use them emerges distinctly.

But there are, among the various concepts making up the highly mixed fabric of human cognition, some that are determined for pure a priori use as well (i.e., for a use that is completely independent of all experience); and their right to be so used always requires a deduction. For proofs based on experience are insufficient to establish the legitimacy of using them in that way; yet we do need to know how these concepts can refer to objects even though they do not take these objects from any experience. Hence when I explain in what way concepts can refer to objects a priori, I call that explanation the *transcendental deduction* of these concepts. And I distinguish transcendental deduction from *empirical* deduction, which indicates in what way a concept has been acquired through experience and through reflection upon experience, and which therefore concerns not the concept's legitimacy but only the fact whereby we came to possess it.

We [B118] already have, at this point, two types of concepts that, while being wholly different in kind, do yet agree inasmuch as both of them refer to objects completely a priori: viz., on the one hand, the concepts of space and time as forms of sensibility; and, on the other hand, the categories as concepts of understanding. To attempt an empirical deduction of these two types of concepts would be a futile job. For what is distinctive in their nature is precisely the fact that they refer to their objects without having borrowed anything from experience in order to present these objects. Hence if a deduction of these concepts is needed, then it must always be transcendental.

But even for these concepts, as for all cognition, we can locate in experience, if not the principle of their possibility, then at least the occasioning causes of their production. Thus the impressions of the senses first prompt [us] to open up the whole cognitive power in regard to them, and to bring about experience. Experience contains two quite heterogeneous elements: viz., a *matter* for cognition, taken from the senses; and a certain *form* for ordering this matter, taken from the inner source of pure intuition and thought. It is on the occasion of the impressions of the senses that pure intuition and thought are first brought into operation and produce concepts. Such exploration of our cognitive power's first endeavors to ascend from singular perceptions to universal concepts [B119] is doubtless highly beneficial, and we are indebted to the illustrious *Locke* for first opening up the path to it.¹⁴³ Yet such exploration can never yield a *deduction*¹⁴⁴ of the pure a priori concepts, which does not lie on that path at all. For in view of these concepts' later use, which is to be wholly independent of experience, they must be able to display a birth certificate quite different from that of descent from experiences. The attempted¹⁴⁵ physiological derivation concerns a *quaestio facti*,¹⁴⁶ and therefore cannot properly be called a deduction at all. Hence I shall name it the explanation of our *possession* of a pure cognition. Clearly, then, the only possible deduction of this pure cognition is a transcendental and by no means an empirical one, and empirical deductions regarding the pure a priori concepts are nothing but futile attempts — attempts that only those can engage in who have not comprehended the quite peculiar nature of these cognitions.

Yet even if it be granted that the only possible kind of deduction of pure a priori cognition is one along the transcendental path, that still does not show that this deduction is inescapably necessary. We did earlier trace the concepts of space and time to their sources by means of a transcendental deduction, and [B120] we explained and determined their a priori objective validity. Yet geometry, using nothing but a priori cognitions, follows its course securely without needing to ask philosophy for a certificate of the pure and legitimate descent of geometry's basic concept of space. On the other hand, the use of the concept of space in this

science does apply only to the external world of sense. Space is the pure form of the intuition of that world. In that world, therefore, all geometric cognition is directly evident, because it is based on a priori intuition; and, through cognition itself, objects are (as regards their form) given a priori in intuition. With the *pure concepts of understanding*, on the other hand, begins the inescapable requirement to seek a transcendental deduction — not only of these concepts themselves, but also of space. For these concepts speak of objects through predicates of pure a priori thought, not through predicates of intuition and sensibility; hence they refer to objects universally, i.e., apart from all conditions of sensibility. They are, then, concepts that are not based on experience; and in a priori intuition, too, they cannot display any object on which they might, prior to all experience, base their synthesis. Hence these concepts not only arouse suspicion concerning the objective validity and limits of their use, but they also make ambiguous [B121] the *concept of space*; for they tend to use it even beyond the conditions of sensible intuition—and this indeed is the reason why a transcendental deduction of this concept was needed above. I must therefore convince the reader, before he has taken a single step in the realm of pure reason, that such a deduction is inescapably necessary. For otherwise he proceeds blindly, and after manifold wanderings must yet return to the ignorance from which he started. But the reader must also distinctly see in advance the inevitable difficulty of providing such a deduction. For otherwise he might complain of obscurity when in fact the matter itself is deeply shrouded, or might be too quickly discouraged during the removal of obstacles. For we either must entirely abandon all claims to pure rational insights into the realm that we care about most, viz., the realm beyond the bounds of all possible experience, or else must bring this critical inquiry to completion.

We had little trouble above in making comprehensible how the concepts of space and time, despite being a priori cognitions, must yet refer necessarily to objects, and how they make possible, independently of any experience, a synthetic cognition of objects. For only by means of such pure forms of sensibility can an object appear to us, i.e., can it be an object of empirical intuition. Hence space and [B122] time are pure intuitions containing a priori the condition for the possibility of objects as appearances, and the synthesis in space and time has objective validity.

The categories of understanding, on the other hand, do not at all present to us the conditions under which objects are given in intuition. Therefore objects can indeed appear to us without having to refer necessarily to functions of understanding, and hence without the understanding's containing a priori the conditions of these objects. Thus we find here a difficulty that we did not encounter in the realm of sensibility: viz., how *subjective conditions of thought* could have *objective validity*, i.e., how they could yield conditions for the possibility of all cognition of objects. For appearances can indeed be given in intuition without functions of understanding. Let me take, e.g., the concept of cause. This concept signifies a special kind of synthesis where upon [the occurrence of] something, A, something quite different, B, is posited according to a rule. Why appearances should contain anything like that is not evident a priori. (I say *a priori* because experience cannot be adduced as proof, since we must be able to establish this concept's objective validity a priori.) Hence there is doubt a priori whether perhaps such a concept might not even be empty and encounter no object at all among appearances. For while it is evident that objects of sensible intuition must conform to the formal conditions of [B123] sensibility lying a priori in the mind, since otherwise they would not be objects for us, it is not so easy to see the inference whereby they must in addition conform to the conditions that the understanding requires for the synthetic unity of thought. For, I suppose, appearances might possibly be of such a character that the understanding would not find them to conform at all to the conditions of its unity. Everything might then be so confused that, e.g., the sequence of appearances would offer us nothing providing us with a rule of synthesis and thus corresponding to the concept of cause and effect, so that this concept would then be quite empty, null, and without signification. But appearances would nonetheless offer objects to our intuition; for intuition in no way requires the functions of thought.

Suppose that we planned to extricate ourselves from these troublesome inquiries by saying that examples of such regularity among appearances are offered to us incessantly by experience, and that these examples give us sufficient prompting to isolate from them the concept of cause and thus to verify at the same time the objective validity of such a concept. In that case we would be overlooking the fact that the concept of cause cannot arise in that way at all; rather, it either must have its basis completely a priori in the [B124] understanding, or must be given up entirely as a mere chimera. For this concept definitely requires that something, A, be of such a kind that something else, B, follows from it *necessarily* and according to an *absolutely universal rule*. Although appearances do provide us with cases from which we can obtain a rule whereby something usually happens, they can never provide us with a rule whereby the result is *necessary*. This is, moreover, the reason why the synthesis of cause and effect is imbued with a dignity that cannot at all be expressed empirically: viz., that the effect is not merely added to the cause, but is posited *through* the cause and results *from* it. And the strict universality of the rule is indeed no property whatever of empirical rules;

empirical rules can, through induction, acquire none but comparative universality, i.e., extensive usability. But if we treated the pure concepts of understanding as merely empirical products, then our use of them would change entirely.

TRANSITION TO THE TRANSCENDENTAL DEDUCTION OF THE CATEGORIES

Only two cases are possible where synthetic presentation and its objects can concur, can necessarily refer to each other, and can — as it were — meet each other: viz., either if the object makes the presentation possible, or if the presentation alone makes the object possible. If the object makes the presentation possible, [B125] then the reference is only empirical and the presentation is never possible a priori. This is what happens in the case of appearances, as regards what pertains to sensation in them. But suppose that the presentation alone makes the object possible. In that case, while presentation in itself does not produce its object *as regards existence* (for the causality that presentation has by means of the will is not at issue here at all), yet presentation is a priori determinative in regard to the object if *cognizing something as an object* is possible only through it. Now there are two conditions under which alone there can be cognition of an object. The first condition is *intuition*; through it the object is given, though only as appearance. The second condition is the *concept*; through it an object is thought that corresponds to this intuition. Now it is evident from the above that the first condition, viz., the condition under which alone objects can be intuited, does indeed, as far as their form is concerned, underlie objects a priori in the mind. Hence all appearances necessarily agree with this formal condition of sensibility, because only through it can they appear, i.e., be empirically intuited and given. Now the question arises whether concepts do not also a priori precede [objects], as conditions under which alone something can be, if not intuited, yet thought as object as such. For in that case all empirical cognition of [B126] objects necessarily conforms to such concepts, because nothing is possible as *object of experience* unless these concepts are presupposed. But all experience, besides containing the senses' intuition through which something is given, does also contain a *concept* of an object that is given in intuition, or that appears. Accordingly, concepts of objects as such presumably underlie all experiential cognition as its a priori conditions. Hence presumably the objective validity of the categories, as a priori concepts, rests on the fact that through them alone is experience possible (as far as the form of thought in it is concerned). For in that case the categories refer to objects of experience necessarily and a priori, because only by means of them can any experiential object whatsoever be thought at all.

Hence the transcendental deduction of all a priori concepts has a principle to which the entire investigation must be directed: viz., the principle that these concepts must be cognized as a priori conditions for the possibility of experience (whether the possibility of the intuition found in experience, or the possibility of the thought). If concepts serve as the objective basis for the possibility of experience, then — precisely because of this — they are necessary. But to unfold the experience in which these concepts are found is not to deduce them (but is only to illustrate them); for otherwise they would, after all, be only contingent. [B127] Without that original reference of these concepts to possible experience wherein all objects of cognition occur, their reference to any object whatever would be quite incomprehensible.

The illustrious **Locke**, not having engaged in this contemplation, and encountering pure concepts of understanding in experience, also derived them from experience. Yet he proceeded so *inconsistently* that he dared to try using these concepts for cognitions that go far beyond any boundary of experience. **David Hume** recognized that in order for us to be able to do this, the origin of these concepts must be a priori. But he was quite unable to explain how it is possible that concepts not in themselves combined in the understanding should nonetheless have to be thought by it as necessarily combined in the object. Nor did it occur to him that perhaps the understanding itself might, through these concepts, be the author of the experience wherein we encounter the understanding's objects. Thus, in his plight, he derived these concepts from experience (viz., from *habit*, a subjective necessity that arises in experience through repeated association and that ultimately is falsely regarded as objective). But he proceeded quite consistently after that, for he declared that we cannot use these concepts and the principles that they occasion in order to go beyond the boundary of experience. [B128] Yet the *empirical* derivation of these concepts which occurred to both¹⁴⁷ cannot be reconciled with the scientific a priori cognitions that we actually have, viz., our a priori cognitions of *pure mathematics* and *universal natural science*, and hence this empirical derivation is refuted by that fact.

Of these two illustrious men, Locke left the door wide open for *fanaticism*; for once reason has gained possession of such rights, it can no longer be kept within limits by indefinite exhortations to moderation. Hume, believing that he had uncovered so universal a delusion—regarded as reason—of our cognitive power, surrendered entirely to *skepticism*. We are now about to try to find out whether we cannot provide for human reason safe passage between these two cliffs, assign to it determinate bounds, and yet keep open for it the entire realm of its appropriate activity.

The only thing that I still want to do before we start is to *explicate the categories*: they are concepts of an object as such whereby the object's intuition is regarded as *determined* in terms of one of the logical functions in judging. Thus the function of the *categorical* judgment — i.e., All bodies are divisible — is that of the relation of subject to predicate. But the understanding's merely logical use left undetermined to which of the two concepts we want to give the function [B129] of the subject, and to which the function of the predicate. For we can also say, Something divisible is a body. If, on the other hand, I bring the concept of a body under the category of substance, then through this category is determined the fact that the body's empirical intuition in experience must be considered always as subject only, never as mere predicate. And similarly in all the remaining categories.

Deduction of the Pure Concepts of Understanding

Section II
[Second Edition]
Transcendental Deduction of the Pure Concepts of Understanding

§15

ON THE POSSIBILITY OF A COMBINATION AS SUCH

The [uncombined] manifold of presentations can be given in an intuition that is merely sensible, i.e., nothing but receptivity,¹⁴⁸ and the form of this intuition can lie a priori in our power of presentation without being anything but the way in which the subject is affected. But a manifold's *combination* (*coniunctio*) as such can never come to us through the senses; nor, therefore, can it already be part of what [B130] is contained in the pure form of sensible intuition. For this combination is an act of spontaneity by the power of presentation; and this power must be called understanding, in order to be distinguished from sensibility. Hence all combination is an act of understanding—whether or not we become conscious of such combination; whether it is a combination of the manifold of intuition or of the manifold of various concepts; and whether, in the case of intuition, it is a combination of sensible or of nonsensible intuition. I would assign to this act of understanding the general name *synthesis*, in order to point out at the same time: that we cannot present anything as combined in the object without ourselves' having combined it beforehand; and that, among all presentations, *combination* is the only one that cannot be given through objects, but—being an act of the subject's self-activity—can be performed only by the subject himself. We readily become aware here that this act of synthesis must originally be a single act and must hold equally for all combination; and that resolution or *analysis*, which seems to be its opposite yet always presupposes it. For where the understanding has not beforehand combined anything, there it also cannot resolve anything, because only *through the understanding* could the power of presentation have been given something as combined.

But the concept of combination carries with it, besides the concept of the manifold and of its synthesis, also the concept of the manifold's unity. Combination [B131] is presentation of the *synthetic* unity of the manifold.¹⁴⁹ Hence the presentation of this unity cannot arise from the combination; rather, by being added to the presentation of the manifold, it makes possible the concept of combination in the first place. This unity, which thus precedes a priori all concepts of combination, is by no means the category of unity mentioned earlier (in § 10¹⁵⁰). For all categories are based on logical functions occurring in judgments; but in these functions combination, and hence unity of given concepts, is already thought. Hence a category already presupposes combination. We must therefore search for this unity (which is qualitative unity; see § 12¹⁵¹) still higher up, viz., in what itself contains the basis for the unity of different concepts in judgments, and hence contains the basis for the possibility of understanding, even as used logically.

ON THE ORIGINAL SYNTHETIC UNITY OF APPERCEPTION

The *I think* must be *capable* of accompanying all my presentations. For otherwise something would be presented to me that could not be thought at all — which [B132] is equivalent to saying that the presentation either would be impossible, or at least would be nothing to me. Presentation that can be given prior to all thought is called *intuition*. Hence everything manifold in intuition has a necessary reference to the *I think* in the same subject in whom this manifold is found. But this presentation [i.e., the *I think*] is an act of spontaneity; i.e., it cannot be regarded as belonging to sensibility. I call it *pure apperception*, in order to distinguish it from *empirical apperception*. Or, again, I call it *original apperception*; for it is the self-consciousness which, because it produces the presentation *I think* that must be capable of accompanying all other presentations[,] and [because it] is one and the same in all consciousness, cannot be accompanied by any further presentation. I also call the *unity* of this apperception the *transcendental* unity of self-consciousness, in order to indicate that a priori cognition can be obtained from it. For the manifold presentations given in a certain intuition would not one and all be *my* presentations, if they did not one and all belong to one self-consciousness. I.e., as my presentations (even if I am not conscious of them as being mine), they surely must conform necessarily to the condition under which alone they *can* stand together in one universal self-consciousness, since otherwise they would not thoroughly belong to me. And [B133] from this original combination much can be inferred.

This same thoroughgoing identity of the apperception of a manifold given in intuition contains a synthesis of presentations, and is possible only through the consciousness of this synthesis. For the empirical consciousness that accompanies different presentations is intrinsically sporadic and without any reference to the subject's identity. Hence this reference comes about not through my merely accompanying each presentation with consciousness, but through my *adding* one presentation to another and being conscious of their synthesis. Hence only because I can combine a manifold of given presentations *in one consciousness*, is it possible for me to present the *identity itself of the consciousness in these presentations*.¹⁵² I.e., the *analytic* unity of apperception is possible only under [B134] the presupposition of some *synthetic* unity of apperception.¹⁵³ The thought that these presentations given in intuition belong one and all to me is, accordingly, tantamount to the thought that I unite them, or at least can unite them, in one self-consciousness. And although that thought itself is not yet the consciousness of the *synthesis* of the presentations, it still presupposes the possibility of that synthesis. I.e., only because I can comprise the manifold of the presentations in one consciousness, do I call them one and all *my* presentations. For otherwise I would have a self as many-colored and varied as I have presentations that I am conscious of. Hence synthetic unity of the manifold of intuitions, as given a priori, is the basis of the identity itself of apperception, which precedes a priori all *my* determinate thought. But combination does not lie in objects, and can by no means be borrowed from them by perception and thus be taken up only then into the understanding. It is, rather, solely something performed by the understanding; [B135] and understanding itself is nothing more than the power to combine a priori and to bring the manifold of given intuitions under the unity of apperception — the principle of this unity being the supreme principle in all of human cognition.

Now, it is true that this principle of the necessary unity of apperception is itself merely an identical¹⁵⁴ and hence an analytic proposition. Yet it does declare as necessary a synthesis of the manifold given in an intuition, a synthesis without which that thoroughgoing identity of self-consciousness cannot be thought. For through the *I*, as simple presentation, nothing manifold is given; only in intuition, which is distinct from this presentation, can a manifold be given, and only through *combination* can it be thought in one consciousness. An understanding wherein through self-consciousness alone everything manifold would at the same time be given would be an understanding that *intuits*.¹⁵⁵ Our understanding can only *think*, and must seek intuition in the senses. I am, then, conscious of the self as identical, as regards the manifold of the presentations given to me in an intuition, because I call them one and all *my* presentations that make up one presentation. That, however, is tantamount to saying that I am conscious of a necessary a priori synthesis of them. This synthesis is called the original synthetic unity of apperception. All presentations given to me are subject to this unity; but they [B136] must also be brought under it through a synthesis.

§17

THE PRINCIPLE OF THE SYNTHETIC UNITY OF APPERCEPTION IS THE SUPREME PRINCIPLE FOR ALL USE OF THE UNDERSTANDING

The supreme principle for the possibility of all intuition in reference to sensibility was, according to the Transcendental Aesthetic, that everything manifold in intuition is subject to the formal conditions of space and time. The supreme principle for the possibility of all intuition in reference to understanding is that everything manifold in intuition is subject to conditions of the original synthetic unity of apperception.¹⁵⁶ All manifold presentations of intuition are subject to the first principle insofar as they are *given* to us. They are subject to the second principle insofar as they [B137] must be capable of being *combined* in one consciousness. For without that combination, nothing can be thought or cognized through such presentations, because the given presentations do then not have in common the act of apperception, *I think*, and thus would not be collated¹⁵⁷ in one self-consciousness.

Understanding — speaking generally—is the power of *cognitions*. Cognitions consist in determinate reference of given presentations to an object. And an *object* is that in whose concept the manifold of a given intuition is *united*. But all unification of presentations requires that there be unity of consciousness in the synthesis of them. Consequently the reference of presentations to an object consists solely in this unity of consciousness, and hence so does their objective validity and consequently their becoming cognitions. On this unity, consequently, rests the very possibility of the understanding.

Hence the principle of the original *synthetic* unity of apperception is the primary pure cognition of understanding, on which the entire remaining use of the understanding is based; and this cognition is at the same time entirely independent of all conditions of sensible intuition. Thus the mere form of outer sensible intuition, i.e., space, is as yet no cognition at all; it provides only the manifold of a priori intuition for a possible cognition. Rather, in order to cognize something or other — e.g., a line — in space, I must *draw* it; and hence I must bring about synthetically [B138] a determinate combination of the given manifold, so that the unity of this act¹⁵⁸ is at the same time the unity of consciousness (in the concept of a line), and so that an object (a determinate space) is thereby first cognized. The synthetic unity of consciousness is, therefore, an objective condition of all cognition. Not only do I myself need this condition in order to cognize an object, but every intuition must be subject to it *in order to become an object for me*. For otherwise, and without that synthesis, the manifold would *not* unite in one consciousness.

Although this last proposition makes the synthetic unity [of consciousness] a condition of all thought, it is —as I have said—itself analytic. For it says no more than that all *my* presentations in some given intuition must be subject to the condition under which alone I can ascribe them—as *my* presentations—to the identical self, and hence under which alone I can collate them, as combined synthetically in one apperception, through the universal expression *I think*.

On the other hand, this principle is not one for every possible understanding as such, but is a principle only for that [kind of] understanding through whose pure apperception, in the presentation *I think*, nothing manifold whatever is yet given. An alternative [kind of] understanding would be that understanding through whose self-consciousness the manifold of intuition would at the same time be given — i.e., an [B139] understanding through whose presentation the objects of this presentation would at the same time exist.¹⁵⁹ Such an understanding would not require, for the unity of consciousness, a special act of synthesis of the manifold. The human understanding, which merely thinks but does not intuit, does need that synthesis. But still, for the human understanding the principle¹⁶⁰ is unavoidably the first principle. And thus our understanding cannot even frame the slightest concept of a different possible understanding — whether of an understanding that itself would intuit; or of an understanding that would indeed have lying at its basis a sensible intuition, yet one of a different kind from that in space and time.

§18

WHAT OBJECTIVE UNITY OF SELF-CONSCIOUSNESS IS

The *transcendental unity* of apperception is the unity whereby everything manifold given in an intuition is united in a concept of the object. Hence this unity is called *objective*, and must be distinguished from *subjective* unity of consciousness, which is a *determination of inner sense* whereby that manifold of intuition for such [objective] combination is given empirically. Whether I can be conscious *empirically* of the manifold as simultaneous or as sequential depends on circumstances or empirical conditions. [B140] Hence empirical unity of consciousness, through association of presentations, itself concerns an appearance and is entirely contingent. On the other hand, the pure form of intuition in time, merely as intuition as such containing a given manifold, is subject to the original unity of consciousness. It is subject to that unity solely through the necessary reference of the manifold of intuition to the one [self], i.e., to the *I think*, and hence through the understanding's pure synthesis that lies a priori at the basis of the empirical synthesis. Only the original unity of consciousness is valid objectively. The empirical unity of apperception, which we are not examining here and which moreover is only derived from the original unity under given conditions *in concreto*, has only subjective validity. One person will link the presentation of a certain word with one thing, another with some other thing; and the unity of consciousness in what is empirical is not, as regards what is given, necessary and universally valid.

§19

THE LOGICAL FORM OF ALL JUDGMENTS CONSISTS IN THE OBJECTIVE UNITY OF APPERCEPTION OF THE CONCEPTS CONTAINED IN THEM

I have never been able to settle for the explication that logicians give of a judgment as such. A judgment, they say, is the presentation of a relation between two concepts. Now, I shall not here quarrel with them [B141] about one respect in which this explication is defective (although this oversight has given rise to many irksome consequences for logic): viz., that it fits at most *categorical* judgments only, but not hypothetical and disjunctive ones (since these contain a relation not of concepts but of further judgments).¹⁶¹ I shall point out only that this explication of a judgment leaves undetermined wherein this *relation*¹⁶² consists.

But suppose that I inquire more precisely into the [relation or] reference of given cognitions in every judgment, and that I distinguish it, as belonging to the understanding, from the relation in terms of laws of the reproductive imagination (a relation that has only subjective validity). I then find that a judgment is nothing but a way of bringing given cognitions to the objective unity of apperception. This is what the little relational word *is* in judgments intends [to indicate [B142]], in order to distinguish the objective unity of given presentations from the subjective one. For this word indicates the reference of the presentations to original apperception and its *necessary unity*. The reference to this necessary unity is there even if the judgment itself is empirical and hence contingent—e.g., Bodies are heavy. By this I do not mean that these presentations belong *necessarily to one another* in the empirical intuition. Rather, I mean that they belong to one another *by virtue of the necessary unity* of apperception in the synthesis of intuitions; i.e., they belong to one another according to principles of the objective determination of all presentations insofar as these presentations can become cognition—all of these principles being derived from the principle of the transcendental unity of apperception. Only through this [reference to original apperception and its necessary unity] does this relation [among presentations] become a *judgment*, i.e., a relation that is *valid objectively* and can be distinguished adequately from a relation of the same presentations that would have only subjective validity—e.g., a relation according to laws of association. According to these laws, all I could say is: When I support a body, then I feel a pressure of heaviness. I could not say: It, the body, is heavy—which amounts to saying that these two presentations are not merely together in perception (no matter how often repeated), but are combined in the object, i.e., combined independently of what the subject's state is.

[B143] §20

ALL SENSIBLE INTUITIONS ARE SUBJECT TO THE CATEGORIES, WHICH ARE CONDITIONS UNDER WHICH ALONE THEIR MANIFOLD CAN COME TOGETHER IN ONE CONSCIOUSNESS

The manifold given [which is found] in a sensible intuition is subject necessarily to the original synthetic unity of apperception; for solely through this unity is the *unity* of intuition possible. (§ 17.) But the act of understanding whereby the manifold of given presentations (whether intuitions or concepts) are brought under one apperception as such is the logical function of judgments. (§ 19.) Therefore everything manifold, insofar as it is given in one empirical intuition, is *determined* in regard to one of the logical functions of judging, inasmuch as through this function it is brought to one consciousness as such. The *categories*, however, are indeed nothing but precisely these functions of judging insofar as the manifold of a given intuition is determined in regard to them. (§ 13.) Hence, by the same token, the manifold in a given intuition is subject necessarily to the categories.

§21 [B144]

COMMENT

Through the synthesis of understanding, a manifold contained in an intuition that I call mine is presented as belonging to the *necessary* unity of self-consciousness, and this presenting is done by means of the category.¹⁶³ Hence the category indicates that the empirical consciousness of a given manifold of one intuition is just as subject to a pure a priori self-consciousness, as empirical intuition is subject to a pure sensible intuition that likewise takes place a priori. Hence in the above proposition¹⁶⁴ I have made the beginning of a *deduction* of the pure concepts of understanding. Since the categories are *independent of sensibility* and arise in the understanding alone, I must still abstract, in this deduction, from the way in which the manifold for an empirical intuition is given, in order to take account solely of the unity that the understanding contributes to the intuition by means of the category. Afterwards (§ 26) I shall show, from the way in which the empirical intuition [B145] is given in sensibility, that the intuition's unity is none other than the unity that (by § 20, above) the category prescribes to the manifold of a given intuition as such; and that hence by my explaining the category's a priori validity regarding all objects of our senses, the deduction's aim will first be fully attained.

From one point, however, I could not abstract in the above proof: viz., from the fact that the manifold for the intuition must be given still prior to the understanding's synthesis, and independently of it; but how it is given remains undetermined here. For if I were to think of an understanding¹⁶⁵ that itself intuited¹⁶⁶ (as, e.g., a divine understanding that did not present given objects¹⁶⁷ but through whose presentation the objects would at the same time be given or produced), then in regard to such cognition the categories would have no signification whatever. The categories are only rules for an understanding whose entire power consists in thought, i.e., in the act of bringing to the unity of apperception the synthesis of the manifold that has, in intuition, been given to it from elsewhere. Hence such an understanding by itself cognizes nothing whatever, but only combines and orders the material for cognition, i.e., the intuition, which must be given to it by the object. But why our understanding has this peculiarity, that it a priori brings about unity [B146] of apperception only by means of the categories, and only by just this kind and number of them — for this no further reason can be given, just as no reason can be given as to why we have just these and no other functions in judging, or why time and space are the only forms of our possible intuition.

§22

A CATEGORY CANNOT BE USED FOR COGNIZING THINGS EXCEPT WHEN IT IS APPLIED TO OBJECTS OF EXPERIENCE

Thinking an object and *cognizing* an object are, then, not the same. For cognition involves two components: first, the concept (the category), through which an object as such is thought; and second, the intuition, through which the object is given. For if no intuition corresponding to the concept could be given at all, then in terms of its form the concept would indeed be a thought; but it would be a thought without any object, and no cognition at all of any thing whatsoever would be possible by means of it. For as far as I would know, there would be nothing, and could be nothing, to which my thought could be applied. Now, all intuition that is possible for us is sensible (see the Transcendental Aesthetic). Hence in us, thinking an object as such by means of a pure concept of understanding can become cognition only insofar as this concept is referred to objects of the senses. Sensible [B147] intuition is either pure intuition (space and time) or empirical intuition of what, through sensation, is presented directly as actual in space and time. By determining pure intuition we can (in mathematics) acquire a priori cognition of objects as appearances, but only in terms of their form; that, however, still leaves unestablished whether there can be things that must be intuited in this form. Consequently all mathematical concepts are, by themselves, no cognitions — except insofar as one presupposes that there are things that can be exhibited to us only in accordance with the form of that pure sensible intuition. But *things in space and time* are given only insofar as they are perceptions (i.e., presentations accompanied by sensation), and hence are given only through empirical presentation. Consequently the pure concepts of understanding, even when they are (as in mathematics) applied to a priori intuitions, provide cognition only insofar as these intuitions—and hence, by means of them, also the concepts of understanding—can be applied to empirical intuitions. Consequently the categories also do not supply us, by means of intuition, with any cognition of things, except through their possible application to *empirical* intuition. I.e., the categories serve only for the possibility of *empirical cognition*. Such cognition, however, is called *experience*. Consequently the categories cannot be used for [B148] cognizing things except insofar as these things are taken as objects of possible experience.

§23

The last proposition above is of the greatest importance. For it determines the bounds for the use of the pure concepts of understanding in regard to objects just as much as the Transcendental Aesthetic determined the bounds for the use of the pure form of our sensible intuition. Space and time, as conditions for the possibility as to how objects can be given to us, hold no further than for objects of the senses, and hence hold for objects of experience only. Beyond these bounds, space and time present nothing whatsoever; for they are only in the senses and have no actuality apart from them. The pure concepts of understanding are free from this limitation and extend to objects of intuition as such, whether this intuition is similar to ours or not, as long as it is sensible rather than intellectual. But this further extension of the concepts beyond *our* sensible intuition is of no benefit to us whatsoever. For they are then empty concepts of objects, i.e., concepts through which we cannot judge at all whether or not these objects are so much as possible. I.e., the pure concepts of understanding are then mere forms of thought, without objective reality; for we then have available no intuition to which the synthetic unity of apperception — which is all that those concepts contain — could be applied so [B149] that the concepts could determine an object. Solely *our* sensible and empirical intuition can provide them with meaning and significance.

Hence if we suppose an object of a *nonsensible* intuition¹⁶⁸ as given, then we can indeed present it through all the predicates that are already contained in the presupposition *that the object has as a property nothing belonging to sensible intuition*: hence we can present that it is not extended or in space, that its duration is not a time, that no change (i.e., succession of determinations in time) is to be found in it, etc. But yet I have no proper cognition if I merely indicate how the intuition of the object is *not*, without being able to say what the intuition does contain. For I have not then presented the possibility of there being an object for my pure concept of understanding, since I was unable to give an intuition corresponding to the concept, but was able only to say that our intuition does not hold for it. However, the foremost point here is that to such a something not even one single category could be applied. E.g., one could not apply to it the concept of a substance, i.e., the concept of something that can exist as subject but never as mere predicate. For I do not know at all, concerning this concept, whether there can be anything whatever corresponding to this conceptual determination [of substance], unless empirical intuition gives me the instance for applying it. But more about this later.

ON APPLYING THE CATEGORIES TO OBJECTS OF THE SENSES AS SUCH

The pure concepts of understanding refer, through mere understanding, to objects of intuition as such— i.e., we leave undetermined whether this intuition is ours or some other, although it must be sensible intuition. But the concepts are, precisely because of this, mere *forms of thought*, through which as yet no determinate object is cognized. We saw that the synthesis or combination of the manifold in them referred merely to the unity of apperception, and was thereby the basis for the possibility of a priori cognition insofar as such cognition rests on the understanding; and hence this synthesis was not just transcendental but was also purely intellectual only. But there lies at the basis in us a priori a certain form of sensible intuition, a form that is based on the receptivity of our capacity to present (i.e., based on our sensibility). Hence the understanding (as spontaneity) can, by means of the manifold of given presentations, determine inner sense in accordance with the synthetic unity of apperception; and thus it can think synthetic unity of the apperception of the manifold of a priori *sensible intuition*—this unity being the condition to which all objects of our (i.e., human) intuition must necessarily be subject. And thereby the categories, as themselves mere forms of thought, acquire objective reality. I.e., they acquire application [B151] to objects that can be given to us in intuition. But they apply to these objects only as appearances; for only of appearances are we capable of having a priori intuition.

This *synthesis of the manifold of sensible intuition*, which is a priori possible and necessary, may be called *figurative synthesis* (*synthesis speciosa*). This serves to distinguish it from the synthesis that would be thought in the mere category, in regard to the manifold of an intuition as such;¹⁶⁹ this latter synthesis is called combination of understanding (*synthesis intellectualis*). Both these syntheses are *transcendental*, not just because they themselves proceed a priori, but because they also are the basis for the possibility of other a priori cognition.

However, when the figurative synthesis concerns merely the original synthetic unity of apperception, i.e., merely this transcendental unity thought in the categories, then it must be called the *transcendental synthesis of imagination*, to distinguish it from the merely intellectual combination.¹⁷⁰ **Imagination** is the power of presenting an object in intuition even *without the object's being present*. Now, all our intuition is sensible; and hence the imagination, because of the subjective condition under which alone it can give to the concepts of understanding a corresponding intuition, belongs to *sensibility*. Yet the synthesis of imagination is an exercise of spontaneity, which is [B152] determinative, rather than merely determinable, as is sense; hence this synthesis can a priori determine sense in terms of its form in accordance with the unity of apperception. To this extent, therefore, the imagination is a power of determining sensibility a priori; and its synthesis of intuitions *in accordance with the categories* must be the transcendental synthesis of *imagination*. This synthesis is an action of the understanding upon sensibility, and is the understanding's first application (and at the same time the basis of all its other applications) to objects of the intuition that is possible for us. As figurative, this synthesis is distinct from the intellectual synthesis, which proceeds without any imagination but merely through understanding. Now insofar as the imagination is spontaneity, I sometimes also call it the *productive* imagination, thereby distinguishing it from the *reproductive* imagination. The synthesis of the reproductive imagination is subject solely to empirical laws, viz., to the laws of association. Therefore this synthesis contributes nothing to the explanation of the possibility of a priori cognition, and hence belongs not in transcendental philosophy but in psychology.

Now, this is the place to clarify something paradoxical that must have struck everyone in reading the exposition of the form of inner sense (§ 6): viz., how this sense exhibits to consciousness even ourselves [B153] only as we appear to ourselves, not as we are in ourselves. For we intuit ourselves only as we are inwardly *affected*; and this seems contradictory, because we [despite being active] would then have to relate to ourselves as passive.¹⁷¹ And this is the reason why people in their systems of psychology usually prefer to pass *inner sense* off as being the same as the power of *apperception* (which we carefully distinguish from inner sense).

However, what determines inner sense is the understanding and its original power of combining the manifold of intuition, i.e., the power of bringing that manifold under one apperception (on which apperception the understanding's possibility itself rests). Now in us human beings the understanding is not itself a power of intuitions; and even if an intuition were already given in sensibility, the understanding cannot take it up *into itself*, in order — as it were — to combine the manifold of [what would then be] *its own* intuition. Hence when the understanding is considered by itself alone, then its synthesis is nothing but the

unity of the understanding's act: the act of which the understanding is conscious as an act even apart from sensibility, but through which the understanding itself is able to determine sensibility inwardly as regards the manifold that may, in accordance with the form of sensibility's intuition, be given to the understanding. Hence it is understanding which performs, on the *passive* subject whose *power* it is, that act—under the name of a *transcendental synthesis of imagination* — of which we rightly say that inner sense [B154] is affected by it. Apperception and its synthetic unity is so far from being the same as inner sense that, as the source of all combination, it applies rather to the manifold of *intuitions as such*,¹⁷² and — under the name of the categories — applies, prior to all sensible intuition, to objects as such. Inner sense, on the other hand, contains the mere *form* of intuition, but without combination of the manifold in this form, and hence contains as yet no *determinate* intuition at all. Determinate intuition is possible only through the consciousness of the manifold's determination by the transcendental act of imagination (i.e., by the synthetic influence of understanding on inner sense) — the act that I have called figurative synthesis.

This [need for figurative synthesis], moreover, we always perceive in ourselves. We cannot think a line without *drawing* it in thought. We cannot think a circle without *describing* it.¹⁷³ We cannot at all present the three dimensions of space without *placing* three lines perpendicularly to one another from the same point. And even time we cannot present except inasmuch as, in *drawing* a straight line (meant to be the externally figurative presentation¹⁷⁴ of time), we attend merely to the act of the manifold's synthesis whereby we successively determine inner sense, and thereby attend to the succession of this determination in inner sense. Indeed, what first produces the concept [B155] of succession is motion, taken as act of the subject (rather than as a determination of an object)¹⁷⁵ and consequently as the synthesis of the manifold in space, if we abstract from this manifold and attend merely to the act whereby we determine *inner sense* according to its form. Hence by no means does the understanding already find in inner sense such a combination of the manifold; rather, the understanding *produces it*, inasmuch as the understanding *affects* that sense. But how (inasmuch as in addition to sensible intuition I can present, at least as possible, a different kind of intuition) can the *I* who thinks be distinct from the *I* that intuits itself,¹⁷⁶ and yet be the same as it by being the same subject? And hence how can I say: I, as intelligence and *thinking* subject, cognize myself as an object that is *thought*, viz., I so cognize myself insofar as in addition¹⁷⁷ I am also given to myself in intuition — except that I cognize myself, as I do other phenomena, not as I am to the understanding, but as I appear to myself? This question involves neither more nor less difficulty than does the question as to how I can be an object to myself at all, viz., an object [B156] of intuition and of inner perceptions. Yet so it must actually be, as we can easily establish if space is already accepted as being merely a pure form of the appearances of outer senses. For as regards time, which after all is not an object of outer intuition at all, we cannot present it to ourselves except under the image of a line insofar as we draw that line; without exhibiting time in this way, we could not cognize the singleness of its dimension. Likewise, in seeking for all inner perceptions the determination of length of time, or again of time positions, we must always get this determination from what changeable features are exhibited to us by outer things. Consequently the determinations of inner sense must be arranged by us as appearances in time in precisely the same way as the determinations of the outer senses are arranged by us in space. Hence if concerning the determinations of the outer senses we grant that we cognize objects through them only insofar as we are outwardly affected, then we must also concede concerning inner sense that we intuit ourselves through it only as we are inwardly affected *by ourselves*; i.e., we must concede that, as far as inner intuition is concerned, our own [self as] subject is cognized by us only as appearance, but not in terms of what it is in itself.¹⁷⁸

§25 [B157]

By contrast, in the transcendental synthesis of the manifold of presentations as such, and hence in the synthetic original unity of apperception, I am not conscious of myself as I appear to myself, nor as I am in myself, but am conscious only that I am. This *presentation* is a *thought*, not an *intuition*. Now *cognition* of ourselves requires not only the act of thought that brings the manifold of every possible intuition to the unity of apperception, but requires in addition a definite kind of intuition whereby this manifold is given. Hence although my own existence is not appearance (still less mere illusion), determination [B158] of my existence¹⁷⁹ can occur only in conformity with the form of inner sense and according to the particular way in which the manifold that I combine is given in inner intuition. Accordingly I have no *cognition* of myself as I am but merely cognition of how I appear to myself. Hence consciousness of oneself is far from being a cognition of oneself, regardless of all the categories, which make up the thought of an *object as such* through the combination of the manifold in one apperception. We saw that in order for me to cognize an object different from myself, I not only require the thinking (which I have in the category) of an object as such, but do also require an intuition whereby I determine that universal concept. In the same way, in order to cognize myself, too, I not only require the consciousness of myself or the fact that I think myself, but require also an intuition of the manifold in me whereby I determine this thought. And I exist as an intelligence. This intelligence is [B159] conscious solely in its power of combination. But as regards the manifold that it is to combine, this intelligence is subjected to a limiting condition (which it calls inner sense). As subjected to this condition, it can make that combination intuitable only in terms of time relations, which lie wholly outside the concepts of understanding, properly so called.¹⁸⁰ And hence this intelligence can still cognize itself only as, in regard to an intuition (one that cannot be intellectual and given by the understanding itself), it merely appears to itself; it cannot cognize itself as it would if its *intuition* were intellectual.

TRANSCENDENTAL DEDUCTION OF THE UNIVERSALLY POSSIBLE USE IN EXPERIENCE OF THE PURE CONCEPTS OF UNDERSTANDING

In the *metaphysical deduction*¹⁸¹ we established the a priori origin of the categories as such through their complete concurrence with the universal logical functions of thought. But in the *transcendental deduction* we exhibited the possibility of them¹⁸² as a priori cognitions of objects of an intuition as such (§§ 20, 21). We must now explain how it is possible, through *categories*, to cognize a priori whatever objects *our senses may encounter*—to so cognize them as regards not the form of their intuition, but the laws of their combination — and hence, as it were, to prescribe laws to nature, and even to make nature possible. For [B160] without this suitability of the categories,¹⁸³ one would fail to see how everything that our senses may encounter would have to be subject to the laws that arise a priori from the understanding alone.

First of all, let me point out that by *synthesis of apprehension* I mean that combination of the manifold in an empirical intuition whereby perception, i.e., empirical consciousness of the intuition (as appearance), becomes possible.

We have a priori, in the presentations of space and time, *forms* of both outer and inner sensible intuition; and to these forms the synthesis of apprehension of the manifold of appearance must always conform, because that synthesis itself can take place only according to this form. But space and time are presented a priori not merely as *forms* of sensible intuition, but as themselves *intuitions* (containing a manifold), and hence are presented with the determination¹⁸⁴ of the *unity* of this manifold in them (see the Transcendental [B161] Aesthetic).¹⁸⁵ Therefore even *unity of synthesis* of the manifold outside or within us, and hence also a *combination* to which everything that is to be presented determinately in space or time must conform, is already given a priori as condition of the synthesis of all *apprehension* — given along with (not in) these intuitions. This synthetic unity, however, can be none other than the unity of the combination, conforming to the categories but applied to our *sensible intuition*, of the manifold of a given *intuition as such* in an original consciousness. Consequently all synthesis, the synthesis through which even perception becomes possible, is subject to the categories; and since experience is cognition through connected perceptions, the categories are conditions of the possibility of experience and hence hold a priori also for all objects of experience.

Hence, [B162] e.g., when I turn the empirical intuition of a house into a perception by apprehending the intuition's manifold, then in this apprehension I use as a basis the *necessary unity* of space and of outer sensible intuition as such; and I draw, as it were, the house's shape in conformity with this synthetic unity of the manifold in space. But this same unity, if I abstract from the form of space, resides in the understanding, and is the category of the synthesis of the homogeneous in an intuition as such, i.e., the category of *magnitude*.¹⁸⁶ Hence the synthesis of apprehension, i.e., perception,¹⁸⁷ must conform throughout to that category.¹⁸⁸

When (to take a different example) I perceive the freezing of water, then I apprehend two states (fluidity and solidity) as states that stand to each other in a relation of time. Since the appearance is inner *intuition*, I lay time at its basis. But in time I necessarily present [B163] synthetic *unity* of the manifold; without this unity, that relation¹⁸⁹ could not be given *determinately* (as regards time sequence) in an intuition. However, this synthetic unity, as a priori condition under which I combine the manifold of an *intuition as such*, is — if I abstract from the constant form of *my* inner intuition, i.e., from time — the category of *cause*; through this category, when I apply it to my sensibility, *everything that happens is, in terms of its relation, determined by me in time as such*. Therefore apprehension in such an event, and hence the event itself, is subject—as regards possible perception — to the concept of the *relation of effects and causes*; and thus it is in all other cases.

Categories are concepts that prescribe laws a priori to appearances, and hence to nature regarded as the sum of all appearances (*natura materialiter spectata*).¹⁹⁰ And now this question arises: Since the categories are not derived from nature and do not conform to it as their model (for then they would be merely empirical), how are we to comprehend the fact that nature must conform to the categories, i.e., how can the categories

determine a priori the combination of nature's manifold without gleaning that combination from nature? Here now is the solution of this puzzle.

[B164] How it is that the laws of appearances in nature must agree with the understanding and its a priori form, i.e., with the understanding's power to combine the manifold as such, is not any stranger than how it is that appearances themselves must agree with the form of a priori sensible intuition. For just as appearances exist not in themselves but only relatively to the subject in whom the appearances inhere insofar as the subject has senses, so the laws exist not in the appearances but only relatively to that same being insofar as that being has understanding. Things in themselves would have their law-governedness necessarily, even apart from an understanding that cognizes them. But appearances are only presentations of things that exist unrecognized as regards what they may be in themselves. As mere appearances, however, they are subject to no law of connection whatever except the one prescribed by the connecting power. Now what connects the manifold of sensible intuition is imagination; and imagination depends on understanding as regards the unity of its intellectual synthesis, and on sensibility as regards the manifoldness of apprehension. Now all possible perception depends on this synthesis of apprehension; but it itself, this empirical synthesis, depends on transcendental synthesis and hence on the categories. Therefore all possible perceptions, and hence also everything whatever [B165] that can reach empirical consciousness, i.e., all appearances of nature, must in regard to their combination be subject to the categories. Nature (regarded merely as nature as such) depends (as *natura formaliter spectata*)¹⁹¹ on the categories as the original basis of its necessary law-governedness. But even the pure power of understanding does not suffice for prescribing a priori to appearances, through mere categories, more laws than those underlying a *nature as such* considered as law-governedness of appearances in space and time. Particular laws, because they concern appearances that are determined empirically, are not *derivable completely* from those laws,¹⁹² although the particular laws are one and all subject to the categories. Experience must be added in order for us to become acquainted with particular laws *at all*; but the a priori laws alone give us information about experience as such and about what can be cognized as an object of that experience.

RESULT OF THIS DEDUCTION OF THE CONCEPTS OF UNDERSTANDING

We cannot *think* an object except through categories; we cannot cognize an object thought by us except through intuitions corresponding to those concepts. Now all our intuitions are sensible, and this [sensible] cognition is empirical insofar as its object is given. [B166] Empirical cognition, however, is experience. *Consequently no cognition is possible for us a priori except solely of objects of possible experience.*¹⁹³

But this cognition, which is limited to just objects of experience, is not therefore all taken from experience. Rather, as far as pure intuitions as well as pure concepts of understanding are concerned, they are elements of cognition that are found in us a priori. Now, there are only two ways in which one can conceive of a *necessary* agreement of experience with the concepts of its objects: either experience makes these concepts possible, or these concepts make experience possible. The first alternative is not what happens as [B167] regards the categories (nor as regards pure sensible intuition). For they are a priori concepts and hence are independent of experience. (To assert that their origin is empirical would be to assert a kind of *generatio aequivoca*).¹⁹⁴ There remains, consequently, only the second alternative (a system¹⁹⁵ of *epigenesis*, as it were, of pure reason):¹⁹⁶ viz., that the categories contain the bases, on the part of the understanding, of the possibility of all experience as such. But as to how the categories make experience possible, and as to what principles of the possibility of experience they provide us with when applied to appearances, more information will be given in the following chapter on the transcendental use of our power of judgment.

Someone might want to propose, in addition to the two sole ways mentioned above, a middle course between them: viz., that the categories are neither *self-thought* a priori first principles of our cognition, nor again are drawn from experience, but are subjective predispositions for thinking that are implanted in us [and given to us] simultaneously with our existence; and that they were so arranged by our originator that their use harmonizes exactly with the laws of nature governing the course of experience (this theory would be a kind of *preformation system* of pure reason).¹⁹⁷ If such a middle course were proposed, the following would decide against it (apart from the fact that with such a hypothesis one can see no end to [B168] how far the presupposition of predetermined predispositions to future judgments might be carried): viz., that the categories would in that case lack the *necessity* which belongs essentially to the concept of them. For, the concept of cause, e.g., which asserts the necessity of a result under a presupposed condition, would be false if it rested only on an arbitrary subjective necessity, implanted in us, to link certain empirical presentations according to such a rule of relation. I could then not say that the effect is connected with the cause in the object (i.e., connected with it necessarily), but could say only that I am so equipped that I cannot think this presentation otherwise than as thus connected. And this is just what the skeptic most longs [to hear]. For then all our insight, achieved through the supposed objective validity of our judgments, is nothing but sheer illusion; and there would also be no lack of people who would not concede this subjective necessity (which must be felt) in themselves. At the very least one could not quarrel with anyone about something that rests merely on the way in which his [self as] subject is organized.

BRIEF SKETCH OF THIS DEDUCTION

This deduction is the exhibition of the pure concepts of understanding (and, with them, of all theoretical a priori cognition) as principles of the possibility of experience; the exhibition of these principles, however, as the *determination* of appearances in space [B169] and time *as such*; and the exhibition, finally, of this determination as arising from the *original* synthetic unity of apperception, this unity being the form of understanding as referred to space and time, the original forms of sensibility.

Only up to this point do I consider the division into subsections to be necessary, because we have been dealing with the elementary concepts. Now that we want to present to ourselves the use of these concepts, the treatise may go on without such division, cohering in terms of continuity.

B

SECOND ANALOGY

PRINCIPLE OF TEMPORAL SUCCESSION ACCORDING TO THE LAW OF CAUSALITY

All changes occur according to the law of the connection of cause and effect.

Proof

(The previous principle has established that all appearances [forming part] of the temporal succession¹⁹⁸ are one and all only *changes*;¹⁹⁹ i.e., they are a successive being and not-being of the determinations of substance, which itself is permanent. The principle has established, therefore, that there is no such thing as the being of substance itself as succeeding its not-being, or its not-being as succeeding its existence; [B233] in other words, there is no such thing as the arising or passing away of substance itself. The principle could also have been expressed thus: *All variation (succession) on the part of appearances is only change*; for an arising or passing away of substance would not be changes of it, because the concept of change presupposes the same subject as existing, and hence as being permanent, with two opposite determinations. After this preliminary reminder, there now follows the proof.)

I perceive that appearances succeed one another, i.e., that at one time there is a state of things whose opposite was there in the things' previous state. Hence I am in fact connecting two perceptions in time. Now connection is not the work of mere sense and intuition, but is here the product of a synthetic ability of our imagination which determines inner sense in regard to time relation. But imagination can link those two states in two ways, so that either the one or the other state precedes in time. For time cannot in itself be perceived, and what precedes or follows cannot be determined by reference to it in the object—empirically, as it were. I am, therefore, conscious only that my imagination places one state before and the other after, but not that the one state [B234] precedes the other in the object. In other words, mere perception leaves indeterminate the *objective relation* of the appearances following one another. Now in order for this objective relation to be cognized as determinate, the relation between the two states must be thought as being such that it determines as necessary which of the states must be placed before and which after, rather than vice versa. But a concept carrying with it a necessity of synthetic unity can only be a pure concept of understanding, which therefore does not reside in perception. Here this concept is that of the *relation of cause and effect*; of these two, the cause is what determines the effect in time, and determines it as the consequence, rather than as something that [as occurring] merely in imagination might [instead] precede (or might not even be perceived at all). Therefore experience itself—i.e., empirical cognition of appearances—is possible only inasmuch as we subject the succession of appearances, and hence all change, to the law of causality. Hence appearances themselves, taken as objects of experience, are possible only in accordance with this law.

Apprehension of the manifold of appearances is always successive. The presentations of the parts succeed one another. Whether they also follow one another in the object is a second point for reflection which is not already contained in the first point.²⁰⁰ Now it is true that anything, even every presentation insofar as one is conscious of it, can be called an object. Yet what this word might signify in the case [B235] of appearances, not insofar as they (as presentations) are objects but insofar as they only designate an object, calls for deeper investigation. Insofar as appearances, taken only as presentations, are simultaneously objects of consciousness, they are not at all distinct from apprehension, i.e., from the taking up into the synthesis of imagination; and we must say, therefore, that the manifold of appearances is always produced in the mind successively. If appearances were things in themselves, then no human being could gather²⁰¹ from the succession of presentations how their manifold is combined in the object. For we deal, after all, only with our presentations; how things may be in themselves (i.e., apart from taking account of presentations whereby they affect us), is entirely outside our sphere of cognition. Appearances, then, are indeed not things in themselves; but they are all that can be given to us for cognition. And now, whereas the presentation [as such] of the manifold in apprehension is always successive, I am to indicate what sort of combination in time belongs to the manifold in appearances themselves. Thus, e.g., the apprehension of the manifold in the appearance of a house standing before me is successive. Now the question is whether the manifold of this house itself is successive intrinsically as well; and this, to be sure, no one will grant. [B236] But once I raise my concepts of an object to the level of transcendental signification, the house is not at all a thing in itself, but is only an appearance, i.e., a presentation, whose transcendental object is unknown. What, then, do I mean by the question as to how the manifold may be combined in appearance itself (which, after all, is nothing in itself)? Here what lies in the successive apprehension is regarded as presentation; but the appearance that is given to me, despite being nothing more than a sum of these presentations, is regarded as their object, with which the concept that I obtain from the presentations of apprehension is to agree. We soon see that, since agreement of cognition

with the object is truth, the question can only be inquiring after the formal conditions of empirical truth; and we see that appearance, as contrasted with the presentations of apprehension, can be presented as an object distinct from them only if it is subject to a rule that distinguishes it from any other apprehension and that makes necessary one kind of combination of the manifold. That [element] in the appearance which contains the condition of this necessary rule of apprehension is the object.

Let us now proceed to our problem. That something occurs, i.e., that something, or a state that was not there before, comes to be cannot be perceived [B237] empirically²⁰² unless it is preceded by an appearance that does not contain this state. For an actuality succeeding an empty time, i.e., an arising not preceded by any state of things, cannot be apprehended any more than empty time itself. Hence any apprehension of an event is a perception succeeding another perception. But because, as I showed above by reference to the appearance of a house, this is so in all synthesis of apprehension, the apprehension of an event is not yet distinguished thereby from other apprehensions. Yet I also observe that if, in an appearance containing an occurrence, I call A the preceding state of the perception and B the succeeding state, then B can in apprehension only succeed A, and similarly perception A cannot succeed B but can only precede it. For example, I see a ship floating down the river. My perception of its position lower down in the course of the river succeeds the perception of its position higher up, and there is no possibility that in the apprehension of this appearance the ship should be perceived first lower down and afterwards higher up in the river. Hence the order in the perceptions' succession in apprehension is here determinate, and apprehension is tied to this order. In the previous example of a house my perceptions could, in apprehension, [B238] start from the house's top and end at the bottom, but they could also start from below and end above; and they could likewise apprehend the manifold of the empirical intuition by proceeding either to the right or to the left. Hence in the series of these perceptions there was no determinate order making necessary the point in apprehension where I must begin in order to combine the manifold empirically. In the perception of what occurs,²⁰³ however, this rule²⁰⁴ is always to be found, and through it the order of the perceptions succeeding one another (in the apprehension of this appearance) is made *necessary*.

In our case,²⁰⁵ therefore, I shall have to derive the *subjective succession* of apprehension from the *objective succession* of appearances; for otherwise the subjective succession is entirely indeterminate and fails to distinguish any one appearance from some other appearance. The subjective succession by itself, being entirely arbitrary, proves nothing about the connection of the manifold in the object. Hence the objective succession will consist in the order of the manifold of appearance whereby the apprehension of the one item (viz., what occurs) succeeds the apprehension of the other (viz., what precedes) *according to a rule*. This alone can entitle me to say of the appearance itself, and not merely of my apprehension, that a succession is to be found in it — which means the same as that I cannot perform the apprehension except in precisely this succession.²⁰⁶

In accordance with such a rule, therefore, what precedes an event as such must contain the condition [B239] for a rule whereby this event always and necessarily follows. But I cannot go, conversely, from the event backward and determine (through apprehension) what precedes. For no appearance goes back from the succeeding point of time to the previous one, although it does refer *to some previous one*. The progression from a given time to the determinate following time, on the other hand, is necessary. Hence because it²⁰⁷ is, after all, something that follows, I must necessarily refer it to something else as such that precedes it and that it succeeds according to a rule, i.e., necessarily. Thus the event, as the conditioned, directs us reliably to some condition, while this condition determines the event.

Suppose that an event is not preceded by anything that it must succeed according to a rule. Then all succession of perception would be determined solely in apprehension, i.e., merely subjectively; but this would not at all determine objectively which item in fact precedes in perception and which follows. We would in that way have only a play of presentations that would not refer to any object whatever; i.e., our perception would not at all distinguish one appearance from all others in terms of time relation. For the succession in apprehending is in that case everywhere the same, and hence there is in appearance [B240] nothing determining this succession so that a certain²⁰⁸ succession is, as objective, made necessary by it. Hence I shall in that case not say that two states succeed each other in appearance. Rather, I shall say only that one apprehension succeeds the other; and this is merely something *subjective* and determines no object, and hence cannot count as cognition of any object (not even of an object in [the realm of] appearance).

Hence when we experience that something occurs, then in doing so we always presuppose that it is preceded by something or other that it succeeds according to a rule. Otherwise I would not say of the object that it succeeds; for the mere succession in my apprehension, if it is not determined by a rule by reference to something preceding it, justifies no [assumption of a] succession in the object. Hence it is always on account

of a rule that I make my subjective synthesis (of apprehension) objective, viz., a rule according to which appearances in their succession, i.e., as they occur, are determined by the previous state. And the experience itself of something that occurs is possible solely and exclusively under this presupposition.

It is true that this seems to contradict all the remarks that people have always made about the course taken by our understanding. According to those remarks, it is only by perceiving and comparing the agreeing successions of events that follow upon preceding appearances that we are first led to discover a rule [B241] whereby certain events always succeed certain appearances, and only thereby we are first prompted to frame the concept of cause. This concept would, on such a basis, be merely empirical. And the rule whereby everything that occurs has a cause, as this concept provides it, would be just as contingent as the experience itself.²⁰⁹ The rule's universality and necessity would then be attributed to it only fictitiously and would have no true universal validity, because they would be based not on anything a priori, but only on induction. But the case with this rule is the same as that with other pure a priori presentations (e.g., space and time): we can extract them as clear concepts from experience solely because we have put them into experience and hence have brought experience about through them in the first place. To be sure, this presentation of a rule determining the series of events, as a concept of cause, can have logical clarity only once we have made use of it in experience. Yet [our] taking account of this presentation, [viz.,] as a condition of the synthetic unity in time of appearances, was nonetheless the basis of the experience itself, and hence the experience was preceded a priori by this condition.

Hence we must show, in the example [of an event], that even in experience we never attribute succession (in the case of an event—where something occurs that was not there before) to the object and we never distinguish this succession from the subjective one [B242] in our apprehension, except when there lies at the basis a rule that compels us to observe this order of perceptions rather than some other order; indeed, we must show that this compulsion is what in fact makes the presentation of a succession in the object possible in the first place.

We have within us presentations of which we can also become conscious. But no matter how far this consciousness²¹⁰ may extend and how accurate and punctilious it may be, they still remain forever only presentations, i.e., inner determinations of our mind in this or that time relation. How is it, then, that we posit an object for these presentations; or how is it that in addition to the subjective reality that they have as modifications [of the mind], we also attribute to them who knows what sort of objective reality? Their objective signification cannot consist in the reference to another presentation (of what one would want to call object). For otherwise the question returns: how does this other presentation, in turn, go beyond itself and acquire objective signification in addition to the subjective one that it possesses by being a determination of the mental state? Suppose that we inquire what new character is given to our presentations by the *reference to an object*, and what is the dignity that they thereby obtain. We then find that this reference does nothing beyond making necessary the presentations' being combined²¹¹ in a certain way and being [B243] subjected to a rule; and we find, conversely, that only through the necessity of a certain order in the time relation of our presentations is objective signification conferred on them.

In the synthesis of appearances the manifold of presentations is always successive. Now, through this succession no object whatever is presented; for through this succession, which is common to all apprehensions, nothing is distinguished from anything else. But once I perceive, or assume in advance, that there is in this succession a reference to the preceding state, upon which the presentation follows according to a rule, then something presents itself as an event, or as something that occurs. I.e., I then cognize an object that I must posit in a certain determinate position in time — a position that in view of the preceding state cannot be assigned to it differently. Hence when I perceive that something occurs, then this presentation contains, first, [the presupposition] that something precedes; for precisely by reference to this preceding something does the appearance acquire its time relation, viz., its existing after a preceding time in which it was not. But, second, it can obtain its determinate time position in this relation only inasmuch as in the preceding state something is presupposed that it succeeds always, i.e., succeeds according to a rule. And from this results, first, that I cannot reverse the series, taking what occurs and putting it ahead of what it succeeds; and, second, that if the state that precedes is posited, then this specific event [B244] succeeds unfailingly and necessarily. Thus it is that among our presentations there comes to be an order in which what is present directs us (insofar as it has come to be) to some preceding state as a correlate of the happening that is given. And although this correlate is still indeterminate, it does refer determinatively to this happening as its consequence and in the time series connects it with itself necessarily.

Suppose, then, that it is a necessary law of our sensibility, and hence a *formal condition* of all perceptions,

that the previous time necessarily determines the following one (inasmuch as I cannot arrive at the following time except through the preceding one). If this is so, then it is also an indispensable *law of empirical presentation* of the time series that the appearances of past time determine every existent in the following time; and that these existents, as events, do not take place except insofar as their existence is determined in time — i.e., fixed in time according to a rule — by those appearances of past time. For *only in appearances can we cognize empirically this continuity in the coherence of times*.

Understanding is required for all experience and for its possibility. And the first thing that understanding does for these is not that of making the presentation of objects distinct, but that of making the presentation of an object possible at all. Now, this is [B245] done through the understanding's transferring the time order to the appearances and to their existence, by allotting to each appearance, as consequence, a position in time determined a priori with regard to the preceding appearances; without this position in time the appearance would not agree with time itself, which a priori determines for all its parts their position. Now this determination of an appearance's position cannot be taken from the relation of appearances toward absolute time (for absolute time is not an object of perception). Rather, conversely, the appearances must themselves determine for one another their positions in time, and must make these positions necessary in the time order; i.e., what follows or occurs must succeed what was contained in the previous state and must do so according to a universal rule. This results in a series of appearances that, by means of the understanding, produces and makes necessary in the series of possible perceptions the same order and steady coherence that is found a priori in the form of inner intuition (i.e., in time), in which all [such] perceptions would have to have their position.

Hence that something occurs is a perception belonging to a possible experience. This experience becomes actual when I view the appearance as determined as regards its position in time, and hence view it as an object that in the coherence of perceptions can always be found according to a rule. This rule, [B246] however, for determining something in regard to temporal succession, is that the condition under which an event always (i.e., necessarily) follows is to be found in what precedes the event. Hence the principle of sufficient basis²¹² is the basis of possible experience, i.e., of objective cognition of appearances with regard to their relation in time sequence.

The basis for proving this proposition, however, rests solely on the following moments. All empirical cognition involves the synthesis of the manifold by the imagination. This synthesis is always successive, i.e., in it the presentations always succeed one another. In the imagination itself, however, the sequence is not at all determined as regards order (i.e., as to what must precede and what must follow), and the series of the presentations following one another can be taken as proceeding backward just as well as forward. But if this synthesis is a synthesis of apprehension (of the manifold of a given appearance), then the order is determined in the object, or — to speak more accurately — there is in this apprehension an order of successive synthesis that determines an object; and according to this order something must necessarily precede, and when this something is posited then the other event must necessarily follow. Hence if my perception is to contain the cognition of an event, i.e., of something's actually occurring, then it must be an empirical judgment in which we think of the consequence as [B247] determined, i.e., as presupposing in terms of time another appearance that it succeeds necessarily, or according to a rule. Otherwise, if I posited what precedes and the event did not succeed it necessarily, then I would have to regard this event as only a subjective play of my imaginings; and if I still presented by it something objective, then I would have to call it a mere dream. Therefore the relation of appearances (as possible perceptions) whereby what follows (occurs) is with regard to its existence determined in time, necessarily and according to a rule, by something preceding it—in other words, the relation of cause to effect—is the condition of the objective validity of our empirical judgments as regards the series of perceptions, and hence is the condition of these judgments' empirical truth and therefore of experience. The principle of the causal relation in the succession of appearances holds, therefore, also for all objects of experience ([insofar as they are] under the conditions of succession), because it is itself the basis of the possibility of such experience.

Here, however, emerges a perplexity that must still be removed. The principle of the causal connection among appearances is, in our formulation, limited to their [occurring in] sequence. Yet in using the principle we find that it fits also the case of their concomitance, and that cause and effect can be simultaneous. E.g., there is heat in the room which is not found in the open air. I look around for the [B248] cause, and discover a heated stove. Now this stove, as cause, is simultaneous with its effect, the room's heat. Hence here there is between cause and effect no sequence in terms of time. They are, rather, simultaneous; and yet the law of cause and effect does hold. The majority of efficient causes in nature are simultaneous with their effects, and the temporal succession of the effects is due only to the fact that the cause cannot accomplish its entire effect

in one instant. But at the instant when the effect first arises, it is always simultaneous with the causality of its cause. For if the cause had ceased to be an instant before, then the effect would not have arisen at all. It must be noted carefully, here, that what we are considering is the *order* of time, not the *lapse* of time; the relation remains even if no time has elapsed. The time between the causality of the cause and the cause's direct effect may be *vanishingly brief*, but yet the relation of the cause to the effect always remains determinable in terms of time. If I consider as cause a [lead] ball that lies on a stuffed cushion and makes an indentation in it, then this cause is simultaneous with the effect. But I nonetheless distinguish the two by the time relation of their dynamical connection. For if I lay the ball on the cushion, then the previous smooth shape of the cushion is succeeded by the indentation; but if the [B249] cushion has an indentation (no matter from where), then this is not succeeded by a lead ball.²¹³

Hence temporal succession is indeed an effect's sole empirical criterion in reference to the causality of the cause preceding it. The [totally filled] tumbler is the cause of the water's rising above the horizontal plane [at the top] of the tumbler, although the two appearances are simultaneous. For as soon as water is scooped from a larger vessel with [an empty] tumbler, there ensues this: the horizontal level that the water had in the larger vessel changes to a concave level in the [partially filled] tumbler.

This causality leads to the concept of action; action leads to the concept of force and thereby to the concept of substance. Since my critical project deals solely with the sources of synthetic a priori cognition and I do not want to mingle with it dissections [of concepts], which concern merely the elucidation (rather than the expansion) of concepts, I leave the detailed exposition of these concepts to a future system of pure reason — although such an analysis can also be found in abundance in the textbooks of this kind that are already familiar. What I must, however, touch upon is the empirical criterion of a substance insofar as it seems to manifest itself not through the permanence of appearance but better and more easily through action.

Where [B250] there is action and hence activity and force, there is also substance, and in substance alone must be sought the seat of that fertile source of appearances. That is nicely said; but if we are to explain what we mean by substance and want to avoid the fallacy of circular reasoning, then the answer is not so easy. How, from action on something, are we to infer at once *the agent's permanence* — this permanence being, after all, so essential and peculiar a characteristic of substance ([as] *phaenomenon*²¹⁴). Yet according to our previous remarks, solving the question is not so difficult after all, even though the question would be quite insoluble according to the usual way (of proceeding with one's concepts, viz., merely analytically). Action already means the relation of the causality's subject to the effect. Now any effect consists in what occurs, and hence in the mutable that designates time in terms of succession. Therefore the ultimate subject of the mutable is the *permanent* as the substratum of everything that varies, i.e., substance. For according to the principle of causality actions are always the first basis of all variation by appearances; hence actions cannot reside in a subject that itself varies, since otherwise other actions and another subject determining that variation would be required. By virtue of this does action prove, as a sufficient empirical criterion, the substantiality of a subject, without my [B251] needing first of all to search for the subject's permanence by perceptions that I have compared. Nor could proving this substantiality along this path of comparison be accomplished as comprehensively as is required by the magnitude and strict universality of the concept of substance. For, that the first subject of the causality of all arising and passing away cannot itself arise and pass away (in the realm of appearances) is a safe inference that issues in empirical necessity and permanence in existence, and hence in the concept of a substance as appearance.

When something occurs then the mere arising, even if we take no account of what arises, is in itself already an object of inquiry. The transition itself from a state's not-being to this state, even supposing that this state contained no quality in [the realm] of appearance, already calls for inquiry. This arising, as was shown in the First Analogy, concerns not substance (for substance does not arise) but its state. Hence arising is only change, and not origination from nothing. For if this origination from nothing is regarded as effect of an extraneous cause, then it is called creation; and creation cannot be admitted as an event among appearances, because its very possibility would already annul the unity of experience. If, on the other hand, I regard all things not as phenomena but as things in themselves and as objects merely of understanding, then despite their being substances [B252] they can still be regarded as being dependent, in terms of their existence, on an extraneous cause. That alternative, however, would then entail quite different significations of the words, and would not fit appearances, as possible objects of experience.

Now, we do not a priori have the least concept as to how anything can be changed at all, i.e., how it is possible that one state occurring at one point of time can be succeeded by an opposite state occurring at another point of time. This [concept of how change is possible] requires knowledge of actual forces — e.g., knowledge of the motive forces, or, which is the same, of certain successive appearances (as motions)

indicating such forces—and such knowledge can be given only empirically. But we can nonetheless examine a priori, according to the law of causality and the conditions of time, the form of every change, i.e., the condition under which alone, as an arising of a different state, change can take place (no matter what may be its content, i.e., the state being changed); and hence we can so examine the succession itself of the states (i.e., the occurrence).²¹⁵

When [B253] a substance passes from one state, *a*, to another, *b*, then the point of time of the second state is different from the point of time of the first, and follows it. In the same way, too, the second state as reality (in [the realm of] appearance) differs from the first, in which this reality was not, as *b* differs from zero; i.e., even if state *b* were to differ from state *a* only in magnitude, the change is [still] an arising of *b*-*a*,²¹⁶ which in the previous state was not and in regard to which that state = 0.

The question, therefore, is how a thing passes from one state, = *a*, to another, = *b*. Between two instants there is always a time, and between two states at those instants there is always a difference that has a magnitude (for all parts of appearances are always magnitudes in turn). Hence any transition from one state to another occurs in a time that is contained between two instants, the first instant determining the state that the thing leaves and the second instant determining the state that it enters. Both instants, therefore, are bounds of the time of a change and hence bounds of the intermediate state between the two states, and as such belong also to the entire change. Now every change has a cause that manifests its causality in the entire time wherein the change takes place. Hence this cause produces its [B254] change not suddenly (i.e., all at once, or in one instant), but in a time; so that, as the time increases from its initial instant (*a*) up to its completion (in *b*), the reality's magnitude (*b* - *a*) is also produced through all the smaller degrees contained between the first degree and the last. Hence all change is possible only through a continuous action of the causality; this action, insofar as it is uniform, is called a moment. Change does not consist of these moments, but is produced by them as their effect.

This, then, is the law of the continuity of all change. The basis of this law is this fact: that neither time nor, for that matter, appearance in time consists of parts that are the smallest; and that nonetheless, as a thing changes, its state passes through all these parts, as elements, to the thing's second state. *No difference* of the real in [the realm of] appearance is *the smallest*, just as no difference in the magnitude of times is the smallest. And thus the reality's new state grows, starting from the first state, in which it was not, through all the infinite degrees of this reality; and the differences of the degrees from one another are all smaller than the difference between 0 and *a*.

What benefit this principle may have for the investigation of nature is of no concern to us here. But how is such a principle, which thus seems to expand our cognition of nature, possible completely a priori? This question very much requires our examination, even though what the principle says is [so] obviously actual and correct that we might believe ourselves to be [B255] exempted from the question as to how the principle was possible. For there is such a variety of unfounded claims about our cognition's expansion by pure reason, that we must adopt as a universal principle [the resolve] to be throughout distrustful on that account, and not to believe or assume anything of the sort, even upon the clearest dogmatic proof, without documentation that can provide a well-founded deduction.

All increase of empirical cognition and any progress of perception—no matter what the objects may be, whether appearances or pure intuitions—is nothing but an expansion of the determination of inner sense, i.e., a progression in time. This progression in time determines everything and is in itself determined through nothing further. I.e., the progression's parts are given only in time and through the synthesis of time; they are not given prior to the synthesis. Because of this, every transition in perception to something that follows in time is a determination of time through the production of this perception; and since time is always and in all its parts a magnitude, every such transition is the production of a perception as a magnitude that goes through all degrees, none of which is the smallest, from zero onward up to the perception's determinate degree. From this, then, is evident the possibility of cognizing a priori a law governing [B256] changes as regards their form. For we only anticipate our own apprehension, whose formal condition, since it resides in ourselves prior to all given appearance, must indeed be capable of being cognized a priori.

We have seen that time contains the sensible a priori condition for the possibility of a continuous progression of what exists to what follows. In the same way the understanding, by means of the unity of apperception, is the a priori condition for the possibility of a continuous determination, through the series of causes and effects, of all positions for appearances in this time — the causes entailing unfailingly the existence of the effects, and thereby making the empirical cognition of time relations valid for every time (i.e., universally) and hence valid objectively.

Refutation of Idealism

Idealism (I mean *material* idealism) is the theory that declares the existence of objects in space outside us either to be merely doubtful and *unprovable*, or to be *false* and *impossible*. The *first* is the *problematic* idealism of Descartes; it declares only one empirical assertion (*assertio*) to be indubitable, viz.: *I am*. The *second* is the *dogmatic* idealism of Berkeley; it declares space, with all the things to which space attaches as inseparable condition, to be something that is in itself impossible, and hence also declares the things in space to be mere imaginings. Dogmatic idealism is unavoidable if one regards space as a property that is to belong to things in themselves; for then space, with everything that space serves as condition, is a nonentity. However, the basis for this idealism has already been removed by us in the Transcendental Aesthetic. Problematic idealism, which asserts nothing [B275] about this but only alleges that we are unable to prove by direct experience an existence apart from our own, is reasonable and is in accordance with a thorough philosophical way of thinking—viz., in permitting no decisive judgment before a sufficient proof has been found. The proof it demands must, therefore, establish that regarding external things we have not merely *imagination* but also *experience*. And establishing this surely cannot be done unless one can prove that even our *inner* experience, indubitable for Descartes, is possible only on the presupposition of *outer* experience.

Theorem

The mere, but empirically determined, consciousness of my own existence proves the existence of objects in space outside me.

Proof

I am conscious of my existence as determined in time. All time determination presupposes something *permanent* in perception. But this permanent something cannot be something within me, precisely because my existence can be determined in time only by this permanent something. Therefore perception of this permanent something is possible only through a *thing* outside me and not through mere *presentation* of a thing outside me. Hence determination of my existence in time is possible only through the existence of actual things that I perceive outside me. Now [B276] consciousness of my existence in time is necessarily linked with consciousness of the possibility of this time determination; therefore it is necessarily linked also with the existence of things outside me, as condition of the time determination. I.e., the consciousness of my own existence is simultaneously a direct consciousness of the existence of other things outside me.

Comment 1. In the preceding proof one becomes aware that the game that idealism played is being turned around and against it—and more rightly so. Idealism assumed that the only direct experience is inner experience and that from it we only *infer* external things; but²¹⁷ we infer them only unreliably, as happens whenever we infer *determinate* causes from given effects, because the cause of the presentations that we ascribe—perhaps falsely—to external things may also reside in ourselves. Yet here we have proved that outer experience is in fact direct,²¹⁸ and that only by means of it can there be inner experience — i.e., [B277] not indeed consciousness of our own existence, but yet determination of that existence in time. To be sure, the presentation *I am*, which expresses the consciousness that can accompany all thinking, is what directly includes the existence of a subject; but it is not yet a *cognition* of that subject, and hence is also no empirical cognition — i.e., experience — of it. For such experience involves, besides the thought of something existent, also intuition, and here specifically inner intuition, in regard to which — viz., time — the subject must be determined; and this determination definitely requires external objects. Thus, consequently, inner experience is itself only indirect and is possible only through outer experience.

Comment 2. Now, all experiential use that we make of our cognitive power in determining time agrees completely with this view. Not only can we perceive any time determination solely through the variation in external relations (i.e., through motion) by reference to the permanent in space (e.g., the sun's motion with respect to the earth's objects); but except merely [B278] for *matter* we do not even have anything permanent on which, as intuition, we could base the concept of a substance. And even this permanence is not drawn from outer experience, but is presupposed a priori as necessary condition of all time determination, and hence presupposed also as determination of inner sense, with regard to our own existence, through the existence of external things. The consciousness that I have of myself in the presentation *I* is not an intuition at all, but is a merely *intellectual* presentation of a thinking subject's self-activity. Hence this *I* also does not have the least predicate of intuition that, as *permanent*, could serve as correlate for the time determination in inner sense — as, say, *impenetrability* is such a predicate of *empirical* intuition in matter.

Comment 3. It does not follow, from the fact that the existence of external objects is required for the possibility of a determinate consciousness of ourselves, that every intuitive presentation of external things implies also these things' existence; for the presentation may very well be (as it is in dreams as well as in madness) the mere effect of the imagination. Yet it is this effect merely through the reproduction of former outer perceptions; and these, as has been shown, are possible only through the actuality of external objects. What was here to be proved is only that inner experience as such is possible only through [B279] outer experience as such. Whether this or that supposed experience is not perhaps a mere imagining must be ascertained by reference to its particular determinations and by holding it up to the criteria of all actual experience.

1. [The Cape of Good Hope.—W.S.P.]
2. [Author of the only extant continuous account of the lives and doctrines of the main Greek philosophers. He is thought to have flourished (where is not clear) in the early part of the third century A.D. His work is known under various titles, such as *The Lives of Philosophers*, *Lives and Opinions of Famous Philosophers*, and several others.]
3. [Thales of Miletus (in Asia Minor), who was considered one of the Seven Wise Men of ancient Greece, flourished around 585 B.C. He has been regarded, since early antiquity, as the founder of the Ionian school of natural philosophy, and is generally credited with having introduced geometry to Greece.]
4. [Francis Bacon (1561–1616), Baron Verulam, Viscount St. Albans, lord chancellor of England, philosopher, and man of letters.]
5. [Evangelista Torricelli (1608–1647), Italian physicist and mathematician. He was first to create a sustained vacuum, and he invented the barometer.]
6. [Georg Ernst Stahl (1660–1734), German physician and chemist. He developed the phlogiston theory of combustion, which offered the first comprehensive explanation of combustion and of such related biological processes as respiration, fermentation, and decay. The theory dominated chemical thought for almost a century, until its replacement by Lavoisier's oxidation theory of combustion.]
7. [The "something" was thought to be phlogiston. On the phlogiston theory of combustion (cf. previous note), the processes involved are these: Metals, when heated, lose phlogiston and become calces (or calx, in the singular), kinds of ashy powder now known to be oxides. Calces, when heated with charcoal, reabsorb phlogiston and become metals again. (The original phlogiston having been scattered and lost, the new phlogiston absorbed by the calx comes from the charcoal, which is especially rich in phlogiston.)]
8. I am not here following with precision the course of the history of the experimental method; indeed, the first beginnings of that history are not well known.
9. [As a result of the mentioned experiments.]
10. [Nicolaus Copernicus (1473–1543), the Polish astronomer, reinvented the heliocentric hypothesis. The hypothesis had been advanced previously by Aristarchus, a Greek astronomer of the third century B.C. But his work was lost a few decades after he wrote it, and we know about it only through other writers' testimony that itself was not recovered until long after the time of Copernicus.]
11. [As do the intuitions.]
12. [Because the objects under discussion are objects of our experience, i.e., objects as experienced (objects given to us in experience).]
13. This method, then, which imitates that of the investigator of nature, consists in searching for the elements of pure reason in what can be *confirmed or refuted by an experiment*. Now the propositions of pure reason, especially if they venture beyond all bounds of possible experience, cannot be tested by doing (as we do in natural science) an experiment with their *objects*. Hence testing such propositions will be feasible only by doing an experiment with *concepts* and *principles* that we assume a priori. In that experiment we must arrange [to use] these concepts and principles in such a way that the same objects can be contemplated from two different standpoints: *on the one hand*, for the sake of experience, as objects of the senses and of the understanding; yet *on the other hand*, for the sake of isolated reason that strives to transcend all bounds of experience, as objects that we merely think. Now if it turns out that contemplating things from that twofold point of view results in harmony with the principle of reason, but that doing so from one and the same point of view puts reason into an unavoidable conflict with itself, then the experiment decides in favor of the correctness of distinguishing the two points of view.
14. [I.e., legitimation of the claim that we have such a power.]
15. [Viz., that our power of a priori cognition can inform us only about appearances, but can never take us beyond the boundary of possible experience and allow us to cognize the thing in itself.]
16. This experiment of pure reason is very similar to that done in *chemistry*, which is called sometimes the experiment of *reduction*, but generally the *synthetic procedure*. The *analysis* of the *metaphysician* has divided pure a priori cognition into two very heterogeneous elements, viz., such cognition of things as appearances, and of things in themselves. The [metaphysician's] *dialectic* recombines the two so as to yield *agreement* with reason's necessary idea of the *unconditioned*, and finds that this agreement can never be obtained except through that distinction, which is

therefore [a] true one.

17. [I.e., the realm of objects considered as things in themselves rather than as objects of sense.]

18. [I.e., make the concept determinate, give it content by means of attributes or “determinations.”]

19. [I.e., the use of practical reason.]

20. In the same way [as Kant has just described in the case of metaphysics] the central laws governing the motions of the celestial bodies provided with established certainty what *Copernicus* had initially assumed only as a hypothesis, and at the same time provided proof of the invisible force (*Newtonian* attraction) that links together the world edifice. That force would have remained forever undiscovered if Copernicus had not dared, in a manner that conflicted with the senses but yet was true, to seek the observed motions not in the celestial objects but in the spectator. The transformation in the way of thinking [in metaphysics] which I set forth in the *Critique* is analogous to the Copernician hypothesis. Here in the preface I likewise put it forth only as a hypothesis, even though in the treatise itself it will be proved, not hypothetically but apodeictically, from the character of our presentations of space and time and from the elementary concepts [i.e., the categories] of the understanding. Here I put it forth as a hypothesis in order merely to draw attention to the first attempts at such a transformation; and such attempts are always hypothetical.

21. [“Thinking that nothing was done as long as anything remained to be done.” The quote is from the (unfinished) *De bello civili* (*On the Civil War*) by the Roman poet Lucan (Marcus Annaeus Lucanus, A.D. 39–65), ii, 657. The poem, which is also called *Pharsalia* (after the battle of Pharsalos described in Book vii), deals with the contest between Julius Caesar and the Senate, and the person referred to in the quote is Caesar. Actually, instead of *reputans* (thinking) the original has *credens* (believing), and instead of *si* it has *dum* or possibly *cum* (a switch that does not affect the meaning here).]

22. [If used in the way described.]

23. In order for me to *cognize* an object I must be able to prove its [real] possibility (either from its actuality as attested by experience, or a priori by means of reason). But I can *think* whatever I want to, even if I am unable to commit myself to there being, in the sum of all [logical] possibilities, an object corresponding to the concept. All that is required in order for me to think something is that I do not contradict myself, i.e., that my concept be a [logically] possible thought. But I require something further in order to attribute objective reality to a concept (i.e., real possibility, as distinguished from the merely logical possibility just mentioned). However — and this is my point — this something further need not be sought in theoretical sources of cognition, but may also lie in practical ones.

24. [I.e., including things in themselves.]

25. [I.e., as things in themselves.]

26. [A soul.]

27. [Viz., as ruled out by the necessary mechanism of nature.]

28. [Of freedom, as presupposed by morality.]

29. [That freedom cannot be thought.]

30. [Which would thus prove the original supposition, viz., that freedom cannot be thought. The opposite (or denial) of this supposition is that freedom *can* be thought, which would contradict a necessary mechanism that (as would have been proved by speculative reason) rules out freedom.]

31. [Here the opposite (or denial) is that there is no freedom and hence no (possibility of) morality, which would not contradict a necessary mechanism, obviously not even one that ruled out freedom. Hence here the opposite or denial cannot prove the original supposition, viz., of freedom as presupposed by morality. A contradiction would arise only if we had already presupposed freedom: freedom would contradict both its own denial and that of (the possibility of) morality.]

32. [By the same reasoning that has just been used.]

33. [In the realm of the sciences.]

34. [“What he is as ignorant of as I am he wants to appear to be the only one to understand.” I am grateful to Francis E. Sparshott for identifying this quote (and to Geoffrey Payzant for knowing whom to ask). It is from Horace’s *Epistles*, II, i, 87. The original text actually has *ignorat* instead of (the synonymous) *nescit*.]

35. [In metaphysics.]

36. [Baron Christian von Wolff (1679–1754), German mathematician, natural scientist, and, above all, rationalist philosopher of the Enlightenment. He is the author of numerous writings. Although his work follows the tradition of Descartes and Leibniz, he developed his own philosophical system within that tradition.]

37. [I.e., instrument. See B 86.]

38. [Pursuit of a creed.]

39. [In the plan displaying that systematic structure.]

40. Only one of my alterations could I call, properly speaking, an addition, and even it concerns only the kind of proof I offer. It consists — see p. [B] 275 — in a new refutation of psychological *idealism*, and a strict proof (also, I believe, the only possible proof) of the objective reality of outer intuition. However innocuous idealism may be considered to be (without in fact being so) as regards the essential purposes of metaphysics,

there always remains this scandal for philosophy and human reason in general [if we accept idealism]: that we have to accept merely on faith the existence of things outside us (even though they provide us with all the material we have for cognitions, even for those of our inner sense); and that, if it occurs to someone to doubt their existence, we have no satisfactory proof with which to oppose him. Since there is some obscurity in the expressions I used in that proof, from the third to the sixth line, I request that the passage be changed to the following: “But *this permanent something cannot be an intuition within me. For all bases determining my existence that can be encountered within me are presentations; and, being presentations, they themselves require something permanent distinct from them, by reference to which their variation, and hence my existence in the time in which they vary, can be determined.*” I suppose some will object to this proof by saying: But all I am conscious of directly is what is within me, i.e., my *presentation* of external things, and hence we still have not established whether or not there is anything corresponding to it outside me. However, through inner *experience* I am [BxI] conscious of *my existence in time* (and hence also of its determinability in time), and that is more than to be conscious merely of my presentation. But this consciousness of my existence (and of its determinability) in time is the same thing as *empirical consciousness of my existence*, and that can be determined only by reference to something linked with my existence that is *outside me*. Therefore this consciousness of my existence in time is linked, by way of identity, with the consciousness of a relation to something outside me; and hence what inseparably connects what is outside me with my inner sense is experience rather than invention, [outer] sense rather than my power of imagination. For outer sense is in itself already the referring of intuition to something actual outside me; and the reality of outer sense, as distinguished from imagination, rests only on our linking outer sense inseparably, as we are doing here, with inner experience itself, viz., as the condition of the possibility of inner experience. [This empirical consciousness of my existence contrasts with] the *intellectual consciousness* of my existence that I have in the conception I am, which accompanies all my judgments and acts of understanding; if with that intellectual consciousness of my existence I could at the same time link a determination of my existence through intellectual intuition, then this determination would not include necessarily the consciousness of a relation to something outside me. But in fact I am unable to do so. That intellectual consciousness of my existence does indeed lead the way; but the inner intuition in which alone my existence can be determined is sensible intuition, and is tied to the condition of time. But this [kind of] determination [of my existence], and hence inner experience itself, depends on something permanent to which I must regard myself as related by way of contrast; and anything permanent is not within me and hence is to [BxI] be found only in something outside me. Hence the reality of outer sense is linked necessarily with the reality of inner sense, and this [link] makes experience as such possible. In other words, I am conscious with just as much certainty that there are things outside me that have reference to my sense, as I am conscious that I myself exist as determined in time. On the other hand, for which of my given intuitions there actually are objects outside me that correspond to them, objects that must hence be attributed not to the power of imagination but to outer sense, as belonging to it, must be established in each particular case. It must be established — and here the proposition that there actually is outer experience must always lie at the basis — in accordance with the rules by which experience as such (even inner experience) is distinguished from imagination. We may add to this a comment: The presentation of something *permanent* in one’s existence is not the same thing as a *permanent presentation*. For although — like all our presentations, even those of matter — the presentation of something permanent may be quite mutable and may vary greatly, it yet refers to something permanent. Hence this permanent something must be a thing that is distinct from all my presentations and is external. The existence of this thing is included necessarily in the *determination* of my own existence, and [together] with it amounts to only a single experience; and this experience would not take place even inwardly if it were not (in part) outer at the same time. As to how this occurs, we cannot explain that any further, just as in general we cannot explain further how what is constant is thought by us [as constant] in time, with the concept of change arising from the simultaneity of what is constant with what varies.

41. In making the alterations I mentioned above.

42. [Or “custom”: *Enquiry Concerning Human Understanding*, V, Pt. I, and cf. VII, Pt. II. Cf. also below, B 19–20, 127. Kant knew Hume’s *Treatise of Human Nature* only indirectly, through citations (translated into German) from James Beattie’s *Essay on the Nature and Immutability of Truth*, of 1770.]

43. [Examples from the sciences or from ordinary understanding.]

44. [I.e., even the higher-order rules.]

45. [The concept of an object as such does not include even (the property or “determination” of) permanence.]

46. [I.e., than the fact that we have a priori cognitions as described.]

47. [I.e., experience.]

48. [Johann Andreas von Segner (1704–1777), German physicist and mathematician at Jena, Gottingen, and Halle. He is the author of several significant works, and introduced the concept of the surface tension of liquids. The work mentioned here, as translated from the Latin, is his *Anfangsgründe der Arithmetik (Elements of Arithmetic)*. See the second edition (Halle/Saale: Renger, 1773), pp. 27, 79.]

49. [Actual or possible experience.]

50. [The problem, roughly, is this: In the case of *analytic* judgments (judgments whose truth depends solely on the meanings of their terms, i.e., on the content of the concepts involved) it is easy to see how such judgments can (by which Kant means “can legitimately”) be made a priori (independently of experience). But the truth of *synthetic* (nonanalytic) judgments depends on *more* than their meaning (conceptual content). An example is the judgment (see B 17) that in all changes in the corporeal world the quantity of matter remains unchanged. This judgment is clearly not analytic, but asserts something (not merely conceptual) about the world (and hence about any possible experience that we may have of it). How then can we make such judgments a priori? Kant’s answer lies in his “Copernican revolution” (B xvi–xviii). We can make synthetic judgments a priori insofar as objects of experience (which are the same thing as object-experiences) must conform a priori to what we contribute to experience (and hence to them), instead of experience’s conforming a priori to totally independent objects (things in themselves) by means of

some preestablished harmony. By the same token, as Kant will show in the Transcendental Dialectic, synthetic a priori judgments that go *beyond* all possible experience (make assertions about things in themselves) cannot be justified (legitimated) theoretically at all (though they may still be justifiable *morally-practically*.)]

51. [I.e., how synthetic judgments are possible a priori.]

52. [Principle of causality.]

53. This actuality may still be doubted by some in the case of pure natural science. Yet we need only examine the propositions that are to be found at the beginning of physics proper (empirical physics), such as those about the permanence of the quantity of matter, about inertia, about the equality of action and reaction, etc., in order to soon be convinced that these propositions themselves amount to a *physica pura* (or *physica rationalis*). Such a physics, as a science in its own right, surely deserves to be put forth separately and in its whole range, whether this range be narrow or broad.

54. [Natural metaphysics.]

55. [I.e., our power of reason.]

56. [The problem as to how (in general) synthetic judgments are possible a priori: B 19.]

57. [Of dogmatic metaphysics.]

58. [I.e., a system of a priori concepts of objects in general.]

59. [Of our inquiry.]

60. [Of supplying these concepts, as such principles.]

61. [For the distinction between “a priori” and “pure,” see B 3.]

62. Whereupon the system is *no longer* pure, though it is still a priori.

63. [I.e., in effect, of sensibility.]

64. [I.e., as a means to such cognition.]

65. The Germans are the only people who have come to use the word *aesthetic[s]* to designate what others call the critique of taste. They are doing so on the basis of a false hope conceived by that superb analyst, *Baumgarten* Alexander Gottlieb Baumgarten (1714–1762), philosopher in the Leibnizian tradition and disciple of Wolff. He introduced the term “aesthetics” in a sense close to the modern one. Kant himself later found a way to base the critique of taste on a priori principles; his aesthetic theory forms the first part of the third *Critique*, published in 1790. Kant there reacts to the aesthetic theories prevalent at the time, including that of Baumgarten., who hoped to bring one critical judging of the beautiful under rational principles, and to raise the rules for such judging to the level of a science. Yet that endeavor is futile. For, as regards their principal sources, those rules or criteria are merely empirical. Hence they can never serve as determinate a priori laws to which our judgment of taste would have to conform; it is, rather, our judgment of taste which constitutes the proper touchstone for the correctness of those rules or criteria. Because of this it is advisable to follow either of two alternatives. One of these is to let this new name *aesthetic[s]* become extinct again, and to reserve the name *aesthetic* for the doctrine that is true science. (In doing so we would also come closer to the language of the ancients and its meaning: among the ancients the division of cognition into *αἰσθητά καὶ νοητά* [the sensible and the intelligible] was quite famous. The other alternative would be for the new aesthetic[s] to share the name with speculative philosophy; we would then take the name partly in its transcendental sense, and partly in the psychological meaning.

66. [The metaphysical exposition investigates the nature of the presentation of space and shows that this presentation is given a priori. The transcendental exposition of space (in § 3) shows that and how from the a priori presentation of space something else that is a priori follows — viz., synthetic a priori cognitions (propositions of geometry). Cf. B 133–34.]

67. [But, as Kant has indicated, from this original intuition of space concepts can be formed, including such concepts as those of empirical space, relative space, Euclidean space, mathematical space.]

68. [The criteria numbered (1) and (2) at the beginning of this subsection.]

69. [As Leibniz claimed when he said that space involves nothing but the relations among the monads (things in themselves).]

70. [As in the case of Newton’s absolute space.]

71. [As in the case of Leibniz, who held that time involves nothing but relations among the monads (things in themselves).]

72. [As added to the concept of a thing as such.]

73. [The transcendental idealism of time, properly speaking.]

74. [I.e., (instances of) their surreptitious substitution for, and thus confusion with, something in the object, as discussed: B 44–45.]

75. [I.e., the colors, sounds, etc., surreptitiously treated as properties of the object.]

76. [Whereas the colors, sounds, etc., do not.]

77. [And is here treated as such, subreption thus being precluded.]

78. [See the end of the section on space: B 44–45.]

79. I can indeed say: My presentations follow one another. But that means only that we are conscious of them as being in a time sequence — in accordance, i.e., with the form of inner sense. Time is not, on that account, something in itself, nor is it a determination attaching to things

objectively.

80. [For Kant's view that things in themselves are (thought of as) what appears, see B xxvii.]

81. [For Kant's discussion of these two alternatives, representing (respectively) the Newtonian and the Leibnizian views, cf. the beginning of the preceding subsection, B 49.]

82. [Of space and time.]

83. [Which on the opposing view just mentioned it was not.]

84. [The self-subsistent space and time as being eternal and infinite.]

85. [To which to appeal.]

86. [Space and time.]

87. [Namely, matter.]

88. [Held by Leibniz.]

89. [And not in intuition.]

90. [This is exactly what is involved in Kant's Copernican revolution. See B xvi–xvii.]

91. [In Kant's usual (transcendental) sense of this expression, rather than in its empirical sense (found, e.g., at B 45 and B 62).]

92. The predicates of the appearance can be ascribed to the object itself in relation to our sense: e.g., to the rose, the red color or the scent. But what is mere illusion can never be ascribed as predicate to an object, precisely because illusion ascribes to the object taken *by itself* what belongs to it only in relation to the senses or in general to the subject—an example being the two handles initially ascribed to Saturn. If something is not to be met with at all in the object in itself, but is always to be met with in the object's relation to the subject and is inseparable from the presentation of the object, then it is appearance. And thus the predicates of space and time are rightly ascribed to objects of the senses, as such; and in this there is no illusion. Illusion first arises if, by contrast, I ascribe the redness to the rose *in itself*, or the handles to Saturn, or extension to all external objects *in themselves*, without taking account of—and limiting my judgment to—a determinate relation of these objects to the subject.

93. [Rather than intellectual.]

94. [In the a priori intuition.]

95. [The judgment's dependence on intuition and the merely synthetic connection to the concept.]

96. [I.e., the self-activity (cf. B 68) of using concepts in thought and cognition and of expanding them to frame new ones.]

97. [I.e., apart from that thought, whereby this determination enters into our cognition of the object.]

98. [I.e., the intuition or concept.]

99. [Only an intuitive understanding (ours is discursive, i.e., conceptual) can have *intellectual* intuition. See B 72.]

100. [I.e., sensibility and understanding.]

101. [See n.99, just above.]

102. [To cognition.]

103. [I.e., common sense.]

104. [Pure general logic.]

105. [Objects of experience (which includes sensation) and objects of pure geometry.]

106. [I.e., concepts originating neither from empirical intuition nor from intuition generally.]

107. [I.e., in effect, the definition.]

108. [Reference works characterize this saying as a Greco-Roman proverb quoted (e.g.) in Samuel Hieron, *Works* (1616), i, 586; and in John Hales, *Several Tracts* (1656), 40. Milking of rams is mentioned also in Vergil's *Eclogues*, iii, 91.]

109. [Indispensable (or necessary) condition.]

110. [I.e., the principles just mentioned.]

111. [The topic (or topics) of (general) logic is the art, developed above all by Aristotle in his *Topics*, of discovering plausible (though not demonstrative) arguments to establish or refute a given position. This discovery is accomplished by means of general argument forms that, being prepared in advance, serve as the "places" (Greek τόποι [*tópoi*], [*tópoi*], Latin *topica*) or headings to which the more specific arguments are referred.]

112. [Of the understanding; similarly for "universal and unlimited use" just below.]

113. [I.e., as such a misuse.]

114. [I.e., even from a priori intuition.]

115. [Viz., the Transcendental Analytic.]

116. [I.e., analysis.]

117. [The analysis of concepts mentioned above.]
118. [And set forth.]
119. [Inasmuch as they involve such an act.]
120. [I.e., in effect, universal.]
121. [As is done in transcendental logic (as distinguished from general logic).]
122. [I.e., as two kinds of judgments (propositions), rather than as parts of a syllogism.]
123. [That the soul is nonmortal.]
124. [I.e., the space (of the sphere's range) that includes whatever is nonmortal.]
125. [As the judgment that the soul is nonmortal.]
126. Just as if thought were a function of the *understanding* in the case of problematic judgments, of our *power of judgment* in the case of assertoric ones, and of *reason* in the case of apodeictic judgments. This remark must wait for its clarification until later.
127. [For locating these concepts.]
128. [Substance, quantity, quality, relation, place, time, posture, state, action, undergoing.]
129. [The five relational categories, of doubtful authenticity, found in chs. 10–15 of the *Categories*: opposition, priority, simultaneity, motion, having.]
130. [Respectively, when (time), where (place), posture, prior (priority), simultaneous (simultaneity).]
131. [Motion.]
132. [Action, passion (undergoing).]
133. [On Aristotle's list.]
134. [I.e., as contained in Kant's own table of categories.]
135. [I.e., categories.]
136. [Presumably the activity of producing a metaphysics of nature. Cf. B xliii.]
137. [To produce the category of community.]
138. [In thinking a thing as divisible.]
139. [Any being is one, true, good.]
140. [I.e., the relation implied in the categories.]
141. [Legality and factuality.]
142. [I.e., legitimation.]
143. [See *An Essay Concerning Human Understanding*, Bk. II.]
144. [I.e., legitimation.]
145. [By philosophers such as Locke.]
146. [Question of fact (rather than of legality or legitimation).]
147. [Locke and Hume.]
148. [In contrast to an intellectual intuition. See B 72.]
149. We need not here consider whether the [manifold] presentations themselves are identical, so that one can be thought analytically through the other: the *consciousness* of the one presentation can nonetheless, insofar as we are talking about the manifold, always be distinguished from the consciousness of the other presentation; and what matters here is solely the synthesis of this (possible) consciousness.
150. [Specifically, B 106.]
151. [Specifically, B 114.]
152. [I.e., across these presentations.]
153. The analytic unity of consciousness attaches to all concepts that are, and inasmuch as they are, common [to several presentations]. E.g., in thinking *red* as such, I present a property that can be found (as a characteristic) in something or other or can be combined with other presentations; hence only by virtue of a possible synthetic unity that I think beforehand can I present the analytic unity. A presentation that is to be thought as common to different presentations [B134] is regarded as belonging to presentations that, besides having it, also have something *different* about them. Consequently it must beforehand be thought in synthetic unity with other presentations (even if only possible ones). Only then can I think in it the analytic unity of consciousness that makes the presentation a *conceptus communis*. And thus the synthetic unity of apperception is the highest point, to which we must attach all use of the understanding, even the whole of logic, and in accordance with it transcendental philosophy; indeed, this power is the understanding itself.
154. [I.e., based, for its truth, on identity.]
155. [On intuitive understanding and its (intellectual) intuition, see above, B 72.]

156. Space and time, and all their parts, are *intuitions*; hence they, with the manifold that they contain, are singular presentations. (See the Transcendental Aesthetic.^a) Hence space and time are not mere concepts, through which the very same consciousness is encountered as contained in many presentations. They are, rather, [presentations through which] many presentations are encountered as contained in one presentation and in the consciousness thereof, and hence [they are presentations] encountered as composite; and consequently the unity of this consciousness is encountered as *synthetic*, but yet as original. This *singularity* of [intuition] is important when applied [to specific contexts]. (See §25.^b)

^a[Although Kant did not there use the term ‘singular,’ the reference seems to be to ¶ numbers 3 and 4 (A 24–25/ B 39), and § 4, numbers 4 and 5 (A 31–2/ B 47).]

^b[B 157–59.]

157. [I.e., arranged and held together.]

158. [Of synthesis.]

159. [This would be an intuitive understanding, and its intuition would be intellectual. See B 72.]

160. [Of the synthetic unity of apperception.]

161. The voluminous doctrine of the four syllogistic figures concerns only categorical syllogisms. Now, this doctrine is nothing more than the art of surreptitiously creating, by concealing immediate inferences (*consequentiae immediatae*) among the premises of a pure syllogism, the illusion that there are more kinds of inference than that of the first figure. Still, the doctrine would not on account of that illusion alone have met with special fortune, had it not also succeeded in procuring for categorical judgments an exclusive reputation, viz. as judgments to which all others must be capable of being referred [as their basis]—which, however, is false by § 9.

162. [Between the concepts.]

163. The basis of proof for this rests on the presented *unity of intuition*, through which an *object*^a is given. That unity always implies^b a synthesis of the manifold given^c for an intuition, and already contains this manifold given’s reference to unity of apperception.

^a[Emphasis added.]

^b[Or ‘includes’: *in sich schließ*.]

^c[Here again ‘manifold’ is an adjective, and ‘given’ is a participle that is about to be construed as a noun. Cf. B 143.]

164. [The proposition at the beginning of § 21.]

165. [Other than our own.]

166. [See, B 72.]

167. [As does our understanding, which presents objects given outside of itself, viz., in sensible intuition.]

168. [I.e., intellectual intuition. See, B 72.]

169. [I.e., sensible or intellectual.]

170. [Of understanding.]

171. [I.e., even though as intuiting we would be active, as *being intuited* we (the same subject) would simultaneously be passive.]

172. [Sensible or intellectual.]

173. [I.e., without tracing it in thought.]

174. [I.e., the presentation that is figurative in the external way.]

175. Motion of an *object* in space does not belong in a pure science, and consequently not in geometry. For the fact that something is movable cannot be cognized a priori, but can be cognized only through experience. But motion taken as the *describing* [i.e., outlining] of a space is a pure act of the successive synthesis, by productive imagination, of the manifold in outer intuition as such, and belongs not only to geometry but even to transcendental philosophy.

176. [The point of the parenthetical remark may be that this distinctness combined with sameness seems even *more* problematic if we consider intuition *as such* — including, i.e., the intellectual intuition of an intuitive understanding—than if we consider sensible intuition, which at least is not the intuition of an understanding. Or perhaps Kant is saying merely that this issue of distinctness arises because in our case intuition and understanding are *not* united.]

177. [To being thought.]

178. I fail to see how one can find so many difficulties in the view that inner sense is affected by ourselves—of which every act of *attention* can provide us with an example. In such acts the understanding always determines inner sense, in accordance with the combination that the understanding thinks, turning it into the inner intuition that corresponds to the manifold in the understanding’s synthesis. Everyone will be able to perceive in himself how much the mind is commonly affected by this.

179. The *I think* expresses the act of determining my existence. Hence the existence [of myself] is already given through this *I think*; but there is not yet given through it the way in which I am to determine that existence, i.e., posit the manifold belonging to it. In order for that manifold to

be given, self-intuition is required; and at the basis of this self-intuition lies a form given a priori, viz., time, which is sensible and belongs to the ability to receive the determinable. [B158] Now unless I have in addition a different [viz., intellectual] self-intuition that gives, prior to the act of *determination*, the *determinative* in me (only of its spontaneity am I in fact conscious) just as time so gives the determinable, then I cannot determine my existence as that of a self-active being; instead I present only the spontaneity of my thought, i.e., of the [act of] determination, and my existence remains determinable always only sensibly, i.e., as the existence of an appearance. But it is on account of this spontaneity that I call myself an *intelligence*.

180. [I.e., unschematized.]

181. [B 90–116. Kant did not there use this name.]

182. [The categories as such.]

183. [For such cognition and prescription.]

184. [I.e., here, property.]

185. Space, presented as *object* (as we are actually required to present it in geometry), contains more than mere form of intuition; viz., it contains also *combination*, of the manifold given^a according to the form of sensibility, into an *intuitive*^b presentation — so that the *form of intuition* gives us merely a manifold, but *formal intuition* gives us unity of presentation. In the Transcendental Aesthetic I had merely included [B161] this unity with sensibility, wanting only to point out that it precedes any concept. But in fact this unity presupposes a synthesis; this synthesis does not belong to the senses, but through it do all concepts of space and time first become possible. For through this unity (inasmuch as understanding determines sensibility) space or time are first *given* as intuitions, and hence the unity of this a priori intuition belongs to space and time, and not to the concept of understanding (see § 24).

^a[*Des mannigfaltigen ... Gegebenen*. I.e., ‘manifold’ is an adjective, and ‘given’ is a participle functioning as a noun.]

^b[*anschaulich*.]

186. [I.e., quantity.]

187. [Not apprehension but the synthesis of apprehension is being equated with perception.]

188. In this way we prove that the synthesis of apprehension, which is empirical, must conform necessarily to the synthesis of apperception, which is intellectual and is contained wholly a priori in the category. The spontaneity that brings combination into the manifold of intuition is one and the same in the two cases: in apprehension it does so under the name of power of imagination; in apperception it does so under the name of understanding.

189. [Of time.]

190. [Nature considered materially.]

191. [Nature considered formally.]

192. [The a priori laws underlying a nature as such.]

193. In order to keep my readers from being troubled prematurely by the worrisome detrimental consequences of this proposition, let me just remind them that in our *thinking* the categories are not limited by the conditions of our sensible intuition, but have an unbounded realm. Intuition is required only for *cognizing* what we think, i.e., only for determining the object. Thus if intuition is lacking, the thought of the object can otherwise still have its true and useful consequences for the subject’s *use of reason*. But because the use of reason is not always directed to the determination of the object and hence to cognition, but is sometimes directed also to the determination of the subject and his volition, it cannot yet be set forth here. [Kant is here referring to the practical use of pure reason in the realm of morality.]

194. [A generation of something by something so different from it that such generation would be an absurdity.]

195. [Or, i.e., theory.]

196. [I.e., a system of pure reason whereby experience comes about by epigenesis.]

197. [I.e., a system of pure reason whereby experience is formed in advance.]

198. [And hence all variation (cf. the restatement of the principle, just below).]

199. [Of substance.]

200. [The first point being that the presentations of the parts succeed one another.]

201. [Human beings lack the intellectual intuition (viz., of things in themselves) that an intuitive understanding would have. See B 72.]

202. [As Kant uses the term ‘perceive,’ ‘empirically’ is actually redundant.]

203. [As in the case of the ship floating down the river.]

204. [As to where I must begin.]

205. [I.e., the case of an event.]

206. [Or “sequence.”]

207. [I.e., the event.]

208. [I.e., specific or particular.]

209. [On which it is based.]
210. [Of our presentations.]
211. [Or “linked”: *Verbindung*.]
212. [Kant is reinterpreting, in accordance with the second analogy, the principle of sufficient reason used by Leibniz and later broadened by Wolff (to include not only the contingent).]
213. [Kant’s point is that temporal succession decides empirically what is the cause and what is the effect. The indentation did not cause the lead ball, because it is not succeeded by the lead ball.]
214. [I.e., substance ([taken as] phenomenal).]
215. It should be noted carefully that I am talking not about the change of certain relations as such, but about change of a state. Thus if a body moves uniformly then it does not change its state (of motion) at all; but it does change its state if its motion increases or decreases.
216. [I.e., *b* minus *a*.]
217. [Or “*definite* (or *specific*) causes,” as distinguished from inferring *some* cause or other.]
218. In the preceding theorem, the *direct* consciousness of the existence of external things is not presupposed but proved, whether or not we have insight into the possibility of this consciousness. The question concerning that possibility would be whether we have only an inner sense, and no outer sense but merely outer imagination. Clearly, however, in order for us even to imagine something — i.e., exhibit it to sense in intuition — as external, we must already have an outer sense, and must thereby distinguish directly the mere receptivity of an outer intuition from the spontaneity that characterizes all imagining. For if even outer sense were merely imagined, this would annul our very power of intuition which is to be determined by the imagination.

*Grounding for the Metaphysics of Morals**

[387] PREFACE

Ancient Greek philosophy was divided into three sciences: physics, ethics, and logic. This division is perfectly suitable to the nature of the subject, and the only improvement that can be made in it is perhaps only to supply its principle so that there will be a possibility on the one hand of insuring its completeness and on the other of correctly determining its necessary subdivisions.

All rational knowledge is either material and concerned with some object, or formal and concerned only with the form of understanding and of reason themselves and with the universal rules of thought in general without regard to differences of its objects. Formal philosophy is called logic. Material philosophy, however, has to do with determinate objects and with the laws to which these objects are subject; and such philosophy is divided into two parts, because these laws are either laws of nature or laws of freedom. The science of the former is called physics, while that of the latter is called ethics; they are also called doctrine of nature and doctrine of morals respectively.

Logic cannot have any empirical part, i.e., a part in which the universal and necessary laws of thought would be based on grounds taken from experience; for in that case it would not be logic, i.e., a canon for understanding and reason, which is valid for all thinking and which has to be demonstrated.¹ Natural and moral philosophy, on the contrary, can each have an empirical part. The former has to because it must determine the laws of nature as an object of experience, and the latter because it must determine the will of man insofar as [388] the will is affected by nature. The laws of the former are those according to which everything does happen, while the laws of the latter are those according to which everything ought to happen, although these moral laws also consider the conditions under which what ought to happen frequently does not.

All philosophy insofar as it is founded on experience may be called empirical, while that which sets forth its doctrines as founded entirely on a priori principles may be called pure. The latter, when merely formal, is called logic; but when limited to determinate objects of the understanding, it is called metaphysics.

In this way there arises the idea of a twofold metaphysics: a metaphysics of nature and a metaphysics of morals.² Physics will thus have its empirical part, but also a rational one. Ethics will too, though here the empirical part might more specifically be called practical anthropology,³ while the rational part might properly be called morals.

All industries, crafts, and arts have gained by the division of labor, viz., one man does not do everything, but each confines himself to a certain kind of work that is distinguished from all other kinds by the treatment it requires, so that the work may be done with the highest perfection and with greater ease. Where work is not so distinguished and divided, where everyone is a jack of all trades, there industry remains sunk in the greatest barbarism. Whether or not pure philosophy in all its parts requires its own special man might well be in itself a subject worthy of consideration. Would not the whole of this learned industry be better off if those who are accustomed, as the public taste demands, to purvey a mixture of the empirical with the rational in all sorts of proportions unknown even to themselves and who style themselves independent thinkers, while giving the name of hair-splitters to those who apply themselves to the purely rational part, were to be given warning about pursuing simultaneously two jobs which are quite different in their technique, and each of which perhaps requires a special talent that when combined with the other talent produces nothing but bungling? But I only ask here whether the nature of science does not require that the empirical part always be carefully separated from the rational part. Should not physics proper (i.e., empirical physics) be preceded by a metaphysics of nature, and practical anthropology by a metaphysics of morals? Both of these [389] metaphysics must be carefully purified of everything empirical in order to know how much pure reason can accomplish in each case and from what sources it draws its a priori teaching, whether such teaching be conducted by all moralists (whose name is legion) or only by some who feel a calling thereto.

Since I am here primarily concerned with moral philosophy, the foregoing question will be limited to a consideration of whether or not there is the utmost necessity for working out for once a pure moral philosophy that is wholly cleared of everything which can only be empirical and can only belong to anthropology. That there must be such a philosophy is evident from the common idea of duty and of moral laws. Everyone must admit that if a law is to be morally valid, i.e., is to be valid as a ground of obligation, then it must carry with it absolute necessity. He must admit that the command, "Thou shalt not lie," does not hold only for men, as if other rational beings had no need to abide by it, and so with all the other moral laws properly so called; and he must concede that the ground of obligation here must therefore be sought not in the nature of man nor in the circumstances of the world in which man is placed, but must be sought a priori solely in the concepts of pure reason; he must grant that every other precept which is founded on principles of mere experience — even a precept that may in certain respects be universal — insofar as it rests in the least on empirical grounds — perhaps only in its motive — can indeed be called a practical rule, but never a moral law.

Thus not only are moral laws together with their principles essentially different from every kind of practical cognition in which there is anything empirical, but all moral philosophy rests entirely on its pure part. When applied to man, it does not in the least borrow from acquaintance with him (anthropology) but gives a priori laws to him as a rational being. To be sure, these laws require, furthermore, a power of judgment sharpened by experience, partly in order to distinguish in what cases they are applicable, and partly to gain for them access to the human will as well as influence for putting them into practice. For man is affected by so many inclinations that, even though he is indeed capable of the idea of a pure practical reason, he is not so easily able to make that idea effective *in concreto* in the conduct of his life.

A metaphysics of morals is thus indispensably necessary, [390] not merely because of motives of speculation regarding the source of practical principles which are present a priori in our reason, but because morals themselves are liable to all kinds of corruption as long as the guide and supreme norm for correctly estimating them are missing. For in the case of what is to be morally good, that it conforms to the moral law is not enough; it must also be done for the sake of the moral law. Otherwise that conformity is only very contingent and uncertain, since the non-moral ground may now and then produce actions that conform with the law but quite often produces actions that are contrary to the law. Now the moral law in its purity and genuineness (which is of the utmost concern in the practical realm) can be sought nowhere but in a pure philosophy. Therefore, pure philosophy (metaphysics) must precede; without it there can be no moral philosophy at all. That philosophy which mixes pure principles with empirical ones does not deserve the name of philosophy (for philosophy is distinguished from ordinary rational knowledge by its treatments in a separate science of what the latter comprehends only confusedly). Still less does it deserve the name of moral philosophy, since by this very confusion it spoils even the purity of morals and counteracts its own ends.

There must be no thought that what is required here is already contained in the propaedeutic that precedes the celebrated Wolff's moral philosophy, i.e., in what he calls *Universal Practical Philosophy*,⁴ and that hence there is no need to break entirely new ground. Just because his work was to be a universal practical philosophy, it has not taken into consideration any special kind of will, such as one determined solely by a priori principles without any empirical motives and which could be called a pure will, but has considered volition in general, together with all the actions and conditions belonging to it under this general signification. And thereby does his propaedeutic differ from a metaphysics of morals in the same way that general logic, which expounds the acts and rules of thinking in general, differs from transcendental philosophy, which treats merely of the particular acts and rules of pure thinking, i.e., of that thinking whereby objects are cognized completely a priori. For the metaphysics of morals has to investigate the idea and principles of a possible pure will and not the [391] actions and conditions of human volition as such, which are for the most part drawn from psychology. Moral laws and duty are discussed in this universal practical philosophy (though quite improperly), but this is no objection to what has been said about such philosophy. For the authors of this science remain true to their idea of it on the following point also: they do not distinguish the motives which, as such, are presented completely a priori by reason alone and are properly moral, from the empirical motives which the understanding raises to general concepts merely by the comparison of experiences. Rather, they consider motives irrespective of any difference in their source; and inasmuch as they regard all motives as being homogeneous, they consider nothing but their relative strength or weakness. In this way they frame their concept of obligation, which is certainly not moral, but is all that can be expected from a philosophy which never decides regarding the origin of all possible practical concepts whether they are a priori or merely a posteriori.

I intend some day to publish a metaphysics of morals,⁵ but as a preliminary to that I now issue this *Grounding* [1785]. Indeed there is properly no other foundation for such a metaphysics than a critical

examination of pure practical reason, just as there is properly no other foundation for a metaphysics [of nature] than the critical examination of pure speculative reason, which has already been published.⁶ But, in the first place, the former critique is not so absolutely necessary as the latter one, because human reason can, even in the most ordinary mind, be easily brought in moral matters to a high degree of correctness and precision, while on the other hand in its theoretical but pure use it is wholly dialectical. In the second place, if a critical examination of pure practical reason is to be complete, then there must, in my view, be the possibility at the same time of showing the unity of practical and speculative reason in a common principle; for in the final analysis there can be only one and the same reason, which is to be differentiated solely in its application. But there is no possibility here of bringing my work to such completeness, without introducing considerations of an entirely different kind and without thereby confusing the reader. Instead of calling the present work a *Critique of Pure Practical Reason*, I have, therefore, adopted the title *Grounding for the Metaphysics of Morals* [*Grundlegung zur Metaphysik der Sitten*].⁷

But, in the third place, since a metaphysics of morals, despite the forbidding title, is nevertheless capable of a high degree of popularity and adaptation to the ordinary understanding, I find it useful to separate from the aforementioned metaphysics this preliminary work on its foundation [*Grundlage*] in order later to have no need to introduce unavoidable subtleties into doctrines that are easier to grasp. [392]

The present *Grounding* [*Grundlegung*] is, however, intended for nothing more than seeking out and establishing the supreme principle of morality. This constitutes by itself a task which is complete in its purpose and should be kept separate from every other moral inquiry. The application of this supreme principle to the whole ethical system would, to be sure, shed much light on my conclusions regarding this central question, which is important but has not heretofore been at all satisfactorily discussed; and the adequacy manifested by the principle throughout such application would provide strong confirmation for the principle. Nevertheless, I must forego this advantage, which after all would be more gratifying for myself than helpful for others, since ease of use and apparent adequacy of a principle do not provide any certain proof of its soundness, but do awaken, rather, a certain bias which prevents any rigorous examination and estimation of it for itself, without any regard to its consequences.

The method adopted in this work is, I believe, one that is most suitable if we proceed analytically from ordinary knowledge to a determination of the supreme principle and then back again synthetically from an examination of this principle and its sources to ordinary knowledge where its application is found. Therefore, the division turns out to be the following:

1. *First Section.* Transition from the Ordinary Rational Knowledge of Morality to the Philosophical.
2. *Second Section.* Transition from Popular Moral Philosophy to a Metaphysics of Morals.
3. *Third Section.* Final Step from a Metaphysics of Morals to a Critique of Pure Practical Reason.

FIRST [393] SECTION

TRANSITION FROM THE ORDINARY RATIONAL KNOWLEDGE OF MORALITY TO THE PHILOSOPHICAL

There is no possibility of thinking of anything at all in the world, or even out of it, which can be regarded as good without qualification, except, a *good will*. Intelligence, wit, judgment, and whatever talents of the mind one might want to name are doubtless in many respects good and desirable, as are such qualities of temperament as courage, resolution, perseverance. But they can also become extremely bad and harmful if the will, which is to make use of these gifts of nature and which in its special constitution is called character, is not good. The same holds with gifts of fortune; power, riches, honor, even health, and that complete well-being and contentment with one's condition which is called happiness make for pride and often hereby even arrogance, unless there is a good will to correct their influence on the mind and herewith also to rectify the whole principle of action and make it universally conformable to its end. The sight of a being who is not graced by any touch of a pure and good will but who yet enjoys an uninterrupted prosperity can never delight a rational and impartial spectator. Thus a good will seems to constitute the indispensable condition of being even worthy of happiness.

Some qualities are even conducive to this good [394] will itself and can facilitate its work. Nevertheless, they have no intrinsic unconditional worth; but they always presuppose, rather, a good will, which restricts the high esteem in which they are otherwise rightly held, and does not permit them to be regarded as absolutely good. Moderation in emotions and passions, self-control, and calm deliberation are not only good in many respects but even seem to constitute part of the intrinsic worth of a person. But they are far from being rightly called good without qualification (however unconditionally they were commended by the ancients). For without the principles of a good will, they can become extremely bad; the coolness of a villain makes him not only much more dangerous but also immediately more abominable in our eyes than he would have been regarded by us without it.

A good will is good not because of what it effects or accomplishes, nor because of its fitness to attain some proposed end; it is good only through its willing, i.e., it is good in itself. When it is considered in itself, then it is to be esteemed very much higher than anything which it might ever bring about merely in order to favor some inclination, or even the sum total of all inclinations. Even if, by some especially unfortunate fate or by the niggardly provision of stepmotherly nature, this will should be wholly lacking in the power to accomplish its purpose; if with the greatest effort it should yet achieve nothing, and only the good will should remain (not, to be sure, as a mere wish but as the summoning of all the means in our power), yet would it, like a jewel, still shine by its own light as something which has its full value in itself. Its usefulness or fruitlessness can neither augment nor diminish this value. Its usefulness would be, as it were, only the setting to enable us to handle it in ordinary dealings or to attract to it the attention of those who are not yet experts, but not to recommend it to real experts or to determine its value.

But there is something so strange in this idea of the absolute value of a mere will, in which no account is taken of any useful results, that in spite of all the agreement received even from ordinary reason, yet there must arise the suspicion that such an idea may perhaps have as its hidden basis merely some high-flown fancy, and that we may have misunderstood the purpose of nature in assigning to reason the governing [395] of our will. Therefore, this idea will be examined from this point of view.

In the natural constitution of an organized being, i.e., one suitably adapted to the purpose of life, let there be taken as a principle that in such a being no organ is to be found for any end unless it be the most fit and the best adapted for that end. Now if that being's preservation, welfare, or in a word its happiness, were the real end of nature in the case of a being having reason and will, then nature would have hit upon a very poor arrangement in having the reason of the creature carry out this purpose. For all the actions which such a creature has to perform with this purpose in view, and the whole rule of his conduct would have been prescribed much more exactly by instinct; and the purpose in question could have been attained much more certainly by instinct than it ever can be by reason. And if in addition reason had been imparted to this favored creature, then it would have had to serve him only to contemplate the happy constitution of his nature, to admire that nature, to rejoice in it, and to feel grateful to the cause that bestowed it; but reason would not have served him to subject his faculty of desire to its weak and delusive guidance nor would it have served him to meddle incompetently with the purpose of nature. In a word, nature would have taken care that reason did not strike out into a practical use nor presume, with its weak insight, to think out for itself a plan for happiness and the means for attaining it. Nature would have taken upon herself not only the choice of ends

but also that of the means, and would with wise foresight have entrusted both to instinct alone.

And, in fact, we find that the more a cultivated reason devotes itself to the aim of enjoying life and happiness, the further does man get away from true contentment. Because of this there arises in many persons, if only they are candid enough to admit it, a certain degree of misology, i.e., hatred of reason. This is especially so in the case of those who are the most experienced in the use of reason, because after calculating all the advantages they derive, I say not from the invention of all the arts of common luxury, but even from the sciences (which in the end seem to them to be also a luxury of the understanding), they yet find that they have in fact only brought [396] more trouble on their heads than they have gained in happiness. Therefore, they come to envy, rather than despise, the more common run of men who are closer to the guidance of mere natural instinct and who do not allow their reason much influence on their conduct. And we must admit that the judgment of those who would temper, or even reduce below zero, the boastful eulogies on behalf of the advantages which reason is supposed to provide as regards the happiness and contentment of life is by no means morose or ungrateful to the goodness with which the world is governed. There lies at the root of such judgments, rather, the idea that existence has another and much more worthy purpose, for which, and not for happiness, reason is quite properly intended, and which must, therefore, be regarded as the supreme condition to which the private purpose of men must, for the most part, defer.

Reason, however, is not competent enough to guide the will safely as regards its objects and the satisfaction of all our needs (which it in part even multiplies); to this end would an implanted natural instinct have led much more certainly. But inasmuch as reason has been imparted to us as a practical faculty, i.e., as one which is to have influence on the will, its true function must be to produce a will which is not merely good as a means to some further end, but is good in itself. To produce a will good in itself reason was absolutely necessary, inasmuch as nature in distributing her capacities has everywhere gone to work in a purposive manner. While such a will may not indeed be the sole and complete good, it must, nevertheless, be the highest good and the condition of all the rest, even of the desire for happiness. In this case there is nothing inconsistent with the wisdom of nature that the cultivation of reason, which is requisite for the first and unconditioned purpose, may in many ways restrict, at least in this life, the attainment of the second purpose, viz., happiness, which is always conditioned. Indeed happiness can even be reduced to less than nothing, without nature's failing thereby in her purpose; for reason recognizes as its highest practical function the establishment of a good will, whereby in the attainment of this end reason is capable only of its own kind of satisfaction, viz., that of fulfilling a purpose which is in turn determined only by reason, even though such fulfillment should often interfere with the purposes of inclination.

The concept of a will estimable in itself and good [397] without regard to any further end must now be developed. This concept already dwells in the natural sound understanding and needs not so much to be taught as merely to be elucidated. It always holds first place in estimating the total worth of our actions and constitutes the condition of all the rest. Therefore, we shall take up the concept of *duty*, which includes that of a good will, though with certain subjective restrictions and hindrances, which far from hiding a good will or rendering it unrecognizable, rather bring it out by contrast and make it shine forth more brightly.

I here omit all actions already recognized as contrary to duty, even though they may be useful for this or that end; for in the case of these the question does not arise at all as to whether they might be done from duty, since they even conflict with duty. I also set aside those actions which are really in accordance with duty, yet to which men have no immediate inclination, but perform them because they are impelled thereto by some other inclination. For in this [second] case to decide whether the action which is in accord with duty has been done from duty or from some selfish purpose is easy. This difference is far more difficult to note in the [third] case where the action accords with duty and the subject has in addition an immediate inclination to do the action. For example,⁸ that a dealer should not overcharge an inexperienced purchaser certainly accords with duty; and where there is much commerce, the prudent merchant does not overcharge but keeps to a fixed price for everyone in general, so that a child may buy from him just as well as everyone else may. Thus customers are honestly served, but this is not nearly enough for making us believe that the merchant has acted this way from duty and from principles of honesty; his own advantage required him to do it. He cannot, however, be assumed to have in addition [as in the third case] an immediate inclination toward his buyers, causing him, as it were, out of love to give no one as far as price is concerned any advantage over another. Hence the action was done neither from duty nor from immediate inclination, but merely for a selfish purpose.

On the other hand,⁹ to preserve one's life is a duty; and, furthermore, everyone has also an immediate inclination to do so. But on this account the often anxious care taken by most men for it has no intrinsic worth, [398] and the maxim of their action has no moral content. They preserve their lives, to be sure, in

accordance with duty, but not from duty. On the other hand,¹⁰ if adversity and hopeless sorrow have completely taken away the taste for life, if an unfortunate man, strong in soul and more indignant at his fate than despondent or dejected, wishes for death and yet preserves his life without loving it — not from inclination or fear, but from duty—then his maxim indeed has a moral content.¹¹

To be beneficent where one can is a duty; and besides this, there are many persons who are so sympathetically constituted that, without any further motive of vanity or self-interest, they find an inner pleasure in spreading joy around them and can rejoice in the satisfaction of others as their own work. But I maintain that in such a case an action of this kind, however dutiful and amiable it may be, has nevertheless no true moral worth.¹² It is on a level with such actions as arise from other inclinations, e.g., the inclination for honor, which if fortunately directed to what is in fact beneficial and accords with duty and is thus honorable, deserves praise and encouragement, but not esteem; for its maxim lacks the moral content of an action done not from inclination but from duty. Suppose then the mind of this friend of mankind to be clouded over with his own sorrow so that all sympathy with the lot of others is extinguished, and suppose him still to have the power to benefit others in distress, even though he is not touched by their trouble because he is sufficiently absorbed with his own; and now suppose that, even though no inclination moves him any longer, he nevertheless tears himself from this deadly insensibility and performs the action without any inclination at all, but solely from duty—then for the first time his action has genuine moral worth.¹³ Further still, if nature has put little sympathy in this or that man's heart, if (while being an honest man in other respects) he is by temperament cold and indifferent to the sufferings of others, perhaps because as regards his own sufferings he is endowed with the special gift of patience and fortitude and expects or even requires that others should have the same; if such a man (who would truly not be nature's worst product) had not been exactly fashioned by her to be a philanthropist, would he not yet find in himself a source from which he might give himself a worth far higher than any that a good-natured temperament might have? By all means, because just here does the [399] worth of the character come out; this worth is moral and incomparably the highest of all, viz., that he is beneficent, not from inclination, but from duty.¹⁴

To secure one's own happiness is a duty (at least indirectly); for discontent with one's condition under many pressing cares and amid unsatisfied wants might easily become a great temptation to transgress one's duties. But here also do men of themselves already have, irrespective of duty, the strongest and deepest inclination toward happiness, because just in this idea are all inclinations combined into a sum total.¹⁵ But the precept of happiness is often so constituted as greatly to interfere with some inclinations, and yet men cannot form any definite and certain concept of the sum of satisfaction of all inclinations that is called happiness. Hence there is no wonder that a single inclination which is determinate both as to what it promises and as to the time within which it can be satisfied may outweigh a fluctuating idea; and there is no wonder that a man, e.g., a gouty patient, can choose to enjoy what he likes and to suffer what he may, since by his calculation he has here at least not sacrificed the enjoyment of the present moment to some possibly groundless expectations of the good fortune that is supposed to be found in health. But even in this case, if the universal inclination to happiness did not determine his will and if health, at least for him, did not figure as so necessary an element in his calculations; there still remains here, as in all other cases, a law, viz., that he should promote his happiness not from inclination but from duty, and thereby for the first time does his conduct have real moral worth.¹⁶

Undoubtedly in this way also are to be understood those passages of Scripture which command us to love our neighbor and even our enemy. For love as an inclination cannot be commanded; but beneficence from duty, when no inclination impels us¹⁷ and even when a natural and unconquerable aversion opposes such beneficence,¹⁸ is practical, and not pathological, love. Such love resides in the will and not in the propensities of feeling, in principles of action and not in tender sympathy; and only this practical love can be commanded.

The second proposition¹⁹ is this: An action done from duty has its moral worth, not in the purpose that is to be attained by it, but in the maxim according to which the action is determined. The moral worth depends, therefore, not on the realization of the object [400] of the action, but merely on the principle of volition according to which, without regard to any objects of the faculty of desire, the action has been done. From what has gone before it is clear that the purposes which we may have in our actions, as well as their effects regarded as ends and incentives of the will, cannot give to actions any unconditioned and moral worth. Where, then, can this worth lie if it is not to be found in the will's relation to the expected effect? Nowhere but in the principle of the will, with no regard to the ends that can be brought about through such action. For the will stands, as it were, at a crossroads between its a priori principle, which is formal, and its a posteriori incentive, which is material; and since it must be determined by something, it must be determined by the

formal principle of volition, if the action is done from duty — and in that case every material principle is taken away from it.

The third proposition, which follows from the other two, can be expressed thus: Duty is the necessity of an action done out of respect for the law. I can indeed have an inclination for an object as the effect of my proposed action; but I can never have respect for such an object, just because it is merely an effect and is not an activity of the will. Similarly, I can have no respect for inclination as such, whether my own or that of another. I can at most, if my own inclination, approve it; and, if that of another, even love it, i.e., consider it to be favorable to my own advantage. An object of respect can only be what is connected with my will solely as ground and never as effect—something that does not serve my inclination but, rather, outweighs it, or at least excludes it from consideration when some choice is made—in other words, only the law itself can be an object of respect and hence can be a command. Now an action done from duty must altogether exclude the influence of inclination and therewith every object of the will. Hence there is nothing left which can determine the will except objectively the law and subjectively pure respect for this practical law, i.e., the will can be subjectively determined by the maxim²⁰ that I should follow such a law even if all my inclinations are thereby thwarted. [401]

Thus the moral worth of an action does not lie in the effect expected from it nor in any principle of action that needs to borrow its motive from this expected effect. For all these effects (agreeableness of one's condition and even the furtherance of other people's happiness) could have been brought about also through other causes and would not have required the will of a rational being, in which the highest and unconditioned good can alone be found. Therefore, the pre-eminent good which is called moral can consist in nothing but the representation of the law in itself, and such a representation can admittedly be found only in a rational being insofar as this representation, and not some expected effect, is the determining ground of the will. This good is already present in the person who acts according to this representation, and such good need not be awaited merely from the effect.²¹

But [402] what sort of law can that be the thought of which must determine the will without reference to any expected effect, so that the will can be called absolutely good without qualification? Since I have deprived the will of every impulse that might arise for it from obeying any particular law, there is nothing left to serve the will as principle except the universal conformity of its actions to law as such, i.e., I should never act except in such a way that I can also will that my maxim should become a universal law.²² Here mere conformity to law as such (without having as its basis any law determining particular actions) serves the will as principle and must so serve it if duty is not to be a vain delusion and a chimerical concept. The ordinary reason of mankind in its practical judgments agrees completely with this, and always has in view the aforementioned principle.

For example, take this question. When I am in distress, may I make a promise with the intention of not keeping it? I readily distinguish here the two meanings which the question may have; whether making a false promise conforms with prudence or with duty. Doubtless the former can often be the case. Indeed I clearly see that escape from some present difficulty by means of such a promise is not enough. In addition I must carefully consider whether from this lie there may later arise far greater inconvenience for me than from what I now try to escape. Furthermore, the consequences of my false promise are not easy to for see, even with all my supposed cunning; loss of confidence in me might prove to be far more disadvantageous than the misfortune which I now try to avoid. The more prudent way might be to act according to a universal maxim and to make it a habit not to promise anything without intending to keep it. But that such a maxim is, nevertheless, always based on nothing but a fear of consequences becomes clear to me at once. To be truthful from duty is, however, quite different from being truthful from fear of disadvantageous consequences; in the first case the concept of the action itself contains a law for me, while in the second I must first look around elsewhere to see what are the results for me that might be connected with the action. For to deviate from the principle of duty is quite certainly bad; but to abandon my [403] maxim of prudence can often be very advantageous for me, though to abide by it is certainly safer. The most direct and infallible way, however, to answer the question as to whether a lying promise accords with duty is to ask myself whether I would really be content if my maxim (of extricating myself from difficulty by means of a false promise) were to hold as a universal law for myself as well as for others, and could I really say to myself that everyone may promise falsely when he finds himself in a difficulty from which he can find no other way to extricate himself. Then I immediately become aware that I can indeed will the lie but can not at all will a universal law to lie. For by such a law there would really be no promises at all, since in vain would my willing future actions be professed to other people who would not believe what I professed, or if they over-hastily did believe, then they would pay me back in like coin. Therefore, my maxim would necessarily destroy itself just as soon as it was made a

universal law.²³

Therefore, I need no far-reaching acuteness to discern what I have to do in order that my will may be morally good. Inexperienced in the course of the world and incapable of being prepared for all its contingencies, I only ask myself whether I can also will that my maxim should become a universal law. If not, then the maxim must be rejected, not because of any disadvantage accruing to me or even to others, but because it cannot be fitting as a principle in a possible legislation of universal law, and reason exacts from me immediate respect for such legislation. Indeed I have as yet no insight into the grounds of such respect (which the philosopher may investigate). But I at least understand that respect is an estimation of a worth that far outweighs any worth of what is recommended by inclination, and that the necessity of acting from pure respect for the practical law is what constitutes duty, to which every other motive must give way because duty is the condition of a will good in itself, whose worth is above all else.

Thus within the moral cognition of ordinary human reason we have arrived at its principle. To be sure, such reason does not think of this principle abstractly in its universal form, but does always have it actually in view and does use it as the standard of [404] judgment. It would here be easy to show how ordinary reason, with this compass in hand, is well able to distinguish, in every case that occurs, what is good or evil, in accord with duty or contrary to duty, if we do not in the least try to teach reason anything new but only make it attend, as Socrates did, to its own principle — and thereby do we show that neither science nor philosophy is needed in order to know what one must do to be honest and good, and even wise and virtuous. Indeed we might even have conjectured beforehand that cognizance of what every man is obligated to do, and hence also to know, would be available to every man, even the most ordinary. Yet we cannot but observe with admiration how great an advantage the power of practical judgment has over the theoretical in ordinary human understanding. In the theoretical, when ordinary reason ventures to depart from the laws of experience and the perceptions of sense, it falls into sheer inconceivabilities and self-contradictions, or at least into a chaos of uncertainty, obscurity, and instability. In the practical, however, the power of judgment first begins to show itself to advantage when ordinary understanding excludes all sensuous incentives from practical laws. Such understanding then becomes even subtle, whether in quibbling with its own conscience or with other claims regarding what is to be called right, or whether in wanting to determine correctly for its own instruction the worth of various actions. And the most extraordinary thing is that ordinary understanding in this practical case may have just as good a hope of hitting the mark as that which any philosopher may promise himself. Indeed it is almost more certain in this than even a philosopher is, because he can have no principle other than what ordinary understanding has, but he may easily confuse his judgment by a multitude of foreign and irrelevant considerations and thereby cause it to swerve from the right way. Would it not, therefore, be wiser in moral matters to abide by the ordinary rational judgment or at most to bring in philosophy merely for the purpose of rendering the system of morals more complete and intelligible and of presenting its rules in a way that is more convenient for use (especially in disputation), but not for the purpose of leading ordinary human understanding away from its happy simplicity in practical matters and of bringing it by means of philosophy into a new path of inquiry and instruction?

Innocence is indeed a glorious thing; but, unfortunately, [405] it does not keep very well and is easily led astray. Consequently, even wisdom — which consists more in doing and not doing than in knowing — needs science, not in order to learn from it, but in order that wisdom's precepts may gain acceptance and permanence. Man feels within himself a powerful counterweight to all the commands of duty, which are presented to him by reason as being so pre-eminently worthy of respect; this counterweight consists of his needs and inclinations, whose total satisfaction is summed up under the name of happiness. Now reason irremissibly commands its precepts, without thereby promising the inclinations anything; hence it disregards and neglects these impetuous and at the same time so seemingly plausible claims (which do not allow themselves to be suppressed by any command). Hereby arises a natural dialectic, i.e., a propensity to quibble with these strict laws of duty, to cast doubt upon their validity, or at least upon their purity and strictness, and to make them, where possible, more compatible with our wishes and inclinations. Thereby are such laws corrupted in their very foundations and their whole dignity is destroyed — something which even ordinary practical reason cannot in the end call good.

Thus is ordinary human reason forced to go outside its sphere and take a step into the field of practical philosophy, not by any need for speculation (which never befalls such reason so long as it is content to be mere sound reason) but on practical grounds themselves. There it tries to obtain information and clear instruction regarding the source of its own principle and the correct determination of this principle in its opposition to maxims based on need and inclination, so that reason may escape from the perplexity of opposite claims and may avoid the risk of losing all genuine moral principles through the ambiguity into which it easily falls. Thus

when ordinary practical reason cultivates itself, there imperceptibly arises in it a dialectic which compels it to seek help in philosophy. The same thing happens in reason's theoretical use; in this case, just as in the other, peace will be found only in a thorough critical examination of our reason.

SECOND [406] SECTION

TRANSITION FROM POPULAR MORAL PHILOSOPHY TO A METAPHYSICS OF MORALS

If we have so far drawn our concept of duty from the ordinary use of our practical reason, one is by no means to infer that we have treated it as a concept of experience. On the contrary, when we pay attention to our experience of the way human beings act, we meet frequent and — as we ourselves admit — justified complaints that there cannot be cited a single certain example of the disposition to act from pure duty; and we meet complaints that although much may be done that is in accordance with what duty commands, yet there are always doubts as to whether what occurs has really been done from duty and so has moral worth. Hence there have always been philosophers who have absolutely denied the reality of this disposition in human actions and have ascribed everything to a more or less refined self-love. Yet in so doing they have not cast doubt upon the rightness of the concept of morality. Rather, they have spoken with sincere regret as to the frailty and impurity of human nature, which they think is noble enough to take as its precept an idea so worthy of respect but yet is too weak to follow this idea: reason, which should legislate for human nature, is used only to look after the interest of inclinations, whether singly or, at best, in their greatest possible harmony with one another.

In fact there is absolutely no possibility by means [407] of experience to make out with complete certainty a single case in which the maxim of an action that may in other respects conform to duty has rested solely on moral grounds and on the representation of one's duty. It is indeed sometimes the case that after the keenest self-examination we can find nothing except the moral ground of duty that could have been strong enough to move us to this or that good action and to such great sacrifice. But there cannot with certainty be at all inferred from this that some secret impulse of self-love, merely appearing as the idea of duty, was not the actual determining cause of the will. We like to flatter ourselves with the false claim to a more noble motive; but in fact we can never, even by the strictest examination, completely plumb the depths of the secret incentives of our actions. For when moral value is being considered, the concern is not with the actions, which are seen, but rather with their inner principles, which are not seen.

Moreover, one cannot better serve the wishes of those who ridicule all morality as being a mere phantom of human imagination getting above itself because of self-conceit than by conceding to them that the concepts of duty must be drawn solely from experience (just as from indolence one willingly persuades himself that such is the case as regards all other concepts as well). For by so conceding, one prepares for them a sure triumph. I am willing to admit out of love for humanity that most of our actions are in accordance with duty; but if we look more closely at our planning and striving, we everywhere come upon the dear self, which is always turning up, and upon which the intent of our actions is based rather than upon the strict command of duty (which would often require self-denial). One need not be exactly an enemy of virtue, but only a cool observer who does not take the liveliest wish for the good to be straight off its realization, in order to become doubtful at times whether any true virtue is actually to be found in the world. Such is especially the case when years increase and one's power of judgment is made shrewder by experience and keener in observation. Because of these things nothing can protect us from a complete falling away from our ideas of duty and preserve in the soul a well-grounded respect for duty's law except [408] the clear conviction that, even if there never have been actions springing from such pure sources, the question at issue here is not whether this or that has happened but that reason of itself and independently of all experience commands what ought to happen. Consequently, reason unrelentingly commands actions of which the world has perhaps hitherto never provided an example and whose feasibility might well be doubted by one who bases everything upon experience; for instance, even though there might never yet have been a sincere friend, still pure sincerity in friendship is nonetheless required of every man, because this duty, prior to all experience, is contained as duty in general in the idea of a reason that determines the will by means of a priori grounds.

There may be noted further that unless we want to deny to the concept of morality all truth and all reference to a possible object, we cannot but admit that the moral law is of such widespread significance that it must hold not merely for men but for all rational beings generally, and that it must be valid not merely under contingent conditions and with exceptions but must be absolutely necessary. Clearly, therefore, no experience can give occasion for inferring even the possibility of such apodeictic laws. For with what right could we bring into unlimited respect as a universal precept for every rational nature what is perhaps valid only under the contingent conditions of humanity? And how could laws for the determination of our will be regarded as laws for the determination of a rational being in general and of ourselves only insofar as we are rational beings, if

these laws were merely empirical and did not have their source completely a priori in pure, but practical, reason?

Moreover, worse service cannot be rendered morality than that an attempt be made to derive it from examples. For every example of morality presented to me must itself first be judged according to principles of morality in order to see whether it is fit to serve as an original example, i.e., as a model. But in no way can it authoritatively furnish the concept of morality. Even the Holy One of the gospel must first be compared with our ideal of moral perfection before he is recognized as such. Even he says of himself, [409] “Why do you call me (whom you see) good? None is good (the archetype of the good) except God only (whom you do not see).” But whence have we the concept of God as the highest good? Solely from the idea of moral perfection, which reason frames a priori and connects inseparably with the concept of a free will. Imitation has no place at all in moral matters. And examples serve only for encouragement, i.e., they put beyond doubt the feasibility of what the law commands and they make visible what the practical rule expresses more generally. But examples can never justify us in setting aside their true original, which lies in reason, and letting ourselves be guided by them.

If there is then no genuine supreme principle of morality that must rest merely on pure reason, independently of all experience, I think it is unnecessary even to ask whether it is a good thing to exhibit these concepts generally (*in abstracto*), which, along with the principles that belong to them, hold a priori, so far as the knowledge involved is to be distinguished from ordinary knowledge and is to be called philosophical. But in our times it may well be necessary to do so. For if one were to take a vote as to whether pure rational knowledge separated from everything empirical, i.e., metaphysics of morals, or whether popular practical philosophy is to be preferred, one can easily guess which side would be preponderant.

This descent to popular thought is certainly very commendable once the ascent to the principles of pure reason has occurred and has been satisfactorily accomplished. That would mean that the doctrine of morals has first been grounded on metaphysics and that subsequently acceptance for morals has been won by giving it a popular character after it has been firmly established. But it is quite absurd to try for popularity in the first inquiry, upon which depends the total correctness of the principles. Not only can such a procedure never lay claim to the very rare merit of a true philosophical popularity, inasmuch as there is really no art involved at all in being generally intelligible if one thereby renounces all basic insight, but such a procedure turns out a disgusting mishmash of patchwork observations and half-reasoned principles in which shallowpates revel because all this is something quite useful for the chitchat of everyday life. Persons of insight, on the other hand, feel confused by all this and turn their eyes away with a dissatisfaction which they nevertheless cannot cure. Yet philosophers, who quite see through the delusion, [410] get little hearing when they summon people for a time from this pretended popularity in order that they may be rightfully popular only after they have attained definite insight.

One need only look at the attempts to deal with morality in the way favored by popular taste. What he will find in an amazing mixture is at one time the particular constitution of human nature (but along with this also the idea of a rational nature in general), at another time perfection, at another happiness; here moral feeling, and there the fear of God; something of this, and also something of that. But the thought never occurs to ask whether the principles of morality are to be sought at all in the knowledge of human nature (which can be had only from experience). Nor does the thought occur that if these principles are not to be sought here but to be found, rather, completely a priori and free from everything empirical in pure rational concepts only, and are to be found nowhere else even to the slightest extent — then there had better be adopted the plan of undertaking this investigation as a separate inquiry, i.e., as pure practical philosophy or (if one may use a name so much decried) as a metaphysics²⁴ of morals. It is better to bring this investigation to full completeness entirely by itself and to bid the public, which demands popularity, to await the outcome of this undertaking.

But such a completely isolated metaphysics of morals, not mixed with any anthropology, theology, physics, or hyperphysics, and still less with occult qualities (which might be called hypophysical), is not only an indispensable substratum of all theoretical and precisely defined knowledge of duties, but is at the same time a desideratum of the highest importance for the actual fulfillment of their precepts. For the pure thought of duty and of the moral law generally, unmixed with any extraneous addition of empirical inducements, has by the way of reason alone (which first becomes aware hereby that it can of itself be practical) an influence on the human heart so much more powerful than all other incentives²⁵ which may [411] be derived from the empirical field that reason in the consciousness of its dignity despises such incentives and is able gradually to become their master. On the other hand, a mixed moral philosophy, compounded both of incentives drawn from feelings and inclinations and at the same time of rational concepts, must make the mind waver between motives that cannot be brought under any principle and that can only by accident lead to the good but often

can also lead to the bad.

It is clear from the foregoing that all moral concepts have their seat and origin completely a priori in reason, and indeed in the most ordinary human reason just as much as in the most highly speculative. They cannot be abstracted from any empirical, and hence merely contingent, cognition. In this purity of their origin lies their very worthiness to serve us as supreme practical principles; and to the extent that something empirical is added to them, just so much is taken away from their genuine influence and from the absolute worth of the corresponding actions. Moreover, it is not only a requirement of the greatest necessity from a theoretical point of view, when it is a question of speculation, but also of the greatest practical importance, to draw these concepts and laws from pure reason, to present them pure and unmixed, and indeed to determine the extent of this entire practical and pure rational cognition, i.e., to determine the [412] whole faculty of pure practical reason. The principles should not be made to depend on the particular nature of human reason, as speculative philosophy may permit and even sometimes finds necessary; but, rather, the principles should be derived from the universal concept of a rational being in general, since moral laws should hold for every rational being as such. In this way all morals, which require anthropology in order to be applied to humans, must be entirely expounded at first independently of anthropology as pure philosophy, i.e., as metaphysics (which can easily be done in such distinct kinds of knowledge). One knows quite well that unless one is in possession of such a metaphysics, then the attempt is futile. I shall not say to determine exactly for speculative judgment the moral element of duty in all that accords with duty, but that the attempt is impossible, even in ordinary and practical usage, especially in that of moral instruction, to ground morals on their genuine principles and thereby to produce pure moral dispositions and engraft them on men's minds for the promotion of the highest good in the world.

In this study we must advance by natural stages not merely from ordinary moral judgment (which is here ever so worthy of respect) to philosophical judgment, as has already been done, but also from popular philosophy, which goes no further than it can get by groping about with the help of examples, to metaphysics (which does not permit itself to be held back any longer by what is empirical, and which, inasmuch as it must survey the whole extent of rational knowledge of this kind, goes right up to ideas, where examples themselves fail us). In order to make such an advance, we must follow and clearly present the practical faculty of reason from its universal rules of determination to the point where the concept of duty springs from it.

Everything in nature works according to laws. Only a rational being has the power to act according to his conception of laws, i.e., according to principles, and thereby has he a will. Since the derivation of actions from laws requires reason, the will is nothing but practical reason. If reason infallibly determines the will, then in the case of such a being actions which are recognized to be objectively necessary are also subjectively necessary, i.e., the will is a faculty of choosing only that which reason, independently of inclination, recognizes as being practically necessary, i.e., as good. But if reason of itself does not sufficiently determine the will, and if the will submits also to subjective conditions (certain incentives) which do [413] not always agree with objective conditions; in a word, if the will does not in itself completely accord with reason (as is actually the case with men), the actions which are recognized as objectively necessary are subjectively contingent, and the determination of such a will according to objective laws is necessitation. That is to say that the relation of objective laws to a will not thoroughly good is represented as the determination of the will of a rational being by principles of reason which the will does not necessarily follow because of its own nature.

The representation of an objective principle insofar as it necessitates the will is called a command (of reason), and the formula of the command is called an imperative.

All imperatives are expressed by an *ought* and thereby indicate the relation of an objective law of reason to a will that is not necessarily determined by this law because of its subjective constitution (the relation of necessitation). Imperatives say that something would be good to do or to refrain from doing, but they say it to a will that does not always therefore do something simply because it has been represented to the will as something good to do. That is practically good which determines the will by means of representations of reason and hence not by subjective causes, but objectively, i.e., on grounds valid for every rational being as such. It is distinguished from the pleasant as that which influences the will only by means of sensation from merely subjective causes, which hold only for this or that person's senses but do not hold as a principle of reason valid for everyone.²⁶

A perfectly good will would thus be quite as much [414] subject to objective laws (of the good), but could not be conceived as thereby necessitated to act in conformity with law, inasmuch as it can of itself, according to its subjective constitution, be determined only by the representation of the good. Therefore no imperatives hold for the divine will, and in general for a holy will; the *ought* is here out of place, because the *would* is already of itself necessarily in agreement with the law. Consequently, imperatives are only formulas for

expressing the relation of objective laws of willing in general to the subjective imperfection of the will of this or that rational being, e.g., the human will.

Now all imperatives command either hypothetically or categorically. The former represent the practical necessity of a possible action as a means for attaining something else that one wants (or may possibly want). The categorical imperative would be one which represented an action as objectively necessary in itself, without reference to another end.

Every practical law represents a possible action as good and hence as necessary for a subject who is practically determinable by reason; therefore all imperatives are formulas for determining an action which is necessary according to the principle of a will that is good in some way. Now if the action would be good merely as a means to something else, so is the imperative hypothetical. But if the action is represented as good in itself, and hence as necessary in a will which of itself conforms to reason as the principle of the will, then the imperative is categorical.

An imperative thus says what action possible by me would be good, and it presents the practical rule in relation to a will which does not forthwith perform an action simply because it is good, partly because the subject does not always know that the action is good and partly because (even if he does know it is good) his maxims might yet be opposed to the objective principles of practical reason.

A hypothetical imperative thus says only that an [415] action is good for some purpose, either possible or actual. In the first case it is a problematic practical principle; in the second case an assertoric one. A categorical imperative, which declares an action to be of itself objectively necessary without reference to any purpose, i.e., without any other end, holds as an apodeictic practical principle.

Whatever is possible only through the powers of some rational being can be thought of as a possible purpose of some will. Consequently, there are in fact infinitely many principles of action insofar as they are represented as necessary for attaining a possible purpose achievable by them. All sciences have a practical part consisting of problems saying that some end is possible for us and of imperatives telling us how it can be attained. These can, therefore, be called in general imperatives of skill. Here there is no question at all whether the end is reasonable and good, but there is only a question as to what must be done to attain it. The prescriptions needed by a doctor in order to make his patient thoroughly healthy and by a poisoner in order to make sure of killing his victim are of equal value so far as each serves to bring about its purpose perfectly. Since there cannot be known in early youth what ends may be presented to us in the course of life, parents especially seek to have their children learn many different kinds of things, and they provide for skill in the use of means to all sorts of arbitrary ends, among which they cannot determine whether any one of them could in the future become an actual purpose for their ward, though there is always the possibility that he might adopt it. Their concern is so great that they commonly neglect to form and correct their children's judgment regarding the worth of things which might be chosen as ends.

There is, however, one end that can be presupposed as actual for all rational beings (so far as they are dependent beings to whom imperatives apply); and thus there is one purpose which they not merely can have but which can certainly be assumed to be such that they all do have by a natural necessity, and this is happiness. A hypothetical imperative which represents the practical necessity of an action as means for the promotion of happiness is assertoric. It may be [416] expounded not simply as necessary to an uncertain, merely possible purpose, but as necessary to a purpose which can be presupposed a priori and with certainty as being present in everyone because it belongs to his essence. Now skill in the choice of means to one's own greatest well-being can be called prudence²⁷ in the narrowest sense. And thus the imperative that refers to the choice of means to one's own happiness, i.e., the precept of prudence, still remains hypothetical; the action is commanded not absolutely but only as a means to a further purpose.

Finally, there is one imperative which immediately commands a certain conduct without having as its condition any other purpose to be attained by it. This imperative is categorical. It is not concerned with the matter of the action and its intended result, but rather with the form of the action and the principle from which it follows; what is essentially good in the action consists in the mental disposition, let the consequences be what they may. This imperative may be called that of morality.

Willing according to these three kinds of principles is also clearly distinguished by dissimilarity in the necessitation of the will. To make this dissimilarity clear I think that they are most suitably named in their order when they are said to be either *rules of skill*, *counsels of prudence*, or *commands (laws) of morality*. For law alone involves the concept of a necessity that is unconditioned and indeed objective and hence universally valid, and commands are laws which must be obeyed, i.e., must be followed even in opposition to inclination. Counsel does indeed involve necessity, but involves such necessity as is valid only under a subjectively

contingent condition, viz., whether this or that man counts this or that as belonging to his happiness. On the other hand, the categorical imperative is limited by no condition, and can quite properly be called a command since it is absolutely, though practically, necessary. The first kind of imperatives might also be called technical (belonging to art), the second kind pragmatic²⁸ (belonging to welfare), the third kind moral (belonging [417] to free conduct as such, i.e., to morals).

The question now arises: how are all of these imperatives possible?²⁹ This question does not seek to know how the fulfillment of the action commanded by the imperative can be conceived, but merely how the necessitation of the will expressed by the imperative in setting a task can be conceived. How an imperative of skill is possible requires no special discussion. Whoever wills the end, wills (so far as reason has decisive influence on his actions) also the means that are indispensably necessary to his actions and that lie in his power. This proposition, as far as willing is concerned, is analytic. For in willing an object as my effect there is already thought the causality of myself as an acting cause, i.e., the use of means. The imperative derives the concept of actions necessary to this end from the concept of willing this end. (Synthetic propositions are indeed required for determining the means to a proposed end; but such propositions are concerned not with the ground, i.e., the act of the will, but only with the way to realize the object of the will.) Mathematics teaches by nothing but synthetic propositions that in order to bisect a line according to a sure principle I must from each of its extremities draw arcs such that they intersect. But when I know that the proposed result can come about only by means of such an action, then the proposition (if I fully will the effect, then I also will the action required for it) is analytic. For it is one and the same thing to conceive of something as an effect that is possible in a certain way through me and to conceive of myself as acting in the same way with regard to the aforesaid effect.

If it were only as easy to give a determinate concept [418] of happiness, then the imperatives of prudence would exactly correspond to those of skill and would be likewise analytic. For there could be said in this case just as in the former that whoever wills the end also wills (necessarily according to reason) the sole means thereto which are in his power. But, unfortunately, the concept of happiness is such an indeterminate one that even though everyone wishes to attain happiness, yet he can never say definitely and consistently what it is that he really wishes and wills. The reason for this is that all the elements belonging to the concept of happiness are unexceptionally empirical, i.e., they must be borrowed from experience, while for the idea of happiness there is required an absolute whole, a maximum of well-being in my present and in every future condition. Now it is impossible for the most insightful and at the same time most powerful, but nonetheless finite, being to frame here a determinate concept of what it is that he really wills. Does he want riches? How much anxiety, envy, and intrigue might he not thereby bring down upon his own head! Or knowledge and insight? Perhaps these might only give him an eye that much sharper for revealing that much more dreadfully evils which are at present hidden but are yet unavoidable, or such an eye might burden him with still further needs for the desires which already concern him enough. Or long life? Who guarantees that it would not be a long misery? Or health at least? How often has infirmity of the body kept one from excesses into which perfect health would have allowed him to fall, and so on? In brief, he is not able on any principle to determine with complete certainty what will make him truly happy, because to do so would require omniscience. Therefore, one cannot act according to determinate principles in order to be happy, but only according to empirical counsels, e.g., of diet, frugality, politeness, reserve, etc., which are shown by experience to contribute on the average the most to well-being. There follows from this that imperatives of prudence, strictly speaking, cannot command at all, i.e., present actions objectively as practically necessary. They are to be taken as counsels (*consilia*) rather than as commands (*praecepta*) of reason. The problem of determining certainly and universally what action will promote the happiness of a rational being is completely insoluble. Therefore, regarding such action no imperative that in the strictest sense could command what is to be done to make one happy is possible, inasmuch as happiness is not an ideal of reason but of imagination. [419] Such an ideal rests merely on empirical grounds; in vain can there be expected that such grounds should determine an action whereby the totality of an infinite series of consequences could be attained. This imperative of prudence would, nevertheless, be an analytic practical proposition if one assumes that the means of happiness could with certainty be assigned; for it differs from the imperative of skill only in that for it the end is given while for the latter the end is merely possible. Since both, however, command only the means to what is assumed to be willed as an end, the imperative commanding him who wills the end to will likewise the means thereto is in both cases analytic. Hence there is also no difficulty regarding the possibility of an imperative of prudence.

On the other hand, the question as to how the imperative of morality is possible is undoubtedly the only one requiring a solution. For it is not at all hypothetical; and hence the objective necessity which it presents cannot be based on any presupposition, as was the case with the hypothetical imperatives. Only there must

never here be forgotten that no example can show, i.e., empirically, whether there is any such imperative at all. Rather, care must be taken lest all imperatives which are seemingly categorical may nevertheless be covertly hypothetical. For instance, when it is said that you should not make a false promise, the assumption is that the necessity of this avoidance is no mere advice for escaping some other evil, so that it might be said that you should not make a false promise lest you ruin your credit when the falsity comes to light. But when it is asserted that an action of this kind must be regarded as bad in itself, then the imperative of prohibition is therefore categorical. Nevertheless, it cannot with certainty be shown by means of an example that the will is here determined solely by the law without any other incentive, even though such may seem to be the case. For it is always possible that secretly there is fear of disgrace and perhaps also obscure dread of other dangers; such fear and dread may have influenced the will. Who can prove by experience that a cause is not present? Experience only shows that a cause is not perceived. But in such a case the so-called moral imperative, which as such appears to be categorical and unconditioned, would actually be only a pragmatic precept which makes us pay attention to our own advantage and merely teaches us to take such advantage into consideration.

We shall, therefore, have to investigate the possibility of a categorical imperative entirely a priori, inasmuch as we do not here have the advantage of [420] having its reality given in experience and consequently of thus being obligated merely to explain its possibility rather than to establish it. In the meantime so much can be seen for now: the categorical imperative alone purports to be a practical law, while all the others may be called principles of the will but not laws. The reason for this is that whatever is necessary merely in order to attain some arbitrary purpose can be regarded as in itself contingent, and the precept can always be ignored once the purpose is abandoned. Contrariwise, an unconditioned command does not leave the will free to choose the opposite at its own liking. Consequently, only such a command carries with it that necessity which is demanded from a law.

Secondly, in the case of this categorical imperative, or law of morality, the reason for the difficulty (of discerning its possibility) is quite serious. The categorical imperative is an a priori synthetic practical proposition;³⁰ and since discerning the possibility of propositions of this sort involves so much difficulty in theoretic knowledge, there may readily be gathered that there will be no less difficulty in practical knowledge.

In solving this problem, we want first to inquire whether perhaps the mere concept of a categorical imperative may not also supply us with the formula containing the proposition that can alone be a categorical imperative. For even when we know the purport of such an absolute command, the question as to how it is possible will still require a special and difficult effort, which we postpone to the last section.³¹

If I think of a hypothetical imperative in general, I do not know beforehand what it will contain until its condition is given. But if I think of a categorical imperative, I know immediately what it contains. For since, besides the law, the imperative contains only the necessity that the maxim³² should accord with [421] this law, while the law contains no condition to restrict it, there remains nothing but the universality of a law as such with which the maxim of the action should conform. This conformity alone is properly what is represented as necessary by the imperative.

Hence there is only one categorical imperative and it is this: Act only according to that maxim whereby you can at the same time will that it should become a universal law.³³

Now if all imperatives of duty can be derived from this one imperative as their principle, then there can at least be shown what is understood by the concept of duty and what it means, even though there is left undecided whether what is called duty may not be an empty concept.

The universality of law according to which effects are produced constitutes what is properly called nature in the most general sense (as to form), i.e., the existence of things as far as determined by universal laws. Accordingly, the universal imperative of duty may be expressed thus: Act as if the maxim of your action were to become through your will a universal law of nature.³⁴

We shall now enumerate some duties, following the usual division of them into duties to ourselves and to others and into perfect and imperfect duties.³⁵

1. A [422] man reduced to despair by a series of misfortunes feels sick of life but is still so far in possession of his reason that he can ask himself whether taking his own life would not be contrary to his duty to himself.³⁶ Now he asks whether the maxim of his action could become a universal law of nature. But his maxim is this: from self-love I make as my principle to shorten my life when its continued duration threatens more evil than it promises satisfaction. There only remains the question as to whether this principle of self-love can become a universal law of nature. One sees at once a contradiction in a system of nature whose law

would destroy life by means of the very same feeling that acts so as to stimulate the furtherance of life, and hence there could be no existence as a system of nature. Therefore, such a maxim cannot possibly hold as a universal law of nature and is, consequently, wholly opposed to the supreme principle of all duty.

2. Another man in need finds himself forced to borrow money. He knows well that he won't be able to repay it, but he sees also that he will not get any loan unless he firmly promises to repay it within a fixed time. He wants to make such a promise, but he still has conscience enough to ask himself whether it is not permissible and is contrary to duty to get out of difficulty in this way. Suppose, however, that he decides to do so. The maxim of his action would then be expressed as follows: when I believe myself to be in need of money, I will borrow money and promise to pay it back, although I know that I can never do so. Now this principle of self-love or personal advantage may perhaps be quite compatible with one's entire future welfare, but the question is now whether it is right.³⁷ I then transform the requirement of self-love into a universal law and put the question thus: how would things stand if my maxim were to become a universal law? He then sees at once that such a maxim could never hold as a universal law of nature and be consistent with itself, but must necessarily be self-contradictory. For the universality of a law which says that anyone believing himself to be in difficulty could promise whatever he pleases with the intention of not keeping it would make promising itself and the end to be attained thereby quite impossible, inasmuch as no one would believe what was promised him but would merely laugh at all such utterances as being vain pretenses.

3. A third finds in himself a talent whose cultivation could make him a man useful in many respects. But he finds himself in comfortable circumstances and [423] prefers to indulge in pleasure rather than to bother himself about broadening and improving his fortunate natural aptitudes. But he asks himself further whether his maxim of neglecting his natural gifts, besides agreeing of itself with his propensity to indulgence, might agree also with what is called duty.³⁸ He then sees that a system of nature could indeed always subsist according to such a universal law, even though every man (like South Sea Islanders) should let his talents rust and resolve to devote his life entirely to idleness, indulgence, propagation, and, in a word, to enjoyment. But he cannot possibly will that this should become a universal law of nature or be implanted in us as such a law by a natural instinct. For as a rational being he necessarily wills that all his faculties should be developed, inasmuch as they are given him for all sorts of possible purposes.

4. A fourth man finds things going well for himself but sees others (whom he could help) struggling with great hardships; and he thinks: what does it matter to me? Let everybody be as happy as Heaven wills or as he can make himself; I shall take nothing from him nor even envy him; but I have no desire to contribute anything to his well-being or to his assistance when in need. If such a way of thinking were to become a universal law of nature, the human race admittedly could very well subsist and doubtless could subsist even better than when everyone prates about sympathy and benevolence and even on occasions exerts himself to practice them but, on the other hand, also cheats when he can, betrays the rights of man, or otherwise violates them. But even though it is possible that a universal law of nature could subsist in accordance with that maxim, still it is impossible to will that such a principle should hold everywhere as a law of nature.³⁹ For a will which resolved in this way would contradict itself, inasmuch as cases might often arise in which one would have need of the love and sympathy of others and in which he would deprive himself, by such a law of nature springing from his own will, of all hope of the aid he wants for himself.

[424] These are some of the many actual duties, or at least what are taken to be such, whose derivation from the single principle cited above is clear. We must be able to will that a maxim of our action become a universal law; this is the canon for morally estimating any of our actions. Some actions are so constituted that their maxims cannot without contradiction even be thought as a universal law of nature, much less be willed as what should become one. In the case of others this internal impossibility is indeed not found, but there is still no possibility of wiling that their maxim should be raised to the universality of a law of nature, because such a will would contradict itself. There is no difficulty in seeing that the former kind of action conflicts with strict or narrow [perfect] (irremissible) duty, while the second kind conflicts only with broad [imperfect] (meritorious) duty.⁴⁰ By means of these examples there has thus been fully set forth how all duties depend as regards the kind of obligation (not the object of their action) upon the one principle.

If we now attend to ourselves in any transgression of a duty, we find that we actually do not will that our maxim should become a universal law — because this is impossible for us—but rather that the opposite of this maxim should remain a law universally.⁴¹ We only take the liberty of making an exception to the law for ourselves (or just for this one time) to the advantage of our inclination. Consequently, if we weighed up everything from one and the same standpoint, namely, that of reason, we would find a contradiction in our own will, viz., that a certain principle be objectively necessary as a universal law and yet subjectively not hold

universally but should admit of exceptions. But since we at one moment regard our action from the standpoint of a will wholly in accord with reason and then at another moment regard the very same action from the standpoint of a will affected by inclination, there is really no contradiction here. Rather, there is an opposition (*antagonismus*) of inclination to the precept of reason, whereby the universality (*universalitas*) of the principle is changed into a mere generality (*generalitas*) so that the practical principle of reason may meet the maxim halfway. Although this procedure cannot be justified in our own impartial judgment, yet it does show that we actually acknowledge the validity of the categorical imperative and (with all respect for it) merely allow ourselves a few exceptions which, as they seem to us, are unimportant and forced upon us.

We have thus at least shown that if duty is a concept [425] which is to have significance and real legislative authority for our actions, then such duty can be expressed only in categorical imperatives but not at all in hypothetical ones. We have also—and this is already a great deal — exhibited clearly and definitely for every application what is the content of the categorical imperative, which must contain the principle of all duty (if there is such a thing at all). But we have not yet advanced far enough to prove a priori that there actually is an imperative of this kind, that there is a practical law which of itself commands absolutely and without any incentives, and that following this law is duty.

In order to attain this proof there is the utmost importance in being warned that we must not take it into our mind to derive the reality of this principle from the special characteristics of human nature. For duty has to be a practical, unconditioned necessity of action; hence it must hold for all rational beings (to whom alone an imperative is at all applicable) and for this reason only can it also be a law for all human wills. On the other hand, whatever is derived from the special natural condition of humanity, from certain feelings and propensities, or even, if such were possible, from some special tendency peculiar to human reason and not holding necessarily for the will of every rational being — all of this can indeed yield a maxim valid for us, but not a law. This is to say that such can yield a subjective principle according to which we might act if we happen to have the propensity and inclination, but cannot yield an objective principle according to which we would be directed to act even though our every propensity, inclination, and natural tendency were opposed to it. In fact, the sublimity and inner worth of the command are so much the more evident in a duty, the fewer subjective causes there are for it and the more they oppose it; such causes do not in the least weaken the necessitation exerted by the law or take away anything from its validity.

Here philosophy is seen in fact to be put in a precarious position, which should be firm even though there is neither in heaven nor on earth anything upon which it depends or is based. Here philosophy must show its purity as author of its laws, and not as the herald of such laws as are whispered to it by an implanted sense or by who knows what tutelary nature. Such laws may be better than nothing at all, but they can never give us principles dictated by [426] reason. These principles must have an origin that is completely a priori and must at the same time derive from such origin their authority to command. They expect nothing from the inclination of men but, rather, expect everything from the supremacy of the law and from the respect owed to the law. Without the latter expectation, these principles condemn man to self-contempt and inward abhorrence.

Hence everything empirical is not only quite unsuitable as a contribution to the principle of morality, but is even highly detrimental to the purity of morals. For the proper and inestimable worth of an absolutely good will consists precisely in the fact that the principle of action is free of all influences from contingent grounds, which only experience can furnish. This lax or even mean way of thinking which seeks its principle among empirical motives and laws cannot too much or too often be warned against, for human reason in its weariness is glad to rest upon this pillow. In a dream of sweet illusions (in which not Juno but a cloud is embraced) there is substituted for morality some bastard patched up from limbs of quite varied ancestry and looking like anything one wants to see in it but not looking like virtue to him who has once beheld her in her true form.⁴²

Therefore, the question is this: is it a necessary law for all rational beings always to judge their actions according to such maxims as they can themselves will that such should serve as universal laws? If there is such a law, then it must already be connected (completely a priori) with the concept of the will of a rational being in general. But in order to discover this connection we must, however reluctantly, take a step into metaphysics, although into a region of it different from speculative philosophy, i.e., we must enter the metaphysics of morals. In practical philosophy the concern is not with accepting grounds for [427] what happens but with accepting laws of what ought to happen, even though it never does happen—that is, the concern is with objectively practical laws. Here there is no need to inquire into the reasons as to why something pleases or displeases, how the pleasure of mere sensation differs from taste, and whether taste differs from a general satisfaction of reason, upon what does the feeling of pleasure and displeasure rest, and how from this feeling desires and inclinations arise, and how, finally, from these there arise maxims through the cooperation of

reason. All of this belongs to an empirical psychology, which would constitute the second part of the doctrine of nature, if this doctrine is regarded as the philosophy of nature insofar as this philosophy is grounded on empirical laws. But here the concern is with objectively practical laws, and hence with the relation of a will to itself insofar as it is determined solely by reason. In this case everything related to what is empirical falls away of itself, because if reason entirely by itself determines conduct (and the possibility of such determination we now wish to investigate), then reason must necessarily do so a priori.

The will is thought of as a faculty of determining itself to action in accordance with the representation of certain laws, and such a faculty can be found only in rational beings. Now what serves the will as the objective ground of its self-determination is an end; and if this end is given by reason alone, then it must be equally valid for all rational beings. On the other hand, what contains merely the ground of the possibility of the action, whose effect is an end, is called the means. The subjective ground of desire is the incentive; the objective ground of volition is the motive. Hence there arises the distinction between subjective ends, which rest on incentives, and objective ends, which depend on motives valid for every rational being. Practical principles are formal when they abstract from all subjective ends; they are material, however, when they are founded upon subjective ends, and hence upon certain incentives. The ends which a rational being arbitrarily proposes to himself as effects of this action (material ends) are all merely relative, for only their relation to a specially constituted faculty of desire in the subject gives them their worth. Consequently, such worth cannot provide any universal principles, which are valid and necessary [428] for all rational beings and, furthermore, are valid for every volition, i.e., cannot provide any practical laws. Therefore, all such relative ends can be grounds only for hypothetical imperatives.

But let us suppose that there were something whose existence has in itself an absolute worth, something which as an end in itself could be a ground of determinate laws. In it, and in it alone, would there be the ground of a possible categorical imperative, i.e., of a practical law.

Now I say that man, and in general every rational being, exists as an end in himself and not merely as a means to be arbitrarily used by this or that will. He must in all his actions, whether directed to himself or to other rational beings, always be regarded at the same time as an end. All the objects of inclinations have only a conditioned value; for if there were not these inclinations and the needs founded on them, then their object would be without value. But the inclinations themselves, being sources of needs, are so far from having an absolute value such as to render them desirable for their own sake that the universal wish of every rational being must be, rather, to be wholly free from them. Accordingly, the value of any object obtainable by our action is always conditioned. Beings whose existence depends not on our will but on nature have, nevertheless, if they are not rational beings, only a relative value as means and are therefore called things. On the other hand, rational beings are called persons inasmuch as their nature already marks them out as ends in themselves, i.e., as something which is not to be used merely as means and hence there is imposed thereby a limit on all arbitrary use of such beings, which are thus objects of respect. Persons are, therefore, not merely subjective ends, whose existence as an effect of our actions has a value for us; but such beings are objective ends, i.e., exist as ends in themselves. Such an end is one for which there can be substituted no other end to which such beings should serve merely as means, for otherwise nothing at all of absolute value would be found anywhere. But if all value were conditioned and hence contingent, then no supreme practical principle could be found for reason at all.

If then there is to be a supreme practical principle and, as far as the human will is concerned, a categorical imperative, then it must be such that from the conception of what is necessarily an end for everyone because this end is an end in itself it constitutes an objective principle of the will and can hence serve as a practical law. The ground of such a principle is this: rational nature exists as an end in itself. In this [429] way man necessarily thinks of his own existence; thus far is it a subjective principle of human actions. But in this way also does every other rational being think of his existence on the same rational ground that holds also for me;⁴³ hence it is at the same time an objective principle, from which, as a supreme practical ground, all laws of the will must be able to be derived. The practical imperative will therefore be the following: Act in such a way that you treat humanity, whether in your own person or in the person of another, always at the same time as an end and never simply as a means.⁴⁴ We now want to see whether this can be carried out in practice.

Let us keep to our previous examples.⁴⁵

First, as regards the concept of necessary duty to oneself, the man who contemplates suicide will ask himself whether his action can be consistent with the idea of humanity as an end in itself. If he destroys himself in order to escape from a difficult situation, then he is making use of his person merely as a means so as to maintain a tolerable condition till the end of his life. Man, however, is not a thing and hence is not

something to be used merely as a means; he must in all his actions always be regarded as an end in himself. Therefore, I cannot dispose of man in my own person by mutilating, damaging, or killing him. (A more exact determination of this principle so as to avoid all misunderstanding, e.g., regarding the amputation of limbs in order to save oneself, or the exposure of one's life to danger in order to save it, and so on, must here be omitted; such questions belong to morals proper.)

Second, as concerns necessary or strict duty to others, the man who intends to make a false promise will immediately see that he intends to make use of another man merely as a means to an end which the latter does not likewise hold. For the man whom I [430] want to use for my own purposes by such a promise cannot possibly concur with my way of acting toward him and hence cannot himself hold the end of this action. This conflict with the principle of duty to others becomes even clearer when instances of attacks on the freedom and property of others are considered. For then it becomes clear that a transgressor of the rights of men intends to make use of the persons of others merely as a means, without taking into consideration that, as rational beings, they should always be esteemed at the same time as ends, i.e., be esteemed only as beings who must themselves be able to hold the very same action as an end.⁴⁶

Third, with regard to contingent (meritorious) duty to oneself, it is not enough that the action does not conflict with humanity in our own person as an end in itself; the action must also harmonize with this end. Now there are in humanity capacities for greater perfection which belong to the end that nature has in view as regards humanity in our own person. To neglect these capacities might perhaps be consistent with the maintenance of humanity as an end in itself, but would not be consistent with the advancement of this end.

Fourth, concerning meritorious duty to others, the natural end that all men have is their own happiness. Now humanity might indeed subsist if nobody contributed anything to the happiness of others, provided he did not intentionally impair their happiness. But this, after all, would harmonize only negatively and not positively with humanity as an end in itself, if everyone does not also strive, as much as he can, to further the ends of others. For the ends of any subject who is an end in himself must as far as possible be my ends also, if that conception of an end in itself is to have its full effect in me.

This principle of humanity and of every rational [431] nature generally as an end in itself is the supreme limiting condition of every man's freedom of action. This principle is not borrowed from experience, first, because of its universality, inasmuch as it applies to all rational beings generally, and no experience is capable of determining anything about them; and, secondly, because in experience (subjectively) humanity is not thought of as the end of men, i.e., as an object that we of ourselves actually make our end which as a law ought to constitute the supreme limiting condition of all subjective ends (whatever they may be); and hence this principle must arise from pure reason [and not from experience]. That is to say that the ground of all practical legislation lies objectively in the rule and in the form of universality, which (according to the first principle) makes the rule capable of being a law (say, for example, a law of nature). Subjectively, however, the ground of all practical legislation lies in the end; but (according to the second principle) the subject of all ends is every rational being as an end in himself. From this there now follows the third practical principle of the will as the supreme condition of the will's conformity with universal practical reason, viz., the idea of the will of every rational being as a will that legislates universal law.⁴⁷

According to this principle all maxims are rejected which are not consistent with the will's own legislation of universal law. The will is thus not merely subject to the law but is subject to the law in such a way that it must be regarded also as legislating for itself and only on this account as being subject to the law (of which it can regard itself as the author).

In the previous formulations of imperatives, viz., that based on the conception of the conformity of actions to universal law in a way similar to a natural order and that based on the universal prerogative of rational beings as ends in themselves, these imperatives just because they were thought of as categorical excluded from their legislative authority all admixture of any interest as an incentive. They were, however, only assumed to be categorical because such an assumption had to be made if the concept of duty was to be explained. But that there were practical propositions which commanded categorically could not itself be proved, nor can it be proved anywhere in this section. But one thing could have been done, viz., to indicate that in willing from duty the renunciation of all interest is the specific mark distinguishing a categorical imperative from a hypothetical one and that such renunciation was expressed in the imperative itself by means of some determination contained [432] in it. This is done in the present (third) formulation of the principle, namely, in the idea of the will of every rational being as a will that legislates universal law.

When such a will is thought of, then even though a will which is subject to law may be bound to this law by means of some interest, nevertheless a will that is itself a supreme lawgiver is not able as such to depend on

any interest. For a will which is so dependent would itself require yet another law restricting the interest of its self-love to the condition that such interest should itself be valid as a universal law.

Thus the principle that every human will as a will that legislates universal law in all its maxims,⁴⁸ provided it is otherwise correct, would be well suited to being a categorical imperative in the following respect: just because of the idea of legislating universal law such an imperative is not based on any interest, and therefore it alone of all possible imperatives can be unconditional. Or still better, the proposition being converted, if there is a categorical imperative (i.e., a law for the will of every rational being), then it can only command that everything be done from the maxim of such a will as could at the same time have as its object only itself regarded as legislating universal law. For only then are the practical principle and the imperative which the will obeys unconditional, inasmuch as the will can be based on no interest at all.

When we look back upon all previous attempts that have been made to discover the principle of morality, there is no reason now to wonder why they one and all had to fail. Man was viewed as bound to laws by his duty; but it was not seen that man is subject only to his own, yet universal, legislation and that he is bound only to act in accordance with his own will, which is, however, a will purposed by nature to legislate universal laws. For when man is thought as being merely subject to a law (whatever it might be), then the law had to carry with it some interest [433] functioning as an attracting stimulus or as a constraining force for obedience, inasmuch as the law did not arise as a law from his own will. Rather, in order that his will conform with law, it had to be necessitated by something else to act in a certain way. By this absolutely necessary conclusion, however, all the labor spent in finding a supreme ground for duty was irretrievably lost; duty was never discovered, but only the necessity of acting from a certain interest. This might be either one's own interest or another's, but either way the imperative had to be always conditional and could never possibly serve as a moral command. I want, therefore, to call my principle the principle of the autonomy of the will, in contrast with every other principle, which I accordingly count under heteronomy.

The concept of every rational being as one who must regard himself as legislating universal law by all his will's maxims, so that he may judge himself and his actions from this point of view, leads to another very fruitful concept, which depends on the aforementioned one, viz., that of a kingdom of ends.

By "kingdom" I understand a systematic union of different rational beings through common laws. Now laws determine ends as regards their universal validity; therefore, if one abstracts from the personal differences of rational beings and also from all content of their private ends, then it will be possible to think of a whole of all ends in systematic connection (a whole both of rational being as ends in themselves and also of the particular ends which each may set for himself); that is, one can think of a kingdom of ends that is possible on the aforesaid principles.

For all rational beings stand under the law that each of them should treat himself and all others never merely as means but always at the same time as an end in himself. Hereby arises a systematic union of rational beings through common objective laws, i.e., a kingdom that may be called a kingdom of ends (certainly only an ideal), inasmuch as these laws have in view the very relation of such beings to one another as ends and means.⁴⁹

A rational being belongs to the kingdom of ends as a member when he legislates in it universal laws while also being himself subject to these laws. He belongs to it as sovereign, when as legislator he is himself subject to the will of no other.

A [434] rational being must always regard himself as legislator in a kingdom of ends rendered possible by freedom of the will, whether as member or as sovereign. The position of the latter can be maintained not merely through the maxims of his will but only if he is a completely independent being without needs and with unlimited power adequate to his will.

Hence morality consists in the relation of all action to that legislation whereby alone a kingdom of ends is possible. This legislation must be found in every rational being and must be able to arise from his will, whose principle then is never to act on any maxim except such as can also be a universal law and hence such as the will can thereby regard itself as at the same time the legislator of universal law. If now the maxims do not by their very nature already necessarily conform with this objective principle of rational beings as legislating universal laws, then the necessity of acting on that principle is called practical necessitation, i.e., duty. Duty does not apply to the sovereign in the kingdom of ends, but it does apply to every member and to each in the same degree.

The practical necessity of acting according to this principle, i.e., duty, does not rest at all on feelings, impulses, and inclinations, but only on the relation of rational beings to one another, a relation in which the will of a rational being must always be regarded at the same time as legislative, because otherwise he could not

be thought of as an end in himself. Reason, therefore, relates every maxim of the will as legislating universal laws to every other will and also to every action toward oneself; it does so not on account of any other practical motive or future advantage but rather from the idea of the dignity of a rational being who obeys no law except what he at the same time enacts himself.

In the kingdom of ends everything has either a price or a dignity. Whatever has a price can be replaced by something else as its equivalent; on the other hand, whatever is above all price, and therefore admits of no equivalent, has a dignity.

Whatever has reference to general human inclinations and needs has a market price; whatever, without presupposing any need, accords with a certain taste, i.e., a delight in the mere unpurposive play of our mental powers,⁵⁰ has an affective price; but that which constitutes the condition under which alone something [435] can be an end in itself has not merely a relative worth, i.e., a price, but has an intrinsic worth, i.e., dignity.

Now morality is the condition under which alone a rational being can be an end in himself, for only thereby can he be a legislating member in the kingdom of ends. Hence morality and humanity, insofar as it is capable of morality, alone have dignity. Skill and diligence in work have market price; wit, lively imagination, and humor have an affective price; but fidelity to promises and benevolence based on principles (not on instinct) have intrinsic worth. Neither nature nor art contain anything which in default of these could be put in their place; for their worth consists, not in the effects which arise from them, nor in the advantage and profit which they provide, but in mental dispositions, i.e., in the maxims of the will which are ready in this way to manifest themselves in action, even if they are not favored with success. Such actions also need no recommendation from any subjective disposition or taste so as to meet with immediate favor and delight; there is no need of any immediate propensity or feeling toward them. They exhibit the will performing them as an object of immediate respect; and nothing but reason is required to impose them upon the will, which is not to be cajoled into them, since in the case of duties such cajoling would be a contradiction. This estimation, therefore, lets the worth of such a disposition be recognized as dignity and puts it infinitely beyond all price, with which it cannot in the least be brought into competition or comparison without, as it were, violating its sanctity,

What then is it that entitles the morally good disposition, or virtue, to make such lofty claims? It is nothing less than the share which such a disposition affords the rational being of legislating universal laws, so that he is fit to be a member in a possible kingdom of ends, for which his own nature has already determined him as an end in himself and therefore as a legislator in the kingdom of ends. Thereby is he free as regards all laws of nature, and he obeys only those laws which he gives to himself. Accordingly, his maxims can belong to a universal legislation to which he at the [436] same time subjects himself. For nothing can have any worth other than what the law determines. But the legislation itself which determines all worth must for that very reason have dignity, i.e., unconditional and incomparable worth; and the word “respect” alone provides a suitable expression for the esteem which a rational being must have for it. Hence autonomy is the ground of the dignity of human nature and of every rational nature.

The aforementioned three ways of representing the principle of morality are at bottom only so many formulas of the very same law: one of them by itself contains a combination of the other two. Nevertheless, there is a difference in them, which is subjectively rather than objectively practical, viz., it is intended to bring an idea of reason closer to intuition (in accordance with a certain analogy) and thereby closer to feeling. All maxims have, namely,

1. A form, which consists in universality; and in this respect the formula of the moral imperative is expressed thus: maxims must be so chosen as if they were to hold as universal laws of nature.
2. A matter, viz., an end; and here the formula says that a rational being, inasmuch as he is by his very nature an end and hence an end in himself, must serve in every maxim as a condition limiting all merely relative and arbitrary ends.
3. A complete determination of all maxims by the formula that all maxims proceeding from his own legislation ought to harmonize with a possible kingdom of ends as a kingdom of nature.⁵¹ There is a progression here through the categories of the *unity* of the form of the will (its universality), the *plurality* of its matter (its objects, i.e., its ends), and the *totality* of completeness of its system of ends. But one does better if in moral judgment he follows the rigorous method and takes as his basis the universal formula of the categorical imperative: Act according to that [437] maxim which can at the same time make itself a universal law. But if one wants also to secure acceptance for the moral law, it is very useful to bring one and the same action under the three aforementioned concepts and thus, as far as possible, to bring the moral law nearer to intuition.

We can now end where we started in the beginning, viz., the concept of an unconditionally good will. That will is absolutely good which cannot be evil, i.e., whose maxim, when made into a universal law, can never conflict with itself. This principle is therefore also its supreme law: Act always according to that maxim whose universality as a law you can at the same time will. This is the only condition under which a will can never be in conflict with itself, and such an imperative is categorical. Inasmuch as the validity of the will as a universal law for possible actions is analogous to the universal connection of the existence of things in accordance with universal laws, which is the formal aspect of nature in general, the categorical imperative can also be expressed thus: Act according to maxims which can at the same time have for their object themselves as universal laws of nature. In this way there is provided the formula for an absolutely good will.

Rational nature is distinguished from the rest of nature by the fact that it sets itself an end. This end would be the matter of every good will. But in the idea of an absolutely good will — good without any qualifying condition (of attaining this or that end) — complete abstraction must be made from every end that has to come about as an effect (since such would make every will only relatively good). And so the end must here be conceived, not as an end to be effected, but as an independently existing end. Hence it must be conceived only negatively, i.e., as an end which should never be acted against and therefore as one which in all willing must never be regarded merely as means but must always be esteemed at the same time as an end. Now this end can be nothing but the subject of all possible ends themselves, because this subject is at the same time the subject of a possible absolutely good will; for such a will cannot without contradiction be subordinated to any other object. [438] The principle: So act in regard to every rational being (yourself and others) that he may at the same time count in your maxim as an end in himself, is thus basically the same as the principle: Act on a maxim which at the same time contains in itself its own universal validity for every rational being. That in the use of means for every end my maxim should be restricted to the condition of its universal validity as a law for every subject says just the same as that a subject of ends, i.e., a rational being himself, must be made the ground for all maxims of actions and must thus be used never merely as means but as the supreme limiting condition in the use of all means, i.e., always at the same time as an end.

Now there follows incontestably from this that every rational being as an end in himself must be able to regard himself with reference to all laws to which he may be subject as being at the same time the legislator of universal law, for just this very fitness of his maxims for the legislation of universal law distinguishes him as an end in himself. There follows also that his dignity (prerogative) of being above all the mere things of nature implies that his maxims must be taken from the viewpoint that regards himself, as well as every other rational being, as being legislative beings (and hence are they called persons). In this way there is possible a world of rational beings (*mundus intelligibilis*) as a kingdom of ends, because of the legislation belonging to all persons as members. Therefore, every rational being must so act as if he were through his maxim always a legislating member in the universal kingdom of ends. The formal principle of these maxims is this: So act as if your maxims were to serve at the same time as a universal law (for all rational beings). Thus a kingdom of ends is possible only on the analogy of a kingdom of nature; yet the former is possible only through maxims, i.e., self-imposed rules, while the latter is possible only through laws of efficient causes necessitated from without. Regardless of this difference and even though nature as a whole is viewed as a machine, yet insofar as nature stands in a relation to rational beings as its ends, it is on this account given the name of a kingdom of nature. Such a kingdom of ends would actually be realized through maxims whose rule is prescribed to all rational beings by the categorical imperative, if these maxims were universally obeyed. But even if a rational being himself strictly obeys such a maxim, he cannot for that reason count on everyone else's being true to it, nor can he expect the kingdom of nature and its purposive order to be in harmony with him as a fitting member of a kingdom of ends made possible by himself, i.e., he cannot expect the kingdom of nature to favor his expectation of happiness. [439] Nevertheless, the law: Act in accordance with the maxims of a member legislating universal laws for a merely possible kingdom of ends, remains in full force, since it commands categorically. And just in this lies the paradox that merely the dignity of humanity as rational nature without any further end or advantage to be thereby gained — and hence respect for a mere idea — should yet serve as an inflexible precept for the will; and that just this very independence of the maxims from all such incentives should constitute the sublimity of maxims and the worthiness of every rational subject to be a legislative member in the kingdom of ends, for otherwise he would have to be regarded as subject only to the natural law of his own needs. And even if the kingdom of nature as well as the kingdom of ends were thought of as both united under one sovereign so that the latter kingdom would thereby no longer remain a mere idea but would acquire true reality, then indeed the kingdom of ends would gain the addition of a strong incentive, but never any increase in its intrinsic worth. For this sole absolute legislator must, in spite of all this, always be thought of as judging the worth of rational beings solely by the disinterested conduct prescribed to themselves by means of this idea alone. The essence of things is not altered by their external relations; and whatever without

reference to such relations alone constitutes the absolute worth of man is also what he must be judged by, whoever the judge may be, even the Supreme Being. Hence morality is the relation of actions to the autonomy of the will, i.e., to the possible legislation of universal law by means of the maxims of the will. That action which is compatible with the autonomy of the will is permitted; that which is not compatible is forbidden. That will whose maxims are necessarily in accord with the laws of autonomy is a holy, or absolutely good, will. The dependence of a will which is not absolutely good upon the principle of autonomy (i.e., moral necessitation) is obligation, which cannot therefore be applied to a holy will. The objective necessity of an action from obligations is called duty.

From what has just been said, there can now easily be explained how it happens that, although in the concept of duty we think of subjection to the law, [440] yet at the same time we thereby ascribe a certain dignity and sublimity to the person who fulfills all his duties. For not insofar as he is subject to the moral law does he have sublimity, but rather has it only insofar as with regard to this very same law he is at the same time legislative, and only thereby is he subject to the law. We have also shown above⁵² how neither fear nor inclination, but solely respect for the law, is the incentive which can give an action moral worth. Our own will, insofar as it were to act only under the condition of its being able to legislate universal law by means of its maxims—this will, ideally possible for us, is the proper object of respect. And the dignity of humanity consists just in its capacity to legislate universal law, though with the condition of humanity's being at the same time itself subject to this very same legislation.

Autonomy of the Will as the Supreme Principle of Morality

Autonomy of the will is the property that the will has of being a law to itself (independently of any property of the objects of volition). The principle of autonomy is this: Always choose in such a way that in the same volition the maxims of the choice are at the same time present as universal law. That this practical rule is an imperative, i.e., that the will of every rational being is necessarily bound to the rule as a condition, cannot be proved by merely analyzing the concepts contained in it, since it is a synthetic proposition. For proof one would have to go beyond cognition of objects to a critical examination of the subject, i.e. go to a critique of pure practical reason, since this synthetic proposition which commands apodeictically must be capable of being cognized completely a priori. This task, however, does not belong to the present section. But that the above principle of autonomy is the sole principle of morals can quite well be shown by mere analysis of the concepts of morality; for thereby the principle of morals is found to be necessarily a categorical imperative, which commands nothing more nor less than this very autonomy.

Heteronomy of the Will as the Source of All Spurious Principles of Morality [441]

If the will seeks the law that is to determine it anywhere but in the fitness of its maxims for its own legislation of universal laws, and if it thus goes outside of itself and seeks this law in the character of any of its objects, then heteronomy always results. The will in that case does not give itself the law, but the object does so because of its relation to the will. This relation, whether it rests on inclination or on representations of reason, admits only of hypothetical imperatives: I ought to do something because I will something else. On the other hand, the moral, and hence categorical, imperative says that I ought to act in this way or that way, even though I did not will something else. For example, the former says that I ought not to lie if I would maintain my reputation; the latter says that I ought not to lie even though lying were to bring me not the slightest discredit. The moral imperative must therefore abstract from every object to such an extent that no object has any influence at all on the will, so that practical reason (the will) may not merely minister to an interest not belonging to it but may merely show its own commanding authority as the supreme legislation. Thus, for example, I ought to endeavor to promote the happiness of others, not as though its realization were any concern of mine (whether by immediate inclination or by any satisfaction indirectly gained through reason), but merely because a maxim which excludes it cannot be comprehended as a universal law in one and the same volition.

Classification of All Possible Principles of Morality Founded upon the Assumed Fundamental Concept of Heteronomy

Here as elsewhere human reason in its pure use, so long as it lacks a critical examination, first tried every possible wrong way before it succeeded in finding the only right way.

All principles that can be taken from this point of [442] view are either empirical or rational. The first kind, drawn from the principle of happiness, are based upon either physical or moral feeling. The second kind,

drawn from the principle of perfection, are based upon either the rational concept of perfection as a possible effect of our will or else upon the concept of an independent perfection (the will of God) as a determining cause of our will.

Empirical principles are wholly unsuited to serve as the foundation for moral laws. For the universality with which such laws ought to hold for all rational beings without exception (the unconditioned practical necessity imposed by moral laws upon such beings) is lost if the basis of these laws is taken from the particular constitution of human nature or from the accidental circumstances in which such nature is placed. But the principle of one's own happiness is the most objectionable. Such is the case not merely because this principle is false and because experience contradicts the supposition that well-being is always proportional to well-doing, nor yet merely because this principle contributes nothing to the establishment of morality, inasmuch as making a man happy is quite different from making him good and making him prudent and sharp-sighted for his own advantage quite different from making him virtuous. Rather, such is the case because this principle of one's own happiness bases morality upon incentives that undermine it rather than establish it and that totally destroy its sublimity, inasmuch as motives to virtue are put in the same class as motives to vice and inasmuch as such incentives merely teach one to become better at calculation, while the specific difference between virtue and vice is entirely obliterated. On the other hand, moral feeling, this alleged special sense,⁵³ remains closer to morality than does the aforementioned principle of one's own happiness. Yet the appeal to the principle of moral feeling is superficial, since men who cannot think believe that they will be helped out by feeling, even when the question is solely one of universal laws. They do so even though feelings naturally differ from one another by an infinity of degrees, so that feelings are not capable of providing a uniform measure of good and evil; furthermore, they do so even though one man cannot by his feeling judge validly at all for other men. Nevertheless, the principle of moral feeling is closer to morality and its dignity than is the principle of one's own happiness inasmuch as the former principle pays virtue [443] the honor of ascribing to her directly the satisfaction and esteem that is held for her, and does not, as it were, tell her to her face that our attachment to her rests not on her beauty but only on our advantage.

Among the rational principles of morality (or those arising from reason rather than from feeling) there is the ontological concept of perfection. It is empty, indeterminate, and hence is no use for finding in the immeasurable field of possible reality the maximum sum suitable for us. Furthermore, in attempting to distinguish specifically between the reality just mentioned and every other, it exhibits an inevitable tendency for turning about in a circle and cannot avoid tacitly presupposing the morality that it has to explain. Nevertheless, it is better than the theological concept, whereby morality is derived from a divine and most perfect will. It is better not merely because we cannot intuit divine perfection but can only derive it from our own concepts, among which morality is foremost; but also because if it is not so derived (and being thus derived would involve a crudely circular explanation), then the only remaining concept of God's will is drawn from such characteristics as desire for glory and dominion combined with such frightful representations as those of might and vengeance. Any system of morals based on such notions would be directly opposed to morality.

But if I had to choose between the concept of moral sense and that of perfection in general (both of which at least do not weaken morality, even though they are not at all capable of serving as its foundation), I would decide for the latter because it at least withdraws the decision of the question from sensibility and brings it to the court of pure reason, though it does not even here get any decision. Furthermore, I would choose the concept of perfection in general because it preserves the indeterminate idea (of a will good in itself) free from falsity until it can be more precisely determined.

For the rest, I believe that I may be excused from a lengthy refutation of all these doctrines. Such a refutation would be merely superfluous labor, since it is so easy and is presumably so well understood even by those whose office requires them to declare themselves for one of these theories (since their hearers would not tolerate suspension of judgment). But what interests us more here is to know that these principles never lay down anything but heteronomy of the will as the first ground of morality and that they must, consequently, necessarily fail in their purpose.

In every case where an object of the will must be [444] laid down as the foundation for prescribing a rule to determine the will, there the rule is nothing but heteronomy. The imperative is then conditioned, viz., if or because one wills this object, one should act thus or so. Hence the imperative can never command morally, i.e., categorically. Now the object may determine the will by means of inclination, as in the case of the principle of one's own happiness, or by means of reason directed to objects of our volition in general, as in the case of the principle of perfection. Yet in both cases the will never determines itself immediately by the thought of an action, but only by the incentive that the anticipated effect of the action has upon the will: I

ought to do something because I will something else. And here must yet another law be assumed in me the subject, whereby I necessarily will this something else; this other law in turn requires an imperative to restrict this maxim. For the impulse which the representation of an object that is possible by means of our powers is to exert upon the will of a subject in accordance with his natural constitution belongs to the nature of the subject, whether to his sensibility (his inclination and taste) or to his understanding and reason, whose employment on an object is by the particular arrangement of their nature attended with satisfaction; consequently, the law would, properly speaking, be given by nature. This law, insofar as it is a law of nature, must be known and proved through experience and is therefore in itself contingent and hence is not fit to be an apodeictic practical rule, such as a moral rule must be. The law of nature under discussion is always merely heteronomy of the will; the will does not give itself the law, but a foreign impulse gives the law to the will by means of the subject's nature, which is adapted to receive such an impulse.

An absolutely good will, whose principle must be a categorical imperative, will therefore be indeterminate as regards all objects and will contain merely the form of willing; and indeed that form is autonomy. This is to say that the fitness of the maxims of every good will to make themselves universal laws is itself the only law that the will of every rational being imposes on itself, without needing to assume any incentive or interest as a basis.

How such a synthetic practical a priori proposition is possible and why it is necessary are problems whose solution does not lie any longer within the bounds of a metaphysics of morals. Furthermore, we have not here asserted the truth of this proposition, much [445] less professed to have within our power a proof of it. We simply showed by developing the universally accepted concept of morality that autonomy of the will is unavoidably bound up with it, or rather is its very foundation. Whoever, then, holds morality to be something real, and not a chimerical idea without any truth, must also admit the principle here put forward. Hence this section, like the first, was merely analytic. To show that morality is not a mere phantom of the brain, which morality cannot be if the categorical imperative, and with it the autonomy of the will, is true and absolutely necessary as an a priori principle, we require a possible synthetic use of pure practical reason. But we must not venture on this use without prefacing it with a critical examination of this very faculty of reason. In the last section we shall give the main outlines of this critical examination as far as sufficient for our purpose.⁵⁴

THIRD [446] SECTION

TRANSITION FROM A METAPHYSICS OF MORALS TO A CRITIQUE OF PURE PRACTICAL REASON

The Concept of Freedom Is the Key for an Explanation of the Autonomy of the Will

The will is a kind of causality belonging to living beings insofar as they are rational; freedom would be the property of this causality that makes it effective independent of any determination by alien causes. Similarly, natural necessity is the property of the causality of all non-rational beings by which they are determined to activity through the influence of alien causes.

The foregoing explanation of freedom is negative and is therefore unfruitful for attaining an insight regarding its essence; but there arises from it a positive concept, which as such is richer and more fruitful. The concept of causality involves that of laws according to which something that we call cause must entail something else — namely, the effect. Therefore freedom is certainly not lawless, even though it is not a property of will in accordance with laws of nature. It must, rather, be a causality in accordance with immutable laws, which, to be sure, is of a special kind; otherwise a free will would be something absurd. As we have already seen [in the preceding paragraph], natural necessity is a heteronomy of efficient causes, [447] inasmuch as every effect is possible only in accordance with the law that something else determines the efficient cause to exercise its causality. What else, then, can freedom of the will be but autonomy, i.e., the property that the will has of being a law to itself? The proposition that the will is in every action a law to itself expresses, however, nothing but the principle of acting according to no other maxim than that which can at the same time have itself as a universal law for its object. Now this is precisely the formula of the categorical imperative and is the principle of morality. Thus a free will and a will subject to moral laws are one and the same.

Therefore if freedom of the will is presupposed, morality (together with its principle) follows by merely analyzing the concept of freedom. However, the principle of morality is, nevertheless, a synthetic proposition: viz., an absolutely good will is one whose maxim can always have itself as content when such maxim is regarded as a universal law; it is synthetic because this property of the will's maxim can never be found by analyzing the concept of an absolutely good will. Now such synthetic propositions are possible only as follows — two cognitions are bound together through their connection with a third in which both of them are to be found. The positive concept of freedom furnishes this third cognition, which cannot, as is the case with physical causes, be the nature of the world of sense (in whose concept is combined the concept of something as cause in relation to something else as effect). We cannot here yet show straight away what this third cognition is which freedom indicates to us and of which we have an a priori idea, nor can we as yet conceive of the deduction of the concept of freedom from pure practical reason and therewith also the possibility of a categorical imperative. Rather, we require some further preparation.

Freedom Must Be Presupposed as a Property of the Will of All Rational Beings

It is not enough to ascribe freedom to our will, on whatever ground, if we have not also sufficient reason for attributing it to all rational beings. For inasmuch as morality serves as a law for us only insofar as we are rational beings, it must also be valid for all rational beings. And since morality must be derived solely from the property of freedom, one must show that freedom is also the property of the will of all rational [448] beings. It is not enough to prove freedom from certain alleged experiences of human nature (such a proof is indeed absolutely impossible, and so freedom can be proved only a priori). Rather, one must show that freedom belongs universally to the activity of rational beings endowed with a will. Now I say that every being who cannot act in any way other than under the idea of freedom is for this very reason free from a practical point of view. This is to say that for such a being all the laws that are inseparably bound up with freedom are valid just as much as if the will of such a being could be declared to be free in itself for reasons that are valid for theoretical philosophy.⁵⁵ Now I claim that we must necessarily attribute to every rational being which has a will also the idea of freedom, under which only can such a being act. For in such a being we think of a reason that is practical, i.e., that has causality in reference to its objects. Now we cannot possibly think of a reason that consciously lets itself be directed from outside as regards its judgments; for in that case the subject would ascribe the determination of his faculty of judgment not to his reason, but to an impulse. Reason must regard itself as the author of its principles independent of foreign influences. Therefore as practical reason or as the

will of a rational being must reason regard itself as free. This is to say that the will of a rational being can be a will of its own only under the idea of freedom, and that such a will must therefore, from a practical point of view, be attributed to all rational beings.

Concerning the Interest Attached to the Ideas of Morality

We have finally traced the determinate concept of morality back to the idea of freedom, but we could not prove freedom to be something actual in ourselves and in human nature. We saw merely that we must [449] presuppose it if we want to think of a being as rational and as endowed with consciousness of its causality as regards actions, i.e., as endowed with a will. And so we find that on the very same ground we must attribute to every being endowed with reason and a will this property of determining itself to action under the idea of its own freedom.

Now there resulted from the presupposition of this idea of freedom also the consciousness of a law of action: that the subjective principles of actions, i.e., maxims, must always be so adopted that they can also be valid objectively, i.e., universally, as principles, and can therefore serve as universal laws of our own legislation. But why, then, should I subject myself to this principle simply as a rational being and by so doing also subject to this principle all other beings endowed with reason? I am willing to grant that no interest impels me to do so, because this would not give a categorical imperative. But nonetheless I must necessarily take an interest in it and discern how this comes about, for this *ought* is properly a *would* which is valid for every rational being, provided that reason is practical for such a being without hindrances. In the case of beings who, like ourselves, are also affected by sensibility, i.e., by incentives of a kind other than the purely rational, and who do not always act as reason by itself would act, this necessity of action is expressed only as an *ought*, and the subjective necessity is to be distinguished from the objective.

It therefore seems as if we have in the idea of freedom actually only presupposed the moral law, namely, the principle of the autonomy of the will, and as if we could not prove its reality and objective necessity independently. In that case we should indeed still have gained something quite considerable by at least determining the genuine principle more exactly than had previously been done. But as regards its validity and the practical necessity of subjecting oneself to it, we would have made no progress. We could give no satisfactory answer if asked the following questions: why must the universal validity of our maxim taken as a law be a condition restricting our actions; upon what do we base the worth that we assign to this way of acting — a worth that is supposed to be so great that there can be no higher interest; [450] how does it happen that by this alone does man believe that he feels his own personal worth, in comparison with which that of an agreeable or disagreeable condition is to be regarded as nothing.

Indeed we do sometimes find that we can take an interest in a personal characteristic which involves no interest in any [external] condition but only makes us capable of participating in the condition in case reason were to effect the allotment. This is to say that the mere worthiness of being happy can of itself be of interest even without the motive of participating in this happiness. This judgment, however, is in fact only the result of the importance that we have already presupposed as belonging to moral laws (when by the idea of freedom we divorce ourselves from all empirical interest). However, in this way we are not as yet able to have any insight into why it is that we should divorce ourselves from such interest, i.e., that we should consider ourselves as free in action and yet hold ourselves as subject to certain laws so as to find solely in our own person a worth that can compensate us for the loss of everything that gives worth to our condition. We do not see how this is possible and hence how the moral law can obligate us.

One must frankly admit that there is here a sort of circle from which, so it seems, there is no way to escape. In the order of efficient causes we assume that we are free so that we may think of ourselves as subject to moral laws in the order of ends. And we then think of ourselves as subject to these laws because we have attributed to ourselves freedom of the will. Freedom and self-legislation of the will are both autonomy and are hence reciprocal concepts. Since they are reciprocal, one of them cannot be used to explain the other or to supply its ground, but can at most be used only for logical purposes to bring seemingly different conceptions of the same object under a single concept (just as different fractions of the same value are reduced to lowest terms).

However, one recourse still remains open to us, namely, to inquire whether we do not take one point of view when by means of freedom we think of ourselves as a priori efficient causes, and another point of view when we represent ourselves with reference to our actions as effects which we see before our eyes.

No subtle reflection is required for the following observation, which even the commonest understanding may be supposed to make, though it does so in its own fashion through some obscure discrimination of the

faculty of judgment which it calls feeling: all representations that come to us without our choice [451] (such as those of the senses) enable us to know objects only as they affect us; what they may be in themselves remains unknown to us. Therefore, even with the closest attention and the greatest clarity that the understanding can bring to such representations, we can attain to a mere knowledge of appearances but never to knowledge of things in themselves. Once this distinction is made (perhaps merely as a result of observing the difference between representations which are given to us from without and in which we are passive from those which we produce entirely from ourselves and in which we show our own activity); then there follows of itself that we must admit and assume that behind the appearances there is something else which is not appearance, namely, things in themselves. Inasmuch as we can never cognize them except as they affect us [through our senses], we must admit that we can never come any nearer to them nor ever know what they are in themselves. This must provide a distinction, however crude, between a world of sense and a world of understanding; the former can vary considerably according to the difference of sensibility [and sense impressions] in various observers, while the latter, which is the basis of the former, remains always the same. Even with regard to himself, a man cannot presume to know what he is in himself by means of the acquaintance which he has through internal sensation. For since he does not, as it were, create himself and since he acquires the concept of himself not a priori but empirically, it is natural that he can attain knowledge even about himself only through inner sense and therefore only through the appearance of his nature and the way in which his consciousness is affected. But yet he must necessarily assume that beyond his own subject's constitution as composed of nothing but appearances there must be something else as basis, namely, his ego as constituted in itself. Therefore with regard to mere perception and the receptivity of sensations, he must count himself as belonging to the world of sense; but with regard to whatever there may be in him of pure activity (whatever reaches consciousness immediately and not through affecting the senses) he must count himself as belonging to the intellectual world, of which he has, however, no further knowledge.

Such a conclusion must be reached by a reflective man regarding all the things that may be presented [452] to him. It is presumably to be found even in the most ordinary understanding, which, as is well known, is quite prone to expect that behind objects of the senses there is something else invisible and acting of itself. But such understanding spoils all this by making the invisible again sensible, i.e., it wants to make the invisible an object of intuition; and thereby does it become not a bit wiser.

Now man really finds in himself a faculty which distinguishes him from all other things and even from himself insofar as he is affected by objects. That faculty is reason, which as pure spontaneity is elevated even above understanding. For although the latter is also spontaneous and does not, like sense, merely contain representations that arise only when one is affected by things (and is therefore passive), yet understanding can produce by its activity no other concepts than those which merely serve to bring sensuous representations [intuitions] under rules and thereby to unite them in one consciousness. Without this use of sensibility, understanding would think nothing at all. Reason, on the other hand, shows such a pure spontaneity in the case of what are called ideas that it goes far beyond anything that sensibility can offer and shows its highest occupation in distinguishing the world of sense from the world of understanding, thereby prescribing limits to the understanding itself.

Therefore a rational being must regard himself qua intelligence (and hence not from the side of his lower powers) as belonging not to the world of sense but to the world of understanding. Therefore he has two standpoints from which he can regard himself and know laws of the use of his powers and hence of all his actions; first, insofar as he belongs to the world of sense subject to laws of nature (heteronomy); secondly, insofar as he belongs to the intelligible world subject to laws which, independent of nature, are not empirical but are founded only on reason.

As a rational being and hence as belonging to the intelligible world, can man never think of the causality of his own will except under the idea of freedom; for independence from the determining causes of the world of sense (an independence which reason must always attribute to itself) is freedom. Now the idea of freedom is inseparably connected with the concept of autonomy, and this in turn with the universal principle of morality, which ideally is the ground of all [453] actions of rational beings, just as natural law is the ground of all appearances.

The suspicion that we raised earlier is now removed, viz., that there might be a hidden circle involved in our inference from freedom to autonomy, and from this to the moral law — this is to say that we had perhaps laid down the idea of freedom only for the sake of the moral law in order subsequently to infer this law in its turn from freedom, and that we had therefore not been able to assign any ground at all for this law but had only assumed it by begging a principle which well-disposed souls would gladly concede us but which we could never put forward as a demonstrable proposition. But now we see that when we think of ourselves as free, we

transfer ourselves into the intelligible world as members and know the autonomy of the will together with its consequence, morality; whereas when we think of ourselves as obligated, we consider ourselves as belonging to the world of sense and yet at the same time to the intelligible world.

How Is a Categorical Imperative Possible?

The rational being counts himself, qua intelligence, as belonging to the intelligible world, and only insofar as he is an efficient cause belonging to the intelligible world does he call his causality a will. But on the other side, he is conscious of himself as being also a part of the world of sense, where his actions are found as mere appearances of that causality. The possibility of these actions cannot, however, be discerned through such causality, which we do not know; rather, these actions as belonging to the world of sense must be viewed as determined by other appearances, namely, desires and inclinations. Therefore, if I were solely a member of the intelligible world, then all my actions would perfectly conform to the principle of the autonomy of a pure will; if I were solely a part of the world of sense, my actions would have to be taken as in complete conformity with the natural law of desires and inclinations, i.e., with the heteronomy of nature. (My actions would in the first case rest on the supreme principle of morality, in the second case on that of happiness.) But the intelligible world contains the ground of the world of sense and therefore also the ground of its laws; consequently, the intelligible world is (and must be thought of as) directly legislative for my will (which belongs wholly to the intelligible world). Therefore, even though on the one hand I must regard myself as a being belonging to the world of sense, yet on the other hand shall I have to know myself as an intelligence and as subject [454] to the law of the intelligible world, i.e., to reason, which contains this law in the idea of freedom, and hence to know myself as subject to the autonomy of the will. Consequently, I must regard the laws of the intelligible world as imperatives for me, and the actions conforming to this principle as duties.

And thus are categorical imperatives possible because the idea of freedom makes me a member of an intelligible world. Now if I were a member of only that world, all my actions *would* always accord with autonomy of the will. But since I intuit myself at the same time as a member of the world of sense, my actions *ought* so to accord. This categorical *ought* presents a synthetic a priori proposition, whereby in addition to my will as affected by sensuous desires there is added further the idea of the same will, but as belonging to the intelligible world, pure and practical of itself, and as containing the supreme condition of the former will insofar as reason is concerned. All this is similar to the way in which concepts [categories] of the understanding, which of themselves signify nothing but the form of law in general, are added to intuitions of the world of sense and thus make possible synthetic a priori propositions, upon which all knowledge of nature rests.

The practical use of ordinary human reason bears out the correctness of this deduction. There is no one, not even the meanest villain, provided only that he is otherwise accustomed to the use of reason, who, when presented with examples of honesty of purpose, of steadfastness in following good maxims, and of sympathy and general benevolence (even when involved with great sacrifices of advantages and comfort) does not wish that he might also possess these qualities. Yet he cannot attain these in himself only because of his inclinations and impulses; but at the same time he wishes to be free from such inclinations which are a burden to him. He thereby proves that by having a will free of sensuous impulses he transfers himself in thought into an order of things entirely different from that of his desires in the field of sensibility. Since he cannot expect to obtain by the aforementioned wish any gratification of his desires or any condition that would satisfy any of his actual or even conceivable inclinations (inasmuch as through such an expectation the very idea that elicited the wish would be deprived of its preeminence) he can only expect a greater intrinsic worth of his own person. This better person he believes himself to be when he transfers himself to the standpoint of a member of the intelligible [455] world, to which he is involuntarily forced by the idea of freedom, i.e., of being independent of determination by causes of the world of sense. From this standpoint he is conscious of having a good will, which by his own admission constitutes the law for the bad will belonging to him as a member of the world of sense — a law whose authority he acknowledges even while he transgresses it. The moral *ought* is, therefore, a necessary *would* insofar as he is a member of the intelligible world, and is thought by him as an *ought* only insofar as he regards himself as being at the same time a member of the world of sense.

Concerning the Extreme Limit of All Practical Philosophy

All men think of themselves as free as far as their will is concerned. Hence arise all judgments upon actions as being such as ought to have been done, even though they were not done. But this freedom is not a concept of experience, nor can it be such, since it always holds, even though experience shows the opposite of those

requirements represented as necessary under the presupposition of freedom. On the other hand, it is just as necessary that whatever happens should be determined without any exception according to laws of nature; and this necessity of nature is likewise no concept of experience, just because it involves the concept of necessity and thus of a priori knowledge. But this concept of nature is confirmed by experience and must inevitably be presupposed if there is to be possible experience, which is coherent knowledge of the objects of sense in accordance with universal laws. Freedom is, therefore, only an idea of reason whose objective reality is in itself questionable; but nature is a concept of the understanding, which proves, and necessarily must prove, its reality by examples from experience.

There arises from this a dialectic of reason, since the freedom attributed to the will seems to contradict the necessity of nature. And even though at this parting of the ways reason for speculative purposes finds the road of natural necessity much better worn and more serviceable than that of freedom, yet for practical [456] purposes the footpath of freedom is the only one upon which it is possible to make use of reason in our conduct. Therefore, it is just as impossible for the most subtle philosophy as for the most ordinary human reason to argue away freedom. Hence philosophy must assume that no real contradiction will be found between freedom and natural necessity in the same human actions, for it cannot give up the concept of nature any more than that of freedom.

Nevertheless, even though one might never be able to comprehend how freedom is possible, yet this apparent contradiction must at least be removed in a convincing manner. For if the thought of freedom contradicts itself or nature, which is equally necessary, then freedom would have to be completely given up in favor of natural necessity.

It would, however, be impossible to escape this contradiction if the subject, deeming himself free, were to think of himself in the same sense or in the very same relationship when he calls himself free as when he assumes himself subject to the law of nature regarding the same action. Therefore, an unavoidable problem of speculative philosophy is at least to show that its illusion regarding the contradiction rests on our thinking of man in a different sense and relation when we call him free from when we regard him as being a part of nature and hence as subject to the laws of nature. Hence it must show not only that both can coexist very well, but that both must be thought of as necessarily united in the same subject; for otherwise no explanation could be given as to why reason should be burdened with an idea which involves us in a perplexity that is solely embarrassing to reason in its theoretic use, even though it may without contradiction be united with another idea that is sufficiently established. This duty, however, is incumbent solely on speculative philosophy in order that it may clear the way for practical philosophy. Thus the philosopher has no option as to whether he will remove the apparent contradiction or leave it untouched; for in the latter case the theory regarding this could be *bonum vacans*,⁵⁶ into the possession of which the fatalist can justifiably enter and chase all morality out of its supposed property as occupying it without title.

Nevertheless, one cannot here say as yet that the boundary of practical philosophy begins. For the settlement of the controversy does not belong to practical philosophy; the latter only requires speculative reason [457] to put an end to the dissension in which it is entangled as regards theoretical questions in order that practical reason may have rest and security from external attacks that might make disputable the ground upon which it wants to build.

The just claim to freedom of the will made even by ordinary human reason is founded on the consciousness and the admitted presupposition that reason is independent of mere subjective determination by causes which together make up what belongs only to sensation and comes under the general designation of sensibility. Regarding himself in this way as intelligence, man thereby puts himself into another order of things. And when he thinks of himself as intelligence endowed with a will and consequently with causality, he puts himself into relation with determining grounds of a kind altogether different from the kind when he perceives himself as a phenomenon in the world of sense (as he really is also) and subjects his causality to external determination according to laws of nature. Now he soon realizes that both can — and indeed must — hold good at the same time. For there is not the slightest contradiction involved in saying that a thing as appearance (belonging to the world of sense) is subject to certain laws, while it is independent of those laws when regarded as a thing or being in itself. That man must represent and think of himself in this twofold way rests, on the one hand, upon the consciousness of himself as an object affected through the senses and, on the other hand, upon the consciousness of himself as intelligence, i.e., as independent of sensuous impulses in his use of reason (and hence as belonging to the intelligible world).

And hence man claims that he has a will which reckons to his account nothing that belongs merely to his desires and inclinations, and which, on the contrary, thinks of actions that can be performed only by disregarding all desires and sensuous incitements as being possible and as indeed being necessary for him. The

causality of such actions lies in man as intelligence and lies in the laws of such effects and actions as are in accordance with principles of an intelligible world, of which he knows nothing more than that in such a world reason alone, and indeed pure reason independent of sensibility, gives the law. Furthermore, since he is in such a world his proper self only as intelligence (whereas regarded as a human being he is merely an appearance of himself), those laws apply to him immediately and categorically. Consequently, incitements from inclinations and impulses (and hence from the whole nature of the world of senses) cannot impair the laws of his willing insofar [458] as he is intelligence. Indeed he does not even hold himself responsible for such inclinations and impulses or ascribe them to his proper self, i.e., his will, although he does ascribe to his will any indulgence which he might extend to them if he allowed them any influence on his maxims to the detriment of the rational laws of his will.

When practical reason thinks itself into an intelligible world, it does not in the least thereby transcend its limits, as it would if it tried to enter it by intuition or sensation. The thought of an intelligible world is merely negative as regards the world of sense. The latter world does not give reason any laws for determining the will and is positive only in this single point, viz., it simultaneously combines freedom as negative determination with a positive faculty and even a causality of reason. This causality is designated as a will to act in such a way that the principle of actions may accord with the essential character of a rational cause, i.e., with the condition that the maxim of these actions have universal validity as a law. But if practical reason were to bring in an object of the will, i.e., a motive of action, from the intelligible world, then it would overstep its boundaries and pretend to be acquainted with something of which it knows nothing. The concept of an intelligible world is thus only a point of view which reason sees itself compelled to take outside of appearances in order to think of itself as practical. If the influences of sensibility were determining for man, reason would not be able to take this point of view, which is nonetheless necessary if he is not to be denied the consciousness of himself as intelligence and hence as a rational cause that is active through reason, i.e., free in its operation. This thought certainly involves the idea of an order and a legislation different from that of the mechanism of nature which applies to the world of sense; and it makes necessary the concept of an intelligible world (i.e., the whole of rational beings as things in themselves). But it makes not the slightest claim to anything more than to think of such a world as regards merely its formal condition — i.e., the universality of the will's maxims as laws and thus the will's autonomy, which alone is consistent with freedom. On the contrary, all laws determined by reference to an object yield heteronomy, which can be found only in laws of nature and can apply only to the world of sense.

But reason would overstep all its bounds if it undertook [459] to explain how pure reason can be practical. This is exactly the same problem as explaining how freedom is possible.

For we can explain nothing but what we can reduce to laws whose object can be given in some possible experience. But freedom is a mere idea, whose objective reality can in no way be shown in accordance with laws of nature and consequently not in any possible experience. Therefore, the idea of freedom can never admit of comprehension or even of insight, because it cannot by any analogy have an example falling under it. It holds only as a necessary presupposition of reason in a being who believes himself conscious of a will, i.e., of a faculty distinct from mere desire (namely, a faculty of determining himself to action as intelligence and hence in accordance with laws of reason independently of natural instincts). But where determination according to laws of nature ceases, there likewise ceases all explanation and nothing remains but defense, i.e., refutation of the objections of those who profess to have seen deeper into the essence of things and thereupon boldly declare freedom to be impossible. One can only show them that their supposed discovery of a contradiction lies nowhere but here: in order to make the law of nature applicable to human actions, they have necessarily had to regard man as an appearance; and now when they are required to think of man *qua* intelligence as thing in himself as well, they still persist in regarding him as appearance. In that case, to be sure, the exemption of man's causality (i.e., his will) from all the natural laws of the world of sense would, as regards one and the same subject, give rise to a contradiction. But this disappears if they would but bethink themselves and admit, as is reasonable, that behind appearances there must lie as their ground also things in themselves (though hidden) and that the laws of their operations cannot be expected to be the same as those that govern their appearances.

[460] The subjective impossibility of explaining freedom of the will is the same as the impossibility of discovering and explaining an interest⁵⁷ which man can take in moral laws. Nevertheless, he does indeed take such an interest, the basis of which in us is called moral feeling. Some people have falsely construed this feeling to be the standard of our moral judgment, whereas it must rather be regarded as the subjective effect that the law exercises upon the will, while reason alone furnishes the objective grounds of such moral feeling.

In order to will what reason alone prescribes as an *ought* for sensuously affected rational beings, there

certainly must be a power of reason to infuse a feeling of pleasure or satisfaction in the fulfillment of duty, and hence there has to be a causality of reason to determine sensibility in accordance with rational principles. But it is quite impossible to discern, i.e., to make a priori conceivable, how a mere thought which itself contains nothing sensuous can produce a sensation of pleasure or displeasure. For here is a special kind of causality regarding which, as with all causality, we can determine nothing a priori but must consult experience alone. However, experience can provide us with no relation of cause and effect except between two objects of experience. But in this case pure reason by means of mere ideas (which furnish no object at all for experience) is to be the cause of an effect that admittedly lies in experience. Consequently, there is for us men no possibility at all for an explanation as to how and why the universality of a maxim as a law, and hence morality, interests us. This much only is certain: the moral law is valid for us not because it interests us (for this is heteronomy and the dependence of practical reason on sensibility, viz., on an underlying feeling whereby reason could [461] never be morally legislative); but, rather, the moral law interests us because it is valid for us as men, since it has sprung from our will as intelligence and hence from our proper self. But what belongs to mere appearance is necessarily subordinated by reason to the nature of the thing in itself.

Thus the question as to how a categorical imperative is possible can be answered to the extent that there can be supplied the sole presupposition under which such an imperative is alone possible — namely, the idea of freedom. The necessity of this presupposition is discernible, and this much is sufficient for the practical use of reason, i.e., for being convinced as to the validity of this imperative, and hence also of the moral law; but how this presupposition itself is possible can never be discerned by any human reason. However, on the presupposition of freedom of the will of an intelligence, there necessarily follows the will's autonomy as the formal condition under which alone the will can be determined. To presuppose this freedom of the will (without involving any contradiction with the principle of natural necessity in the connection of appearances in the world of sense) is not only quite possible (as speculative philosophy can show), but is without any further condition also necessary for a rational being conscious of his causality through reason and hence conscious of a will (which is different from desires) as he makes such freedom in practice, i.e., in idea, the underlying condition of all his voluntary actions. But how pure reason can be practical by itself without other incentives taken from whatever source — i.e., how the mere principle of the universal validity of all reason's maxims as laws (which would certainly be the form of a pure practical reason) can by itself, without any matter (object) of the will in which some antecedent interest might be taken, furnish an incentive and produce an interest which could be called purely moral; or, in other words, how pure reason could be practical: to explain all this is quite beyond the power of human reason, and all the effort and work of seeking such an explanation is wasted.

It is just the same as if I tried to find out how freedom itself is possible as causality of a will. For I [462] thereby leave the philosophical basis of explanation, and I have no other basis. Now I could indeed flutter about in the world of intelligences, i.e., in the intelligible world still remaining to me. But even though I have an idea of such a world—an idea which has its own good grounds—yet I have not the slightest acquaintance with such a world and can never attain such acquaintance by all the efforts of my natural faculty of reason. This intelligible world signifies only a something that remains over when I have excluded from the determining grounds of my will everything that belongs to the world of sense, so as to restrict the principle of having all motives come from the field of sensibility. By so doing I set bounds to this field and show that it does not contain absolutely everything within itself but that beyond it there is still something more, regarding which, however, I have no further acquaintance. After the exclusion of all matter, i.e., cognition of objects, from pure reason which thinks this ideal, nothing remains over for me except such reason's form, viz., the practical law of the universal validity of maxims; and in conformity with this law I think of reason in its relation to a pure intelligible world as a possible efficient cause, i.e., as a cause determining the will. An incentive must in this case be wholly absent; this idea of an intelligible world would here have to be itself the incentive or have to be that in which reason originally took an interest. But to make this conceivable is precisely the problem that we cannot solve.

Here then is the extreme limit of all moral inquiry. To determine this limit is of great importance for the following considerations. On the one hand, reason should not, to the detriment of morals, search around in the world of sense for the supreme motive and for some interest that is conceivable but is nonetheless empirical. On the other hand, reason should not flap its wings impotently, without leaving the spot, in a space that for it is empty, namely, the space of transcendent concepts that is called the intelligible world, and thereby lose itself among mere phantoms of the brain. Furthermore, the idea of a pure intelligible world regarded as a whole of all intelligences to which we ourselves belong as rational beings (even though we are from another standpoint also members of the world of sense) remains always a useful and permissible idea for the purpose of a rational belief, although all knowledge ends at its boundary. This idea produces in us a lively

interest in the moral law by means of the splendid ideal of a universal kingdom of ends in themselves (rational beings), to which we can belong [463] as members only if we carefully conduct ourselves according to maxims of freedom as if they were laws of nature.

Concluding Remark

The speculative use of reason with regard to nature leads to the absolute necessity of some supreme cause of the world. The practical use of reason with reference to freedom leads also to absolute necessity, but only to the necessity of the laws of the actions of a rational being as such. Now it is an essential principle of all use of our reason to push its knowledge to a consciousness of its necessity (for without necessity there would be no rational knowledge). But there is an equally essential restriction of the same reason that it cannot have insight into the necessity either of what is or what does happen or of what should happen, unless there is presupposed a condition under which it is or does happen or should happen. In this way, however, the satisfaction of reason is only further and further postponed by the continual inquiry after the condition. Reason, therefore, restlessly seeks the unconditionally necessary and sees itself compelled to assume this without having any means of making such necessity conceivable; reason is happy enough if only it can find a concept which is compatible with this assumption. Hence there is no fault in our deduction of the supreme principle of morality, but rather a reproach which must be made against human reason generally, involved in the fact that reason cannot render conceivable the absolute necessity of an unconditioned practical law (such as the categorical imperative must be). Reason cannot be blamed for not being willing to explain this necessity by means of a condition, namely, by basing it on some underlying interest, because in that case the law would no longer be moral, i.e., a supreme law of freedom. And so even though we do not indeed grasp the practical unconditioned necessity of the moral imperative, we do nevertheless grasp its inconceivability. This is all that can be fairly asked of a philosophy which strives in its principles to reach the very limit of human reason.

10. [The ensuing example illustrates the fourth case.]
11. [Four different cases have been distinguished in the two foregoing paragraphs. Case 1 involves those actions which are contrary to duty (lying, cheating, stealing, etc.). Case 2 involves those which accord with duty but for which a person perhaps has no immediate inclination, though he does have a mediate inclination thereto (one pays his taxes not because he likes to but in order to avoid the penalties set for delinquents, one treats his fellows well not because he really likes them but because he wants their votes when at some future time he runs for public office, etc.). A vast number of so-called "morally good" actions actually belong to this case 2 — they accord with duty because of self-seeking inclinations. Case 3 involves those which accord with duty and for which a person does have an immediate inclination (one does not commit suicide because all is going well with him, one does not commit adultery because he considers his wife to be the most desirable creature in the whole world, etc.). Case 4 involves those actions which accord with duty but are contrary to some immediate inclination (one does not commit suicide even when he is in dire distress, one does not commit adultery even though his wife has turned out to be an impossible shrew, etc.). Now case 4 is the crucial test case of the will's possible goodness — but Kant does not claim that one should lead his life in such a way as to encounter as many such cases as possible in order constantly to test his virtue (deliberately marry a shrew so as to be able to resist the temptation to commit adultery). Life itself forces enough such cases upon a person without his seeking them out. But when there is a conflict between duty and inclination, duty should always be followed. Case 3 makes for the easiest living and the greatest contentment, and anyone would wish that life might present him with far more of these cases than with cases 2 or 4. But yet one should not arrange his life in such a way as to avoid case 4 at all costs and to seek out case 3 as much as possible (become a recluse so as to avoid the possible rough and tumble involved

with frequent association with one's fellows, avoid places where one might encounter the sick and the poor so as to spare oneself the pangs of sympathy and the need to exercise the virtue of benefiting those in distress, etc.). For the purpose of philosophical analysis Kant emphasizes case 4 as being the test case of the will's possible goodness, but he is not thereby advocating puritanism.]

12. [This is an example of case 3.]

13. [This is an example of case 4.]

14. [This is an even more extreme example of case 4.]

15. [This is an example of case 3.]

16. [This example is a weak form of case 4; the action accords with duty but is not contrary to some immediate inclination.]

17. [This is case 4 in its weak form.]

18. [This is case 4 in its strong form.]

19. [The first proposition of morality says that an action must be done from duty in order to have any moral worth. It is implicit in the preceding examples but was never explicitly stated.]

20. A maxim is the subjective principle of volition. The objective principle (i.e., one which would serve all rational beings also subjectively as a practical principle if reason had full control over the faculty of desire) is the practical law. [See Kant's footnote at Ak. 420–21.]

21. There might be brought against me here an objection that I take refuge behind the word "respect" in an obscure feeling, instead of giving a clear answer to the question by means of a concept of reason. But even though respect is a feeling, it is not one received through any outside influence but is, rather, one that is self-produced by means of a rational concept; hence it is specifically different from all feelings of the first kind, which can all be reduced to inclination or fear. What I recognize immediately as a law for me, I recognize with respect; this means merely the consciousness of the subordination of my will to a law without the mediation of other influences upon my sense. The immediate determination of the will by the law, and the consciousness thereof, is called respect, which is hence regarded as the effect of the law upon the subject and not as the cause of the law. Respect is properly the representation of a worth that thwarts my self-love. Hence respect is something that is regarded as an object of neither inclination nor fear, although it has at the same time something analogous to both. The object of respect is, therefore, nothing but the law — indeed that very law which we impose on ourselves and yet recognize as necessary in itself. As law, we are subject to it without consulting self-love; as imposed on us by ourselves, it is a consequence of our will. In the former aspect, it is analogous to fear; in the latter, to inclination. All respect for a person is properly only respect for the law (of honesty, etc.) of which the person provides an example. Since we regard the development of our talents as a duty, we think of a man of talent as being also a kind of example of the law (the law of becoming like him by practice), and that is what constitutes our respect for him. All so-called moral interest consists solely in respect for the law.

22. [This is the first time in the *Grounding* that the categorical imperative is stated.]

23. [This means that when you tell a lie, you merely take exception to the general rule that says everyone should always tell the truth and believe that what you are saying is true. When you lie, you do not thereby will that everyone else lie and not believe that what you are saying is true, because in such a case your lie would never work to get you what you want.]

24. Pure philosophy of morals (metaphysics) may be distinguished from the applied (viz., applied to human nature) just as pure mathematics is distinguished from applied mathematics and pure logic from applied logic. By this designation one is also immediately reminded that moral principles are not grounded on the peculiarities of human nature but must subsist a priori of themselves, and that from such principles practical rules must be derivable for every rational nature, and accordingly for human nature.

25. I have a letter from the late excellent Sulzer [Johann Georg Sulzer (1720–1779), an important Berlin savant, who translated Hume's *Enquiry Concerning the Principles of Morals* into German in 1755] in which he asks me why it is that moral instruction accomplishes so little, even though it contains so much that is convincing to reason. My answer was delayed so that I might make it complete. But it is just that the teachers themselves have not purified their concepts: since they try to do too well by looking everywhere for motives for being morally good, they spoil the medicine by trying to make it really strong. For the most ordinary observation shows that when a righteous act is represented as being done with a steadfast soul and sundered from all view to any advantage in this or another world, and even under the greatest temptations of need or allurements, it far surpasses and eclipses any similar action that was in the least affected by any extraneous incentive; it elevates the soul and inspires the wish to be able to act in this way. Even moderately young children feel this impression, and duties should never be represented to them in any other way.

26. The dependence of the faculty of desire on sensations is called inclination, which accordingly always indicates a need. The dependence of a contingently determinable will on principles of reason, however, is called interest. Therefore an interest is found only in a dependent will which is not of itself always in accord with reason; in the divine will no interest can be thought. But even the human will can take an interest in something without thereby acting from interest. The former signifies practical interest in the action, while the latter signifies pathological interest in the object of the action. The former indicates only dependence of the will on principles of reason by itself, while the latter indicates the will's dependence on principles of reason for the sake of inclination, i.e., reason merely gives the practical rule for meeting the need of inclination. In the former case the action interests me, while in the latter case what interests me is the object of the action (so far as this object is pleasant for me). In the First Section we have seen that in the case of an action done from duty regard must be given not to the interest in the object, but only to interest in the action itself and in its rational principle (viz., the law).

27. The word "prudence" is used in a double sense: firstly, it can mean worldly wisdom, and, secondly, private wisdom. The former is the skill of

someone in influencing others so as to use them for his own purposes. The latter is the sagacity to combine all these purposes for his own lasting advantage. The value of the former is properly reduced to the latter, and it might better be said of one who is prudent in the former sense but not in the latter that he is clever and cunning, but on the whole imprudent.

28. It seems to me that the proper meaning of the word “pragmatic” could be defined most accurately in this way. For those sanctions are called pragmatic which properly flow not from the law of states as necessary enactments but from provision for the general welfare. A history is pragmatically written when it teaches prudence, i.e., instructs the world how it can provide for its interests better than, or at least as well as, has been done in former times.

29. [That is, why should one let his actions be determined at various times by one or the other of these three kinds of imperatives?]

30. I connect a priori, and therefore necessarily, the act with the will without presupposing any condition taken from some inclination (though I make such a connection only objectively, i.e., under the idea of a reason having full power over all subjective motives). Hence this is a practical proposition which does not analytically derive the willing of an action from some other willing already presupposed (for we possess no such perfect will) but which connects the willing of an action immediately with the concept of the will of a rational being as something which is not contained in this concept.

31. [See Ak. 446–63.]

32. A maxim is the subjective principle of acting and must be distinguished from the objective principle, viz., the practical law. A maxim contains the practical rule which reason determines in accordance with the conditions of the subject (often his ignorance or his inclinations) and is thus the principle according to which the subject does act. But the law is the objective principle valid for every rational being, and it is the principle according to which he ought to act, i.e., an imperative.

33. [This formulation of the categorical imperative is often referred to as the formula of universal law.]

34. [This is often called the formula of the law of nature.]

35. There should be noted here that I reserve the division of duties for a future *Metaphysics of Morals* [in Part II of the *Metaphysics of Morals*, entitled *The Metaphysical Principles of Virtue*, Ak. 417–474]. The division presented here stands as merely an arbitrary one (in order to arrange my examples). For the rest, I understand here by a perfect duty one which permits no exception in the interest of inclination. Accordingly, I have perfect duties which are external [to others], while other ones are internal [to oneself]. This classification runs contrary to the accepted usage of the schools, but I do not intend to justify it here, since there is no difference for my purpose whether this classification is accepted or not.

36. [Not committing suicide is an example of a perfect duty to oneself. See *Metaphysical Principles of Virtue*, Ak. 422–24.]

37. [Keeping promises is an example of a perfect duty to others. See *ibid.*, Ak. 423–31.]

38. [Cultivating one’s talents is an example of an imperfect duty to oneself. See *ibid.*, Ak. 444–46.]

39. [Benefiting others is an example of an imperfect duty to others. See *ibid.*, Ak. 452–54.]

40. [Compare *ibid.*, Ak. 390–94, 410–11, 421–51.]

41. [This is to say, for example, that when you tell a lie, you do so on the condition that others are truthful and believe that what you are saying is true, because otherwise your lie will never work to get you what you want. When you tell a lie, you simply take exception to the general rule that says everyone should always tell the truth.]

42. To behold virtue in her proper form is nothing other than to present morality stripped of all admixture of what is sensuous and of every spurious adornment of reward or self-love. How much she then eclipses all else that appears attractive to the inclinations can be easily seen by everyone with the least effort of his reason, if it be not entirely ruined for all abstraction.

43. This proposition I here put forward as a postulate. The grounds for it will be found in the last section. [See Ak. 446–63.]

44. [This oft-quoted version of the categorical imperative is usually referred to as the formula of the end in itself.]

45. [See Ak. 422–23.]

46. Let it not be thought that the trivial *quod tibi non vis fieri, etc.* [do not do to others what you do not want done to yourself] can here serve as a standard or principle. For it is merely derived from our principle, although with several limitations. It cannot be a universal law, for it contains the ground neither of duties to oneself nor of duties of love toward others (for many a man would gladly consent that others should not benefit him, if only he might be excused from benefiting them). Nor, finally, does it contain the ground of strict duties toward others, for the criminal would on this ground be able to dispute with the judges who punish him; and so on.

47. [This is usually called the formula of autonomy.]

48. I may here be excused from citing instances to elucidate this principle inasmuch as those which were first used to elucidate the categorical imperative and its formula can all serve the same purpose here. [See Ak. 421–23, 429–30.]

49. [This is usually called the formula of the kingdom of ends.]

50. [See Kant, *Critique of Aesthetic Judgment*, §s1–5.]

51. Teleology considers nature as a kingdom of ends; morals regards a possible kingdom of ends as a kingdom of nature. In the former the kingdom of ends is a theoretical idea for explaining what exists. In the latter it is a practical idea for bringing about what does not exist but can be made actual by our conduct, i.e., what can be actualized in accordance with this very idea.

52. [Ak. 400–402.]

53. I count the principle of moral feeling under that of happiness, because every empirical interest promises to contribute to our well-being through the amenity afforded by something, whether immediately and without any reference to advantage or with reference to advantage. Similarly, the principle of sympathy for the happiness of others must with Hutcheson be counted along with the principle of moral sense as adopted by him. [Francis Hutcheson (1694–1746) was Professor of Moral Philosophy in the University of Glasgow, Scotland. He was the main proponent of the doctrine of moral sense.]

54. [The ensuing Third Section is difficult to grasp. Kant expressed himself more clearly regarding the topics discussed there in the *Critique of Practical Reason*, Part I, Book I (“Analytic of Pure Practical Reason”).]

55. I adopt this method of assuming as sufficient for our purpose that freedom is presupposed merely as an idea by rational beings in their actions in order that I may avoid the necessity of having to prove freedom from a theoretical point of view as well. For even if this latter problem is left unresolved, the same laws that would bind a being who was really free are valid equally for a being who cannot act otherwise than under the idea of its own freedom. Thus we can relieve ourselves of the burden which presses on the theory.

56. [Vacant property.]

57. Interest is that by which reason becomes practical, i.e., a cause determining the will. Therefore one says of rational beings only that they take an interest in something; non-rational creatures feel only sensuous impulses. Reason takes an immediate interest in the action only when the universal validity of the maxim of the action is a sufficient determining ground of the will. Such an interest alone is pure. But when reason is able to determine the will only by means of another object of desire or under the presupposition of some special feeling in the subject, then reason takes only a mediate interest in the action. And since reason of itself alone without the help of experience can discover neither objects of the will nor a special feeling underlying the will, the latter interest would be only empirical and not a pure rational interest. The logical interest of reason (viz., to extend its insights) is never immediate, but presupposes purposes for which reason might be used.

G.W.F. Hegel

GW.F. Hegel was born in Stuttgart, Germany, in 1770. He taught at the University of Jena, served eight years as rector at a Gymnasium in Nuremberg and two years at the University of Heidelberg, and taught at the University of Berlin until his death in 1831. Hegel's philosophy is called "Absolute Idealism," the view that all reality is shaped and constituted by the mind. But it is important to see that this kind of idealism is quite different from the subjective idealism of someone like Berkeley. First, the German word for "mind," *Geist*, refers not just to individual minds, but to something that is essentially shared and is realized in what people *do*. It is closer to what we mean by "spirit" when we speak of the "spirit on campus" or a team's "fighting spirit." And, second, instead of denying the existence of matter, Hegel's idealism holds that mind needs a material world in order to be able to express and fulfill itself in a concrete form. In this respect, the "ideas" in this idealism are more like the ordering Ideas in Plato's philosophy than like Berkeley's mental ideas. To say that mind constitutes reality, then, is to say that there is a rational order underlying all reality. Or, as Hegel puts it, "the real is rational and the rational is real."

Hegel's philosophy grows out of Kant's theory in *Critique of Pure Reason*. Kant argued that reality is not something that is simply "out there" waiting for us to try to grasp it, but is instead something that is constituted through our cognitive activity as knowers. The point is that "transcendental apperception," the pure subject, confers form on reality through pure intuition and, most important for Hegel, through the synthesizing power of its concepts. Since our conceptualizing makes possible the objective world we encounter in our experience, we can have knowledge only of "phenomena," that is, things as they appear to us through our concepts.

Hegel draws from Kant the idea that the pure conceptualizing subject (or, as he calls it, the "concept") is the source of the necessary and universal structure permeating all reality. But he rejects Kant's claim that we can never know reality as it is in itself. If we can talk about a reality that is supposedly beyond our comprehension, Hegel says, then we have already comprehended it, and so it *is* known. Thus, there is no room for the notion of a reality that is alien to or totally distinct from the mind. Moreover, Hegel rejects Kant's uncritical assumption that the Newtonian science of his own day was the highest truth to which science could aspire. In Hegel's view, any science that regards the world as consisting of natural kinds simply "out there" in the world is only a temporary stage on the way to true science. Such a view, which Hegel calls "Understanding," will have to give way to "Reason," a more holistic science that grasps the fact that the nature of anything is defined by its relation to what it is not—its "other" or "negation"—within the systematic whole constituted by *Geist*. At the level of Reason, all dualistic oppositions—including those of subject and object, mind and matter, self and others—will be seen for what they are: only partial and distorted manifestations of *Geist*.

The *Phenomenology of Spirit* is supposed to lead us to true science and its recognition of the identity of thinking and being. The book's Introduction begins with a critique of the assumption, fundamental to traditional epistemology, that we are at the most basic levels *minds* attempting to correctly represent an ultimate *reality* (the "Truth," the "Absolute," or the "in itself") presumed to exist totally independent of our minds. Given this subject/object model of our situation, Hegel believes, skepticism is inevitable, for once subject and object are separated, there is no way to find out whether our knowing (regarded as an active tool or a passive medium) is giving us an accurate picture of reality. Despite this problem, however, scientific inquiry keeps making important advances in knowledge, and this seems to suggest that what is problematic is not science, but the uncritical presuppositions built into epistemology's subject/object model.

In order to overcome the subject/object model, it is necessary to work within the confines of science as it is today, within what Hegel calls "apparent science," and to get that science to recognize that it is inadequate by its own criteria. Hegel's conception of knowledge as an appearing, a phenomenon, displays his profound insight into the *historical* nature of knowledge. In his view, history has been characterized by a series of different "shapes" (*Gestalten*) of consciousness, what we today might call "world-views" or "paradigms," which have evolved from the most elementary models to the most sophisticated ones in our contemporary world. What leads consciousness to move from more primitive models to more sophisticated ones is the discovery of internal inconsistencies within the earlier outlooks. This "dialectical" movement will continue, Hegel thinks, until consciousness goes through all possible models of knowledge and arrives at absolute truth (the unity of all reality under the Concept, which he calls the "Idea").

The two excerpted sections of the *Phenomenology* following the Introduction show Hegel's method of immanent critique and determinate negation at work. The section called "Sense Certainty" is especially interesting because it tries to show that the idea of "knowledge by acquaintance"—a knowledge of particulars that is directly "given" in sensory experience—is incoherent. This attack on "the myth of the given" (as it is now called) builds on the assumption that any form of knowledge must be able to formulate its knowledge-claim in such a way that it gives determinate information valid for different times and contexts. The argument then points out that the purely ostensive specification of the known presupposed by sense certainty must take the form of a bare "this— here—now." Such a knowledge-claim will be inadequate by the criteria of genuine knowledge, however, because the indexicals "this," "here," and "now" change their referents depending on context and so cannot provide fixed and determinate information. In order to tie down the meanings of such terms, we would need to say something like *this* red pen is *here*, on so-and-so's desk, *now*, on such-and-such a day and time. But these specifications require the use of concepts or universals, showing that the attempt to understand knowledge must move from immediate sensation to what Hegel calls "perception."

"Mastery and Slavery" appears later in the *Phenomenology* and marks a transition from considering knowledge as the personal undertaking of an individual (as in Descartes) to a social conception of knowledge in which a universal "Reason" is grounded in mutual recognition among subjects. The upshot of the master/slave dialectic is to show that relations based on subordination preclude the possibility of recognition and so must be superseded if the "pure universality of thought" is to be achieved.

• • •

Among the many fine overviews of Hegel's thought are Robert C. Solomon's *In the Spirit of Hegel* (Oxford: Oxford University Press, 1983), Charles Taylor's *Hegel* (Cambridge: Cambridge University Press, 1975), and Robert B. Pippin's *Hegel's Idealism: The Satisfaction of Self-Consciousness* (Cambridge: Cambridge University Press, 1989). Kenneth R. Westphal, *Hegel's Epistemology: A Philosophical Introduction to the "Phenomenology of Spirit"* (Indianapolis: Hackett Publishing Company, 2003) provides insight into Hegel's method. Frederick Beiser's *Cambridge Companion to Hegel* (Cambridge: Cambridge University Press, 1993) is a good collection.

Charles Guignon

*Phenomenology of Spirit**

INTRODUCTION

It is a natural supposition that in philosophy, prior to entering into the matter itself—namely, the actual knowledge of that which truly is — it is first necessary to examine that knowledge either regarded as the tool through which we master the Absolute, or else regarded as the means by which we get a glimpse of it. The concern seems justified, partly because there are different types of knowledge and, among these, one might be more expeditious than the other for reaching this final goal, and thus there could be a wrong choice among them. And this is also partly because—inasmuch as knowledge is a faculty of a specific type and compass — without more precise specifications of its nature and limits, clouds of error could be grasped rather than the heaven of truth. This concern must in fact transform itself into the conviction that the entire starting-point is contradictory in its concept, i.e., that what is in itself can be acquired for consciousness by means of knowledge, and also that there is an absolute divide and boundary between knowledge and the Absolute. For if knowledge is the tool for mastering the Absolute, then it is immediately striking that the application of a tool to any material does not leave it as it was for itself, but rather undertakes a formation and alteration of it. But if knowledge is not a tool of our own making, but to a certain extent a passive medium instead, through which the light of truth reaches us, then too we do not attain to it as it is in itself, but rather the way it is through and in this medium. In both cases we make use of a means, which immediately produces the opposite of its purpose; or rather the contradiction is the fact that we make use of any means at all. It seems indeed that this sorry state of affairs could be remedied through an acquaintance with the ways *the tool* works, for that is what makes it possible in the representation of the Absolute we gain through the tool, to subtract from the result gained with the tool that part which belongs to the tool, and thereby attain the truth in a pure way. However, this improvement would in fact only bring us back where we were before. If we remove from a crafted thing the ways in which a tool has affected it, then the thing—in this case, the Absolute—is for us precisely whatever it was before such a superfluous effort. If through the tool the Absolute is only brought nearer to us generally, without changing anything about it, somewhat like the lime-twig¹ used for catching birds, then it would likely mock this cunning, if it were not in and for itself already with us and did not want to be so. Knowledge would in such a case be cunning, since through its manifold efforts it puts on airs of doing something entirely different than bringing out the immediate and thus effortless relation. Or, if the test of the knowledge that we represent to ourselves as a *medium* teaches us to know the law of its refraction, then it is likewise of no use to subtract it from the result; for it is not the refraction of the beam, but the beam itself through which the truth moves us and that is knowledge, and abstracted from this only the mere direction or the empty locus would be indicated for us.

Meanwhile, if the concern about falling into error brings with it a distrust of science, which, without any such reservations, goes on with the work itself and actually knows things, then it cannot be said ahead of time why the opposite would not apply, that we should mistrust this mistrust, that this fear of error is not itself the error. In point of fact this concern presupposes that something is true, indeed that many things are true, and props its reservations and consequences on these grounds, which have to be tested first as to whether they are the truth. To wit, it presupposes *representations of knowledge as a tool and medium*, and also a *differentiation of ourselves from that knowledge*; but primarily this, that the Absolute stands *on one side* and *knowledge on the other side* for itself and separate from the Absolute, but nevertheless knowledge is something real or true, even though it is outside the Absolute and in fact outside of truth — an assumption by virtue of which that which is called a fear of error can be recognized instead as a fear of the truth.

This consequence derives from the fact that the Absolute alone is true, or that the true alone is absolute. It can be refuted by differentiating a kind of knowledge which is not recognized as Absolute, as science desires it, but is yet true; and knowledge in general, even if it is incapable of grasping the Absolute, is still capable of grasping other truths. But we see right away that such talking back and forth results in a nebulous distinction between something absolutely true and something otherwise true, and then “Absolute,” “Knowledge,” etc., are

words which presuppose a meaning, and establishing that is our first concern.

Instead of concerning ourselves with such useless representations and ways of speaking about knowledge as a tool for grasping the Absolute or as a medium through which we can glimpse the truth, etc., relationships which come at the end of all these representations of knowledge separated from the Absolute, and an Absolute separated from knowledge;—instead of making up excuses which the very incapacity of science itself creates out of the assumptions about such relations, we could be freed from the strains of science and simultaneously give the appearance of a serious and zealous effort, if the use of related terms like “Absolute,” “Knowledge,” “Objective,” and “Subjective” (and countless others whose meaning is assumed to be generally known) could be seen as a deception. And then, instead of plaguing ourselves with answers to all these things, they could be rejected right off as accidental and arbitrary representations. The pretense, partly that the significance of these terms is generally known, and partly that anybody even has the concept of them, seems rather to spare us from the main issue, which is to present this concept. On the contrary, with more justification one could spare the effort of taking any notice of such representations and ways of speaking by means of which we would be protected from science itself; for they only constitute a mere appearance of knowledge, which immediately disappears once science emerges. But science itself, inasmuch as it takes the stage, makes an appearance; its taking the stage is not yet science amplified and extended in its truth. To that extent it is a matter of indifference *that* it presents itself as an appearing, because it takes the stage *alongside another* knowledge, or calls that other untrue knowledge the appearance. Science must liberate itself from this seeming, and it can only do this by turning against it. For science can neither simply discard untrue knowledge as an ordinary view of things, and insure that it is an entirely different [kind of] knowledge and that such knowing is nothing at all as far as science is concerned, nor can it appeal to the intimation of something better in itself. Through such an *assurance* science clarified its Being as power; but the untrue knowing also makes the same appeal, that *it is*, and *assures* that science is nothing as far as it is concerned. *One* bland assurance counts exactly as much as the other. Even less can science invoke the better intuition which is present in the untrue knowledge, and which is therein the pointer toward science, for on the one hand that would once again be invoking a Being; but on the other hand science would be appealing to itself as the manner in which the untrue knowing exists, i.e., a bad manner of its being, and rather appealing to its appearing than the way it is in and for itself. For this reason the presentation of knowing as it appears should be undertaken next.

But since this presentation has as its object only knowing as it appears, this presentation itself does not appear to be free science in its characteristically self-moving form, but from this standpoint it can be taken as the way of natural consciousness, which presses toward true knowledge; or the way of the soul, which traverses the series of its forms as though stations marked out for it ahead of time by its own nature,² so that it might purify itself into spirit, to the extent that it arrives at a recognition of what it is in itself by means of the complete experience of itself.

Natural consciousness will prove to be merely the concept of knowledge, not real knowledge. But to the extent that it considers itself to be unmediated real knowledge, this path has a negative significance for it, and that which is rather a loss of itself counts instead as a realization of the concept; for along this path natural consciousness loses its own truth. For that reason it can be seen as the way of *doubt*, or more properly the way of despair. For along that path what happens is not what is usually understood as doubt—a jogging of this or that presumed truth, whereupon there is an appropriate re-disappearance of the doubt and a return to the truth, so that in the end the matter is understood as it was before. Rather this way is the conscious insight into the untruth of apparent knowledge, for which the unrealized concept is instead what is truly most real. Thus this self-fulfilling skepticism also is not that for which a serious zeal for truth and science had imagined it had prepared and armed itself to gain mastery, namely with the *intention* of proving everything oneself through science and only following one’s own convictions, not giving oneself over to the thoughts of others, on their authority—or better yet, to produce everything oneself and to consider only one’s own activity as true. The series of these forms, which consciousness itself traverses along this path, is really the thoroughgoing history of the *education* of consciousness itself in the direction of science. That intention presents education in a simplistic manner as though the intention immediately made the matter over and done with, whereas this path is really a pursuit against untruth. To follow one’s own conviction is, to be sure, something more than submitting to authority; but the content itself does not necessarily change on account of the reversal—maintaining something on the basis of authority and maintaining it because of one’s own conviction—nor has truth necessarily replaced error. To be stuck in a system of opining or pre-judgments on the basis of the authority of others or out of one’s own conviction is differentiated only by the vanity which dwells in the latter mode. The skepticism which extends to the entire compass of appearing consciousness, in contrast, first renders spirit fit to test what truth is, by bringing to bear a despair of the so-called natural representations,

thoughts, and opinions. It is a matter of indifference whether they are called one's own or come from elsewhere, and with which consciousness, proceeding *straightaway* to proofs, is still filled and burdened, but for that reason it is in fact incapable of that which it wants to undertake.

The *completeness* of the forms of the not-real consciousness will manifest itself through the necessity of their progression and connection. To make this understandable, it can be remarked in general at the outset that the presentation of the not-true consciousness in its untruth is not merely a *negative* movement. Natural consciousness generally has such a one-sided view of not-real consciousness. And any knowledge which makes this one-sidedness into its essence is one of the shapes of such an incomplete consciousness as will occur along the pathway itself and which will eventually show up there. It is skepticism, to be precise, which always sees only *pure Nothing* in the result, and abstracts therefrom, that this Nothing is certainly the Nothing *of that from which it results*. The Nothing, however, taken as the Nothing of that from which it derives, is in fact only the true result. It is therewith itself something *determinate* and it has a *content*. Skepticism, which concludes with the abstraction of the Nothing or with emptiness, can go no further with this, but must await whether and what new thing presents itself, in order to cast it into the same empty abyss. Contrariwise, inasmuch as the result is grasped as *determinate* negation, as it is in truth, a new form has immediately sprung up, and in the negation the transition is made through which the progress over the complete series of forms results of itself.

The *goal*, however, is as necessarily marked out for knowledge as is the series of progressive steps. The goal is the point where knowledge no longer has to surpass itself, where it discovers itself, and where the concept corresponds to the object and the object corresponds to the concept. Progress toward this goal is therefore also unstoppable, and cannot find satisfaction at any earlier station. Whatever is limited to a natural life is incapable of going on its own beyond its immediate existence; but it is driven beyond that through something else, and this "being torn from itself is its death. But consciousness for itself *is its concept*, and therewith immediately a going beyond the limited, and, since that limited belongs to it, going beyond itself. Thus even with the particular the Beyond is also posited, even if it is only *next to* the limited, as in the case of spatial perception. Consciousness therefore suffers this violence coming from within itself, spoiling its limited satisfaction. In the presence of the feeling of this force its anxiety in the face of the truth may recede, and strive to uphold that whose loss is threatened. But it can find no rest: Even if it gets stuck in thoughtless inertia, thought encroaches on thoughtlessness, and its restlessness disturbs inertia. Or if it fortifies itself as sensitivity, which insures that it will find everything *good after its own kind*, this insurance suffers a parallel violence from reason, which, on just those grounds, finds something that is not good, namely the fact that it is only a "kind." Or else fear of the truth may lead this fear to hide from itself and others behind seeming, as though precisely the heated fervor for truth makes it so difficult, in fact impossible, to find any other truth than that of vanity, and these thoughts are at least more clever than those which somebody has from himself or from somebody else. This vanity, which knows how to make every truth vain and thus returns back to itself on the basis of that, and ruminates on this its own understanding, which always knows how to dissolve all thoughts and to find the dry Ego instead of any content — this vanity is a satisfaction for which it must be left to itself, for it flees the universal and seeks only that which is for itself.

Since this has been said in a preliminary and general way about the manner and necessity of the progression, it could be helpful to remind ourselves of the *method of explication*. This presentation as the *posture of science* toward *apparent knowledge*, represented as the *investigation and testing of the reality of recognition*, apparently cannot take place without some presupposition underlying it as its *measure*. The test consists in laying down the accepted measure and in the resulting equality or inequality of that which is being tested, and therewith the decision whether it is correct or incorrect; and the measure in general, and likewise science, if it were the measure, is thereby taken to be the *essence* or *the in-itself*. But here, where science first comes upon the stage, it has justified neither itself as the essence or the in-itself, nor anything else; and without some such thing no proof can apparently take place.

This contradiction and its disposal will become more determinate when we first remember the abstract determinations of knowledge and of truth, as they come before consciousness. Consciousness, namely, *distinguishes* something from itself, to which it is simultaneously *related*; or as this takes on expression, it is something *for consciousness*, and the determinate side of this *relation*, or of the *Being* of something *for a consciousness* is *knowledge*. From this Being for an other, however, we distinguish the *Being-in-itself*, and that which is related to knowledge is likewise distinguished therefrom and posited as *being* even outside this relationship; this side of the in-itself is called *truth*. What may actually be in these determinations does not concern us any further here; inasmuch as appearing knowledge is our present object, its determinations are at first taken up as they immediately present themselves; and in that way they likely do present themselves just about as they are grasped.

If we now investigate the truth of knowledge, it seems that we investigate what it is *in itself*. But in this investigation it is *our* object, it is *for us*; and its *in-itself*, which manifests itself, would instead be its Being *for us*. What we would maintain to be its essence is instead not its truth, but only our knowledge of the object. The essence, or the measure, would fall within us, and that which is supposedly contrasted with it and which should be decided by means of that contrast, does not have to recognize that.

But the nature of the object we investigate spares us this separation—or this seeming separation—and presupposition. Consciousness finds its measure within itself, and the investigation thereby becomes a comparison of itself with itself; for the investigation just undertaken falls within itself. There is in it something which is *for an other*; in other words, it has in general the determination of the moment of knowledge in itself; at the same time for consciousness this other is not only *for it*, but also outside this relation or *in itself*: the moment of truth. We do have the measure for what consciousness clarifies within itself as the *in-itself* or the *true*, which it itself establishes as something to measure its knowledge against. If we call *knowledge* the *concept*, but refer to the essence or the *true* as the Being or the *object*, then the test consists in making sure that the concept corresponds to the object. But if we call *the essence* or the *in-itself of the object* the concept, and instead understand by *object*, i.e., as it is *for another*, then the test consists in making sure that the object corresponds to its concept. One can probably see that both are the same; but it is essential to hold fast to this for the entire investigation, so that both these moments, *concept* and *object*, *being-for-another* and *being-in-itself* themselves fall within the knowledge that we are investigating. For this reason it is not necessary for us to bring along measures and apply *our* brainstorm and thoughts in the investigation; and by virtue of the fact that we leave these aside, we arrive at the point that we observe the thing as it is *in and for itself*.

But it is not only from this angle that any additional contribution from us is superfluous — that concept and object, measure and the thing to be tested, are both present in consciousness itself. But we are also spared the effort of comparing the two and of the actual *testing*, so that, to the extent that consciousness tests itself, from this angle also the only thing remaining is merely to watch what happens. For consciousness is on the one hand consciousness of the object and on the other hand consciousness of itself; consciousness of that which is true for it and consciousness of its knowledge thereof. Inasmuch as both are *for the same*, namely consciousness, it itself is their comparison; it comes to be *for the same*, whether its knowledge of the object corresponds to that or not. For consciousness the object seems in fact to be only as it knows it; and it seems as though it cannot get behind the way the object is *not for consciousness*, but the way it is *in itself*; and therefore it also cannot test its knowledge therewith. But precisely because it is aware of an object at all, the distinction is already at hand, so that for it the *in itself* is a different moment, whereas knowledge or the Being of the object is *for* consciousness. Testing rests on this differentiation, which is at hand. If neither of these corresponds to the other, then it seems that consciousness must change its knowledge, in order to make it fit the object; but in the changing of the knowledge, the object itself in actuality changes for consciousness; because the knowledge at hand was essentially a knowledge of the object; and with this knowledge the object too becomes something different, because it belonged essentially to this knowledge. It thus develops for consciousness that what for it was previously *in itself* is not *in-itself*, or that it was only an *in-itself* for it. Since it thus finds that its knowledge does not correspond to the object, the object does not persist either. In other words the measure of the test is changed, when that whose measure it was supposed to be does not survive the test. And the test is not only a test of knowledge, but also of the measure.

This *dialectical* movement, which consciousness exercises on itself—on its knowledge as well as on its object — *to the extent that the new true object arises* from it, this is actually that which is called *experience*. It is in this connection that a moment is to be highlighted in the above-mentioned course of things, through which a new light will spread on the scientific side of the following presentation. Consciousness knows *something*, and this object is the essence or the *in-itself*; but it is also the *in-itself* for consciousness, and therewith enters the ambiguity of this truth. We see that consciousness now has two objects, the one is the first *in-itself*, the second is the *being this in-itself for consciousness*. The latter seems at first to be only the reflection of consciousness into its own self, a representation, not of an object, but only of its knowledge of the object. However, as was previously shown, the first object changes itself thereby for consciousness; it stops being the *in-itself* and becomes for it something which is an *in-itself* only *for it*; but then it results that *the being-in-itself of this for-it* is the *true*, but that means this is the *essence*, or its *object*. This new object contains the nullity of the first, the object is now the experience attained on the basis of the former.

In this representation of the course of experience there is a moment which makes it seem that it does not conform to what is usually understood by experience: The transition, namely, from the first object and the knowledge of it, to the other object, *in reference to which* one says that experience has been established, was presented as though the knowledge of the first object — i.e., the *for-consciousness* of the first *in-itself*—

should become the second object itself. Contrariwise it would seem that we establish the experience of the untruth of our first concept *on the basis of another* object, which we somehow find by chance and on the outside, so that the only thing that falls within us is the pure *grasping* of that which is in and for itself. In that regard, however, the new object is manifested as having come into being through a *reversal of consciousness* itself. This view of the matter is our contribution, whereby the series of experiences of consciousness elevates itself into a scientific progression, but that does not exist for the consciousness which we observe. In actuality this is the same circumstance which was earlier discussed with regard to the relation of this presentation to skepticism, namely, that the regular result that eventuates in the case of any untrue knowledge can never flow together into an empty nothing, but rather must be understood as the nothing of *that thing*, whose *result* it is; a result, which retains the truth which the prior knowledge had within it. This presents itself here in such a way that, whatever at first it seemed to be, for consciousness the object sinks to the level of our knowledge of it, and the *in-itself* becomes a *being-for-consciousness* of the *in-itself*. And this is the new object whereby a new form of consciousness takes the stage, for which something other than the previous object is the essence. It is this circumstance which guides the entire sequence of the forms of consciousness in its necessity. It is only this necessity itself, or the *genesis* of this new object, which presents itself to consciousness, without its knowing how that happens to it, which occurs for us as though it were behind our back. There comes thus into its movement a moment of the *being-in-itself* or of *being-for-us* which does not present itself for consciousness, which is grasped in experience itself. But the *content* of that which comes to be for us is *for it*, and we only grasp the formal aspect of it, or its pure genesis; *for it* this thing that has come to pass is only an object, but *for us* it is simultaneously motion and becoming.

Through this necessity, this way to science is itself already *science*, and according to its content it is thus the science of the *experience of consciousness*.

That experience which consciousness gains concerning itself can, by virtue of its concept, grasp and conceive nothing less than its entire system, i.e., the entire realm of the truth of Spirit, so that the moments of that truth present themselves in this peculiar determinateness, not as abstract, pure moments, but as they are for consciousness; or as consciousness itself takes the stage in its relation to them, whereby the moments of the whole are *forms of consciousness*. To the extent that consciousness presses on to its true existence — it will reach the point at which it lays aside its seeming, burdened with something strange that is only for it and only as something other than it—where the appearing is the same as the essence, and where its presentation thus corresponds with exactly this point of the actual science of Spirit. And finally, inasmuch as consciousness itself grasps this Being, it will itself characterize the nature of absolute knowledge.

Sense Certainty, or the “This” and “Opining”³

That knowledge which is our first and unmediated object can be nothing other than that which is itself unmediated knowledge, *knowledge* of the *immediate* or *the existent*. We must likewise conduct ourselves in an unmediated and receptive manner, thus changing nothing in the way that the object presents itself, keeping a distance between the apprehending and the conceiving of it.

The concrete content of sense certainty makes sense certainty appear unmediated as the richest cognition, indeed as a cognition of infinite richness, for which we can find no limit, whether we go outward into the space and time where this content extends or whether we go inward into it by taking a piece of its fullness and dividing it off. Sense certainty, moreover, appears as the most truthful cognition, for it has not yet neglected any part of the object, but has it in its complete totality in front of itself. This certainty, however, in fact presents itself as the most abstract and poorest *truth*. Of the object which sense certainty knows, it only declares the following: It *is*; and its truth contains only the *being* of the thing; consciousness, on its side, is present in this certainty only as pure *ego* [*I*],⁴ or *I* am therein only as a pure *this* and the object likewise is present only as *this*. I, *this one*, am therefore certain of *this thing*, not because *I* as consciousness developed myself along with it and affected the thought in many ways. Also not because the thing of which I am certain would be a rich relation to itself by virtue of a host of varied characteristics, or a multiple relation to other things. Neither of these concern the truth of sense certainty: Neither *I* nor the thing has therein the meaning of a manifold mediation. The *I* does not have the meaning of a manifold representation or thought, nor has the thing the meaning of manifold characteristics; but rather the thing *is*; and it *is* only because it *is*; it *is* and that is what is essential for sense knowledge, and this pure *Being* or this simple immediacy constitutes its *truth*. Likewise certainty as relation is *immediate relation*; consciousness is *I*, nothing more, a pure *This*; the *individual* knows a pure *this*, or *the individual*.

With regard to *pure Being*, however, which constitutes the essence of this certainty, and which it declares as its truth, many other things also play a role, if we pay attention to them. An actual sense certainty is not only this pure immediacy, but an example of the immediacy. Among the countless differences that arise, we encounter on all sides the main differentiation, namely that the two aforementioned “this’es” right away stand out from pure being: a *this* as *I* and a *this* as *object*. But if *we* reflect on this difference, it turns out that neither the one nor the other is merely *immediate* in sense certainty, but is simultaneously *mediated*: *I* have this certainty *through* something else, namely through the thing; and this thing is likewise a certainty *through* something else, namely through the *I*.

It is not only we who make this distinction between essence and example, between immediacy and mediation, but we find it in sense certainty itself; and it is to be taken up in the form in which the distinction exists in sense certainty, not the way we just determined it. One thing is posited in sense certainty as the simple immediate being, as the essence, the *object*; whereas the other is posited as the inessential and mediated, which thus is not *in itself*, but through something else — *I*, a *knowledge*, that knows the object only because it is, but which could either be or not be. The object, however, *is*, it is the true and the essence: It *is*, regardless whether it is known or not known, it remains, even if it is not known; but there is no knowledge unless the object exists.

The object therefore is to be considered as to whether in sense certainty itself it is in fact the sort of essence as which sense certainty presents it; whether this its concept of being an essence corresponds to the way that concept is present to sense certainty. To that end we do not have to reflect about it and ponder what it might be in truth, but only consider the way that sense certainty has it in itself.

Sense certainty itself must be asked: *What is the “this”?* If we take it in the doubled form of its Being, as the “Now” and the “Here,” then the dialectic which develops out of this Being will take a form which is just as understandable as that Being itself is. To the question “*What is the ‘Now’?*” we might answer, for example, *The “Now” is the night*. To test the truth of this sense certainty a simple experiment is sufficient. We make a note of this truth — a truth can lose nothing by being written down, just as it loses nothing by being preserved. And if now at this noontime we look again at this truth we wrote down, then we have to say that the truth we wrote down, the night, has become stale.

The Now which is night is preserved—i.e., it is treated as that as which it was presented, as a *Being*, but it shows itself rather as a not-being thing. The “Now” itself maintains itself indeed, but as something which is not Night; likewise that “Now” maintains itself as over against the day, which it is now, as something which is

also not day: or as a *negative* in general. This self-maintaining “Now” is therefore not something immediate, but something mediated; for as something persisting and self-maintaining it is determined through the fact that something else, the day and the night, are not. Nevertheless it is just as simply as it was before *Now*; and in this simplicity it is a matter of indifference what is at play, just as little as the night and the day are its Being, it is also the case that it is night and day; it is not at all affected by this its otherness. Such a simple thing, which is through negation neither this nor that—a *Not-this*, and just as indifferent whether it is this or that—we can call a *universal*, and the universal is therefore in fact the truth of sense certainty.

We also *express* the sensible as a universal: What we say is: *This*, i.e., the *universal This*; or: *it is*, i.e., *Being in general*. By this, to be sure, we do not *represent* to ourselves the universal “This” or Being in general, but we express the universal. In other words, we do not say exactly what we *opine* in this sense certainty. Language, however, is, as we see, more truthful: In language we ourselves immediately contradict our *opinion*, and since the universal is the truth of sense certainty, and language is only expressing this truth, it is entirely impossible that we can ever express the sensuous being that we *opine*.

The same will be the case with the other form of the “This,” with the “Here.” The “Here,” for example, is a *tree*. I turn around and this truth has disappeared and has changed into its opposite. The “Here” is not a *tree*, but rather a *house*. The “Here” itself does not disappear; but *it is* permanently in the disappearing of the house, the tree, and so on, and it is indifferent to its being whether it is a house or tree. The “This” therefore again shows itself as *mediated simplicity*, or as *universality*.

For this sense certainty — showing in itself that the universal is the truth of its object — *pure Being* remains its essence, not as immediate, however, but rather as the sort for which negation and mediation is essential. And thus sense certainty does not show itself as that which we *opine* as *Being*, but rather *Being* together with the *determination* that it is the abstraction or the purely universal. And *our opinion*, for which the truth of sense certainty is not the universal, is the only thing left over against this empty or indifferent “Here” and “Now.”

If we compare the relation in which *knowledge* and the object first showed itself with the same relation as it stands in this result, it has reversed itself. The object, which was supposed to be the essential, is now the inessential of sense certainty. The Universal, which the object has become, is no longer the sort of thing which is essential for sense certainty. Rather it is now present in the opposed, in that which was previously the inessential, namely the knowledge. Sense certainty’s truth is in the object as *my* object, or in the *mine*, the *opined*. It is because *I* know about it. Sense certainty is therefore actually driven out of the object, but not eliminated thereby, but only driven back into the *I*. It remains to be seen what experience will show us about this reality.

Thus the force of the truth of sense certainty is now located in the *I*, in the immediacy of my *seeing*, *hearing*, and so on. The disappearance of the individual “Here” and “Now,” which we opine, is held off by virtue of the fact that *I* hold it fast. The “Now” is *day*, because I see it; the “Here” is a *tree* for the same reason. Sense certainty experiences in this relation, however, the same dialectic as in the previous case. *I*, *this I*, see the tree and *insist that the tree is the “Here”*; but *another I* sees the house and asserts that the “here” is not a tree but rather a house. Both truths have the same confirmation, namely the immediacy of seeing, and the certainty and assurance of both about their knowledge; but the one disappears in the other.

What does not disappear in all of this, is *I* as a *universal*, whose seeing is neither a seeing of the tree nor of this house, but simple seeing, that mediates through the negation of this house and so on, which is just as simple and indifferent in relation to that which plays out here, as it was in relation to the house and the tree. *I* am only a universal, just like “Now,” “Here,” or “This” in general; I opine, to be sure, an *individual I*, but as little as I can express what I opine by “here” and “now,” no more can I express of “I.” To the extent that I say “*this Here, Now*” or an *individual*, I am saying *all this’es, all here’s, now’s, individuals*. Likewise by saying, *I, this individual I*, I say in general: *all Is*. Everybody is that which I say: *I, this individual I*. If this demand is presented to science as its touchstone—something which science absolutely could not endure—to deduce, to construct, to discover a priori a so-called *this thing* or *this human being* or whatever one wants to call it, then it is fair that the demand would *specify*, which *this* thing or which *this I* is meant; but it is impossible to express this.

Sense certainty thus experiences that its essence is neither in the object nor in the *I*, and that the immediacy is neither an immediacy of the one nor the other, for in both cases that which I opine is rather something inessential, and the object and the *I* are universals, in which the particular Here and Now and *I* which I opine, does not remain constant, or *they are not*. And so we come to the point of positing the *entirety* of sense certainty itself as its *essence*, no longer only one of its moments, as happened in both cases, wherein at first the object set in opposition to the *I* should be its reality, and then the *I*. It is thus only the *entire* sense

certainty itself which is steadfast as *immediacy*, and thus excludes all the opposition which occurred in the foregoing.

This pure immediacy therefore does not concern the otherness of the “here” as tree, which changes into a “here” that is non-tree, the otherness of the “now” as day, which becomes the “now” which is night, or another I for which something else is the object. The truth of sense certainty maintains itself as a relation which remains the same for itself, which doesn’t differentiate between essentiality and inessentiality, between the I and the object, and in which therefore no difference whatsoever can intrude. I, this [I], therefore assert the here as a tree, and do not turn around, so that the here would become a non-tree. And I take no notice of the fact that another I sees the “here” as non-tree, or that I myself, at another time, take the “here” to be non-tree, and the “now” as non-day, but I am pure intuition. I, for my part, remain steadfast whether the “now” is the day or the “here” is a tree, and I for my part do not compare the here and now one with the other. But I hold steadfast to the immediate relation: The now is day.

Since this certainty does not want to step forward when we want to call its attention to a “now” which is night or an “I” for which it is night, then we step up to it and let ourselves be shown the “Now” that is asserted. We must let ourselves be shown because the truth of this immediate relation is the truth of *this* I, which confines itself to one “*Here*” and one “*Now*.” If we wanted to take up this truth *later*, or stand *at a distance* from it, then it would have no meaning, since we would have eliminated the immediacy which is essential to it. We must therefore enter into the same point of space and time, show it to ourselves, and let ourselves be transformed into the same “this I” which is the one knowing with certainty. We thus see how the immediate which is shown to us is constituted.

The “*now*” is indicated: *This now. Now!* it has already ceased to be. Inasmuch as it is pointed to, the *now* that *is* is another one from the one that was indicated, and we see that the “now” is precisely this one, to the extent that it already is no more. The “now” as it is indicated to us is something which *has been*; and this is its truth. It does not have the truth of Being. But what is still true, is that it has been. But what *has been* is in fact no *essence*; *it is not*, and the issue was Being.

In this exhibition we thus see only a movement and the following unfolding: (1) I point to the “now” and it is asserted as the truth; but I exhibit it as something which has been, or something lifted and I thus lifted the first truth;⁵ (2) I now assert the I as the second truth, that it *has been* lifted; (3) But that which has been is not; I lift the having been or having been lifted, the second truth, and negate therewith the negation of the “now,” and thus return to the first assertion: that “*now*” is. The “now” and the exhibition of the “now,” therefore, is so constituted that neither the “now” nor the exhibition of the “now” is an unmediated simple, but a movement which has different moments in it: *This* is posited, but more than that *an other* is posited, i.e., the *This* is lifted. And this *being-other* or lifting of the first is itself *in turn lifted* and thus returns to the first. But this first thing reflected into itself is not exactly the same as it was at first, namely something *immediate*; but it is something *reflected into itself* or *simple*, which remains what it is in its otherness; a “now,” which is absolutely many “now’s,” an hour is also many minutes, and this “now” is likewise many “now’s” and so forth.—The exhibition is therefore itself the movement which it expresses, which is the “now” in truth; namely a result or a multiplicity of “now’s” grasped together; and the exhibition is the experiencing that “now” is *universal*.

The *here pointed to*, which I hold steady, is likewise a *this* here, which in fact is *not this* here, but a before and behind, above and below, right and left. The above is likewise this manifold otherness by virtue of being above, below, and so forth. The here which was supposed to be exhibited disappears in another here. But the exhibited disappears as well, that which is held fast and remains, is a *negative this*, which is only to the extent that the here’s are taken as they should be, but to that extent they are themselves lifted. It is a simple complex of many here’s. The “here” that is opined would be the point; however, it *is not*, but to the extent that it is exhibited as being, the exhibiting exhibits itself, not immediate knowledge, but a movement beginning with the opined “here” and going through the many here’s into the universal “here,” which, just as the day is a simple multiplicity of “now’s,” so this is a simple multiplicity of “here’s.”

It becomes clear that the dialectic of sense certainty is nothing other than the simple history of its movement or its experience, and sense certainty itself is nothing other than this history alone. Natural consciousness therefore also comes to this result, that what is true about it is always absent itself and just that constitutes the experience about it; but then it always forgets it again, and begins the movement once again from the beginning. It is therefore remarkable whenever, over against this experience, it is proposed as universal experience—even as a philosophical assertion, and indeed as the result of skepticism—that the reality or being of external things as *this* or as sensuous holds absolute truth for consciousness. Such an assertion at the same time doesn’t realize what it is saying, doesn’t realize that it is saying the opposite of what

it is trying to say. The truth of the sensuous *this* for consciousness is supposed to be universal experience. But actually universal experience is the opposite: All consciousness itself lifts such a truth as, for example, *the “here” is a tree*, or *the “now” is midday*, and expresses the opposite: The “here” is *not* a tree, *but rather* a house. And what in this first lifting assertion is once again an assertion of a sensuous this, that too is lifted right away. And in all sense certainty only that is experienced which we have seen, namely that *this* is assured as a *universal*, the opposite of that which such a claim insures as universal experience. —

With this appeal to universal experience it may be permitted to anticipate the consideration of the practical. In this respect it can be said to those who assert that truth and certainty of the reality of sensuous objects, that they are to be referred back to the lowest school of wisdom, namely the Eleusinian mysteries of Ceres and Bacchus, and that they first have to learn the secret of eating bread and drinking wine: for he who is initiated into these mysteries not only comes to doubt the being of sensuous things, but at a despair of them; and accomplishes in them partly their very nullity, and partly he sees them completed. Even the animals are not excluded from this wisdom, but prove themselves rather to be initiated in them in the deepest degree, for they do not stick with the sensuous things as existing themselves, but, despairing of this reality and in complete certainty of their nullity, they reach out for them and devour them; and all of Nature celebrates these revealed mysteries which teach this, which is the truth of sensible things.

But even those who put forward such an assertion, in accordance with the previous remarks, also immediately say the opposite of that which they opine; a phenomenon perhaps the most capable of getting us to ponder the nature of sense certainty. They speak of the existence of *external* objects, which can be more precisely determined as *actual*, absolutely *particular*, *entirely personal*, *individual* things, of which each no longer has its absolute equal; as if this existence has absolute certainty and truth. They opine *this* piece of paper on which I am writing *this*, or rather I have written it; but what it is that they opine, that they do not say. If they really wanted to *say* this piece of paper which they opine, and they wanted to *say* that, this would be impossible, because the sensuous This that is opined is inaccessible to language, which belongs to consciousness, which is in itself universal. In the actual attempt to say it, it would thus decay: Those who have undertaken its description could never complete it, but would have to leave it to others, who would in the end have to admit that they are speaking of a single thing that *is not*. They may very well opine *this* piece of paper, which is here entirely different from the previous one; but they express actual *things*, *external* or *sensuous objects*, *absolutely individual essences*, and so forth, that is, they say of them only the *universal*; and therefore that which is called the unspeakable is nothing other than the untrue, the irrational, the merely opined.

If nothing further is said about something than that it is an *actual thing*, an *external object*, then it is only expressed as the entirely universal, and thus what is expressed is its sameness with everything else rather than its differentiation, for every thing is a single thing; and likewise *this* thing is anything that anyone wants it to be. More precisely characterized, as *this piece of paper*, every and each piece of paper is a *this* piece of paper, and I have in each case only said the universal. But if I want to come to the aid of speaking — speech which has the divine nature of immediately inverting opinion and making it into something else—and thus not have speech even *get a word in*, so that I *point to* this piece of paper, then I have the experience of what the truth of sense certainty in fact is: I point to it as a *here*, which is a here of other here's, or in itself a simple togetherness of many here's, i.e., a universal. I take it up as it is in truth, and instead of knowing it as something immediate, I perceive it.⁶

Sense certainty was undermined because the “here and now” constantly change, and what remained certain was we, the observers, not the external world. The next move of consciousness is to stipulate something that remains constant despite all these fluctuations, a thing-in-itself. Sense certainty is replaced by self-certainty. In becoming self-conscious, consciousness recognizes the importance of Desire in two regards. Desire is reflective, making me aware of myself as desiring, but it is always of something or someone, making me aware of the Other. Desire is a desire for mastery of Nature. Because of impediments, however, Desire is deflected into a master of other human beings. Thus the master/slave relation is an aberration, a temporary state over which freedom will ultimately triumph. —A.T. and J.H.S.

Mastery and Slavery

A. Independence and Non-independence of Self-Consciousness: Mastery and Slavery

Self-consciousness is, *in-and-for-itself*, thereby and to the extent that it is *in-and-for-itself for an Other*, that is, it exists only as something recognized.⁷ The concept of this its unity in its duplication, of the infinity which realizes itself in self-consciousness, has many sides and many meanings, so that its moments must be kept precisely separate on the one hand, but must in this differentiation simultaneously be kept as undifferentiated on the other hand — or they must always be understood and recognized in their opposed meanings. The double meaning of the differentiated lies in the essence of self-consciousness as being infinite, or as immediately the opposite of the determinateness in which it is posited. The exposition of the concept by taking apart the spiritual unity in its duplication presents us with the motion of recognition.

There is another self-consciousness *for* self-consciousness; it has come out of itself. This has a double meaning: First of all, it has lost itself, since it discovers itself to be *another* essence; second, it has thereby lifted the other, for it does not see the other as an essence, but it sees itself in the other.

It must therefore lift this its otherness: This is the lifting of the first double meaning, and therefore it is itself a second double meaning. First, it must be concerned with lifting the other independent essence, in order thereby to be certain of its own independent essence; secondly, this is a matter of lifting its [own] self, because this other is its self.

This double-sensed lifting of its double-sensed otherness is likewise a double-sensed return into itself; for, first, it gets itself back through this lifting, since it again becomes equal to itself by lifting this otherness. Secondly, however, the other self-consciousness gives back equally in turn, for it was for itself in the other, it lifts this *its* being in the other, and thus also lets the other [go] free.

This movement of self-consciousness in relation to an other self-consciousness is represented, however, as the activity of the one; but this activity of the one has itself the double meaning of being *his* activity just as much as the activity of the other; for the other is equally independent and self-contained, and there is nothing in it which has not come about through it itself. The first does not have the object before it merely as it was for Desire, but as an [object] which exists for itself independently, concerning which it is therefore unable to do anything unless it does the same in itself which the other does to it. The movement, therefore, is simply the double movement of both self-consciousnesses. Each sees *the other* do what *he* does; and each does himself what the other demands; and he therefore does that which he does only to the extent that the other does the same: [for] one-sided activity would be pointless, since that which is supposed to happen can only come about through both of them.

This activity therefore is not only double-sensed to the degree that it is activity equally *toward itself* and *toward the other*, but also to the degree that it is inseparably as much *the activity of the one* as of *the other*.

In this movement we see the process repeating itself which was earlier exhibited as the “play of forces,” but now in consciousness. That which was *for us* in the former is here true for the extremes themselves. The middle term⁸ is self-consciousness, which diffuses itself into the extremes, and each extreme is this exchange of its own determinateness and an absolute transition into its opposite. As consciousness, however, it surely comes *outside itself*, and nevertheless is simultaneously held back *for itself*, in its *being-outside-itself*, and its *outside-itself* is *for it*. It is for it that it *is* and *is not* immediately another consciousness; and likewise this other is only for itself, inasmuch as it lifts itself as *being-for-itself*, and is *for itself* only in the *being-for-itself* of the other. Each is the middle for the other, through which each mediates itself with itself and merges with itself, and each is to itself and to the other an immediate Essence *being-for-itself*, which simultaneously is only *for itself* by virtue of this mediation. They recognize one another as mutually recognizing one another.

This pure concept of recognition, of the duplication of self-consciousness in its unity, is now to be observed in the way its process appears for self-consciousness. It will first exhibit the side of the inequality of both, the emergence of the middle into the extremes, which, as extremes, are opposed to one another, so that the one is only the recognized and the other only the recognizing.

Self-consciousness is, first of all, simple *being-for-itself*, self-identical through the exclusion *from itself* of everything *other*; its essence and absolute object is, for it, *the I*; and it is an individual in this immediacy, that is in this *being* of its *being-for-itself*. What[ever] is *Other* for it is an object characterized as unessential, with the character of the negative. But *the Other* is also self-consciousness; it emerges as an individual over against an

individual. Emerging in such immediacy, they *are* for one another in the manner of ordinary objects, independent shapes, individual consciousnesses immersed in the *Being of Life* — for the being Object determines itself as life. They have not yet completed *for-[one]-another* the movement of absolute abstraction, destroying all immediate Being, being only the pure negative Being of self-identical consciousness—that is, they have not yet represented themselves to one another as pure *being-for-itself*, i.e., as *self-consciousness*. Each is no doubt sure of itself, but not of the other, and therefore its own self-certainty does not yet have any truth; for its truth would only consist in its having its own *being-for-itself* as an independent object, or—what amounts to the same thing—as if the object had presented itself as this pure certainty of its own self. But this, according to the concept of Recognition, is not possible unless each is for the other what the other is for him, and each is itself as such through its own activity, and through the activity of the other, in turn, it accomplishes this pure abstraction of *being-for-itself*.

The presentation of itself as the pure abstraction of self-consciousness, however, consists in showing itself as the pure negation of its objective mode— or in showing that it is not tied to any determinate *existence*, nor to the universal particularity of existence in general, i.e., that it is not tied to Life. This presentation is a double activity—activity of the other and activity through itself. To the extent that it is activity of the other, each aims at the death of the other. But therein the second activity is also present, activity on its own: for the former includes risking its own life. The relationship of both self-consciousnesses, therefore, is determined in such a way that they test themselves and each other through a life-and-death struggle. —They must enter into this struggle because they must elevate their certainty of themselves, of *being-for-themselves*, into a truth with regard to the other and with regard to themselves. And it is only through the risking of life that there is freedom, and it is thus proved that, for self-consciousness, it is not *Being*, not the immediate mode in which it appears, not its submergence in the expanse of Life—the Essence—but rather there is nothing present in it which would not be for it a vanishing moment, that it is only pure *being-for-itself*. Any individual that has not yet risked its life can be recognized as a *person* to be sure; but it has not attained to the truth of this being recognized as an independent self-consciousness. Likewise, each must aim at the other's death, inasmuch as it risks its life; for the other no longer counts for him as itself; its essence presents itself to him as an other, it is outside itself; it must lift its *being-outside-itself*; the other is multiply ensnared, and *being consciousness*; it must view its *being other* as pure *being-for-itself* or absolute negation.

This trial by death, however, also lifts the truth which was supposed to proceed from it, and so too is lifted the certainty of itself in general; for just as life is the *natural* position of consciousness, independence without absolute negativity, just so [death] is its *natural* negation, negation without independence, which therefore remains even without the required significance of recognition. It is through death in fact that the certainty has come about that both risked their lives, and each disdained life, both his own and that of the other; but not for those who survived this struggle. They lift their consciousness, posited in this alien essentiality which is natural existence; or they lift themselves and are lifted as extremes wanting to be *for themselves*. But therewith disappears from the play of change the essential moment, that of diffusing into the extremes of opposed determinations. And the middle collapses into a dead unity, which is broken up into dead, merely existing, non-contrary extremes; and neither of them gives or receives the other reciprocally through consciousness, but rather they leave each other free, but indifferently so, like things. Their activity is abstract negation, not the negation of consciousness, which lifts in such a way that it preserves and upholds the lifted, and in this way survives its becoming lifted.

In this experience it becomes clear to self-consciousness that life is as essential to it as pure self-consciousness. In immediate self-consciousness the simple *I* is the absolute object, which, however, *for us* or *in itself*, is absolute mediation, and has enduring independence as its essential moment. The dissolution of that simple unity is the result of the first experience: There is posited through it a pure self-consciousness, and also a consciousness which is not purely *for itself*, but *for another*—that is, as *existing* consciousness or consciousness in the form of *thinghood*. Both moments are essential: Since they are, to begin with, unequal and opposite, and their reflection into unity has not yet been achieved, they exist as two opposed shapes of consciousness — the one independent, for which the essence is *being-for-itself*, the other non-independent, for which the essence is *life* or *being-for-another*. The former is the master, the latter the slave.

The master is consciousness as being *for itself*, but no longer only as the concept thereof; but rather consciousness as *being* for-itself, is mediated with itself through an *other* consciousness, namely through one whose essence entails that it is synthesized with independent Being or with thinghood in general. The master is related to both these moments: to a thing, as such, the object of desire; and to consciousness, for which thinghood is the essence. And to the extent that he, the master, (a) is immediate relation of *being-for-itself* as the concept of self-consciousness, but (b) now he is at the same time mediation, or *being-for-itself*, which is for

itself only by virtue of an other; therefore he is related (a) immediately to both, and (b) mediately to each by virtue of the other. The master is related mediately to the slave through [an] *independent being*; for precisely therein the slave is bound: It is his chain, from which he could not “abstract” himself in the struggle, and therefore showed himself to be non-independent, to have his independence in thinghood. The master, however, is the power over this Being, because he proved in the struggle, that, for him, that only counts as something negative. Inasmuch as he, the master, has the power over this, but this being has the power over the Other, in this conclusion he holds the other subject to him. In precisely this way the master is related mediately to the thing through the slave; whereas the slave is also related to the thing as self-consciousness generally, and lifts it; but it is simultaneously independent for him, the slave, and he can therefore not negate it to the point of annihilating and being rid of it: In other words he only works on it. For the master, in contrast, this *immediate* relation becomes, through such mediation, the pure negation of the thing, or enjoyment: What did not succeed for Desire, he thus succeeds in being rid of, and contents himself with enjoyment. Desire failed to accomplish this because of the independence of the thing; but the master, who has now interposed the slave between himself and the thing, is only connected to the non-independence of the thing and enjoys it purely. The aspect of its independence he leaves to the slave, who works on it.

In both of these moments, for the master recognition comes about through another consciousness; for in [the masters] this consciousness is posited as something unessential — in the first instance because of its working on the thing, and in the second instance because of its dependence on a determinate existence. In neither case can it be master over its being and achieve its absolute negation. Thus is at hand this moment of recognition, namely that the other consciousness lifts its *being-for-itself*, and therewith itself does that which the first does to it. Likewise, here is the other moment, that this action of the second is the first one’s own action as well: for what the slave does is really the action of the master. For the latter there is only *being-for-himself*, essence: He is the pure negative power, for which the thing is nothing, and therefore the pure essential action in this relationship is his; whereas the slave’s is not pure, but rather a non-essential action. But the moment is lacking for the actual recognition that what the master does against the other, he also does against himself, and what the slave does against himself he also does against the other. There has therefore emerged a recognition which is one-sided and unequal.

In this [recognition], the unessential consciousness is the object for the master, which amounts to the *truth* of his certainty. It becomes clear, however, that this object does not correspond to its own concept, but that which the master has achieved has become for him something entirely other than an independent consciousness. It is not such for him at all, but rather something non-independent; and he is therefore not certain of the *being-for-itself* as his own truth, but rather his truth is instead an unessential consciousness and the unessential activity of the same.

The *truth* of the independent consciousness is therefore slavish consciousness. This appears indeed, at first, *outside* itself, not as the truth of self-consciousness. But just as mastery showed that its essence was the inverse of what it wanted to be, so too slavery will become in its completion the opposite of what it is immediately: It will return into itself as consciousness forced back into itself, and will be turned around into true independence.

We have only seen what slavery is in comparison with mastery. But it too is a self-consciousness and we must now observe what it accordingly is *in-and-for-itself*. At first, for slavery, the master is the essence; and thus the independent consciousness *being-for-itself* is the truth for it, which nonetheless is *for it* but not yet *in it*. Still, it has in fact in itself this truth of pure negativity and of *being-for-itself*; for it has experienced this essence therein. To be precise, this consciousness did not have fear of this or that [thing], nor of this or that moment, but of its entire essence, for it has experienced the fear of death, of the absolute master. In that it has been inwardly dissolved, and has thoroughly trembled inside itself, and everything fixed in it has quaked. This pure universal motion, the absolute fluidity of all endurance, is, however, the simple essence of self-consciousness — absolute negativity, pure *being-for-itself*, that is herewith present in this consciousness. This moment of pure *being-for-itself* is also *for it*, for the slave, since it exists for him in the master *as his object*. Furthermore, this is not only this universal dissolution *in general*, but in serving it actually accomplishes it. In all the *individual* moments [of his service] he lifts his dependence on natural existence and works it away.

The feeling of absolute power, however, in general and in the particulars of service, is only the dissolution *in itself*; and although indeed “the fear of the Lord is the beginning of wisdom,”⁹ consciousness is therein *for its own self*, not *being-for-itself*. Through work, however, the slave “comes to” himself. In the moment which corresponds to desire in the consciousness of the master, it appeared indeed that the aspect of the unessential relation to the thing fell to the slave consciousness, since in that relation the thing maintained its independence. Desire kept to itself the pure negation of the object and thereby its unmixed self-feeling. This

satisfaction, however, is for that reason itself only something vanishing, for it is lacking the objective side, permanence. Work, in contrast, is Desire *held in check*, the vanishing halted: Work is formative. The negative relation to the object becomes its *Form* and becomes something permanent; and it is precisely for the worker that the Object has independence. This negative middle [term], or the formative activity, is simultaneously the particularity or the pure *being-for-itself* of consciousness, which now, in the work outside it, comes upon the element of permanence: The working consciousness thus comes through this to the intuition of independent being as its own independence.

The formative activity, however, does not only have this positive meaning that the slave consciousness, as pure *being-for-itself*, thereby becomes *the being thing*; but also the negative meaning, counter to its first moment, fear. For in the making of the thing its own negativity, its *being-for-itself*, becomes an Object by virtue of the fact that it lifts the existing form opposed to it. But this opposed and objective negative is precisely the alien essence before which it had trembled. Now, however, it destroys this alien, sets itself up as such, [the negative,] in the element of permanence; and thereby becomes for itself a *being-for-itself*. For the slave the *being-for-itself* in the master is an other, but only *for it*; in fear, *being-for-itself* is present for the slave himself; in formative activity *being-for-itself* becomes its very own for it, and it “comes to” consciousness that it itself is *in-and-for-itself*. The form does not become something other than itself by the fact that it is posited outside itself; for that very form is its pure *being-for-itself*, which thereby becomes its truth. And therefore through this rediscovery of himself through himself comes about his own sense, precisely in work, which had only seemed to have an alien meaning. — Both moments, fear and servitude in general, are necessary for this reflexion, as is formative activity, and simultaneously both of them in a universal manner. Without the discipline of service and obedience, fear remains stuck at something formal and does not spread out to the conscious actuality of existence. Without formative activity fear remains inward and mute, and consciousness does not become *for itself*. If consciousness forms the thing without absolute, it is only a vain stubbornness, having only its own sense, for its form or negativity is not negative *in itself*; and its formative activity therefore cannot give it the consciousness of itself as its essence. If he has not endured absolute fear, but only some anxiety, then the negative essence would have remained something external for him, its substance has not been thoroughly infected by it. To the extent that not all fulfillments of its natural consciousness have remained shaky, it belongs *in itself* to determinate being; its own sense is just self-will, a freedom which remains within the bonds of slavery. Just as little as pure form can become essence for him, just so little is that form, considered as extended over the particular, a universal formation or an absolute concept; rather it is a skill which is only powerful over some things, but not the universal power and the whole objective essence.

3. [*Meinung*, which we here translate as “Opining,” connotes subjectivity and contrasts with knowledge, certainty, and proof. The first syllable of *Meinung* means “mine,” and Hegel takes advantage of this feature of the word.]
4. [*Das Ich* can be translated either as “ego” or as “I.” We use either, depending on the context.]
5. [Hegel uses the word *aufheben* as a triple pun: its meaning is “to lift up,” but colloquially it means both “to cancel” and “to preserve.” In the dialectical process any given state of affairs will be preserved as it is cancelled or overcome and lifted up.]
6. [The German word for “perception” is *Wahrnehmung*, which literally means “truth-taking” or “taking to be true.”]
7. [Hegel here emphasizes the social and political sense of “recognition” as in “recognizing the authority of government.”]
8. [The terms “middle” and “extreme” are taken from Aristotelian logic. In the syllogism “All humans are rational; all slaves are human; therefore, all slaves are rational,” “human” is the middle term, the extreme term “rational.”]
9. [Psalm 111:10 and Proverbs 9:10. Throughout *Herr/Herrschaft* can be translated either as “lord/lordship” or “master/mastery.” In passages such as this one the religious connotations of the former version are clear — and ironic. Similarly, *Knecht/Knechtschaft* can be translated as “slave/slavery,” “servant/servitude,” or “bondsmen/bondage.”]

Arthur Schopenhauer

Arthur Schopenhauer was born in 1788 in Danzig and died in 1860. He is notorious for his pessimism and hostility toward women. His obstinacy is revealed in his volunteering to teach a course at the University of Berlin at the same time the popular Hegel was lecturing. Schopenhauer did not attract students, and his course was cancelled.

Schopenhauer's dissertation, *The Fourfold Root of the Principle of Sufficient Reason* (1813), draws on the Kantian distinction between the noumenal and phenomenal worlds and elaborates on the causal conditions for every type of phenomenon (empirical representations, concepts, time and space, and individual selves). The principle of sufficient reason asserts that every phenomenon depends on the presence of sufficient causal conditions. The definitive statement of Schopenhauer's system is *The World as Will and Representation*, first published in 1819 (revised second edition, 1844; third edition, 1859). He later added a second volume.

Schopenhauer sought to integrate central ideas from the systems of his three heroes—Plato, Kant, and Buddha. *The World as Will and Representation* begins with an announcement of its thoroughly idealistic metaphysical view: "The world is my representation." The world as representation is governed by the principle of sufficient reason. By contrast, the inner reality of the world is Will, an irrational striving. We experience this inner reality through our personal emotions and striving, and in this sense we have a direct awareness of noumenal reality. Every other entity and force within the phenomenal world, the world that we experience, also has a comparable inner side. In light of the fact that we experience the inner reality as will, Schopenhauer uses the term "Will" for the inner reality of everything. In contrast with the Will, which is ultimately the only reality, the phenomenal world, as Kant tells us, is a construction of our own powers of representation.

To account for natural kinds as they are observed in the phenomenal world and the orderly relations between them, Schopenhauer conjoins the Kantian distinction between the noumenal and phenomenal with Plato's Theory of Forms or Ideas. Things within the phenomenal world are classifiable into natural kinds, because each participates in a Platonic Idea for the kind of thing that it is. Schopenhauer characterizes the Platonic Ideas as modes or "grades" through which the Will manifests itself. He describes each Platonic Idea as a perfectly adequate manifestation of the Will at a given grade. In other words, a perfect prototype for a particular type of thing manifests the Will. Phenomenal entities, by contrast, imperfectly embody the Platonic Ideas in which they participate.

Although the Will is the same inner reality in all things, we are captivated and deluded by the Will's phenomenal manifestations. Schopenhauer analyzes our belief in the reality of the individuated entities of the phenomenal world as a natural illusion. This illusion gives rise to our practical motivations toward the entities we perceive, including other sentient beings. Because our own inner nature is Will, we are filled with desires. We want some things, and we want to avoid others; we desire some individuals, and we view others as obstacles. All of these consequences of our belief in the reality of individuation motivate our various ambitions, which we typically pursue without regard to any harm we do to others or ourselves in the process. Schopenhauer concludes that Buddha was right to claim that the suffering of life stems from our selfish cravings, and that elimination of these cravings is necessary to eliminate suffering.

Most of us, however, will not achieve the radical resignation required for spiritual liberation. Aside from the saints of various traditions, most human beings escape what Schopenhauer calls "the penal servitude of willing" only occasionally through aesthetic experience, which involves a shift in perspective from seeing an object as a particular, individuated thing to seeing the Platonic Idea in which it participates. This shift dislocates the object from its location in the time-space continuum in which we relate to objects in accordance with egotistical agendas. The object becomes for the perceiver a timeless manifestation of Will, and the observer is transformed into the "pure, will-less subject of knowledge." In other words, during aesthetic experience the observer stops conceiving of him- or herself as an individuated being with desires and comes to an awareness of the self as a manifestation of universal consciousness. At such moments, one no longer identifies oneself with the hankerings of one's personal will. These desires are momentarily silenced, and one experiences peace. In this way aesthetic experience liberates us, but only temporarily.

Ultimately, the only method for lasting liberation is to overcome the illusion of individuation and renounce one's own willfulness. Schopenhauer contends that this ethical aim is the core of ethics and religion. If one fully absorbs the insight that individuation is merely illusory and that the inner reality of other sentient beings is actually the same as one's own, motivation to struggle against others and against one's circumstances would

be destroyed. In practice, however, the destruction of one's willful tendencies is achieved only through ascetic practice, which in exceptional cases like those of the saints weakens and eventually undercuts willfulness and even the desire to continue to live. Schopenhauer is not optimistic that many people will actually achieve this state, so aesthetic experience is the closest that most people come to the condition of sanctity. Because the liberated state of pure willlessness is achieved through the cessation of the desires that structure our personal existence, its positive content is unknown, although saints describe this condition as blissful.

Rudiger Safranski's *Schopenhauer and the Wild Years of Philosophy*, trans. Ewald Osers (Cambridge, Mass.: Harvard University Press, 1989), is a colorful and detailed biography of Schopenhauer. A critical survey of Schopenhauer's philosophy is provided in Patrick L. Gardiner, *Schopenhauer* (Baltimore: Penguin Books, 1963), which also relates features of Schopenhauer's thought to more recent phenomena in the arts and the history of ideas. Bryan Magee's *The Philosophy of Schopenhauer*, rev. ed. (Oxford: Oxford University Press, 1997) thoroughly considers the internal details of Schopenhauer's thought, including a number of chapters focusing on his influence on other thinkers and artists.

Because *The World as Will and Representation* is the summary statement of Schopenhauer's thought, many of the secondary works on Schopenhauer focus on it specifically. Julian Young offers a lucid and nicely organized reading of the work in *Willing and Unwilling: A Study in the Philosophy of Arthur Schopenhauer* (Norwell, Mass.: Martinus Nijhoff, 1987). D. W. Hamlyn provides a good analysis of both *The World as Will and Representation* and *The Fourfold Root of the Principle of Sufficient Reason* in his *Schopenhauer* (London: Routledge, 1999). Both of these books also stress Schopenhauer's Kantian roots, as does Christopher Janaway, *Self and World in Schopenhauer's Philosophy* (Oxford: Oxford University Press, 1999), although Janaway emphasizes Schopenhauer's ambivalence toward Kant. John E. Atwell argues that Schopenhauer's central thought is that the world is the self-knowledge of the Will in *Schopenhauer on the Character of the World: The Metaphysics of Will* (Berkeley: University of California Press, 1995). Christopher Janaway, ed., *The Cambridge Companion to Schopenhauer* (New York: Cambridge University Press, 1999) is a scholarly but accessible selection of essays.

Kathleen Higgins

*The World as Will and Representation**

BOOK II

§17.

... [Directing our attention entirely to the representation of perception, we shall endeavour to arrive at a knowledge of its content, its more precise determinations, and the forms it presents to us. It will be of special interest for us to obtain information about its real significance, that significance, otherwise merely felt, by virtue of which these pictures or images do not march past us strange and meaningless, as they would otherwise inevitably do, but speak to us directly, are understood, and acquire an interest that engrosses our whole nature.

We direct our attention to mathematics, natural science, and philosophy, each of which holds out the hope that it will furnish a part of the information desired. In the first place, we find philosophy to be a monster with many heads, each of which speaks a different language. Of course, they are not all at variance with one another on the point here mentioned, the significance of the representation of perception. For, with the exception of the Sceptics and Idealists, the others in the main speak fairly consistently of an *object* forming the *basis* of the representation. This object indeed is different in its whole being and nature from the representation, but yet is in all respects as like it as one egg is like another. But this does not help us, for we do not at all know how to distinguish that object from the representation. We find that the two are one and the same, for every object always and eternally presupposes a subject, and thus remains representation. We then recognize also that being-object belongs to the most universal form of the representation, which is precisely the division into object and subject. Further, the principle of sufficient reason, to which we here refer, is also for us only the form of the representation, namely the regular and orderly combination of one representation with another, and not the combination of the whole finite or infinite series of representations with something which is not representation at all, and is therefore not capable of being in any way represented. We spoke above of the Sceptics and Idealists, when discussing the controversy about the reality of the external world.

Now if we look to mathematics for the desired more detailed knowledge of the representation of perception, which we have come to know only quite generally according to the mere form, then this science will tell us about these representations only in so far as they occupy time and space, in other words, only in so far as they are quantities. It will state with extreme accuracy the How-many and the How-large; but as this is always only relative, that is to say, a comparison of one representation with another and even that only from the one-sided aspect of quantity, this too will not be the information for which principally we are looking.

Finally, if we look at the wide province of natural science, which is divided into many fields, we can first of all distinguish two main divisions. It is either a description of forms and shapes, which I call *Morphology*; or an explanation of changes, which I call *Etiology*. The former considers the permanent forms, the latter the changing matter, according to the laws of its transition from one form into another. Morphology is what we call natural history in its whole range, though not in the literal sense of the word. As botany and zoology especially, it teaches us about the various, permanent, organic, and thus definitely determined forms in spite of the incessant change of individuals; and these forms constitute a great part of the content of the perceptive representation. In natural history they are classified, separated, united, and arranged according to natural and artificial systems, and brought under concepts that render possible a survey and knowledge of them all. There is further demonstrated an infinitely fine and shaded analogy in the whole and in the parts of these forms which runs through them all (*unité de plan*),¹ by virtue of which they are like the many different variations on an unspecified theme. The passage of matter into those forms, in other words the origin of individuals, is not a main part of the consideration, for every individual springs from its like through generation, which everywhere is equally mysterious, and has so far baffled clear knowledge. But the little that is known of this finds its place in physiology, which belongs to etiological natural science. Mineralogy, especially where it becomes geology, though it belongs mainly to morphology, also inclines to this etiological science. Etiology proper includes all the branches of natural science in which the main concern everywhere is knowledge of cause and effect. These sciences teach how, according to an invariable rule, one state of matter is necessarily followed by another definite state; how one definite change necessarily conditions and brings about another definite change; this demonstration is called *explanation*. Here we find principally mechanics, physics, chemistry, and physiology.

But if we devote ourselves to its teaching, we soon become aware that the information we are chiefly looking for no more comes to us from etiology than it does from morphology. The latter presents us with innumerable and infinitely varied forms that are nevertheless related by an unmistakable family likeness. For

us they are representations that in this way remain eternally strange to us, and, when considered merely in this way, they stand before us like hieroglyphics that are not understood. On the other hand, etiology teaches us that, according to the law of cause and effect, this definite condition of matter produces that other condition, and with this it has explained it, and has done its part. At bottom, however, it does nothing more than show the orderly arrangement according to which the states or conditions appear in space and time, and teach for all cases what phenomenon must necessarily appear at this time and in this place. It therefore determines for them their position in time and space according to a law whose definite content has been taught by experience, yet whose universal form and necessity are known to us independently of experience. But in this way we do not obtain the slightest information about the inner nature of any one of these phenomena. This is called a *natural force*, and lies outside the province of etiological explanation, which calls the unalterable constancy with which the manifestation of such a force appears whenever its known conditions are present, a *law of nature*. But this law of nature, these conditions, this appearance in a definite place at a definite time, are all that it knows, or ever can know. The force itself that is manifested, the inner nature of the phenomena that appear in accordance with those laws, remain for it an eternal secret, something entirely strange and unknown, in the case of the simplest as well as of the most complicated phenomenon. For although etiology has so far achieved its aim most completely in mechanics, and least so in physiology, the force by virtue of which a stone falls to the ground, or one body repels another, is, in its inner nature, just as strange and mysterious as that which produces the movements and growth of an animal. Mechanics presupposes matter, weight, impenetrability, communicability of motion through impact, rigidity, and so on as unfathomable; it calls them forces of nature, and their necessary and regular appearance under certain conditions a law of nature. Only then does its explanation begin, and that consists in stating truly and with mathematical precision how, where, and when each force manifests itself, and referring to one of those forces every phenomenon that comes before it. Physics, chemistry, and physiology do the same in their province, only they presuppose much more and achieve less. Consequently, even the most perfect etiological explanation of the whole of nature would never be more in reality than a record of inexplicable forces, and a reliable statement of the rule by which their phenomena appear, succeed, and make way for one another in time and space. But the inner nature of the forces that thus appear was always bound to be left unexplained by etiology, which had to stop at the phenomenon and its arrangement, since the law followed by etiology does not go beyond this. In this respect it could be compared to a section of a piece of marble showing different veins side by side, but not letting us know the course of these veins from the interior of the marble to the surface. Or, if I may be permitted a facetious comparison, because it is more striking, the philosophical investigator must always feel in regard to the complete etiology of the whole of nature like a man who, without knowing how, is brought into a company quite unknown to him, each member of which in turn presents to him another as his friend and cousin, and thus makes them sufficiently acquainted. The man himself, however, while assuring each person introduced of his pleasure at meeting him, always has on his lips the question: "But how the deuce do I stand to the whole company?"

Hence, about those phenomena by us only as our representations, etiology can never give us the desired information that leads us beyond them. For after all its explanations, they still stand quite strange before us, as mere representations whose significance we do not understand. The causal connexion merely gives the rule and relative order of their appearance in space and time, but affords us no further knowledge of that which so appears. Moreover, the law of causality itself has validity only for representations, for objects of a definite class, and has meaning only when they are assumed. Hence, like these objects themselves, it always exists only in relation to the subject, and so conditionally. Thus it is just as well known when we start from the subject, i.e., *a priori*, as when we start from the object, i.e., *a posteriori*, as Kant has taught us.

But what now prompts us to make enquiries is that we are not satisfied with knowing that we have representations, that they are such and such, and that they are connected according to this or that law, general expression is always the principle of sufficient reason. We want to know the significance of those representations; we ask whether this world is nothing more than representation. In that case, it would inevitably pass by us like an empty dream, or a ghostly vision not worth our consideration. Or we ask whether it is something else, something in addition, and if so what that something is. This much is certain, namely that this something about which we are enquiring must be by its whole nature completely and fundamentally different from the representation; and so the forms and laws of the representation must be wholly foreign to it. We cannot, then, reach it from the representation under the guidance of those laws that merely combine objects, representations, with one another; these are the forms of the principle of sufficient reason.

Here we already see that we can never get at the inner nature of things *from without*. However much we may investigate, we obtain nothing but images and names. We are like a man who goes round a castle, looking in vain for an entrance, and sometimes sketching the façades. Yet this is the path that all philosophers

before me have followed.

§ 18.

In fact, the meaning that I am looking for of the world that stands before me simply as my representation, or the transition from it as mere representation of the knowing subject to whatever it may be besides this, could never be found if the investigator himself were nothing more than the purely knowing subject (a winged cherub without a body). But he himself is rooted in that world; and thus he finds himself in it as an *individual*, in other words, his knowledge, which is the conditional supporter of the whole world as representation, is nevertheless given entirely through the medium of a body, and the affections of this body are, as we have shown, the starting-point for the understanding in its perception of this world. For the purely knowing subject as such, this body is a representation like any other, an object among objects. Its movements and actions are so far known to him in just the same way as the changes of all other objects of perception; and they would be equally strange and incomprehensible to him, if their meaning were not unravelled for him in an entirely different way. Otherwise, he would see his conduct follow on presented motives with the constancy of a law of nature, just as the changes of other objects follow upon causes, stimuli, and motives. But he would be no nearer to understanding the influence of the motives than he is to understanding the connexion with its cause of any other effect that appears before him. He would then also call the inner, to him incomprehensible, nature of those manifestations and actions of his body a force, a quality, or a character, just as he pleased, but he would have no further insight into it. All this, however, is not the case; on the contrary, the answer to the riddle is given to the subject of knowledge appearing as individual, and this answer is given in the word *Will*. This and this alone gives him the key to his own phenomenon, reveals to him the significance and shows him the inner mechanism of his being, his actions, his movements. To the subject of knowing, who appears as an individual only through his identity with the body, this body is given in two entirely different ways. It is given in intelligent perception as representation, as an object among objects, liable to the laws of these objects, But it is also given in quite a different way, namely as what is known immediately to everyone, and is denoted by the word *will*. Every true act of his will is also at once and inevitably a movement of his body; he cannot actually will the act without at the same time being aware that it appears as a movement of the body. The act of will and the action of the body are not two different states objectively known, connected by the bond of causality; they do not stand in the relation of cause and effect, but are one and the same thing, though given in two entirely different ways, first quite directly, and then in perception for the understanding. The action of the body is nothing but the act of will objectified, i.e., translated into perception. Later on we shall see that this applies to every movement of the body, not merely to movement following on motives, but also to involuntary movement following on mere stimuli; indeed, that the whole body is nothing but the objectified will, i.e., will that has become representation. All this will follow and become clear in the course of our discussion. Therefore the body ... will ... be called the *objectivity of the will*. Therefore, in a certain sense, it can also be said that the will is knowledge *a priori* of the body, and that the body is knowledge *a posteriori* of the will. Resolutions of the will relating to the future are mere deliberations of reason about what will be willed at some time, not real acts of will. Only the carrying out stamps the resolve; till then, it is always a mere intention that can be altered; it exists only in reason, in the abstract. Only in reflection are willing and acting different; in reality they are one. Every true, genuine, immediate act of the will is also at once and directly a manifest act of the body; and correspondingly, on the other hand, every impression on the body is also at once and directly an impression on the will. As such, it is called pain when it is contrary to the will, and gratification or pleasure when in accordance with the will. The gradations of the two are very different. However, we are quite wrong in calling pain and pleasure representations, for they are not these at all, but immediate affections of the will in its phenomenon, the body; an enforced, instantaneous willing or not-willing of the impression undergone by the body. There are only a certain few impressions on the body which do not rouse the will, and through these alone is the body an immediate object of knowledge; for, as perception in the understanding, the body is an indirect object like all other objects. These impressions are therefore to be regarded directly as mere representations, and hence to be excepted from what has just been said. Here are meant the affections of the purely objective senses of sight, hearing, and touch, although only in so far as their organs are affected in the specific natural way that is specially characteristic of them. This is such an exceedingly feeble stimulation of the enhanced and specifically modified sensibility of these parts that it does not affect the will, but, undisturbed by any excitement of the will, only furnishes for the understanding data from which perception arises. But every stronger or heterogeneous affection of these sense-organs is painful, in other words, is against the will; hence they too belong to its objectivity. Weakness of the nerves shows itself in the fact that the impressions which should have merely that degree of intensity that is sufficient to make them data for the understanding, reach the higher degree at which they stir the will, that is to say,

excite pain or pleasure, though more often pain. This pain, however, is in part dull and inarticulate; thus it not merely causes us to feel painfully particular tones and intense light, but also gives rise generally to a morbid and hypochondriacal disposition without being distinctly recognized. The identity of the body and the will further shows itself, among other things, in the fact that every vehement and excessive movement of the will, in other words, every emotion, agitates the body and its inner workings directly and immediately, and disturbs the course of its vital functions." ...

Finally, the knowledge I have of my will, although an immediate knowledge, cannot be separated from that of my body. I know my will not as a whole, not as a unity, not completely according to its nature, but only in its individual acts, and hence in time, which is the form of my body's appearing, as it is of every body. Therefore, the body is the condition of knowledge of my will. Accordingly, I cannot really imagine this will without my body... .

The identity of the will and of the body ... can never be demonstrated, that is to say, deduced as indirect knowledge from some other more direct knowledge, for the very reason that it is itself the most direct knowledge. If we do not apprehend it and stick to it as such, in vain shall we expect to obtain it again in some indirect way as derived knowledge... . For it is not ... the reference of an abstract representation to another representation, or to the necessary form of intuitive or of abstract representing, but it is the reference of a judgement to the relation that a representation of perception, namely the body, has to that which is not a representation at all, but is *toto genere*² different therefrom, namely will. I should therefore like to distinguish this truth from every other, and call it *philosophical truth*. ... We can turn the expression of this truth in different ways and say: My body and my will are one; or, What as representation of perception I call my body, I call my will in so far as I am conscious of it in an entirely different way comparable with no other; or, My body is the *objectivity* of my will; or, Apart from the fact that my body is my representation, it is still my will, so on.

§ 19.

... [I]t has now become clear to us that something in the consciousness of everyone distinguishes the representation of his own body from all others that are in other respects quite like it. This is that the body occurs in consciousness in quite another way, *toto genere* different, that is denoted by the word *will*. It is just this double knowledge of our own body which gives us information about that body itself, about its action and movement following on motives, as well as about its suffering through outside impressions, in a word, about what it is, not as representation, but as something over and above this, and hence what it is *in itself*. We do not have such immediate information about the nature, action, and suffering of any other real objects.

The knowing subject is an individual precisely by reason of this special relation to the one body which, considered apart from this, is for him only a representation like all other representations. But the relation by virtue of which the knowing subject is an *individual*, subsists for that very reason only between him and one particular representation among all his representations. He is therefore conscious of this particular representation not merely as such, but at the same time in a quite different way, namely as a will. But if he abstracts from that special relation, from that twofold and completely heterogeneous knowledge of one and the same thing, then that one thing, the body, is a representation like all others. Therefore, in order to understand where he is in this matter, the knowing individual must either assume that the distinctive feature of that one representation is to be found merely in the fact that his knowledge stands in this double reference only to that one representation; that only into this one object of perception is an insight in two ways at the same time open to him; and that this is to be explained not by a difference of this object from all others, but only by a difference between the relation of his knowledge to this one object and its relation to all others. Or he must assume that this one object is essentially different from all others; that it alone among all objects is at the same time will and representation, the rest, on the other hand, being mere representation, i.e., mere phantoms. Thus, he must assume that his body is the only real individual in the world, i.e., the only phenomenon of will, and the only immediate object of the subject. That the other objects, considered as mere *representations*, are like his body, in other words, like this body fill space (itself perhaps existing only as representation), and also, like this body, operate in space — this, I say, is demonstrably certain from the law of causality, which is *a priori* certain for representations, and admits of no effect without a cause. But apart from the fact that we can infer from the effect only a cause in general, not a similar cause, we are still always in the realm of the mere representation, for which alone the law of causality is valid, and beyond which it can never lead us. But whether the objects known to the individual only as representations are yet, like his own body, phenomena of a will, is ... the proper meaning of the question as to the reality of the external world. To deny this is the meaning of *theoretical egoism*, which in this way regards as phantoms all phenomena outside its own

will, just as practical egoism does in a practical respect; thus in it a man regards and treats only his own person as a real person, and all others as mere phantoms, Theoretical egoism, of course, can never be refuted by proofs, yet in philosophy it has never been positively used otherwise than as a sceptical sophism, i.e., for the sake of appearance. As a serious conviction, on the other hand, it could be found only in a madhouse; as such it would then need not so much a refutation as a cure. Therefore we do not go into it any further, but regard it as the last stronghold of scepticism, which is always polemical. Thus our knowledge, bound always to individuality and having its limitation in this very fact, necessarily means that everyone can *be* only one thing, whereas he can *know* everything else, and it is this very limitation that really creates the need for philosophy. Therefore we, who for this very reason are endeavouring to extend the limits of our knowledge through philosophy, shall regard this sceptical argument of theoretical egoism, which here confronts us, as a small frontier fortress. Admittedly the fortress is impregnable, but the garrison can never sally forth from it, and therefore we can pass it by and leave it in our rear without danger.

The double knowledge which we have of the nature and action of our own body, and which is given in two completely different ways, has now been clearly brought out. Accordingly, we shall use it further as a key to the inner being of every phenomenon in nature. We shall judge all objects which are not our own body, and therefore are given to our consciousness not in the double way, but only as representations, according to the analogy of this body. We shall therefore assume that as, on the one hand, they are representation, just like our body, and are in this respect homogeneous with it, so on the other hand, if we set aside their existence as the subject's representation, what still remains over must be, according to its inner nature, the same as what in ourselves we call *will*. For what other kind of existence or reality could we attribute to the rest of the material world? From what source could we take the elements out of which we construct such a world? Besides the will and the representation, there is absolutely nothing known or conceivable for us. If we wish to attribute the greatest known reality to the material world, which immediately exists only in our representation, then we give it that reality which our own body has for each of us, for to each of us this is the most real of things. But if now we analyse the reality of this body and its actions, then, beyond the fact that it is our representation, we find nothing in it but the will; with this even its reality is exhausted. Therefore we can nowhere find another kind of reality to attribute to the material world. If, therefore, the material world is to be something more than our mere representation, we must say that, besides being the representation, and hence in itself and of its inmost nature, it is what we find immediately in ourselves as will. I say 'of its inmost nature,' but we have first of all to get to know more intimately this inner nature of the will, so that we may know how to distinguish from it what belongs not to it itself, but to its phenomenon, which has many grades. Such, for example, is the circumstance of its being accompanied by knowledge, and the determination by motives which is conditioned by this knowledge. As we proceed, we shall see that this belongs not to the inner nature of the will, but merely to its most distinct phenomenon as animal and human being. Therefore, if I say that the force which attracts a stone to the earth is of its nature, in itself, and apart from all representation, will, then no one will attach to this proposition the absurd meaning that the stone moves itself according to a known motive, because it is thus that the will appears in man. But we will now prove, establish, and develop to its full extent, clearly and in more detail, what has hitherto been explained provisionally and generally.

§ 20.

As the being-in-itself of our own body, as that which this body is besides being object of perception, namely representation, the *will*, as we have said, proclaims itself first of all in the voluntary movements of this body, in so far as these movements are nothing but the visibility of the individual acts of the will. These movements appear directly and simultaneously with those acts of will; they are one and the same thing with them, and are distinguished from them only by the form of perceptibility into which they have passed, that is to say, in which they have become representation.

But these acts of the will always have a ground or reason outside themselves in motives. Yet these motives never determine more than what I will at *this* time, in *this* place, in *these* circumstances, not *that* I will in general, or *what* I will in general, in other words, the maxim characterizing the whole of my willing. Therefore, the whole inner nature of my willing cannot be explained from the motives, but they determine merely its manifestation at a given point of time; they are merely the occasion on which my will shows itself. This will itself, on the other hand, lies outside the province of the law of motivation; only the phenomenon of the will at each point of time is determined by this law. Only on the presupposition of my empirical character is the motive a sufficient ground of explanation of my conduct. But if I abstract from my character, and then ask why in general I will this and not that, no answer is possible, because only the *appearance* or *phenomenon* of the will is subject to the principle of sufficient reason, not the will itself, which in this respect may be called *groundless*. ...

Now if every action of my body is an appearance or phenomenon of an act of will in which my will itself in general and as a whole, and hence my character, again expresses itself under given motives, then phenomenon or appearance of the will must also be the indispensable condition and presupposition of every action. For the will's appearance cannot depend on something which does not exist directly and only through it, and would therefore be merely accidental for it, whereby the will's appearance itself would be only accidental. But that condition is the whole body itself. Therefore this body itself must be phenomenon of the will, and must be related to my will as a whole, that is to say, to my intelligible character, the phenomenon of which in time is my empirical character, in the same way as the particular action of the body is to the particular act of the will. Therefore the whole body must be nothing but my will become visible, must be my will itself, in so far as this is object of perception, representation of the first class. It has already been advanced in confirmation of this that every impression on my body also affects my will at once and immediately, and in this respect is called pain or pleasure, or in a lower degree, pleasant or unpleasant sensation. Conversely, it has also been advanced that every violent movement of the will, and hence every emotion and passion, convulses the body, and disturbs the course of its functions. Indeed, an etiological, though very incomplete, account can be given of the origin of my body, and a somewhat better account of its development and preservation. Indeed this is physiology; but this explains its theme only in exactly the same way as motives explain action. Therefore the establishment of the individual action through the motive, and the necessary sequence of the action from the motive, do not conflict with the fact that action, in general and by its nature, is only phenomenon or appearance of a will that is in itself groundless... . [N]o etiological explanation can ever state more than the necessarily determined position in time and space of a particular phenomenon and its necessary appearance there according to a fixed rule. On the other hand, the inner nature of everything that appears in this way remains for ever unfathomable, and is presupposed by every etiological explanation; it is merely expressed by the name force, or law of nature, or, when we speak of actions, the name character or will. Thus, although every particular action, under the presupposition of the definite character, necessarily ensues with the presented motive, and although growth, the process of nourishment, and all the changes in the animal body take place according to necessarily acting causes (stimuli), the whole series of actions, and consequently every individual act and likewise its condition, namely the whole body itself which performs it, and therefore also the process through which and in which the body exists, are nothing but the phenomenal appearance of the will, its becoming visible, the *objectivity of the will*. On this rests the perfect suitability of the human and animal body to the human and animal will in general, resembling, but far surpassing, the suitability of a purposely made instrument to the will of its maker, and on this account appearing as fitness or appropriateness, i.e., the teleological accountability of the body. Therefore the parts of the body must correspond completely to the chief demands and desires by which the will manifests itself; they must be the visible expression of these desires. Teeth, gullet, and intestinal canal are objectified hunger; the genitals are objectified sexual impulse; grasping hands and nimble feet correspond to the more indirect strivings of the will which they represent. Just as the general human form corresponds to the general human will, so to the individually modified will, namely the character of the individual, there corresponds the individual bodily structure, which is therefore as a whole and in all its parts characteristic and full of expression... .

§ 21.

From all these considerations the reader has now gained in the abstract, and hence in clear and certain terms, a knowledge which everyone possesses directly in the concrete, namely as feeling. This is the knowledge that the inner nature of his own phenomenon, which manifests itself to him as representation both through his actions and through the permanent substratum of these his body, is his *will*. This will constitutes what is most immediate in his consciousness, but as such it has not wholly entered into the form of the representation, in which object and subject stand over against each other; on the contrary, it makes itself known in an immediate way in which subject and object are not quite clearly distinguished, yet it becomes known to the individual himself not as a whole, but only in its particular acts. The reader who with me has gained this conviction, will find that of itself it will become the key to the knowledge of the innermost being of the whole of nature, since he now transfers it to all those phenomena that are given to him, not like his own phenomenon both in direct and in indirect knowledge, but in the latter solely, and hence merely in a one-sided way, as *representation* alone. He will recognize that same will not only in those phenomena that are quite similar to his own, in men and animals, as their innermost nature, but continued reflection will lead him to recognize the force that shoots and vegetates in the plant, indeed the force by which the crystal is formed, the force that turns the magnet to the North Pole, the force whose shock he encounters from the contact of metals of different kinds, the force that appears in the elective affinities of matter as repulsion and attraction, separation and union, and finally even gravitation, which acts so powerfully in all matter, pulling the stone to the earth and the earth to

the sun; all these he will recognize as different only in the phenomenon, but the same according to their inner nature. He will recognize them all as that which is immediately known to him so intimately and better than everything else, and where it appears most distinctly is called *will*. It is only this application of reflection which no longer lets us stop at the phenomenon, but leads us on to the *thing-in-itself*. Phenomenon means representation and nothing more. All representation, be it of whatever kind it may, all *object*, is *phenomenon*. But only the *will* is *thing-in-itself*; as such it is not representation at all, but *toto genere* different therefrom. It is that of which all representation, all object, is the phenomenon, the visibility, the *objectivity*. It is the innermost essence, the kernel, of every particular thing and also of the whole. It appears in every blindly acting force of nature, and also in the deliberate conduct of man, and the great difference between the two concerns only the degree of the manifestation, not the inner nature of what is manifested.

Søren Kierkegaard

Søren Kierkegaard was born in Copenhagen, Denmark, in 1813, the youngest child of a large family. He was raised in a wealthy middle-class home, with the strictest devotion to church and religion. His father was a successful merchant and an avid reader of theology, and his mother had been his father's servant before she became his second wife. Kierkegaard had a hunchback, and this, according to some, is the "thorn in his flesh" he often mentions in his writings. He viewed his life as governed by a deep melancholy, which he self-consciously attempted to hide with wit and gaiety. An event of crucial importance for Kierkegaard was his breaking of his engagement to Regine Olsen in 1841. His reason for this action is an important but unsolved mystery. First educated at home, he began university as a student of theology but soon turned to literature and philosophy. Kierkegaard was especially steeped in the philosophy of Hegel, which he studied in Berlin. A dominant theme in his life was his opposition to official state Christianity, seen by him as encumbered by a passionless conformity to bourgeois respectability and stability. Instead, Kierkegaard advocated a life of intense religious commitment, free from superficiality and empty formalism. His works include *Either/Or* (1843), *Fear and Trembling* (1843), *Philosophical Fragments* (1844), *Concluding Unscientific Postscript* (1846), *The Sickness unto Death* (1849), *Training in Christianity* (1851), and *The Attack upon "Christendom"* (1854–1855). His writings were largely ignored outside of Denmark until the twentieth century, when they became very influential. Kierkegaard died in 1855, at the age of 42, after collapsing while carrying the last of his inheritance from the bank.

The overriding concern in Kierkegaard's religious and philosophical writings is to provide insight into meaning and fulfillment in human life. Achieving meaning in life, in his view, is not something simply given to us, but it is accomplished through our decisions. But Kierkegaard does not believe that we are ultimately on our own in making the best possible choice for our lives. His final recommendations are religious, and he argues that the best decision we can make is one in which we are dependent on God.

Kierkegaard claims that human existence involves a profound tension or conflict between two dimensions. A self is a tension between the finite and the infinite, between the temporal and the eternal. The notion of the temporal signifies the events of our lives considered as separate and particular moments, immediate and distinct from one another. As temporal beings, we are no different from the other animals, which also have sensations and try to satisfy desires. The notion of the eternal, by contrast, signifies the overarching unity that these events can have just for humans. Though we are beings governed by basic passions and desires, aiming at momentary satisfactions, we are also beings who can make life something more coherent and unified, something more than just a series of fragmented projects aimed at transitory enjoyments.

One can come to understand Kierkegaard's views by considering his threefold classification of the ways we humans can attempt to achieve fulfillment. For him there are three main "spheres of existence" or modes of life: the aesthetic, the ethical, and the religious. The most fundamental characteristic of the person living the aesthetic life is that his purposes are exhausted by the satisfaction of desires for momentary or short-term fulfillments. Kierkegaard believes that the aesthetic option will always fail as a route to meaning in life. Both the attraction and the failure of the aesthetic life can be explained by the fact that it expresses only one side of the self, the temporal aspect.

Kierkegaard believes that the expression of the eternal side can be achieved only by means of a decisive, continuously renewed choice that produces an overarching unity among the disparate moments in one's experience. This choice calls for a commitment, a "leap," that will unify one's life. Such a commitment might be ethical, for example, a commitment to another person in marriage; or religious, a commitment to God. The mark of the ethical life is a constantly renewed decision, made by one's own will alone, to live in accord with ethical duty. By continuously renewing this commitment, one can attempt to provide a unity to the various moments in one's life that expresses one's eternal nature. But Kierkegaard describes striving to express the eternal through one's own will alone as the most agonizing, albeit the highest, form of despair.

Kierkegaard maintains that there is a better solution to be found in the religious life, in part because in making a religious commitment one need not rely on oneself. His most thorough work on religion, the *Concluding Unscientific Postscript*, poses the claim that *truth is subjectivity*. Yet Kierkegaard does not mean to deny that there are objective facts. Rather, "truth is subjectivity" means that, when meaning in one's life is at stake, one's attitude toward the object of one's concerns takes precedence over the issue of whether one is actually right about some fact. In Kierkegaard's view, what is especially important for meaning in life is one's

attitude in a relationship with a person or thing, by contrast with merely having true beliefs about that person or thing.

For example, someone might master all of the true sentences about something that is genuinely important, while maintaining a detached, theoretical stance. Imagine, for example, a psychologist who develops a theory about human relationships so accurate and insightful that it has changed the lives of many people. But suppose further that as a scientist she has developed so detached an attitude that she is unable to live in accordance with her theory in her own relationships, with the result that her life is empty and unfulfilled. Such a person possesses the truth objectively, but not subjectively. By contrast, another person might deeply and passionately live her relationships in accord with her insights. She would be in the truth subjectively.

In Kierkegaard's view, what is most important in the search for meaning and fulfillment for one's life is the nature of one's relationship. If one is attempting to relate oneself to God, the infinite being, the appropriate kind of relationship is one of infinite intensity. To illustrate these claims about truth, Kierkegaard argues that a pagan praying with infinite passion, "although his eyes rest on the image of an idol," has a more appropriate relationship to the truth, or is more "in the truth," than someone who has fewer false beliefs and more true beliefs about religion but holds them without deep feeling.

*Concluding Unscientific Postscript**

The Subjective Truth, Inwardness, Truth Is Subjectivity

... The way of objective reflection makes the subject accidental, and thereby transforms existence into something indifferent, something vanishing. Away from the subject the objective way of reflection leads to the objective truth, and while the subject and his subjectivity become indifferent, the truth also becomes indifferent, and this indifference is precisely its objective validity; for all interest, like all decisiveness, is rooted in subjectivity. The way of objective reflection leads to abstract thought, to mathematics, to historical knowledge of different kinds; and always it leads away from the subject, whose existence or non-existence, and from the objective point of view quite rightly, becomes infinitely indifferent. Quite rightly, since as Hamlet says,¹ existence and nonexistence have only subjective significance. At its maximum this way will arrive at a contradiction, and in so far as the subject does not become wholly indifferent to himself, this merely constitutes a sign that his objective striving is not objective enough. At its maximum this way will lead to the contradiction that only the objective has come into being, while the subjective has gone out; that is to say, the existing subjectivity has vanished, in that it has made an attempt to become what in the abstract sense is called subjectivity, the mere abstract form of an abstract objectivity. And yet, the objectivity which has thus come into being is, from the subjective point of view at the most, either an hypothesis or an approximation, because all eternal decisiveness is rooted in subjectivity.

However, the objective way deems itself to have a security which the subjective way does not have (and, of course, existence and existing cannot be thought in combination with objective security); it thinks to escape a danger which threatens the subjective way, and this danger is at its maximum: madness. In a merely subjective determination of the truth, madness and truth become in the last analysis indistinguishable, since they may both have inwardness.² Nevertheless, perhaps I may here venture to offer a little remark, one which would seem to be not wholly superfluous in an objective age. The absence of inwardness is also madness. The objective truth as such, is by no means adequate to determine that whoever utters it is sane; on the contrary, it may even betray the fact that he is mad, although what he says may be entirely true, and especially objectively true. I shall here permit myself to tell a story, which without any sort of adaptation on my part comes direct from an asylum. A patient in such an institution seeks to escape, and actually succeeds in effecting his purpose by leaping out of a window, and prepares to start on the road to freedom, when the thought strikes him (shall I say sanely enough or madly enough?): "When you come to town you will be recognized, and you will at once be brought back here again; hence you need to prepare yourself fully to convince everyone by the objective truth of what you say, that all is in order as far as your sanity is concerned." As he walks along and thinks about this, he sees a ball lying on the ground, picks it up, and puts it into the tail pocket of his coat. Every step he takes the ball strikes him, politely speaking, on his hinder parts, and every time it thus strikes him he says: "Bang, the earth is round." He comes to the city, and at once calls on one of his friends; he wants to convince him that he is not crazy, and therefore walks back and forth, saying continually: "Bang, the earth is round!" But is not the earth round? Does the asylum still crave yet another sacrifice for this opinion, as in the time when all men believed it to be flat as a pancake? Or is a man who hopes to prove that he is sane, by uttering a generally accepted and generally respected objective truth, insane? And yet it was clear to the physician that the patient was not yet cured; though it is not to be thought that the cure would consist in getting him to accept the opinion that the earth is flat. But all men are not physicians, and what the age demands seems to have a considerable influence upon the question of what madness is. Aye, one could almost be tempted sometimes to believe that the modern age, which has modernized Christianity, has also modernized the question of Pontius Pilate,³ and that its urge to find something in which it can rest proclaims itself in the question: What is madness? When a *Privatdocent*,⁴ every time his scholastic gown reminds him that he ought to say something, says *de omnibus dubitandum est*,⁵ and at the same time writes away at a system which offers abundant internal evidence in every other sentence that the man has never doubted anything at all: he is not

regarded as mad.

Don Quixote⁶ is the prototype for a subjective madness, in which the passion of inwardness embraces a particular finite fixed idea. But the absence of inwardness gives us on the other hand the prating madness, which is quite as comical; and it might be a very desirable thing if an experimental psychologist would delineate it by taking a handful of such philosophers and bringing them together. In the type of madness which manifests itself as an aberrant inwardness, the tragic and the comic is that the something which is of such infinite concern to the unfortunate individual is a particular fixation which does not really concern anybody. In the type of madness which consists in the absence of inwardness, the comic is that though the something which the happy individual knows really is the truth, the truth which concerns all men, it does not in the slightest degree concern the much respected prater. This type of madness is more inhuman than the other. One shrinks from looking into the eyes of a madman of the former type lest one be compelled to plumb there the depths of his delirium; but one dares not look at a madman of the latter type at all, from fear of discovering that he has eyes of glass and hair made from carpet-rags; that he is, in short, an artificial product. If you meet someone who suffers from such a derangement of feeling, the derangement consisting in his not having any, you listen to what he says in a cold and awful dread, scarcely knowing whether it is a human being who speaks, or a cunningly contrived walking stick in which a talking machine has been concealed. It is always unpleasant for a proud man to find himself unwittingly drinking a toast of brotherhood with the public hangman;⁷ but to find oneself engaged in rational and philosophical conversation with a walking stick is almost enough to make a man lose his mind.

The subjective reflection turns its attention inwardly to the subject, and desires in this intensification of inwardness to realize the truth. And it proceeds in such fashion that, just as in the preceding objective reflection, when the objectivity had come into being, the subjectivity had vanished, so here the subjectivity of the subject becomes the final stage, and objectivity a vanishing factor. Not for a single moment is it forgotten that the subject is an existing individual, and that existence is a process of becoming, and that therefore the notion of the truth as identity of thought and being is a chimera of abstraction, in its truth only an expectation of the creature; not because the truth is not such an identity, but because the knower is an existing individual for whom the truth cannot be such an identity as long as he lives in time. Unless we hold fast to this, speculative philosophy will immediately transport us into the fantastic realism of the I-am-I,⁸ which modern speculative thought has not hesitated to use without explaining how a particular individual is related to it; and God knows, no human being is more than such a particular individual.

If an existing individual were really able to transcend himself, the truth would be for him something final and complete; but where is the point at which he is outside himself? The I-am-I is a mathematical point which does not exist, and in so far there is nothing to prevent everyone from occupying this standpoint; the one will not be in the way of the other. It is only momentarily that the particular individual is able to realize existentially a unity of the infinite and the finite which transcends existence. This unity is realized in the moment of passion. Modern philosophy has tried anything and everything in the effort to help the individual to transcend himself objectively, which is a wholly impossible feat; existence exercises its restraining influence, and if philosophers nowadays had not become mere scribblers in the service of a fantastic thinking and its preoccupation, they would long ago have perceived that suicide was the only tolerable practical interpretation of its striving. But the scribbling modern philosophy holds passion in contempt; and yet passion is the culmination of existence for an existing individual — and we are all of us existing individuals. In passion the existing subject is rendered infinite in the eternity of the imaginative representation, and yet he is at the same time most definitely himself. The fantastic I-am-I is not an identity of the infinite and the finite, since neither the one nor the other is real; it is a fantastic rendezvous in the clouds,⁹ an unfruitful embrace, and the relationship of the individual self to this mirage is never indicated.

All essential knowledge relates to existence, or only such knowledge as has an essential relationship to existence is essential knowledge. All knowledge which does not inwardly relate itself to existence, in the reflection of inwardness, is, essentially viewed, accidental knowledge; its degree and scope is essentially indifferent. That essential knowledge is essentially related to existence does not mean the above-mentioned identity which abstract thought postulates between thought and being; nor does it signify, objectively, that knowledge corresponds to something existent as its object. But it means that knowledge has a relationship to the knower, who is essentially an existing individual, and that for this reason all essential knowledge is essentially related to existence. Only ethical and ethico-religious knowledge has an essential relationship to the existence of the knower.

Mediation is a mirage, like the I-am-I. From the abstract point of view everything is and nothing comes

into being. Mediation can therefore have no place in abstract thought, because it presupposes *movement*. Objective knowledge may indeed have the existent for its object; but since the knowing subject is an existing individual, and through the fact of his existence in process of becoming, philosophy must first explain how a particular existing subject is related to a knowledge of mediation. It must explain what he is in such a moment, if not pretty nearly *distract*; where he is, if not in the moon? There is constant talk of mediation and mediation; is mediation then a man, as Peter Deacon¹⁰ believes that *Imprimatur* is a man? How does a human being manage to become something of this kind? Is this dignity, this great *philosophicum*, the fruit of study, or does the magistrate give it away, like the office of deacon or grave-digger? Try merely to enter into these and other such plain questions of a plain man, who would gladly become mediation if it could be done in some lawful and honest manner, and not either by saying abracadabra, or by forgetting that he is himself an existing human being, for whom existence is therefore something essential, and an ethico-religious existence a suitable *quantum satis*.¹¹ A speculative philosopher may perhaps find it in bad taste to ask such questions. But it is important not to direct the polemic to the wrong point, and hence not to begin in a fantastic objective manner to discuss *pro* and *contra*¹² whether there is a mediation or not, but to hold fast what it means to be a human being.

In an attempt to make clear the difference of way that exists between an objective and a subjective reflection, I shall now proceed to show how a subjective reflection makes its way inwardly in inwardness. Inwardness in an existing subject culminates in passion; corresponding to passion in the subject the truth becomes a paradox; and the fact that the truth becomes a paradox is rooted precisely in its having a relationship to an existing subject. Thus the one corresponds to the other. By forgetting that one is an existing subject, passion goes by the board and the truth is no longer a paradox; the knowing subject becomes a fantastic entity rather than a human being, and the truth becomes a fantastic object for the knowledge of this fantastic entity.

*When the question of truth is raised in an objective manner, reflection is directed objectively to the truth, as an object to which the knower is related. Reflection is not focussed upon the relationship, however, but upon the question of whether it is the truth to which the knower is related. If only the object to which he is related is the truth, the subject is accounted to be in the truth. When the question of the truth is raised subjectively, reflection is directed subjectively to the nature of the individual's relationship; if only the mode of this relationship is in the truth, the individual is in the truth even if he should happen to be thus related to what is not true.*¹³ Let us take as an example the knowledge of God. Objectively, reflection is directed to the problem of whether this object is the true God; subjectively, reflection is directed to the question whether the individual is related to a something *in such a manner* that his relationship is in truth a God-relationship. On which side is the truth now to be found? Ah, may we not here resort to a mediation, and say: It is on neither side, but in the mediation of both? Excellently well said, provided we might have it explained how an existing individual manages to be in a state of mediation. For to be in a state of mediation is to be finished, while to exist is to become. Nor can an existing individual be in two places at the same time — he cannot be an identity of subject and object. When he is nearest to being in two places at the same time he is in passion; but passion is momentary, and passion is also the highest expression of subjectivity.

The existing individual who chooses to pursue the objective way enters upon the entire approximation-process by which it is proposed to bring God to light objectively. But this is in all eternity impossible, because God is a subject, and therefore exists only for subjectivity in inwardness. The existing individual who chooses the subjective way apprehends instantly the entire dialectical difficulty involved in having to use some time, perhaps a long time, in finding God objectively; and he feels this dialectical difficulty in all its painfulness, because every moment is wasted in which he does not have God.¹⁴ That very instant he has God, not by virtue of any objective deliberation, but by virtue of the infinite passion of inwardness. The objective inquirer, on the other hand, is not embarrassed by such dialectical difficulties as are involved in devoting an entire period of investigation to finding God — since it is possible that the inquirer may die tomorrow; and if he lives he can scarcely regard God as something to be taken along if convenient, since God is precisely that which one takes *a tout prix*,¹⁵ which in the understanding of passion constitutes the true inward relationship to God.

It is at this point, so difficult dialectically, that the way swings off for everyone who knows what it means to think, and to think existentially; which is something very different from sitting at a desk and writing about what one has never done, something very different from writing *de omnibus dubitandum*¹⁶ and at the same time being as credulous existentially as the most sensuous of men. Here is where the way swings off, and the change is marked by the fact that while objective knowledge rambles comfortably on by way of the long road

of approximation without being impelled by the urge of passion, subjective knowledge counts every delay a deadly peril, and the decision so infinitely important and so instantly pressing that it is as if the opportunity had already passed.

Now when the problem is to reckon up on which side there is most truth, whether on the side of one who seeks the true God objectively, and pursues the approximate truth of the God-idea; or on the side of one who, driven by the infinite passion of his need of God, feels an infinite concern for his own relationship to God in truth (and to be at one and the same time on both sides equally, is as we have noted not possible for an existing individual, but is merely the happy delusion of an imaginary I-am-I): the answer cannot be in doubt for anyone who has not been demoralized with the aid of science. If one who lives in the midst of Christendom goes up to the house of God, the house of the true God, with the true conception of God in his knowledge, and prays, but prays in a false spirit; and one who lives in an idolatrous community prays with the entire passion of the infinite, although his eyes rest upon the image of an idol: where is there most truth? The one prays in truth to God though he worships an idol; the other prays falsely to the true God, and hence worships in fact an idol.

When one man investigates objectively the problem of immortality, and another embraces an uncertainty with the passion of the infinite: where is there most truth, and who has the greater certainty? The one has entered upon a never-ending approximation, for the certainty of immortality lies precisely in the subjectivity of the individual; the other is immortal, and fights for his immortality by struggling with the uncertainty. Let us consider Socrates. Nowadays everyone dabbles in a few proofs; some have several such proofs, others fewer. But Socrates! He puts the question objectively in a problematic manner: *if* there is an immortality. He must therefore be accounted a doubter in comparison with one of our modern thinkers with the three proofs? By no means. On this “if” he risks his entire life, he has the courage to meet death, and he has with the passion of the infinite so determined the pattern of his life that it must be found acceptable — *if* there is an immortality. Is any better proof capable of being given for the immortality of the soul? But those who have the three proofs do not at all determine their lives in conformity therewith; if there is an immortality it must feel disgust over their manner of life: can any better refutation be given of the three proofs? The bit of uncertainty that Socrates had, helped him because he himself contributed the passion of the infinite; the three proofs that the others have do not profit them at all, because they are dead to spirit and enthusiasm, and their three proofs, in lieu of proving anything else, prove just this. A young girl may enjoy all the sweetness of love on the basis of what is merely a weak hope that she is beloved, because she rests everything on this weak hope; but many a wedded matron more than once subjected to the strongest expressions of love, has in so far indeed had proofs, but strangely enough has not enjoyed *quod erat demonstrandum*.¹⁷ The Socratic ignorance, which Socrates held fast with the entire passion of his inwardness, was thus an expression for the principle that the eternal truth is related to an existing individual, and that this truth must therefore be a paradox for him as long as he exists; and yet it is possible that there was more truth in the Socratic ignorance as it was in him, than in the entire objective truth of the System, which flirts with what the times demand and accommodates itself to *Privatdocents*.

The objective accent falls on WHAT is said, the subjective accent on HOW it is said. This distinction holds even in the aesthetic realm, and receives definite expression in the principle that what is in itself true may in the mouth of such and such a person become untrue. In these times this distinction is particularly worthy of notice, for if we wish to express in a single sentence the difference between ancient times and our own, we should doubtless have to say: “In ancient times only an individual here and there knew the truth; now all know it, except that the inwardness of its appropriation stands in an inverse relationship to the extent of its dissemination.”¹⁸ Aesthetically the contradiction that truth becomes untruth in this or that person’s mouth, is best construed comically: In the ethico-religious sphere, accent is again on the “how.” But this is not to be understood as referring to demeanor, expression, or the like; rather it refers to the relationship sustained by the existing individual, in his own existence, to the content of his utterance. Objectively the interest is focussed merely on the thought-content, subjectively on the inwardness. At its maximum this inward “how” is the passion of the infinite, and the passion of the infinite is the truth. But the passion of the infinite is precisely subjectivity, and thus subjectivity becomes the truth. Objectively there is no infinite decisiveness, and hence it is objectively in order to annul the difference between good and evil, together with the principle of contradiction, and therewith also the infinite difference between the true and the false. Only in subjectivity is there decisiveness, to seek objectivity is to be in error. It is the passion of the infinite that is the decisive factor and not its content, for its content is precisely itself. In this manner subjectivity and the subjective “how” constitute the truth.

But the “how” which is thus subjectively accentuated precisely because the subject is an existing individual,

is also subject to a dialectic with respect to time. In the passionate moment of decision, where the road swings away from objective knowledge, it seems as if the infinite decision were thereby realized. But in the same moment that existing individual finds himself in the temporal order, and the subjective “how” is transformed into a striving, a striving which receives indeed its impulse and a repeated renewal from the decisive passion of the infinite, but is nevertheless a striving.

When subjectivity is the truth, the conceptual determination of the truth must include an expression for the antithesis to objectivity, a memento of the fork in the road where the way swings off; this expression will at the same time serve as an indication of the tension of the subjective inwardness. Here is such a definition of truth: *An objective uncertainty held fast in an appropriation-process of the most passionate inwardness is the truth*, the highest truth attainable for an *existing* individual. At the point where the way swings off (and where this is cannot be specified objectively, since it is a matter of subjectivity), there objective knowledge is placed in abeyance. Thus the subject merely has, objectively, the uncertainty; but it is this which precisely increases the tension of that infinite passion which constitutes his inwardness. The truth is precisely the venture which chooses an objective uncertainty with the passion of the infinite. I contemplate the order of nature in the hope of finding God, and I see omnipotence and wisdom; but I also see much else that disturbs my mind and excites anxiety. The sum of all this is an objective uncertainty. But it is for this very reason that the inwardness becomes as intense as it is, for it embraces this objective uncertainty with the entire passion of the infinite. In the case of a mathematical proposition the objectivity is given, but for this reason the truth of such a proposition is also an indifferent truth.

But the above definition of truth is an equivalent expression for faith. Without risk there is no faith. Faith is precisely the contradiction between the infinite passion of the individual’s inwardness and the objective uncertainty. If I am capable of grasping God objectively, I do not believe, but precisely because I cannot do this I must believe. If I wish to preserve myself in faith I must constantly be intent upon holding fast the objective uncertainty, so as to remain out upon the deep, over seventy thousand fathoms of water, still preserving my faith.

1. [Act III, Scene 1.—S.M.C.]
2. Even this is not really true, however for madness never has the specific inwardness of the infinite. Its fixed idea is precisely some sort of objectivity, and the contradiction of madness consists in embracing this with passion. The critical point in such madness is this again not the subjective, but the little finitude which has become a fixed idea, which is something that can never happen to the infinite.
3. [The reference is to the first-century Roman governor of Judea who, according to the New Testament, officiated at the trial of Jesus.]

13. The reader will observe that the question here is about essential truth, or about the truth that is essentially related to existence, and that it is precisely for the sake of clarifying it as inwardness or as subjectivity that this contrast is drawn.
14. In this manner, God certainly becomes a postulate, but not in the otiose manner in which this word is commonly understood. It becomes clear rather that the only way in which an existing individual comes into relation with God is when the dialectical contradictions brings his passion to the point of despair and helps him to embrace God with the “category of despair” (faith). Then the postulate is so far from being arbitrary that it is precisely a life-necessity. It is then not so much that God is a postulate as that the existing individual’s postulation of God is a necessity.
15. [At any cost.]
16. [About everything that can be doubted.]

18. *Stages on Life's Way*, Note on p. 426. Though ordinarily not wishing an expression of opinion on the part of reviewers, I might at this point almost desire it, provided such opinions, so far from flattering me, amounted to an assertion of the daring truth that what I say is something that everybody knows, even every child, and that the cultured know infinitely much better. If it only stands fast that everyone knows it, my standpoint is in order, and I shall doubtless make shift to manage with the unity of the comic and the tragic. If there were anyone who did not know it I might perhaps be in danger of being dislodged from my position of equilibrium by the thought that I might be in a position to communicate to someone the needful preliminary knowledge. It is just this which engages my interest so much, this that the cultured are accustomed to say: that everyone knows what the highest is. This was not the case in paganism, nor in Judaism, not in the seventeen centuries of Christianity. Hail to the nineteenth century! Everyone knows it. What progress has been made since the time when only a few knew it. To make up for this, perhaps, we must assume that no one nowadays does it.

John Stuart Mill

John Stuart Mill (1806–1873) was born in London, the son of a well-known philosopher, James Mill. He was extremely well educated by his father, beginning his studies of Greek and Latin at the ages of three and eight, and subsequently reading widely in the classics, history, philosophy, logic, and mathematics. In 1826, at the age of twenty, he underwent a period of acute depression: his ability to feel emotion, he believed, had been weakened by his intensive analytic training. He responded to this crisis by turning to the arts, taking special solace in the poetry of Wordsworth. Eventually he recovered fully. Hired as a clerk by the East India Company in 1823, he supported himself by working for this concern in various capacities until his retirement in 1858. In 1831 he met Harriet Taylor, a merchant's wife with whom he fell in love. Mill and Harriet Taylor were close and constant friends for many years, collaborating on many literary enterprises and finally marrying in 1851 after her husband's death. In his later years, Mill served a term in Parliament (1865–1868).

Mill's contributions to philosophy and social thought are varied. *A System of Logic* (1843) and *An Examination of Sir William Hamilton's Philosophy* (1865) deal with questions of logic and epistemology. *On Liberty* (1859) is a well-known discussion of the extent to which society may interfere with individuals' liberties. In *Utilitarianism* (first published in *Eraser's Magazine*, 1861), Mill expounds his own version of utilitarian ethics. Other topics of social importance are discussed in *Principles of Political Economy* (1848), *Considerations on Representative Government* (1861), *August Comte and Positivism* (1865), and *The Subjection of Women* (1869). His *Autobiography* (1873) presents a fascinating picture of his life.

Like the earlier empiricists, Mill believed that sensation and the mind's awareness of its own activity are the sole sources of all knowledge. However, his empiricism differs from earlier versions on a number of important issues, among them the nature of ordinary objects and the role of induction. Mill accepted Berkeley's contention that ordinary objects are collections of sense-impressions but rejected his contention that the continuous existence of these objects is due mainly to God's continuing perception of them. Rather, Mill argued, the continuous existence of tables, chairs, and other objects resides entirely in the fact that we *could* perceive them at any moment. Ordinary objects are just "permanent possibilities of sensation." Concerning induction, or reasoning that extrapolates from known regularities to conclusions about what is likely to happen in unknown instances, Mill did not share Hume's skepticism. Inductive reasoning, he argued, is licensed by a general axiom of nature's uniformity (itself arrived at inductively) and is the fundamental element in all forms of inference, including deductive inference. Even the truths of mathematics and geometry, generally held to be known a priori, are actually determined by generalizing from past experience.

Mill's moral philosophy is known as utilitarianism. Its fundamental principle is that we should always perform those acts that will bring the most happiness or, failing that, the least unhappiness. This "greatest happiness principle" did not originate with Mill but was pioneered by Jeremy Bentham (1748–1832), the English philosopher and social reformer. However, Mill's essay *Utilitarianism* is the principle's best-known formulation. In support of the greatest happiness principle, Mill argued that "the sole evidence it is possible to produce that anything is desirable is that people do actually desire it"; and that, as a matter of fact, happiness is the one and only thing that people desire. When they seem to desire other things, such as wealth or virtue, it is always because these things are either means to their happiness or "part of their happiness." Given this reasoning, Mill naturally differed with Bentham over the values of different types of pleasure. Bentham had held that the intensity of a pleasure is the only criterion of its worth. For him, sublime moments of intellect or sentiment were worth no more than equally intense moments of animal gratification. For Mill, however, pleasures of equal intensity could differ in worth. Anyone who has experienced both the pleasures of the brute and the pleasures of the civilized person will prefer the latter to the former; and so, according to Mill, the civilized pleasures must be preferable.

At first glance, Mill's greatest-happiness principle may seem to imply that society should interfere with people's liberties whenever such interference will maximize overall happiness. However, Mill did not take any such position. Rather, he argued in *On Liberty* that "the only purpose for which power can be rightfully exercised over any member of a civilised community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant." In support of this principle, Mill cited the varied benefits of liberty in self-regarding actions. Such liberty, he argued, leads to the discovery of useful new truths and modes of life; confirms and strengthens the insights we already possess; and promotes the happiness of each individual more surely than any enforced and uniform standard can. In this and other ways, Mill

attempted to reconcile his utilitarianism with the plurality of values that we possess.

For general discussions of Mill's work, see R. P. Anschutz, *The Philosophy of John Stuart Mill* (Oxford: Oxford University Press, 1953); Alan Ryan, *J. S. Mill* (London: Routledge & Kegan Paul, 1974); John Skorupski, *John Stuart Mill* (London and New York: Routledge, 1989); and David Lyons, *Rights, Welfare, and Mill's Moral Theory* (Oxford: Clarendon, 1994). For shorter essays, see J. P. Schneewind, ed., *Mill: A Collection of Critical Essays* (Garden City, N.J.: Doubleday, 1968); Samuel Gorovitz, ed., *Utilitarianism with Critical Essays* (Indianapolis: Bobbs-Merrill, 1971); David Lyons, ed., *Mill's Utilitarianism* (Lanham, Md.: Rowman & Littlefield, 1997); and John Skorupski, ed., *The Cambridge Companion to Mill* (Cambridge: Cambridge University Press, 1998). A clear general discussion of utilitarianism can be found in J. J. C. Smart and Bernard Williams, *Utilitarianism: For and Against* (Cambridge: Cambridge University Press, 1973).

George Sher

*Utilitarianism**

CHAPTER I

General Remarks

There are few circumstances among those which make up the present condition of human knowledge more unlike what might have been expected, or more significant of the backward state in which speculation on the most important subjects still lingers, than the little progress which has been made in the decision of the controversy respecting the criterion of right and wrong. From the dawn of philosophy, the question concerning the *summum bonum*, or, what is the same thing, concerning the foundation of morality, has been accounted the main problem in speculative thought, has occupied the most gifted intellects and divided them into sects and schools carrying on a vigorous warfare against one another. And after more than two thousand years the same discussions continue, philosophers are still ranged under the same contending banners, and neither thinkers nor mankind at a large seem nearer to being unanimous on the subject than when the youth Socrates listened to the old Protagoras¹ and asserted (if Plato's dialogue be grounded on a real conversation) the theory of utilitarianism against the popular morality of the so-called sophist.

It is true that similar confusion and uncertainty and, in some cases, similar discordance exist respecting the first principles of all the sciences, not excepting that which is deemed the most certain of them — mathematics, without much impairing, generally indeed without impairing at all, the trustworthiness of the conclusions of those sciences. An apparent anomaly, the explanation of which is that the detailed doctrines of a science are not usually deduced from, nor depend for their evidence upon, what are called its first principles. Were it not so, there would be no science more precarious, or whose conclusions were more insufficiently made out, than algebra, which derives none of its certainty from what are commonly taught to learners as its elements, since these, as laid down by some of its most eminent teachers, are as full of fictions as English law, and of mysteries as theology. The truths which are ultimately accepted as the first principles of a science are really the last results of metaphysical analysis practiced on the elementary notions with which the science is conversant; and their relation to the science is not that of foundations to an edifice, but of roots to a tree, which may perform their office equally well though they be never dug down to and exposed to light. But though in science the particular truths precede the general theory, the contrary might be expected to be the case with a practical art, such as morals or legislation. All action is for the sake of some end, and rules of action, it seems natural to suppose, must take their whole character and color from the end to which they are subservient. When we engage in pursuit, a clear and precise conception of what we are pursuing would seem to be the first thing we need, instead of the last we are to look forward to. A test of right and wrong must be the means, one would think, of ascertaining what is right or wrong, and not a consequence of having already ascertained it.

The difficulty is not avoided by having recourse to the popular theory of a natural faculty, a sense of instinct, informing us of right and wrong. For—besides that the existence of such a moral instinct is itself one of the matters in dispute—those believers in it who have any pretensions to philosophy have been obliged to abandon the idea that it discerns what is right or wrong in the particular case in hand, as our other senses discern the sight or sound actually present. Our moral faculty, according to all those of its interpreters who are entitled to the name of thinkers, supplies us only with the general principles of moral judgments; it is a branch of our reason, not of our sensitive faculty, and must be looked to for the abstract doctrines of morality, not for perception of it in the concrete. The intuitive, no less than what may be termed the inductive, school of ethics insists on the necessity of general laws. They both agree that the morality of an individual action is not a question of direct perception, but of the application of a law to an individual case. They recognize also, to a great extent, the same moral laws, but differ as to their evidence and the source from which they derive their authority. According to the one opinion, the principles of morals are evident *a priori*, requiring nothing to command assent except that the meaning of the terms be understood. According to the other doctrine, right and wrong, as well as truth and falsehood, are questions of observation and experience. But both hold equally that morality must be deduced from principles; and the intuitive school affirm as strongly as the inductive that there is a science of morals. Yet they seldom attempt to make out a list of the *a priori* principles which are to serve as the premises of the science; still more rarely do they make any effort to reduce those various principles to one first principle or common ground of obligation. They either assume the ordinary precepts of morals as of a *priori* authority, or they lay down as the common groundwork of those maxims some generality much less obviously authoritative than the maxims themselves, and which has never succeeded in gaining popular

acceptance. Yet to support their pretensions there ought either to be some one fundamental principle or law at the root of all morality, or, if there be several, there should be a determinate order of precedence among them; and the one principle, or the rule for deciding between the various principles when they conflict, ought to be self-evident.

To inquire how far the bad effects of this deficiency have been mitigated in practice, or to what extent the moral beliefs of mankind have been vitiated or made uncertain by the absence of any distinct recognition of an ultimate standard, would imply a complete survey and criticism of past and present ethical doctrine. It would, however, be easy to show that whatever steadiness or consistency these moral beliefs have attained has been mainly due to the tacit influence of a standard not recognized. Although the nonexistence of an acknowledged first principle has made ethics not so much a guide as a consecration of men's actual sentiments, still, as men's sentiments, both of favor and of aversion, are greatly influenced by what they suppose to be the effects of things upon their happiness, the principle of utility, or, as Bentham latterly called it, the greatest happiness principle, has had a large share in forming the moral doctrines even of those who most scornfully reject its authority. Nor is there any school of thought which refuses to admit that the influence of actions on happiness is a most material and even predominant consideration in many of the details of morals, however unwilling to acknowledge it as the fundamental principle of morality and the source of moral obligation. I might go much further and say that to all those *a priori* moralists who deem it necessary to argue at all, utilitarian arguments are indispensable. It is not my present purpose to criticize these thinkers; but I cannot help referring, for illustration, to a systematic treatise by one of the most illustrious of them, the *Metaphysics of Ethics* by Kant. This remarkable man, whose system of thought will long remain one of the landmarks in the history of philosophical speculation, does, in the treatise in question, lay down a universal first principle as the origin and ground of moral obligation; it is this: "So act that the rule on which thou actest would admit of being adopted as a law by all rational beings." But when he begins to deduce from this precept any of the actual duties of morality, he fails, almost grotesquely, to show that there would be any contradiction, any logical (not to say physical) impossibility, in the adoption by all rational beings of the most outrageously immoral rules of conduct. All he shows is that the *consequences* of their universal adoption would be such as no one would choose to incur.

On the present occasion, I shall, without further discussion of the other theories, attempt to contribute something toward the understanding and appreciation of the "utilitarian" or "happiness" theory, and toward such proof as it is susceptible of. It is evident that this cannot be proof in the ordinary and popular meaning of the term. Questions of ultimate ends are not amenable to direct proof. Whatever can be proved to be good must be so by being shown to be a means to something admitted to be good without proof. The medical art is proved to be good by its conducing to health; but how is it possible to prove that health is good? The art of music is good, for the reason, among others, that it produces pleasure; but what proof is it possible to give that pleasure is good? If, then, it is asserted that there is a comprehensive formula, including all things which are in themselves good, and that whatever else is good is not so as an end but as a means, the formula may be accepted or rejected, but is not a subject of what is commonly understood by proof. We are not, however, to infer that its acceptance or rejection must depend on blind impulse or arbitrary choice. There is a larger meaning of the word "proof," in which this question is as amenable to it as any other of the disputed questions of philosophy. The subject is within the cognizance of the rational faculty; and neither does that faculty deal with it solely in the way of intuition. Considerations may be presented capable of determining the intellect either to give or withhold its assent to the doctrine; and this is equivalent to proof.

We shall examine presently of what nature are these considerations; in what manner they apply to the case, and what rational grounds, therefore, can be given for accepting or rejecting the utilitarian formula. But it is a preliminary condition of rational acceptance or rejection that the formula should be correctly understood. I believe that the very imperfect notion ordinarily formed of its meaning is the chief obstacle which impedes its reception, and that, could it be cleared even from only the grosser misconceptions, the question would be greatly simplified and a large proportion of its difficulties removed. Before, therefore, I attempt to enter into the philosophical grounds which can be given for assenting to the utilitarian standard, I shall offer some illustrations of the doctrine itself, with the view of showing more clearly what it is, distinguishing it from what it is not, and disposing of such of the practical objections to it as either originate in, or are closely connected with, mistaken interpretations of its meaning. Having thus prepared the ground, I shall afterwards endeavor to throw such light as I can call upon the question considered as one of philosophical theory.

CHAPTER II

What Utilitarianism Is

A passing remark is all that needs be given to the ignorant blunder of supposing that those who stand up for utility as the test of right and wrong use the term in that restricted and merely colloquial sense in which utility is opposed to pleasure. An apology is due to the philosophical opponents of utilitarianism for even the momentary appearance of confounding them with anyone capable of so absurd a misconception; which is the more extraordinary, inasmuch as the contrary accusation, of referring everything to pleasure, and that, too, in its grossest form, is another of the common charges against utilitarianism: and, as has been pointedly remarked by an able writer, the same sort of persons, and often the very same persons, denounce the theory “as impracticably dry when the word ‘utility’ precedes the word ‘pleasure,’ and as too practicably voluptuous when the word ‘pleasure’ precedes the word ‘utility.’” Those who know anything about the matter are aware that every writer, from Epicurus to Bentham, who maintained the theory of utility meant by it, not something to be contradistinguished from pleasure, but pleasure itself, together with exemption from pain; and instead of opposing the useful to the agreeable or the ornamental, have always declared that the useful means these, among other things. Yet the common herd, including the herd of writers, not only in newspapers and periodicals, but in books of weight and pretension, are perpetually falling into this shallow mistake. Having caught up the word “utilitarian,” while knowing nothing whatever about it but its sound, they habitually express by it the rejection or the neglect of pleasure in some of its forms: of beauty, of ornament, or of amusement. Nor is the term thus ignorantly misapplied solely in disparagement, but occasionally in compliment, as though it implied superiority to frivolity and the mere pleasures of the moment. And this perverted use is the only one in which the word is popularly known, and the one from which the new generation are acquiring their sole notion of its meaning. Those who introduced the word, but who had for many years discontinued it as a distinctive appellation, may well feel themselves called upon to resume it if by doing so they can hope to contribute anything toward rescuing it from this utter degradation.²

The creed which accepts as the foundation of morals “utility” or the “greatest happiness principle” holds that actions are right in proportion as they tend to promote happiness; wrong as they tend to produce the reverse of happiness. By happiness is intended pleasure and the absence of pain; by unhappiness, pain and the privation of pleasure. To give a clear view of the moral standard set up by the theory, much more requires to be said; in particular, what things it includes in the ideas of pain and pleasure, and to what extent this is left an open question. But these supplementary explanations do not affect the theory of life on which this theory of morality is grounded — namely, that pleasure and freedom from pain are the only things desirable as ends; and that all desirable things (which are as numerous in the utilitarian as in any other scheme) are desirable either for pleasure inherent in themselves or as means to the promotion of pleasure and the prevention of pain.

Now such a theory of life excites in many minds, and among them in some of the most estimable in feeling and purpose, inveterate dislike. To suppose that life has (as they express it) no higher end than pleasure — no better and nobler object of desire and pursuit—they designate as utterly mean and groveling, as a doctrine worthy only of swine, to whom the followers of Epicurus were, at a very early period, contemptuously likened; and modern holders of the doctrine are occasionally made the subject of equally polite comparisons by its German, French, and English assailants.

When thus attacked, the Epicureans have always answered that it is not they, but their accusers, who represent human nature in a degrading light, since the accusation supposes human beings to be capable of no pleasures except those of which swine are capable. If this supposition were true, the charge could not be gainsaid, but would then be no longer an imputation; for if the sources of pleasure were precisely the same to human beings and to swine, the rule of life which is good enough for the one would be good enough for the other. The comparison of the Epicurean life to that of beasts is felt as degrading, precisely because a beast’s pleasures do not satisfy a human being’s conceptions of happiness. Human beings have faculties more elevated than the animal appetites and, when once made conscious of them, do not regard anything as happiness which does not include their gratification. I do not indeed, consider the Epicureans to have been by any means faultless in drawing out their scheme of consequences from the utilitarian principle. To do this in any sufficient manner, many Stoic, as well as Christian, elements require to be included. But there is no known Epicurean theory of life which does not assign to the pleasures of the intellect, of the feelings and imagination, and of the moral sentiments a much higher value as pleasures than to those of mere sensation. It

must be admitted, however, that utilitarian writers in general have placed the superiority of mental over bodily pleasures chiefly in the greater permanency, safety, uncostliness, etc., of the former — that is, in their circumstantial advantages rather than in their intrinsic nature. And on all these points utilitarians have fully proved their case; but they might have taken the other and, as it may be called, higher ground with entire consistency. It is quite compatible with the principle of utility to recognize the fact that some kinds of pleasure are more desirable and more valuable than others. It would be absurd that, while in estimating all other things quality is considered as well as quantity, the estimation of pleasure should be supposed to depend on quantity alone.

If I am asked what I mean by difference of quality in pleasures, or what makes one pleasure more valuable than another, merely as a pleasure, except its being greater in amount, there is but one possible answer. Of two pleasures, if there be one to which all or almost all who have experience of both give a decided preference, irrespective of any feeling of moral obligation to prefer it, that is the more desirable pleasure. If one of the two is, by those who are competently acquainted with both, placed so far above the other that they prefer it, even though knowing it to be attended with a greater amount of discontent, and would not resign it for any quantity of the other pleasure which their nature is capable of, we are justified in ascribing to the preferred enjoyment a superiority in quality so far outweighing quantity as to render it, in comparison, of small account.

Now it is an unquestionable fact that those who are equally acquainted with and equally capable of appreciating and enjoying both do give a most marked preference to the manner of existence which employs their higher faculties. Few human creatures would consent to be changed into any of the lower animals for a promise of the fullest allowance of a beast's pleasures; no intelligent human being would consent to be a fool, no instructed person would be an ignoramus, no person of feeling and conscience would be selfish and base, even though they should be persuaded that the fool, the dunce, or the rascal is better satisfied with his lot than they are with theirs. They would not resign what they possess more than he for the most complete satisfaction of all the desires which they have in common with him. If they ever fancy they would, it is only in cases of unhappiness so extreme that to escape from it they would exchange their lot for almost any other, however undesirable in their own eyes. A being of higher faculties requires more to make him happy, is capable probably of more acute suffering, and certainly accessible to it at more points, than one of an inferior type; but in spite of these liabilities, he can never really wish to sink into what he feels to be a lower grade of existence. We may give what explanation we please of this unwillingness; we may attribute it to pride, a name which is given indiscriminately to some of the most and to some of the least estimable feelings of which mankind are capable; we may refer it to the love of liberty and personal independence, an appeal to which was with the Stoics one of the most effective means for the inculcation of it; to the love of power or to the love of excitement, both of which do really enter into and contribute to it; but its most appropriate appellation is a sense of dignity, which all human beings possess in one form or other, and in some, though by no means in exact, proportion to their higher faculties, and which is so essential a part of the happiness of those in whom it is strong that nothing which conflicts with it could be otherwise than momentarily an object of desire to them. Whoever supposes that this preference takes place at a sacrifice of happiness — that the superior being, in anything like equal circumstances, is not happier than the inferior—confounds the two very different ideas of happiness and content. It is indisputable that the being whose capacities of enjoyment are low has the greatest chance of having them fully satisfied; and a highly endowed being will always feel that any happiness which he can look for, as the world is constituted, is imperfect. But he can learn to bear its imperfections, if they are at all bearable; and they will not make him envy the being who is indeed unconscious of the imperfections, but only because he feels not at all the good which those imperfections qualify. It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied. And if the fool, or the pig, are of a different opinion, it is because they only know their own side of the question. The other party to the comparison knows both sides.

It may be objected that many who are capable of the higher pleasures occasionally, under the influence of temptation, postpone them to the lower. But this is quite compatible with a full appreciation of the intrinsic superiority of the higher. Men often, from infirmity of character, make their election for the nearer good, though they know it to be the less valuable; and this no less when the choice is between two bodily pleasures than when it is between bodily and mental. They pursue sensual indulgences to the injury of health, though perfectly aware that health is the greater good. It may be further objected that many who begin with youthful enthusiasm for everything noble, as they advance in years, sink into indolence and selfishness. But I do not believe that those who undergo this very common change voluntarily choose the lower description of pleasures in preference to the higher. I believe that, before they devote themselves exclusively to the one, they have already become incapable of the other. Capacity for other nobler feelings is in most natures a very tender plant, easily killed, not only by hostile influences, but by mere want of sustenance; and in the majority of

young persons it speedily dies away if the occupations to which their position in life has devoted them, and the society into which it has thrown them, are not favorable to keeping that higher capacity in exercise. Men lose their high aspirations as they lose their intellectual tastes, because they have not time or opportunity for indulging them; and they addict themselves to inferior pleasures, not because they deliberately prefer them, but because they are either the only ones to which they have access or the only ones which they are any longer capable of enjoying. It may be questioned whether anyone who has remained equally susceptible to both classes of pleasures ever knowingly and calmly preferred the lower, though many, in all ages, have broken down in an ineffectual attempt to combine both.

From this verdict of the only competent judges, I apprehend there can be no appeal. On a question which is the best worth having of two pleasures, or which of two modes of existence is the most grateful to the feelings, apart from its moral attributes and from its consequences, the judgment of those who are qualified by knowledge of both, or, if they differ, that of the majority among them, must be admitted as final. And there needs be the less hesitation to accept this judgment respecting the quality of pleasures, since there is no other tribunal to be referred to even on the question of quantity. What means are there of determining which is the acutest of two pains, or the intensest of two pleasurable sensations, except the general suffrage of those who are familiar with both? Neither pains nor pleasures are homogeneous, and pain is always heterogeneous with pleasure. What is there to decide whether a particular pleasure is worth purchasing at the cost of a particular pain, except the feelings and judgment of the experienced? When, therefore, those feelings and judgment declare the pleasures derived from the higher faculties to be preferable *in kind*, apart from the question of intensity, to those of which the animal nature, disjoined from the higher faculties, is susceptible, they are entitled on this subject to the same regard.

I have dwelt on this point as being a necessary part of a perfectly just conception of utility or happiness considered as the directive rule of human conduct. But it is by no means an indispensable condition to the acceptance of the utilitarian standard; for that standard is not the agent's own greatest happiness, but the greatest amount of happiness altogether; and if it may possibly be doubted whether a noble character is always the happier for its nobleness, there can be no doubt that it makes other people happier, and that the world in general is immensely a gainer by it. Utilitarianism, therefore, could only attain its end by the general cultivation of nobleness of character, even if each individual were only benefited by the nobleness of others, and his own, so far as happiness is concerned, were a sheer deduction from the benefit. But the bare enunciation of such an absurdity as this last renders refutation superfluous.

According to the greatest happiness principle, as above explained, the ultimate end, with reference to and for the sake of which all other things are desirable — whether we are considering our own good or that of other people — is an existence exempt as far as possible from pain, and as rich as possible in enjoyments, both in point of quantity and quality; the test of quality and the rule of measuring it against quantity being the preference felt by those who, in their opportunities of experience, to which must be added their habits of self-consciousness and self-observation, are best furnished with the means of comparison. This, being according to the utilitarian opinion the end of human action, is necessarily also the standard of morality, which may accordingly be defined “the rules and precepts for human conduct,” by the observance of which an existence such as has been described might be, to the greatest extent possible, secured to all mankind; and not to them only, but, so far as the nature of things admits, to the whole sentient creation.

Against this doctrine, however, arises another class of objectors who say that happiness, in any form, cannot be the rational purpose of human life and action; because, in the first place, it is unattainable; and they contemptuously ask, What right hast thou to be happy? — a question which Mr. Carlyle³ clinches by the addition, What right, a short time ago, hadst thou even *to be*? Next they say that men can do *without* happiness; that all noble human beings have felt this, and could not have become noble but by learning the lesson of *Entsagen*, or renunciation; which lesson, thoroughly learned and submitted to, they affirm to be the beginning and necessary condition of all virtue.

The first of these objections would go to the root of the matter were it well founded; for if no happiness is to be had at all by human beings, the attainment of it cannot be the end of morality or of any rational conduct. Though, even in that case, something might still be said for the utilitarian theory, since utility includes not solely the pursuit of happiness, but the prevention or mitigation of unhappiness; and if the former aim be chimerical, there will be all the greater scope and more imperative need for the latter, so long at least as mankind think fit to live and do not take refuge in the simultaneous act of suicide recommended under certain conditions by Novalis.⁴ When, however, it is thus positively asserted to be impossible that human life should be happy, the assertion, if not something like a verbal quibble, is at least an exaggeration. If by happiness be meant a continuity of highly pleasurable excitement, it is evident enough that this is impossible. A state of

exalted pleasure lasts only moments or in some cases, and with some intermissions, hours or days, and is the occasional brilliant flash of enjoyment, not its permanent and steady flame. Of this the philosophers who have taught that happiness is the end of life were as fully aware as those who taunt them. The happiness which they meant was not a life of rapture, but moments of such, in an existence made up of few and transitory pains, many and various pleasures, with a decided predominance of the active over the passive, and having as the foundation of the whole not to expect more from life than it is capable of bestowing. A life thus composed, to those who have been fortunate enough to obtain it, has always appeared worthy of the name of happiness. And such an existence is even now the lot of many during some considerable portion of their lives. The present wretched education and wretched social arrangements are the only real hindrance to its being attainable by almost all.

The objectors perhaps may doubt whether human beings, if taught to consider happiness as the end of life, would be satisfied with such a moderate share of it. But great numbers of mankind have been satisfied with much less. The main constituents of a satisfied life appear to be two, either of which by itself is often found sufficient for the purpose: tranquillity and excitement. With much tranquillity, many find that they can be content with very little pleasure; with much excitement, many can reconcile themselves to a considerable quantity of pain. There is assuredly no inherent impossibility of enabling even the mass of mankind to unite both, since the two are so far from being incompatible that they are in natural alliance, the prolongation of either being a preparation for, and exciting a wish for, the other. It is only those in whom indolence amounts to a vice that do not desire excitement after an interval of repose; it is only those in whom the need of excitement is a disease that feel the tranquillity which follows excitement dull and insipid, instead of pleasurable in direct proportion to the excitement which preceded it. When people who are tolerably fortunate in their outward lot do not find in life sufficient enjoyment to make it valuable to them, the cause generally is caring for nobody but themselves. To those who have neither public nor private affections, the excitements of life are much curtailed, and in any case dwindle in value as the time approaches when all selfish interests must be terminated by death; while those who leave after them objects of personal affection, and especially those who have also cultivated a fellow-feeling with the collective interests of mankind, retain as lively an interest in life on the eve of death as in the vigor of youth and health. Next to selfishness, the principal cause which makes life unsatisfactory is want of mental cultivation. A cultivated mind — I do not mean that of a philosopher, but any mind to which the fountains of knowledge have been opened, and which has been taught, in any tolerable degree, to exercise its faculties — finds sources of inexhaustible interest in all that surrounds it: in the objects of nature, the achievements of art, the imaginations of poetry, the incidents of history, the ways of mankind, past and present, and their prospects in the future. It is possible, indeed, to become indifferent to all this, and that too without having exhausted a thousandth part of it, but only when one has had from the beginning no moral or human interest in these things and has sought in them only the gratification of curiosity.

Now there is absolutely no reason in the nature of things why an amount of mental culture sufficient to give an intelligent interest in these objects of contemplation should not be the inheritance of everyone born in a civilized country. As little is there an inherent necessity that any human being should be a selfish egotist, devoid of every feeling or care but those which center in his own miserable individuality. Something far superior to this is sufficiently common even now, to give ample earnest of what the human species may be made. Genuine private affections and a sincere interest in the public good are possible, though in unequal degrees, to every rightly brought up human being. In a world in which there is so much to interest, so much to enjoy, and so much also to correct and improve, everyone who has this moderate amount of moral and intellectual requisites is capable of an existence which may be called enviable; and unless such a person, through bad laws or subjection to the will of others, is denied the liberty to use the sources of happiness within his reach, he will not fail to find this enviable existence, if he escapes the positive evils of life, the great sources of physical and mental suffering—such as indigence, disease, and the unkindness, worthlessness, or premature loss of objects of affection. The main stress of the problem lies, therefore, in the contest with these calamities from which it is a rare good fortune entirely to escape; which, as things now are, cannot be obviated, and often cannot be in any material degree mitigated. Yet no one whose opinion deserves a moment's consideration can doubt that most of the great positive evils of the world are in themselves removable, and will, if human affairs continue to improve, be in the end reduced within narrow limits. Poverty, in any sense implying suffering, may be completely extinguished by the wisdom of society combined with the good sense and providence of individuals. Even that most intractable of enemies, disease, may be indefinitely reduced in dimensions by good physical and moral education and proper control of noxious influences, while the progress of science holds out a promise for the future of still more direct conquests over this detestable foe. And every advance in that direction relieves us from some, not only of the chances which cut short our own lives, but, what concerns us

still more, which deprive us of those in whom our happiness is wrapt up. As for vicissitudes of fortune and other disappointments connected with worldly circumstances, these are principally the effect either of gross imprudence, of ill-regulated desires, or of bad or imperfect social institutions. All the grand sources, in short, of human suffering are in a great degree, many of them almost entirely, conquerable by human care and effort; and though their removal is grievously slow—though a long succession of generations will perish in the breach before the conquest is completed, and this world becomes all that, if will and knowledge were not wanting, it might easily be made—yet every mind sufficiently intelligent and generous to bear a part, however small and inconspicuous, in the endeavor will draw a noble enjoyment from the contest itself, which he would not for any bribe in the form of selfish indulgence consent to be without.

And this leads to the true estimation of what is said by the objectors concerning the possibility and the obligation of learning to do without happiness. Unquestionably it is possible to do without happiness; it is done involuntarily by nineteen-twentieths of mankind, even in those parts of our present world which are least deep in barbarism; and it of ten has to be done voluntarily by the hero or the martyr, for the sake of something which he prizes more than his individual happiness. But this something, what is it, unless the happiness of others or some of the requisites of happiness? It is noble to be capable of resigning entirely one's own portion of happiness, or chances of it; but, after all, this self-sacrifice must be for some end; it is not its own end; and if we are told that its end is not happiness but virtue, which is better than happiness, I ask, would the sacrifice be made if the hero or martyr did not believe that it would earn for others immunity from similar sacrifices? Would it be made if he thought that his renunciation of happiness for himself would produce no fruit for any of his fellow creatures, but to make their lot like his and place them also in the condition of persons who have renounced happiness? All honor to those who can abnegate for themselves the personal enjoyment of life when by such renunciation they contribute worthily to increase the amount of happiness in the world; but he who does it or professes to do it for any other purpose is no more deserving of admiration than the ascetic mounted on his pillar. He may be an inspiring proof of what men *can* do, but assuredly not an example of what they *should*.

Though it is only in a very imperfect state of the world's arrangements that anyone can best serve the happiness of others by the absolute sacrifice of his own, yet, so long as the world is in that imperfect state, I fully acknowledge that the readiness to make such a sacrifice is the highest virtue which can be found in man. I will add that in this condition of the world, paradoxical as the assertion may be, the conscious ability to do without happiness gives the best prospect of realizing such happiness as is attainable. For nothing except that consciousness can raise a person above the chances of life by making him feel that, let fate and fortune do their worst, they have not power to subdue him; which, once felt, frees him from excess of anxiety concerning the evils of life and enables him, like many a Stoic in the worst times of the Roman Empire, to cultivate in tranquillity the sources of satisfaction accessible to him, without concerning himself about the uncertainty of their duration any more than about their inevitable end.

Meanwhile, let utilitarians never cease to claim the morality of self-devotion as a possession which belongs by as good a right to them as either to the Stoic or to the Transcendentalist.⁵ The utilitarian morality does recognize in human beings the power of sacrificing their own greatest good for the good of others. It only refuses to admit that the sacrifice is itself a good. A sacrifice which does not increase or tend to increase the sum total of happiness, it considers as wasted. The only self-renunciation which it applauds is devotion to the happiness, or to some of the means of happiness, of others, either of mankind collectively or of individuals within the limits imposed by the collective interests of mankind.

I must again repeat what the assailants of utilitarianism seldom have the justice to acknowledge, that the happiness which forms the utilitarian standard of what is right in conduct is not the agent's own happiness but that of all concerned. As between his own happiness and that of others, utilitarianism requires him to be as strictly impartial as a disinterested and benevolent spectator. In the golden rule of Jesus of Nazareth, we read the complete spirit of the ethics of utility. "To do as you would be done by," and "to love your neighbor as yourself," constitute the ideal perfection of utilitarian morality. As the means of making the nearest approach to this ideal, utility would enjoin, first, that laws and social arrangements should place the happiness or (as, speaking practically, it may be called) the interest of every individual as nearly as possible in harmony with the interest of the whole; and, secondly, that education and opinion, which have so vast a power over human character, should so use that power as to establish in the mind of every individual an indissoluble association between his own happiness and the good of the whole, especially between his own happiness and the practice of such modes of conduct, negative and positive, as regard for the universal happiness prescribes; so that not only he may be unable to conceive the possibility of happiness to himself, consistently with conduct opposed to the general good, but also that a direct impulse to promote the general good may be in every individual one

of the habitual motives of action, and the sentiments connected therewith may fill a large and prominent place in every human being's sentient existence. If the impugnors of the utilitarian morality represented it to their own minds in this its true character, I know not what recommendation possessed by any other morality they could possibly affirm to be wanting to it; what more beautiful or more exalted developments of human nature any other ethical system can be supposed to foster, or what springs of action, not accessible to the utilitarian, such systems rely on for giving effect to their mandates.

The objectors to utilitarianism cannot always be charged with representing it in a discreditable light. On the contrary, those among them who entertain anything like a just idea of its disinterested character sometimes find fault with its standard as being too high for humanity. They say it is exacting too much to require that people shall always act from the inducement of promoting the general interests of society. But this is to mistake the very meaning of a standard of morals and confound the rule of action with the motive of it. It is the business of ethics to tell us what are our duties, or by what test we may know them; but no system of ethics requires that the sole motive of all we do shall be a feeling of duty; on the contrary, ninety-nine hundredths of all our actions are done from other motives, and rightly so done if the rule of duty does not condemn them. It is the more unjust to utilitarianism that this particular misapprehension should be made a ground of objection to it, inasmuch as utilitarian moralists have gone beyond almost all others in affirming that the motive has nothing to do with the morality of the action, though much with the worth of the agent. He who saves a fellow creature from drowning does what is morally right, whether his motive be duty or the hope of being paid for his trouble; he who betrays the friend that trusts him is guilty of a crime, even if his object be to serve another friend to whom he is under greater obligations.⁶ But to speak only of actions done from the motive of duty, and in direct obedience to principle: it is a misapprehension of the utilitarian mode of thought to conceive it as implying that people should fix their minds upon so wide a generality as the world, or society at large. The great majority of good actions are intended not for the benefit of the world, but for that of individuals, of which the good of the world is made up; and the thoughts of the most virtuous man need not on these occasions travel beyond the particular persons concerned, except so far as is necessary to assure himself that in benefiting them he is not violating the rights, that is, the legitimate and authorized expectations, of anyone else. The multiplication of happiness is, according to the utilitarian ethics, the object of virtue: the occasions on which any person (except one in a thousand) has it in his power to do this on an extended scale — in other words, to be a public benefactor—are but exceptional; and on these occasions alone is he called on to consider public utility; in every other case, private utility, the interest or happiness of some few persons, is all he has to attend to. Those alone the influence of whose actions extends to society in general need concern themselves habitually about so large an object. In the case of abstinences indeed — of things which people forbear to do from moral considerations, though the consequences in the particular case might be beneficial — it would be unworthy of an intelligent agent not to be consciously aware that the action is of a class which, if practiced generally, would be generally injurious, and that this is the ground of the obligation to abstain from it. The amount of regard for the public interest implied in this recognition is no greater than is demanded by every system of morals, for they all enjoin to abstain from whatever is manifestly pernicious to society.

The same considerations dispose of another reproach against the doctrine of utility, founded on a still grosser misconception of the purpose of a standard of morality and of the very meaning of the words "right" and "wrong." It is often affirmed that utilitarianism renders men cold and unsympathizing; that it chills their moral feelings toward individuals; that it makes them regard only the dry and hard consideration of the consequences of actions, not taking into their moral estimate the qualities from which those actions emanate. If the assertion means that they do not allow their judgment respecting the rightness or wrongness of an action to be influenced by their opinion of the qualities of the person who does it, this is a complaint not against utilitarianism, but against any standard or morality at all; for certainly no known ethical standard decides an action to be good or bad because it is done by a good or bad man, still less because done by an amiable, a brave, or a benevolent man, or the contrary. These considerations are relevant, not to the estimation of actions, but of persons; and there is nothing in the utilitarian theory inconsistent with the fact that there are other things which interest us in persons besides the Tightness and wrongness of their actions. The Stoics, indeed, with the paradoxical misuse of language which was part of their system, and by which they strove to raise themselves above all concern about anything but virtue, were fond of saying that he who has that has everything; that he, and only he, is rich, is beautiful, is a king. But no claim of this description is made for the virtuous man by the utilitarian doctrine. Utilitarians are quite aware that there are other desirable possessions and qualities besides virtue, and are perfectly willing to allow to all of them their full worth. They are also aware that a right action does not necessarily indicate a virtuous character, and that actions which are blamable often proceed from qualities entitled to praise. When this is apparent in any particular case, it

modifies their estimation, not certainly of the act, but of the agent. I grant that they are, notwithstanding, of opinion that in the long run the best proof of a good character is good actions; and resolutely refuse to consider any mental disposition as good of which the predominant tendency is to produce bad conduct. This makes them unpopular with many people, but it is an unpopularity which they must share with everyone who regards the distinction between right and wrong in a serious light; and the reproach is not one which a conscientious utilitarian need be anxious to repel.

If no more be meant by the objection than that many utilitarians look on the morality of actions, as measured by the utilitarian standards, with too exclusive a regard, and do not lay sufficient stress upon the other beauties of character which go toward making a human being lovable or admirable, this may be admitted. Utilitarians who have cultivated their moral feelings, but not their sympathies, nor their artistic perceptions, do fall into this mistake; and so do all other moralists under the same conditions. What can be said in excuse for other moralists is equally available for them, namely, that, if there is to be any error, it is better that it should be on that side. As a matter of fact, we may affirm that among utilitarians, as among adherents of other systems, there is every imaginable degree of rigidity and of laxity in the application of their standard; some are even puritanically rigorous, while others are as indulgent as can possibly be desired by sinner or by sentimentalist. But on the whole, a doctrine which brings prominently forward the interest that mankind have in the repression and prevention of conduct which violates the moral law is likely to be inferior to no other in turning the sanctions of opinion against such violations. It is true, the question "What does violate the moral law?" is one on which those who recognize different standards of morality are likely now and then to differ. But difference of opinion on moral questions was not first introduced into the world by utilitarianism, while that doctrine does supply, if not always an easy, at all events a tangible and intelligible, mode of deciding such differences.

It may not be superfluous to notice a few more of the common misapprehensions of utilitarian ethics, even those which are so obvious and gross that it might appear impossible for any person of candor and intelligence to fall into them; since persons, even of considerable mental endowment, often give themselves so little trouble to understand the bearings of any opinion against which they entertain a prejudice, and men are in general so little conscious of this voluntary ignorance as a defect that the vulgarest misunderstandings of ethical doctrines are continually met with in the deliberate writings of persons of the greatest pretensions both to high principle and to philosophy. We not uncommonly hear the doctrine of utility inveighed against a *godless* doctrine. If it be necessary to say anything at all against so mere an assumption, we may say that the question depends upon what idea we have formed of the moral character of the Deity. If it be a true belief that God desires, above all things, the happiness of his creatures, and that this was his purpose in their creation, utility is not only not a godless doctrine, but more profoundly religious than any other. If it be meant that utilitarianism does not recognize the revealed will of God as the supreme law of morals, I answer that a utilitarian who believes in the perfect goodness and wisdom of *God* necessarily believes that whatever God has thought fit to reveal on the subject of morals must fulfill the requirements of utility in a supreme degree. But others besides utilitarians have been of opinion that the Christian revelation was intended, and is fitted, to inform the hearts and minds of mankind with a spirit which should enable them to find for themselves what is right, and incline them to do it when found, rather than to tell them, except in a very general way, what it is; and that we need a doctrine of ethics, carefully followed out, to *interpret* to us the will of God. Whether this opinion is correct or not, it is superfluous here to discuss; since whatever aid religion, either natural or revealed, can afford to ethical investigation is as open to the utilitarian moralist as to any other. He can use it as the testimony of God to the usefulness or hurtfulness of any given course of action by as good a right as others can use it for the indication of a transcendental law having no connection with usefulness or with happiness.

Again, utility is often summarily stigmatized as an immoral doctrine by giving it the name of "expediency," and taking advantage of the popular use of that term to contrast it with principle. But the expedient, in the sense in which it is opposed to the right, generally means that which is expedient for the particular interest of the agent himself; as when a minister sacrifices the interests of his country to keep himself in place. When it means anything better than this, it means that which is expedient for some immediate object, some temporary purpose, but which violates a rule whose observance is expedient in a much higher degree. The expedient, in this sense, instead of being the same thing with the useful, is a branch of the hurtful. Thus it would often be expedient, for the purpose of getting over some momentary embarrassment, or attaining some object immediately useful to ourselves or others, to tell a lie. But inasmuch as the cultivation in ourselves of a sensitive feeling on the subject of veracity is one of the most useful, and the enfeeblement of that feeling one of the most hurtful, things to which our conduct can be instrumental; and inasmuch as any, even unintentional, deviation from truth does that much toward weakening the trustworthiness of human assertion,

which is not only the principal support of all present social well-being, but the insufficiency of which does more than any one thing that can be named to keep back civilization, virtue, everything on which human happiness on the largest scale depends — we feel that the violation, for a present advantage, of a rule of such transcendent expediency is not expedient, and that he who, for the sake of convenience to himself or to some other individual, does what depends on him to deprive mankind of the good, and inflict upon them the evil, involved in the greater or less reliance which they can place in each other's word, acts the part of one of their worst enemies. Yet that even this rule, sacred as it is, admits of possible exceptions is acknowledged by all moralists; the chief of which is when the withholding of some fact (as of information from a malefactor, or of bad news from a person dangerously ill) would save an individual (especially an individual other than oneself) from great and unmerited evil, and when the withholding can only be effected by denial. But in order that the exception may not extend itself beyond the need, and may have the least possible effect in weakening reliance on veracity, it ought to be recognized and, if possible, its limits defined; and, if the principle of utility is good for anything, it must be good for weighing these conflicting utilities against one another and marking out the region within which one or the other preponderates.

Again, defenders of utility often find themselves called upon to reply to such objections as this—that there is not time, previous to action, for calculating and weighing the effects of any line of conduct on the general happiness. This is exactly as if anyone were to say that it is impossible to guide our conduct by Christianity because there is not time, on every occasion on which anything has to be done, to read through the Old and New Testaments. The answer to the objection is that there has been ample time, namely, the whole past duration of the human species. During all that time mankind have been learning by experience the tendencies of actions; on which experience all the prudence as well as all the morality of life are dependent. People talk as if the commencement of this course of experience had hitherto been put off, and as if, at the moment when some man feels tempted to meddle with the property or life of another, he had to begin considering for the first time whether murder and theft are injurious to human happiness. Even then I do not think that he would find the question very puzzling; but, at all events, the matter is now done to his hand. It is truly a whimsical supposition that, if mankind were agreed in considering utility to be the test of morality, they would remain without any agreement as to what *is* useful, and would take no measures for having their notions on the subject taught to the young and enforced by law and opinion. There is no difficulty in proving any ethical standard whatever to work ill if we suppose universal idiocy to be conjoined with it; but on any hypothesis short of that, mankind must by this time have acquired positive beliefs as to the effects of some actions on their happiness; and the beliefs which have thus come down are the rules of morality for the multitude, and for the philosopher until he has succeeded in finding better. That philosophers might easily do this, even now, on many subjects; that the received code of ethics is by no means of divine right; and that mankind have still much to learn as to the effects of actions on the general happiness, I admit or rather earnestly maintain. The corollaries from the principle of utility, like the precepts of every practical art, admit of indefinite improvement, and, in a progressive state of the human mind, their improvement is perpetually going on. But to consider the rules of morality as improvable is one thing; to pass over the intermediate generalization entirely and endeavor to test each individual action directly by the first principle is another. It is a strange notion that the acknowledgment of a first principle is inconsistent with the admission of secondary ones. To inform a traveler respecting the place of his ultimate destination is not to forbid the use of landmarks and direction-posts on the way. The proposition that happiness is the end and aim of morality does not mean that no road ought to be laid down to that goal, or that persons going thither should not be advised to take one direction rather than another. Men really ought to leave off talking a kind of nonsense on this subject, which they would neither talk nor listen to on other matters of practical concernment. Nobody argues that the art of navigation is not founded on astronomy because sailors cannot wait to calculate the Nautical Almanac. Being rational creatures, they go to sea with it ready calculated; and all rational creatures go out upon the sea of life with their minds made up on the common questions of right and wrong, as well as on many of the far more difficult questions of wise and foolish. And this, as long as foresight is a human quality, it is to be presumed they will continue to do. Whatever we adopt as the fundamental principle of morality, we require subordinate principles to apply it by; the impossibility of doing without them, being common to all systems, can afford no argument against any one in particular; but gravely to argue as if no such secondary principles could be had, and as if mankind had remained till now, and always must remain, without drawing any general conclusions from the experience of human life is as high a pitch, I think, as absurdity has ever reached in philosophical controversy.

The remainder of the stock arguments against utilitarianism mostly consist in laying to its charge the common infirmities of human nature, and the general difficulties which embarrass conscientious persons in shaping their course through life. We are told that a utilitarian will be apt to make his own particular case an

exception to moral rules, and, when under temptation, will see a utility in the breach of a rule, greater than he will see in its observance. But is utility the only creed which is able to furnish us with excuses for evil-doing and means of cheating our own conscience? They are afforded in abundance by all doctrines which recognize as a fact in morals the existence of conflicting considerations, which all doctrines do that have been believed by sane persons. It is not the fault of any creed, but of the complicated nature of human affairs, that rules of conduct cannot be so framed as to require no exceptions, and that hardly any kind of action can safely be laid down as either always obligatory or always condemnable. There is no ethical creed which does not temper the rigidity of its laws by giving a certain latitude, under the moral responsibility of the agent, for accommodation to peculiarities of circumstances; and under every creed, at the opening thus made, self-deception and dishonest casuistry get in. There exists no moral system under which there do not arise unequivocal cases of conflicting obligation. These are the real difficulties, the knotty points both in the theory of ethics and in the conscientious guidance of personal conduct. They are overcome practically, with greater or with less success, according to the intellect and virtue of the individual; but it can hardly be pretended that anyone will be the less qualified for dealing with them, from possessing an ultimate standard to which conflicting rights and duties can be referred. If utility is the ultimate source of moral obligations, utility may be invoked to decide between them when their demands are incompatible. Though the application of the standard may be difficult, it is better than none at all; while in other systems, the moral laws all claiming independent authority, there is no common umpire entitled to interfere between them; their claims to precedence one over another rest on little better than sophistry, and, unless determined, as they generally are, by the unacknowledged influence of consideration of utility, afford a free scope for the action of personal desires and partialities. We must remember that only in these cases of conflict between secondary principles is it requisite that first principles should be appealed to. There is no case of moral obligation in which some secondary principle is not involved; and if only one, there can seldom be any real doubt which one it is, in the mind of any person by whom the principle itself is recognized.

CHAPTER III

Of the Ultimate Sanction of the Principle of Utility

The question is often asked, and properly so, in regard to any supposed moral standard — What is its sanction? what are the motives to obey? or, more specifically, what is the source of its obligation? whence does it derive its binding force? It is a necessary part of moral philosophy to provide the answer to this question, which, though frequently assuming the shape of an objection to the utilitarian morality, as if it had some special applicability to that above others, really arises in regard to all standards. It arises, in fact, whenever a person is called on to *adopt* a standard, or refer morality to any basis on which he has not been accustomed to rest it. For the customary morality, that which education and opinion have consecrated, is the only one which presents itself to the mind with the feeling of being *in itself* obligatory; and when a person is asked to believe that this morality *derives* its obligation from some general principle round which custom has not thrown the same halo, the assertion is to him a paradox; the supposed corollaries seem to have a more binding force than the original theorem; the superstructure seems to stand better without than with what is represented as its foundation. He says to himself, I feel that I am bound not to rob or murder, betray or deceive; but why am I bound to promote the general happiness? If my own happiness lies in something else, why may I not give that the preference?

If the view adopted by the utilitarian philosophy of the nature of the moral sense be correct, this difficulty will always present itself until the influences which form moral character have taken the same hold of the principle which they have taken of some of the consequences—until, by the improvement of education, the feeling of unity with our fellow creatures shall be (what it cannot be denied that Christ intended it to be) as deeply rooted in our character, and to our own consciousness as completely a part of our nature, as the horror of crime is in an ordinarily well-brought up young person. In the meantime, however, the difficulty has no peculiar application to the doctrine of utility, but is inherent in every attempt to analyze morality and reduce it to principles; which, unless the principle is already in men's minds invested with as much sacredness as any of its applications, always seems to divest them of a part of their sanctity.

The principle of utility either has, or there is no reason why it might not have, all the sanctions which belong to any other system of morals. Those sanctions are either external or internal. Of the external sanctions it is not necessary to speak at any length. They are the hope of favor and the fear of displeasure from our fellow creatures or from the Ruler of the universe, along with whatever we may have of sympathy or affection for them, or of love and awe of Him, inclining us to do His will independently of selfish consequences. There is evidently no reason why all these motives for observance should not attach themselves to the utilitarian morality as completely and as powerfully as to any other. Indeed, those of them which refer to our fellow creatures are sure to do so, in proportion to the amount of general intelligence; for whether there be any other ground of moral obligation than the general happiness or not, men do desire happiness; and however imperfect may be their own practice, they desire and commend all conduct in others toward themselves by which they think their happiness is promoted. With regard to the religious motive, if men believe, as most profess to do, in the goodness of God, those who think that conduciveness to the general happiness is the essence or even only the criterion of good must necessarily believe that it is also that which God approves. The whole force therefore of external reward and punishment, whether physical or moral, and whether proceeding from God or from our fellow men, together with all that the capacities of human nature admit of disinterested devotion to either, become available to enforce the utilitarian morality, in proportion as that morality is recognized; and the more powerfully, the more the appliances of education and general cultivation are bent to the purpose.

So far as to external sanctions. The internal sanction of duty, whatever our standard of duty may be, is one and the same — a feeling in our own mind; a pain, more or less intense, attendant on violation of duty, which in properly cultivated moral natures rises, in the more serious cases, into shrinking from it as an impossibility. This feeling, when disinterested and connecting itself with the pure idea of duty, and not with some particular form of it, or with any of the merely accessory circumstances, is the essence of conscience; though in that complex phenomenon as it actually exists, the simple fact is in general all encrusted over with collateral associations derived from sympathy, from love, and still more from fear; from all the forms of religious feeling; from the recollections of childhood and of all our past life; from self-esteem, desire of the esteem of others, and occasionally even self-abasement. This extreme complication is, I apprehend, the origin of the sort of

mystical character which, by a tendency of the human mind of which there are many other examples, is apt to be attributed to the idea of moral obligation, and which leads people to believe that the idea cannot possibly attach itself to any other objects than those which, by a supposed mysterious law, are found in our present experience to excite it. Its binding force, however, consists in the existence of a mass of feeling which must be broken through in order to do what violates our standard of right, and which, if we do nevertheless violate that standard, will probably have to be encountered afterwards in the form of remorse. Whatever theory we have of the nature or origin of conscience, this is what essentially constitutes it.

The ultimate sanction, therefore, of all morality (external motives apart) being a subjective feeling in our own minds, I see nothing embarrassing to those whose standard is utility in the question, What is the sanction of that particular standard? We may answer, the same as of all other moral standards — the conscientious feelings of mankind. Undoubtedly this sanction has no binding efficacy on those who do not possess the feelings it appeals to; but neither will these persons be more obedient to any other moral principle than to the utilitarian one. On them morality of any kind has no hold but through the external sanctions. Meanwhile the feelings exist, a fact in human nature, the reality of which, and the great power with which they are capable of acting on those in whom they have been duly cultivated, are proved by experience. No reason has ever been shown why they may not be cultivated to as great intensity in connection with the utilitarian as with any other rule of morals.

There is, I am aware, a disposition to believe that a person who sees in moral obligation a transcendental fact, an objective reality belonging to the province of “things in themselves,” is likely to be more obedient to it than one who believes it to be entirely subjective, having its seat in human consciousness only. But whatever a person’s opinion may be on this point of ontology, the force he is really urged by is his own subjective feeling, and is exactly measured by its strength. No one’s belief that duty is an objective reality is stronger than the belief that God is so; yet the belief in God, apart from the expectation of actual reward and punishment, only operates on conduct through and in proportion to, the subjective religious feeling. The sanction, so far as it is disinterested, is always in the mind itself; and the notion, therefore, of the transcendental moralists must be that this sanction will not exist *in* the mind unless it is believed to have its root out of the mind; and that if a person is able to say to himself, “That which is restraining me and which is called my conscience is only a feeling in my own mind,” he may possibly draw the conclusion that when the feeling ceases the obligation ceases, and that if he find the feeling inconvenient, he may disregard it and endeavor to get rid of it. But is this danger confined to the utilitarian morality? Does the belief that moral obligation has its seat outside the mind make the feeling of it too strong to get rid of it? The fact is so far otherwise that all moralists admit and lament the ease with which, in the generality of minds, conscience can be silenced or stifled. The question, “Need I obey my conscience?” is quite as often put to themselves by persons who never heard of the principle of utility as by its adherents. Those whose conscientious feelings are so weak as to allow of their asking this question, if they answer it affirmatively, will not do so because they believe in the transcendental theory, but because of the external sanctions.

It is not necessary, for the present purpose, to decide whether the feeling of duty is innate or implanted. Assuming it to be innate, it is an open question to what objects it naturally attaches itself; for the philosophic supporters of that theory are now agreed that the intuitive perception is of principles of morality and not of the details. If there be anything innate in the matter, I see no reason why the feeling which is innate should not be that of regard to the pleasures and pains of others. If there is any principle of morals which is intuitively obligatory, I should say it must be that. If so, the intuitive ethics would coincide with the utilitarian, and there would be no further quarrel between them. Even as it is, the intuitive moralists, though they believe that there are other intuitive moral obligations, do already believe this to be one; for they unanimously hold that a large *portion* of morality turns upon the consideration due to the interests of our fellow creatures. Therefore, if the belief in the transcendental origin of moral obligation gives any additional efficacy to the internal sanction, it appears to me that the utilitarian principle has already the benefit of it.

On the other hand, if, as is my own belief, the moral feelings are not innate but acquired, they are not for that reason the less natural. It is natural to man to speak, to reason, to build cities, to cultivate the ground, though these are acquired faculties. The moral feelings are not indeed a part of our nature in the sense of being in any perceptible degree present in all of us; but this, unhappily, is a fact admitted by those who believe the most strenuously in their transcendental origin. Like the other acquired capacities above referred to, the moral faculty, if not a part of our nature, is a natural outgrowth from it; capable, like them, in a certain small degree, of springing up spontaneously; and susceptible of being brought by cultivation to a high degree of development. Unhappily it is also susceptible, by a sufficient use of the external sanctions and of the force of early impressions, of being cultivated in almost any direction, so that there is hardly anything so absurd or so

mischievous that it may not, by means of these influences, be made to act on the human mind with all the authority of conscience. To doubt that the same potency might be given by the same means to the principle of utility, even if it had no foundation in human nature, would be flying in the face of all experience.

But moral associations which are wholly of artificial creation, when the intellectual culture goes on, yield by degrees to the dissolving force of analysis; and if the feeling of duty, when associated with utility, would appear equally arbitrary; if there were no leading department of our nature, no powerful class of sentiments, with which that association would harmonize, which would make us feel congenial and incline us not only to foster it in others (for which we have abundant interested motives), but also to cherish it in ourselves — if there were not, in short, a natural basis of sentiment for utilitarian morality, it might well happen that this association also, even after it had been implanted by education, might be analyzed away.

But there *is* this basis of powerful natural sentiment; and that it is which, when once the general happiness is recognized as the ethical standard, will constitute the strength of the utilitarian morality. This firm foundation is that of the social feelings of mankind—the desire to be in unity with our fellow creatures, which is already a powerful principle in human nature, and happily one of those which tend to become stronger, even without express inculcation, from the influences of advancing civilization. The social state is at once so natural, so necessary, and so habitual to man, that, except in some unusual circumstances or by an effort of voluntary abstraction, he never conceives himself otherwise than as a member of a body; and this association is riveted more and more, as mankind are further removed from the state of savage independence. Any condition, therefore, which is essential to a state of society becomes more and more an inseparable part of every person's conception of the state of things which he is born into, and which is the destiny of a human being. Now society between human beings, except in the relation of master and slave, is manifestly impossible on any other footing than that the interests of all are to be consulted. Society between equals can only exist on the understanding that the interests of all are to be regarded equally. And since in all states of civilization, every person, except an absolute monarch, has equals, everyone is obliged to live on these terms with somebody; and in every age some advance is made toward a state in which it will be impossible to live permanently on other terms with anybody. In this way people grow up unable to conceive as possible to them a state of total disregard of other people's interests. They are under a necessity of conceiving themselves as at least abstaining from all the grosser injuries, and (if only for their own protection) living in a state of constant protest against them. They are also familiar with the fact of cooperating with others and proposing to themselves a collective, not an individual, interest as the aim (at least for the time being) of their actions. So long as they are co-operating, their ends are identified with those of others; there is at least a temporary feeling that the interests of others are their own interests. Not only does all strengthening of social ties, and all healthy growth of society, give to each individual a stronger personal interest in practically consulting the welfare of others, it also leads him to identify his *feelings* more and more with their good, or at least with an even greater degree of practical consideration for it. He comes, as though instinctively, to be conscious of himself as a being who *of course* pays regard to others. The good of others becomes to him a thing naturally and necessarily to be attended to, like any of the physical conditions of our existence. Now, whatever amount of this feeling a person has, he is urged by the strongest motives both of interest and of sympathy to demonstrate it, and to the utmost of his power encourage it in others; and even if he has none of it himself, he is as greatly interested as anyone else that others should have it. Consequently, the smallest germs of the feeling are laid hold of and nourished by the contagion of sympathy and the influences of education; and a complete web of corroborative association is woven round it by the powerful agency of the external sanctions. This mode of conceiving ourselves and human life, as civilization goes on, is felt to be more and more natural. Every step in political improvement renders it more so, by removing the sources of opposition of interest and leveling those inequalities of legal privilege between individuals or classes, owing to which there are large portions of mankind whose happiness it is still practicable to disregard. In an improving state of the human mind, the influences are constantly on the increase which tend to generate in each individual a feeling of unity with all the rest; which, if perfect, would make him never think of, or desire, any beneficial condition for himself in the benefits of which they are not included. If we now suppose this feeling of unity to be taught as a religion, and the whole force of education, of institutions, and of opinion directed, as it once was in the case of religion, to make every person grow up from infancy surrounded on all sides both by the profession and the practice of it, I think that no one who can realize this conception will feel any misgiving about the sufficiency of the ultimate sanction for the happiness morality. To any ethical student who finds the realization difficult, I recommend, as a means of facilitating it, the second of M. Comte's two principal works, the *Traité de politique positive*.⁷ I entertain the strongest objections to the system of politics and morals set forth in that treatise, but I think it has superabundantly shown the possibility of giving to the service of humanity, even without the aid of belief in a Providence, both the psychological power and the social efficacy of a religion, making it take

hold of human life, and color all thought, feeling, and action in a manner of which the greatest ascendancy ever exercised by any religion may be but a type and foretaste; and of which the danger is, not that it should be insufficient, but that it should be so excessive as to interfere unduly with human freedom and individuality.

Neither is it necessary to the feeling which constitutes the binding force of the utilitarian morality on those who recognize it to wait for those social influences which would make its obligation felt by mankind at large. In the comparatively early state of human advancement in which we now live, a person cannot, indeed, feel that entireness of sympathy with all others which would make any real discordance in the general direction of their conduct in life impossible, but already a person in whom the social feeling is at all developed cannot bring himself to think of the rest of his fellow creatures as struggling rivals with him for the means of happiness, whom he must desire to see defeated in their object in order that he may succeed in his. The deeply rooted conception which every individual even now has of himself as a social being tends to make him feel it one of his natural wants that there should be harmony between his feelings and aims and those of his fellow creatures. If differences of opinion and of mental culture make it impossible for him to share many of their actual feelings — perhaps make him denounce and defy those feelings — he still needs to be conscious that his real aim and theirs do not conflict; that he is not opposing himself to what they really wish for, namely, their own good, but is, on the contrary, promoting it. This feeling in most individuals is much inferior in strength to their selfish feelings, and is often wanting altogether. But to those who have it, it possesses all the characters of a natural feeling. It does not present itself to their minds as a superstition of education or a law despotically imposed by the power of society, but as an attribute which it would not be well for them to be without. This conviction is the ultimate sanction of the greatest happiness morality. This it is which makes any mind of well-developed feelings work with, and not against, the outward motives to care for others, afforded by what I have called the external sanctions; and, when those sanctions are wanting or act in an opposite direction, constitutes in itself a powerful internal binding force, in proportion to the sensitiveness and thoughtfulness of the character, since few but those whose mind is a moral blank could bear to lay out their course of life on the plan of paying no regard to others except so far as their own private interest compels.

CHAPTER IV

Of What Sort of Proof the Principle of Utility Is Susceptible

It has already been remarked that questions of ultimate ends do not admit of proof, in the ordinary acceptation of the term. To be incapable of proof by reasoning is common to all first principles, to the first premises of our knowledge, as well as to those of our conduct. But the former, being matters of fact, may be the subject of a direct appeal to the faculties which judge of fact — namely, our senses and our internal consciousness. Can an appeal be made to the same faculties on questions of practical ends? Or by what other faculty is cognizance taken of them?

Questions about ends are, in other words, questions what things are desirable. The utilitarian doctrine is that happiness is desirable, and the only thing desirable, as an end; all other things being only desirable as means to that end. What ought to be required of this doctrine, what conditions is it requisite that the doctrine should fulfill — to make good its claim to be believed?

The only proof capable of being given that an object is visible is that people actually see it. The only proof that a sound is audible is that people hear it; and so of the other sources of our experience. In like manner, I apprehend, the sole evidence it is possible to produce that anything is desirable is that people do actually desire it. If the end which the utilitarian doctrine proposes to itself were not, in theory and in practice, acknowledged to be an end, nothing could ever convince any person that it was so. No reason can be given why the general happiness is desirable, except that each person, so far as he believes it to be attainable, desires his own happiness. This, however, being a fact, we have not only all the proof which the case admits of, but all which it is possible to require, that happiness is a good: that each person's happiness is a good to that person, and the general happiness, therefore, a good to the aggregate of all persons. Happiness has made out its title as *one* of the ends of conduct and, consequently, one of the criteria of morality.

But it has not, by this alone, proved itself to be the sole criterion. To do that, it would seem, by the same rule, necessary to show, not only that people desire happiness, but that they never desire anything else. Now it is palpable that they do desire things which, in common language, are decidedly distinguished from happiness. They desire, for example, virtue and the absence of vice no less really than pleasure and the absence of pain. The desire of virtue is not as universal, but it is as authentic a fact as the desire of happiness. And hence the opponents of the utilitarian standard deem that they have a right to infer that there are other ends of human action besides happiness, and that happiness is not the standard of approbation and disapprobation.

But does the utilitarian doctrine deny that people desire virtue, or maintain that virtue is not a thing to be desired? The very reverse. It maintains not only that virtue is to be desired, but that it is to be desired disinterestedly, for itself. Whatever may be the opinion of utilitarian moralists as to the original conditions by which virtue is made virtue, however they may believe (as they do) that actions and dispositions are only virtuous because they promote another end than virtue, yet this being granted, and it having been decided, from considerations of this description, what *is* virtuous, they not only place virtue at the very head of the things which are good as means to the ultimate end, but they also recognize as a psychological fact the possibility of its being, to the individual, a good in itself, without looking to any end beyond it; and hold that the mind is not in a right state, not in a state conformable to utility, not in the state most conducive to the general happiness, unless it does love virtue in this manner — as a thing desirable in itself, even although, in the individual instance, it should not produce those other desirable consequences which it tends to produce, and on account of which it is held to be virtue. This opinion is not, in the smallest degree, a departure from the happiness principle. The ingredients of happiness are very various, and each of them is desirable in itself, and not merely when considered as swelling an aggregate. The principle of utility does not mean that any given pleasure, as music, for instance, or any given exemption from pain, as for example health, is to be looked upon as means to a collective something termed happiness, and to be desired on that account. They are desired and desirable in and for themselves; besides being means, they are a part of the end. Virtue, according to the utilitarian doctrine, is not naturally and originally part of the end, but it is capable of becoming so; and in those who live it disinterestedly it has become so, and is desired and cherished, not as a means to happiness, but as a part of their happiness.

To illustrate this further, we may remember that virtue is not the only thing originally a means, and which if it were not a means to anything else would be and remain indifferent, but which by association with what it is a means to comes to be desired for itself, and that too with the utmost intensity. What, for example, shall

we say of the love of money? There is nothing originally more desirable about money than about any heap of glittering pebbles. Its worth is solely that of the things which it will buy; the desires for other things than itself, which it is a means of gratifying. Yet the love of money is not only one of the strongest moving forces of human life, but money is, in many cases, desired in and for itself; the desire to possess it is often stronger than the desire to use it, and goes on increasing when all the desires which point to ends beyond it, to be compassed by it, are falling off. It may, then, be said truly that money is desired not for the sake of an end, but as part of the end. From being a means to happiness, it has come to be itself a principal ingredient of the individual's conception of happiness. The same may be said of the majority of the great objects of human life: power, for example, or fame, except that to each of these there is a certain amount of immediate pleasure annexed, which has at least the semblance of being naturally inherent in them—a thing which cannot be said of money. Still, however, the strongest natural attraction, both of power and of fame, is the immense aid they give to the attainment of our other wishes; and it is the strong association thus generated between them and all our objects of desire which gives to the direct desire of them the intensity it often assumes, so as in some characters to surpass in strength all other desires. In these cases the means have become a part of the end, and a more important part of it than any of the things which they are means to. What was once desired as an instrument for the attainment of happiness has come to be desired for its own sake. In being desired for its own sake it is, however, desired as *part* of happiness. The person is made, or thinks he would be made, happy by its mere possession; and is made unhappy by failure to obtain it. The desire of it is not a different thing from the desire of happiness any more than the love of music or the desire of health. They are included in happiness. They are some of the elements of which the desire of happiness is made up. Happiness is not an abstract idea but a concrete whole; and these are some of its parts. And the utilitarian standard sanctions and approves their being so. Life would be a poor thing, very ill provided with sources of happiness, if there were not this provision of nature by which things originally indifferent, but conducive to, or otherwise associated with, the satisfaction of our primitive desires, become in themselves sources of pleasure more valuable than the primitive pleasures, both in permanency, in the space of human existence that they are capable of covering, and even in intensity.

Virtue, according to the utilitarian conception, is a good of this description. There was no original desire of it, or motive to it, save its conduciveness to pleasure, and especially to protection from pain. But through the association thus formed it may be felt a good in itself, and desired as such with as great intensity as any other good; and with this difference between it and the love of money, of power, or of fame — that all of these may, and often do, render the individual noxious to the other members of the society to which he belongs, whereas there is nothing which makes him so much a blessing to them as the cultivation of the disinterested love of virtue. And consequently, the utilitarian standard, while it tolerates and approves those other acquired desires, up to the point beyond which they would be more injurious to the general happiness than promotive of it, enjoins and requires the cultivation of the love of virtue up to the greatest strength possible, as being above all things important to the general happiness.

It results from the preceding considerations that there is in reality nothing desired except happiness. Whatever is desired otherwise than as a means to some end beyond itself, and ultimately to happiness, is desired as itself a part of happiness, and is not desired for itself until it has become so. Those who desire virtue for its own sake desire it either because the consciousness of it is a pleasure, or because the consciousness of being without it is a pain, or for both reasons united; as in truth the pleasure and pain seldom exist separately, but almost always together—the same person feeling pleasure in the degree of virtue attained, and pain in not having attained more. If one of these gave him no pleasure, and the other no pain, he would not love or desire virtue, or would desire it only for the other benefits which it might produce to himself or to persons whom he cared for.

We have now, then, an answer to the question, of what sort of proof the principle of utility is susceptible. If the opinion which I have now stated is psychologically true—if human nature is so constituted as to desire nothing which is not either a part of happiness or a means of happiness—we can have no other proof, and we require no other, that these are the only things desirable. If so, happiness is the sole end of human action, and the promotion of it the test by which to judge of all human conduct; from whence it necessarily follows that it must be the criterion of morality, since a part is included in the whole.

And now to decide whether this is really so, whether mankind do desire nothing for itself but that which is a pleasure to them, or of which the absence is a pain, we have evidently arrived at a question of fact and experience, dependent, like all similar questions, upon evidence. It can only be determined by practiced self-consciousness and self-observation, assisted by observation of others. I believe that these sources of evidence, impartially consulted, will declare that desiring a thing and finding it pleasant, aversion to it and thinking of it

as painful, are phenomena entirely inseparable or, rather, two parts of the same phenomenon—in strictness of language, two different modes of naming the same psychological fact; that to think of an object as desirable (unless for the sake of its consequences) and to think of it as pleasant are one and the same thing; and that to desire anything except in proportion as the idea of it is pleasant is a physical and metaphysical impossibility.

So obvious does this appear to me that I expect it will hardly be disputed; and the objection made will be, not that desire can possibly be directed to anything ultimately except pleasure and exemption from pain, but that the will is a different thing from desire; that a person of confirmed virtue or any other person whose purposes are fixed carries out his purposes without any thought of the pleasure he has in contemplating them or expects to derive from their fulfillment, and persists in acting on them, even though these pleasures are much diminished by changes in his character or decay of his passive sensibilities, or are outweighed by the pains which the pursuit of the purposes may bring upon him. All this I fully admit and have stated it elsewhere as positively and emphatically as anyone. Will, the active phenomenon, is a different thing from desire, the state of passive sensibility, and, though originally an offshoot from it, may in time take root and detach itself from the parent stock, so much so that in the case of a habitual purpose, instead of willing the thing because we desire it, we often desire it only because we will it. This, however, is but an instance of that familiar fact, the power of habit, and is nowise confined to the case of virtuous actions. Many indifferent things which men originally did from a motive of some sort they continue to do from habit. Sometimes this is done unconsciously, the consciousness coming only after the action; at other times with conscious volition, but volition which has become habitual and is put in operation by the force of habit, in opposition perhaps to the deliberate preference, as often happens with those who have contracted habits of vicious or hurtful indulgence. Third and last comes the case in which the habitual act of will in the individual instance is not in contradiction to the general intention prevailing at other times, but in fulfillment of it, as in the case of the person of confirmed virtue and of all who pursue deliberately and consistently any determinate end. The distinction between will and desire thus understood is an authentic and highly important psychological fact; but the fact consists solely in this — that will, like all other parts of our constitution, is amenable to habit, and that we may will from habit what we no longer desire for itself, or desire only because we will it. It is not the less true that will, in the beginning, is entirely produced by desire, including in that term the repelling influence of pain as well as the attractive one of pleasure. Let us take into consideration no longer the person who has a confirmed will to do right, but him in whom that virtuous will is still feeble, conquerable by temptation, and not to be fully relied on; by what means can it be strengthened? How can the will to be virtuous, where it does not exist in sufficient force, be implanted or awakened? Only by making the person *desire* virtue — by making him think of it in a pleasurable light, or of its absence in a painful one. It is by associating the doing right with pleasure, or the wrong with pain, or by eliciting and impressing and bringing home to the person's experience the pleasure naturally involved in the one or the pain in the other, that it is possible to call forth that will to be virtuous which, when confirmed, acts without any thought of either pleasure or pain. Will is the child of desire, and passes out of the dominion of its parent only to come under that of habit. That which is the result of habit affords no presumption of being intrinsically good; and there would be no reason for wishing that the purpose of virtue should become independent of pleasure and pain were it not that the influence of the pleasurable and painful associations which prompt to virtue is not sufficiently to be depended on for unerring constancy of action until it has acquired the support of habit. Both in feeling and in conduct, habit is the only thing which imparts certainty; and it is because of the importance to others of being able to rely absolutely on one's feelings and conduct, and to oneself of being able to rely on one's own, that the will to do right ought to be cultivated into this habitual independence. In other words, this state of the will is a means to good, not intrinsically a good; and does not contradict the doctrine that nothing is a good to human beings but in so far as it is either itself pleasurable or a means of attaining pleasure or averting pain.

But if this doctrine be true, the principle of utility is proved. Whether it is so or not must now be left to the consideration of the thoughtful reader.

CHAPTER V

On the Connection between Justice and Utility

In all ages of speculation one of the strongest obstacles to the reception of the doctrine that utility or happiness is the criterion of right and wrong has been drawn from the idea of justice. The powerful sentiment and apparently clear perception which that word recalls with a rapidity and certainty resembling an instinct have seemed to the majority of thinkers to point to an inherent quality in things; to show that the just must have an existence in nature as something absolute, generically distinct from every variety of the expedient and, in idea, opposed to it, though (as is commonly acknowledged) never, in the long run, disjoined from it in fact.

In the case of this, as of our other moral sentiments, there is no necessary connection between the question of its origin and that of its binding force. That a feeling is bestowed on us by nature does not necessarily legitimate all its promptings. The feeling of justice might be a peculiar instinct, and might yet require, like our other instincts, to be controlled and enlightened by a higher reason. If we have intellectual instincts leading us to judge in a particular way, as well as animal instincts that prompt us to act in a particular way, there is no necessity that the former should be more infallible in their sphere than the latter in theirs; it may as well happen that wrong judgments are occasionally suggested by those, as wrong actions by these. But though it is one thing to believe that we have natural feelings of justice, and another to acknowledge them as an ultimate criterion of conduct, these two opinions are very closely connected in point of fact. Mankind are always predisposed to believe that any subjective feeling, not otherwise accounted for, is a revelation of some objective reality. Our present object is to determine whether the reality to which the feeling of justice corresponds is one which needs any such special revelation, whether the justice or injustice of an action is a thing intrinsically peculiar and distinct from all its other qualities or only a combination of certain of those qualities presented under a peculiar aspect. For the purpose of this inquiry it is practically important to consider whether the feeling itself, of justice and injustice, is *sui generis* like our sensations of color and taste or a derivative feeling formed by a combination of others. And this it is the more essential to examine, as people are in general willing enough to allow that objectively the dictates of justice coincide with a part of the field of general expediency; but inasmuch as the subjective mental feeling of justice is different from that which commonly attaches to simple expediency, and, except in the extreme cases of the latter, is far more imperative in its demands, people find it difficult to see in justice only a particular kind or branch of general utility, and think that its superior binding force requires a totally different origin.

To throw light upon this question, it is necessary to attempt to ascertain what is the distinguishing character of justice, or of injustice; what is the quality, or whether there is any quality, attributed in common to all modes of conduct designated as unjust (for justice, like many other moral attributes, is best defined by its opposite), and distinguishing them from such modes of conduct as are disapproved, but without having that particular epithet of disapprobation applied to them. If in everything which men are accustomed to characterize as just or unjust some one common attribute or collection of attributes is always present, we may judge whether this particular attribute or combination of attributes would be capable of gathering round it a sentiment of that peculiar character and intensity by virtue of the general laws of our emotional constitution, or whether the sentiment is inexplicable and requires to be regarded as a special provision of nature. If we find the former to be the case, we shall, in resolving this question, have resolved also the main problem; if the latter, we shall have to seek for some other mode of investigating it.

To find the common attributes of a variety of objects, it is necessary to begin by surveying the objects themselves in the concrete. Let us therefore advert successively to the various modes of action and arrangements of human affairs which are classed, by universal or widely spread opinion, as just or as unjust. The things well known to excite the sentiments associated with those names are of a very multifarious character. I shall pass them rapidly in review, without studying any particular arrangement.

In the first place, it is mostly considered unjust to deprive anyone of his personal liberty, his property, or any other thing which belongs to him by law. Here, therefore, is one instance of the application of the terms "just" and "unjust" in a perfectly definite sense, namely, that it is just to respect, unjust to violate, the *legal rights* of anyone. But this judgment admits of several exceptions, arising from the other forms in which the notions of justice and injustice present themselves. For example, the person who suffers the deprivation may (as the phrase is) have *forfeited* the rights which he is so deprived of—a case to which we shall return presently. But also —

Secondly, the legal rights of which he is deprived may be rights which *ought* not to have belonged to him; in other words, the law which confers on him these rights may be a bad law. When it is so or when (which is the same thing for our purpose) it is supposed to be so, opinions will differ as to the justice or injustice of infringing it. Some maintain that no law, however bad, ought to be disobeyed by an individual citizen; that his opposition to it, if shown at all, should only be shown in endeavoring to get it altered by competent authority. This opinion (which condemns many of the most illustrious benefactors of mankind, and would often protect pernicious institutions against the only weapons which, in the state of things existing at the time, have any chance of succeeding against them) is defended by those who hold it on grounds of expediency, principally on that of the importance to the common interest of mankind, of maintaining inviolate the sentiment of submission to law. Other persons, again, hold the directly contrary opinion that any law, judged to be bad, may blamelessly be disobeyed, even though it be not judged to be unjust but only inexpedient, while others would confine the license of disobedience to the case of unjust laws; but, again, some say that all laws which are inexpedient are unjust, since every law imposes some restriction on the natural liberty of mankind, which restriction is an injustice unless legitimated by tending to their good. Among these diversities of opinion it seems to be universally admitted that there may be unjust laws, and that law, consequently, is not the ultimate criterion of justice, but may give to one person a benefit, or impose on another an evil, which justice condemns. When, however, a law is thought to be unjust, it seems always to be regarded as being so in the same way in which a breach of law is unjust, namely, by infringing somebody's right, which, as it cannot in this case be a legal right, receives a different appellation and is called a moral right. We may say, therefore, that a second case of injustice consists in taking or withholding from any person that to which he has a *moral right*.

Thirdly, it is universally considered just that each person should obtain that (whether good or evil) which he *deserves*, and unjust that he should obtain a good or be made to undergo an evil which he does not deserve. This is, perhaps, the clearest and most emphatic form in which the idea of justice is conceived by the general mind. As it involves the notion of desert, the question arises what constitutes desert? Speaking in a general way, a person is understood to deserve good if he does right, evil if he does wrong; and in a more particular sense, to deserve good from those to whom he does or has done good, and evil from those to whom he does or has done evil. The precept of returning good for evil has never been regarded as a case of the fulfillment of justice, but as one in which the claims of justice are waived, in obedience to other considerations.

Fourthly, it is confessedly unjust to *break faith* with anyone: to violate an engagement, either express or implied, or disappoint expectations raised by our own conduct, at least if we have raised those expectations knowingly and voluntarily. Like the other obligations of justice already spoken of, this one is not regarded as absolute, but as capable of being overruled by a stronger obligation of justice on the other side, or by such conduct on the part of the person concerned as is deemed to absolve us from our obligation to him and to constitute a *forfeiture* of the benefit which he has been led to expect.

Fifthly, it is, by universal admission, inconsistent with justice to be *partial* — to show favor or preference to one person over another in matters to which favor and preference do not properly apply. Impartiality, however, does not seem to be regarded as a duty in itself, but rather as instrumental to some other duty; for it is admitted that favor and preference are not always censurable, and, indeed, the cases in which they are condemned are rather the exception than the rule. A person would be more likely to be blamed than applauded for giving his family or friends no superiority in good offices over strangers when he could do so without violating any other duty; and no one thinks it unjust to seek one person in preference to another as a friend, connection, or companion. Impartiality where rights are concerned is of course obligatory, but this is involved in the more general obligation of giving to everyone his right. A tribunal, for example, must be impartial because it is bound to award, without regard to any other consideration, a disputed object to the one of two parties who has the right to it. There are other cases in which impartiality means being solely influenced by desert, as with those who, in the capacity of judges, preceptors, or parents, administer reward and punishment as such. There are cases, again, in which it means being solely influenced by consideration for the public interest, as in making a selection among candidates for a government employment. Impartiality, in short, as an obligation of justice, may be said to mean being exclusively influenced by the considerations which it is supposed ought to influence the particular case in hand, and resisting solicitation of any motives which prompt to conduct different from what those considerations would dictate.

Nearly allied to the idea of impartiality is that of *equality*, which often enters as a component part both into the conception of justice and into the practice of it, and, in the eyes of many persons, constitutes its essence. But in this, still more than in any other case, the notion of justice varies in different persons, and always conforms in its variations to their notion of utility. Each person maintains that equality is the dictate of

justice, except where he thinks that expediency requires inequality. The justice of giving equal protection to the rights of all is maintained by those who support the most outrageous inequality in the rights themselves. Even in slave countries it is theoretically admitted that the rights of the slave, such as they are, ought to be as sacred as those of the master, and that a tribunal which fails to enforce them with equal strictness is wanting in justice; while, at the same time, institutions which leave to the slave scarcely any rights to enforce are not deemed unjust because they are not deemed inexpedient. Those who think that utility requires distinctions of rank do not consider it unjust that riches and social privileges should be unequally dispensed; but those who think this inequality inexpedient think it unjust also. Whoever thinks that government is necessary sees no injustice in as much inequality as is constituted by giving to the magistrate powers not granted to other people. Even among those who hold leveling doctrines, there are differences of opinion about expediency. Some communists consider it unjust that the produce of the labor of the community should be shared on any other principle than that of exact equality; others think it just that those should receive most whose wants are greatest; while others hold that those who work harder, or who produce more, or whose services are more valuable to the community, may justly claim a larger quota in the division of the produce. And the sense of natural justice may be plausibly appealed to in behalf of every one of these opinions.

Among so many diverse applications of the term "justice," which yet is not regarded as ambiguous, it is a matter of some difficulty to seize the mental link which holds them together, and on which the moral sentiment adhering to the term essentially depends. Perhaps, in this embarrassment, some help may be derived from the history of the word, as indicated by its etymology.

In most if not in all languages, the etymology of the word which corresponds to "just" points distinctly to an origin connected with the ordinances of law. *Justum* is a form of *jussum*, that which has been ordered. *Dikaion* comes directly from *dike*, a suit at law. *Recht*, from which came *right* and *righteous*, is synonymous with law. The courts of justice, the administration of justice, are the courts and the administration of law. *La justice*, in French, is the established term for judicature. I am not committing the fallacy, imputed with some show of truth to Horne Tooke,⁸ of assuming that a word must still continue to mean what it originally meant. Etymology is slight evidence of what the idea now signified is, but the very best evidence of how it sprang up. There can, I think, be no doubt that the *idée mère*, the primitive element, in the formation of the notion of justice was conformity to law. It constituted the entire idea among the Hebrews, up to the birth of Christianity; as might be expected in the case of a people whose laws attempted to embrace all subjects on which precepts were required, and who believed those laws to be a direct emanation from the Supreme Being. But other nations, and in particular the Greeks and Romans, who knew that their laws had been made originally, and still continued to be made, by men, were not afraid to admit that those men might make bad laws; might do, by law, the same things, and from the same motives, which if done by individuals without the sanction of law would be called unjust. And hence the sentiment of injustice came to be attached, not to all violations of law, but only to violations of such laws as *ought* to exist, including such as ought to exist but do not, and to laws themselves if supposed to be contrary to what ought to be law. In this manner the idea of law and of its injunctions was still predominant in the notion of justice, even when the laws actually in force ceased to be accepted as the standard of it.

It is true that mankind consider the idea of justice and its obligations as applicable to many things which neither are, nor is it desired that they should be, regulated by law. Nobody desires that laws should interfere with the whole detail of private life; yet everyone allows that in all daily conduct a person may and does show himself to be either just or unjust. But even here, the idea of the breach of what ought to be law still lingers in a modified shape. It would always give us pleasure, and chime in with our feelings of fitness, that acts which we deem unjust should be punished, though we do not always think it expedient that this should be done by the tribunals. We forego that gratification on account of incidental inconveniences. We should be glad to see just conduct enforced and injustice repressed, even in the minutest details, if we were not, with reason, afraid of trusting the magistrate with so unlimited an amount of power over individuals. When we think that a person is bound in justice to do a thing, it is an ordinary form of language to say that he ought to be compelled to do it. We should be gratified to see the obligation enforced by anybody who had the power. If we see that its enforcement by law would be inexpedient, we lament the impossibility, we consider the impunity given to injustice as an evil, and strive to make amends for it by bringing a strong expression of our own and the public disapprobation to bear upon the offender. Thus the idea of legal constraint is still the generating idea of the notion of justice, though undergoing several transformations before that notion as it exists in an advanced state of society becomes complete.

The above is, I think, a true account, as far as it goes, of the origin and progressive growth of the idea of justice. But we must observe that it contains as yet nothing to distinguish that obligation from moral

obligation in general. For the truth is that the idea of penal sanction, which is the essence of law, enters not only into the conception of injustice, but into that of any kind of wrong. We do not call anything wrong unless we mean to imply that a person ought to be punished in some way or other for doing it — if not by law, by the opinion of his fellow creatures; if not by opinion, by the reproaches of his own conscience. This seems the real turning point of the distinction between morality and simple expediency. It is a part of the notion of duty in every one of its forms that a person may rightfully be compelled to fulfill it. Duty is a thing which may be *exacted* from a person, as one exacts a debt. Unless we think that it may be exacted from him, we do not call it his duty. Reasons of prudence, or the interest of other people, may militate against actually exacting it, but the person himself, it is clearly understood, would not be entitled to complain. There are other things, on the contrary, which we wish that people should do, which we like or admire them for doing, perhaps dislike or despise them for not doing, but yet admit that they are not bound to do; it is not a case of moral obligation; we do not blame them, that is, we do not think that they are proper objects of punishment. How we come by these ideas of deserving and not deserving punishment will appear, perhaps, in the sequel; but I think there is no doubt that this distinction lies at the bottom of the notions of right and wrong; that we call any conduct wrong, or employ, instead, some other term of dislike or disparagement, according as we think that the person ought, or ought not, to be punished for it; and we say it would be right to do so and so, or merely that it would be desirable or laudable, according as we would wish to see the person whom it concerns compelled, or only persuaded and exhorted, to act in that manner.⁹

This, therefore, being the characteristic difference which marks off, not justice, but morality in general from the remaining provinces of expediency and worthiness, the character is still to be sought which distinguishes justice from other branches of morality. Now it is known that ethical writers divide moral duties into two classes, denoted by the ill-chosen expressions, duties of perfect and of imperfect obligation; the latter being those in which, though the act is obligatory, the particular occasions of performing it are left to our choice, as in the case of charity or beneficence, which we are indeed bound to practice but not toward any definite person, nor at any prescribed time. In the more precise language of philosophic jurists, duties of perfect obligation are those duties in virtue of which a correlative *right* resides in some person or persons; duties of imperfect obligation are those moral obligations which do not give birth to any right. I think it will be found that this distinction exactly coincides with that which exists between justice and the other obligations of morality. In our survey of the various popular acceptations of justice, the term appeared generally to involve the idea of a personal right—a claim on the part of one or more individuals, like that which the law gives when it confers a proprietary or other legal right. Whether the injustice consists in depriving a person of a possession, or in breaking faith with him, or in treating him worse than he deserves, or worse than other people who have no greater claims—in each case the supposition implies two things: a wrong done, and some assignable person who is wronged. Injustice may also be done by treating a person better than others; but the wrong in this case is to his competitors, who are also assignable persons. It seems to me that this feature in the case—a right in some person, correlative to the moral obligation—constitutes the specific difference between justice and generosity of beneficence. Justice implies something which it is not only right to do, and wrong not to do, but which some individual person can claim from us as his moral right. No one has a moral right to our generosity or beneficence because we are not morally bound to practice those virtues toward any given individual. And it will be found with respect to this as to every correct definition that the instances which seem to conflict with it are those which most confirm it. For if a moralist attempts, as some have done, to make out that mankind generally, though not any given individual, have a right to all the good we can do them, he at once, by that thesis, includes generosity and beneficence within the category of justice. He is obliged to say that our utmost exertions are *due* to our fellow creatures, thus assimilating them to a debt; or that nothing less can be a sufficient *return* for what society does for us, thus classing the case as one of gratitude; both of which are acknowledged cases of justice, and not of the virtue of beneficence; and whoever does not place the distinction between justice and morality in general, where we have now placed it, will be found to make no distinction between them at all, but to merge all morality in justice.

Having thus endeavored to determine the distinctive elements which enter into the composition of the idea of justice, we are ready to enter on the inquiry whether the feeling which accompanies the idea is attached to it by a special dispensation of nature, or whether it could have grown up, by any known laws, out of the idea itself; and, in particular, whether it can have originated in considerations of general expediency.

I conceive that the sentiment itself does not arise from anything which would commonly or correctly be termed an idea of expediency, but that, though the sentiment does not, whatever is moral in it does.

We have seen that the two essential ingredients in the sentiment of justice are the desire to punish a person who has done harm and the knowledge or belief that there is some definite individual or individuals to

whom harm has been done.

Now it appears to me that the desire to punish a person who has done harm to some individual is a spontaneous outgrowth from two sentiments, both in the highest degree natural and which either are or resemble instincts: the impulse of self-defense and the feeling of sympathy.

It is natural to resent and to repel or retaliate any harm done or attempted against ourselves or against those with whom we sympathize. The origin of this sentiment it is not necessary here to discuss. Whether it be an instinct or a result of intelligence, it is, we know, common to all animal nature; for every animal tries to hurt those who have hurt, or who it thinks are about to hurt, itself or its young. Human beings, on this point, only differ from other animals in two particulars. First, in being capable of sympathizing, not solely with their offspring, or, like some of the more noble animals, with some superior animal who is kind to them, but with all human, and even with all sentient, beings; secondly, in having a more developed intelligence, which gives a wider range to the whole of their sentiments, whether self-regarding or sympathetic. By virtue of his superior intelligence, even apart from his superior range of sympathy, a human being is capable of apprehending a community of interest between himself and the human society of which he forms a part, such that any conduct which threatens the security of the society generally is threatening to his own, and calls forth his instinct (if instinct it be) of self-defense. The same superiority of intelligence, joined to the power of sympathizing with human beings generally, enables him to attach himself to the collective idea of his tribe, his country, or mankind in such a manner that any act hurtful to them raises his instinct of sympathy and urges him to resistance.

The sentiment of justice, in that one of its elements which consists of the desire to punish, is thus, I conceive, the natural feeling of retaliation or vengeance, rendered by intellect and sympathy applicable to those injuries, that is, to those hurts, which wound us through, or in common with, society at large. This sentiment, in itself, has nothing moral in it; what is moral is the exclusive subordination of it to the social sympathies, so as to wait on and obey their call. For the natural feeling would make us resent indiscriminately whatever anyone does that is disagreeable to us; but, when moralized by the social feeling, it only acts in the directions conformable to the general good: just persons resenting a hurt to society, though not otherwise a hurt to themselves, and not resenting a hurt to themselves, however painful, unless it be of the kind which society has a common interest with them in the repression of.

It is no objection against this doctrine to say that, when we feel our sentiment of justice outraged, we are not thinking of society at large or of any collective interest, but only of the individual case. It is common enough, certainly, though the reverse of commendable, to feel resentment merely because we have suffered pain; but a person whose resentment is really a moral feeling, that is, who considers whether an act is blamable before he allows himself to resent it — such a person, though he may not say expressly to himself that he is standing up for the interest of society, certainly does feel that he is asserting a rule which is for the benefit of others as well as for his own. If he is not feeling this, if he is regarding the act solely as it affects him individually, he is not consciously just; he is not concerning himself about the justice of his actions. This is admitted even by anti-utilitarian moralists. When Kant (as before remarked) propounds as the fundamental principle of morals, “So act that thy rule of conduct might be adopted as a law by all rational beings,” he virtually acknowledges that the interest of mankind collectively, or at least of mankind indiscriminately, must be in the mind of the agent when conscientiously deciding on the morality of the act. Otherwise he uses words without a meaning; for that a rule even of utter selfishness could not *possibly* be adopted by all rational beings — that there is any insuperable obstacle in the nature of things to its adoption—cannot be even plausibly maintained. To give any meaning to Kant’s principle, the sense put upon it must be that we ought to shape our conduct by a rule which all rational beings might adopt *with benefit to their collective interest*.

To recapitulate: the idea of justice supposes two things—a rule of conduct and a sentiment which sanctions the rule. The first must be supposed common to all mankind and intended for their good. The other (the sentiment) is a desire that punishment may be suffered by those who infringe the rule. There is involved, in addition, the conception of some definite person who suffers by the infringement, whose rights (to use the expression appropriated to the case) are violated by it. And the sentiment of justice appears to me to be the animal desire to repel or retaliate a hurt or damage to oneself or to those with whom one sympathizes, widened so as to include all persons, by the human capacity of enlarged sympathy and the human conception of intelligent self-interest. From the latter elements the feeling derives its morality; from the former, its peculiar impressiveness and energy of self-assertion.

I have, throughout, treated the idea of a *right* residing in the injured person and violated by the injury, not as a separate element in the composition of the idea and sentiment, but as one of the forms in which the other two elements clothe themselves. These elements are a hurt to some assignable person or persons, on the one

hand, and a demand for punishment, on the other. An examination of our own minds, I think, will show that these two things include all that we mean when we speak of violation of a right. When we call anything a person's right, we mean that he has a valid claim on society to protect him in the possession of it, either by the force of law or by that of education and opinion. If he has what we consider a sufficient claim, on whatever account, to have something guaranteed to him by society, we say that he has a right to it. If we desire to prove that anything does not belong to him by right, we think this done as soon as it is admitted that society ought not to take measure for securing it to him, but should leave him to chance or to his own exertions. Thus a person is said to have a right to what he can earn in fair professional competition, because society ought not to allow any other person to hinder him from endeavoring to earn in that manner as much as he can. But he has not a right to three hundred a year, though he may happen to be earning it; because society is not called on to provide that he shall earn that sum. On the contrary, if he owns ten thousand pounds three-per-cent stock, he *has* a right to three hundred a year because society has come under an obligation to provide him with an income of that amount.

To have a right, then, is, I conceive, to have something which society ought to defend me in the possession of. If the objector goes on to ask why it ought, I can give him no other reason than general utility. If that expression does not seem to convey a sufficient feeling of the strength of the obligation, nor to account for the peculiar energy of the feeling, it is because there goes to the composition of the sentiment, not a rational only but also an animal element—the thirst for retaliation; and this thirst derives its intensity, as well as its moral justification, from the extraordinarily important and impressive kind of utility which is concerned. The interest involved is that of security, to everyone's feelings the most vital of all interests. All other earthly benefits are needed by one person, not needed by another; and many of them can, if necessary, be cheerfully foregone or replaced by something else; but security no human being can possibly do without; on it we depend for all our immunity from evil and for the whole value of all and every good, beyond the passing moment, since nothing but the gratification of the instant could be of any worth to us if we could be deprived of everything the next instant by whoever was momentarily stronger than ourselves. Now this most indispensable of all necessities, after physical nutriment, cannot be had, unless the machinery for providing it is kept unintermittedly in active play. Our notion, therefore, of the claim we have on our fellow creatures to join in making safe for us the very groundwork of our existence gathers feelings around it so much more intense than those concerned in any of the more common cases of utility that the difference in degree (as is often the case in psychology) becomes a real difference in kind. The claim assumes that character of absoluteness, that apparent infinity and incommensurability with all other considerations which constitute the distinction between the feeling of right and wrong and that of ordinary expediency and in expediency. The feelings concerned are so powerful, and we count so positively on finding a responsive feeling in others (all being alike interested) that *ought* and *should* grow into *must*, and recognized indispensability becomes a moral necessity, analogous to physical, and often not inferior to it in binding force.

If the preceding analysis, or something resembling it, be not the correct account of the notion of justice — if justice be totally independent of utility, and be a standard *per se*, which the mind can recognize by simple introspection of itself—it is hard to understand why that internal oracle is so ambiguous, and why so many things appear either just or unjust, according to the light in which they are regarded.

We are continually informed that utility is an uncertain standard, which every different person interprets differently, and that there is no safety but in the immutable, ineffaceable, and unmistakable dictates of justice, which carry their evidence in themselves and are independent of the fluctuations of opinion. One would suppose from this that on questions of justice there could be no controversy; that, if we take that for our rule, its application to any given case could leave us in as little doubt as a mathematical demonstration. So far is this from being the fact that there is as much difference of opinion, and as much discussion, about what is just as about what is useful to society. Not only have different nations and individuals different notions of justice, but in the mind of one and the same individual, justice is not some one rule, principle, or maxim, but many which do not always coincide in their dictates, and, in choosing between which, he is guided either by some extraneous standard or by his own personal predilections.

For instance, there are some who say that it is unjust to punish anyone for the sake of example to others, that punishment is just only when intended for the good of the sufferer himself. Others maintain the extreme reverse, contending that to punish persons who have attained years of discretion, for their own benefit, is despotism and injustice, since, if the matter at issue is solely their own good, no one has a right to control their own judgment of it; but that they may justly be punished to prevent evil to others, this being the exercise of the legitimate right of self-defense. Mr. Owen,¹⁰ again, affirms that it is unjust to punish at all, for the criminal did not make his own character; his education and the circumstances which surrounded him have

made him a criminal, and for these he is not responsible. All these opinions are extremely plausible; and so long as the question is argued as one of justice simply, without going down to the principles which lie under justice and are the source of its authority, I am unable to see how any of these reasoners can be refuted. For in truth every one of the three builds upon rules of justice confessedly true. The first appeals to the acknowledged injustice of singling out an individual and making him a sacrifice, without his consent, for other people's benefit. The second relies on the acknowledged justice of self-defense and the admitted injustice of forcing one person to conform to another's notions of what constitutes his good. The Owenite invokes the admitted principle that it is unjust to punish anyone for what he cannot help. Each is triumphant so long as he is not compelled to take into consideration any other maxims of justice than the one he has selected; but as soon as their several maxims are brought face to face, each disputant seems to have exactly as much to say for himself as the others. No one of them can carry out his own notion of justice without trampling upon another equally binding. These are difficulties; they have always been felt to be such; and many devices have been invented to turn rather than to overcome them. As a refuge from the last of the three, men imagined what they called the freedom of the will — fancying that they could not justify punishing a man whose will is in a thoroughly hateful state unless it be supposed to have come into that state through no influence of anterior circumstances. To escape from the other difficulties, a favorite contrivance has been the fiction of a contract whereby at some unknown period all the members of society engaged to obey the laws and consented to be punished for any disobedience to them, thereby giving to their legislators the right, which it is assumed they would not otherwise have had, of punishing them, either for their own good or for that of society. This happy thought was considered to get rid of the whole difficulty and to legitimate the infliction of punishment, in virtue of another received maxim of justice, *volenti non fit injuria* — that is not unjust which is done with the consent of the person who is supposed to be hurt by it. I need hardly remark that, even if the consent were not mere fiction, this maxim is not superior in authority to the others which it is brought in to supersede. It is, on the contrary, an instructive specimen of the loose and irregular manner in which supposed principles of justice grow up. This particular one evidently came into use as a help to the coarse exigencies of courts of law, which are sometimes obliged to be content with very uncertain presumptions, on account of the greater evils which would often arise from any attempt on their part to cut finer. But even courts of law are not able to adhere consistently to the maxim, for they allow voluntary engagements to be set aside on the ground of fraud, and sometimes on that of mere mistake or misinformation.

Again, when the legitimacy of inflicting punishment is admitted, how many conflicting conceptions of justice come to light in discussing the proper apportionment of punishments to offenses. No rule on the subject recommends itself so strongly to the primitive and spontaneous sentiment of justice as the *lex talionis*, an eye for an eye and a tooth for a tooth. Though this principle of the Jewish and of the Mohammedan law has been generally abandoned in Europe as a practical maxim, there is, I suspect, in most minds, a secret hankering after it; and when retribution accidentally falls on an offender in that precise shape, the general feeling of satisfaction evinced bears witness how natural is the sentiment to which this repayment in kind is acceptable. With many, the test of justice in penal infliction is that the punishment should be proportioned to the offense, meaning that it should be exactly measured by the moral guilt of the culprit (whatever be their standard for measuring moral guilt), the consideration what amount of punishment is necessary to deter from the offense having nothing to do with the question of justice, in their estimation; while there are others to whom that consideration is all in all, who maintain that it is not just, at least for man, to inflict on a fellow creature, whatever may be his offenses, any amount of suffering beyond the least that will suffice to prevent him from repeating, and others from imitating, his misconduct.

To take another example from a subject already once referred to. In co-operative industrial associations, is it just or not that talent or skill should give a title to superior remuneration? On the negative side of the question it is argued that whoever does the best he can deserves equally well, and ought not in justice to be put in a position of inferiority for no fault of his own; that superior abilities have already advantages more than enough, in the admiration they excite, the personal influence they command, and the internal sources of satisfaction attending them, without adding to these a superior share of the world's goods; and that society is bound in justice rather to make compensation to the less favored for this unmerited inequality of advantages than to aggravate it. On the contrary side it is contended that society receives more from the efficient laborer; that, his services being more useful, society owes him a larger return for them; that a greater share of the joint result is actually his work, and not to allow his claim to it is a kind of robbery; that, if he is only to receive as much as others, he can only be justly required to produce as much, and to give a smaller amount of time and exertion, proportioned to his superior efficiency. Who shall decide between these appeals to conflicting principles of justice? Justice has in this case two sides to it, which it is impossible to bring into harmony, and the two disputants have chosen opposite sides; the one looks to what it is just that the individual should

receive, the other to what it is just that the community should give. Each, from his own point of view, is unanswerable; and any choice between them, on grounds of justice, must be perfectly arbitrary. Social utility alone can decide the preference.

How many, again, and how irreconcilable are the standards of justice to which reference is made in discussing the repartition of taxation. One opinion is that payment to the state should be in numerical proportion to pecuniary means. Others think that justice dictates what they term graduated taxation — taking a higher percentage from those who have more to spare. In point of natural justice a strong case might be made for disregarding means altogether, and taking the same absolute sum (whenever it could be got) from everyone; as the subscribers to a mess or to a club all pay the same sum for the same privileges, whether they can all equally afford it or not. Since the protection (it might be said) of law and government is afforded to and is equally required by all, there is no injustice in making all buy it at the same price. It is reckoned justice, not injustice, that a dealer should charge to all customers the same price for the same article, not a price varying according to their means of payment. This doctrine, as applied to taxation, finds no advocates because it conflicts so strongly with man's feelings of humanity and of social expediency; but the principle of justice which it invokes is as true and as binding as those which can be appealed to against it. Accordingly it exerts a tacit influence on the line of defense employed for other modes of assessing taxation. People feel obliged to argue that the state does more for the rich man than for the poor, as a justification for its taking more from them, though this is in reality not true, for the rich would be far better able to protect themselves, in the absence of law or government, than the poor, and indeed would probably be successful in converting the poor into their slaves. Others, again, so far defer to the same conception of justice as to maintain that all should pay an equal capitation tax for the protection of their persons (these being of equal value to all), and an unequal tax for the protection of their property, which is unequal. To this others reply that the all of one man is as valuable to him as the all of another. From these confusions there is no other mode of extrication than the utilitarian.

Is, then, the difference between the just and the expedient a merely imaginary distinction? Have mankind been under a delusion in thinking that justice is a more sacred thing than policy, and that the latter ought only to be listened to after the former has been satisfied? By no means. The exposition we have given of the nature and origin of the sentiment recognizes a real distinction; and no one of those who profess the most sublime contempt for the consequences of actions as an element in their morality attaches more importance to the distinction than I do. While I dispute the pretensions of any theory which sets up an imaginary standard of justice not grounded on utility, I account the justice which is grounded on utility to be the chief part, and incomparably the most sacred and binding part, of all morality. Justice is a name for certain classes of moral rules which concern the essentials of human well-being more nearly, and are therefore of more absolute obligation, than any other rules for the guidance of life; and the notion which we have found to be of the essence of the idea of justice—that of a right residing in an individual— implies and testifies to this more binding obligation.

The moral rules which forbid mankind to hurt one another (in which we must never forget to include a wrongful interference with each other's freedom) are more vital to human well-being than any maxims, however important, which only point out the best mode of managing some department of human affairs. They have also the peculiarity that they are the main element in determining the whole of the social feelings of mankind. It is their observance which alone preserves peace among human beings; if obedience to them were not the rule, and disobedience the exception, everyone would see in everyone else an enemy against whom he must be perpetually guarding himself. What is hardly less important, these are the precepts which mankind have the strongest and the most direct inducements for impressing upon one another. By merely giving to each other prudential instruction or exhortation, they may gain, or think they gain, nothing; in inculcating on each other the duty of positive beneficence, they have an unmistakable interest, but far less in degree; a person may possibly not need the benefits of others, but he always needs that they should not do him hurt. Thus the moralities which protect every individual from being harmed by others, either directly or by being hindered in his freedom of pursuing his own good, are at once those which he himself has most at heart and those which he has the strongest interest in publishing and enforcing by word and deed. It is by a person's observance of these that his fitness to exist as one of the fellowship of human beings is tested and decided; for on that depends his being a nuisance or not to those with whom he is in contact. Now it is these moralities primarily which compose the obligation of justice. The most marked cases of injustice, and those which give the tone to the feeling of repugnance which characterizes the sentiment, are acts of wrongful aggression or wrongful exercise of power over someone; the next are those which consist in wrongfully withholding from him something which is his due — in both cases inflicting on him a positive hurt, either in the form of direct suffering or of the privation of some good which he had reasonable ground, either of a physical or of a social

kind, for counting upon.

The same powerful motives which command the observance of these primary moralities enjoin the punishment of those who violate them; and as the impulses of self-defense, of defense of others, and of vengeance are all called forth against such persons, retribution, or evil for evil, becomes closely connected with the sentiment of justice, and is universally included in the idea. Good for good is also one of the dictates of justice; and this, though its social utility is evident, and though it carries with it a natural human feeling, has not at first sight that obvious connection with hurt or injury which, existing in the most elementary cases of just and unjust, is the source of the characteristic intensity of the sentiment. But the connection, though less obvious, is not less real. He who accepts benefits and denies a return of them when needed inflicts a real hurt by disappointing one of the most natural and reasonable of expectations, and one which he must at least tacitly have encouraged, otherwise the benefits would seldom have been conferred. The important rank, among human evils and wrongs, of the disappointment of expectation is shown in the fact that it constitutes the principal criminality of two such highly immoral acts as a breach of friendship and a breach of promise. Few hurts which human beings can sustain are greater, and none wound more, than when that on which they habitually and with full assurance relied fails them in the hour of need; and few wrongs are greater than this mere withholding of good; none excite more resentment, either in the person suffering or in a sympathizing spectator. The principle, therefore, of giving to each what they deserve, that is, good for good as well as evil for evil, is not only included within the idea of justice as we have defined it, but is a proper object of that intensity of sentiment which places the just human estimation above the simply expedient.

Most of the maxims of justice current in the world, and commonly appealed to in its transactions, are simply instrumental to carrying into effect the principles of justice which we have now spoken of. That a person is only responsible for what he has done voluntarily, or could voluntarily have avoided, that it is unjust to condemn any person unheard; that the punishment ought to be proportioned to the offense, and the like, are maxims intended to prevent the just principle of evil for evil from being perverted to the infliction of evil without that justification. The greater part of these common maxims have come into use from the practice of courts of justice, which have been naturally led to a more complete recognition and elaboration than was likely to suggest itself to others, of the rules necessary to enable them to fulfill their double function — of inflicting punishment when due, and of awarding to each person his right.

That first of judicial virtues, impartiality, is an obligation of justice, partly for the reason last mentioned, as being a necessary condition of the fulfillment of other obligations of justice. But this is not the only source of the exalted rank, among human obligations, of those maxims of equality and impartiality, which, both in popular estimation and in that of the most enlightened, are included among the precepts of justice. In one point of view, they may be considered as corollaries from the principles already laid down. If it is a duty to do to each according to his deserts, returning good for good, as well as repressing evil by evil, it necessarily follows that we should treat all equally well (when no higher duty forbids) who have deserved equally well of *us*, and that society should treat all equally well who have deserved equally well of *it*, that is, who have deserved equally well absolutely. This is the highest abstract standard of social and distributive justice, toward which all institutions and the efforts of all virtuous citizens should be made in the utmost possible degree to converge. But this great moral duty rests upon a still deeper foundation, being a direct emanation from the first principle of morals, and not a mere logical corollary from secondary or derivative doctrines. It is involved in the very meaning of utility, or the greatest happiness principle. That principle is a mere form of words without rational signification unless one person's happiness, supposed equal in degree (with the proper allowance made for kind), is counted for exactly as much as another's. Those conditions being supplied, Bentham's dictum "everybody to count for one, nobody for more than one," might be written under the principle of utility as an explanatory commentary.¹¹ The equal claim of everybody to happiness, in the estimation of the moralist and of the legislator, involves an equal claim to all the means of happiness except in so far as the inevitable conditions of human life and the general interest in which that of every individual is included set limits to the maxim; and those limits ought to be strictly construed. As every other maxim of justice, so this is by no means applied or held applicable universally; on the contrary, as I have already remarked, it bends to every person's ideas of social expediency. But in whatever case it is deemed applicable at all, it is held to be the dictate of justice. All persons are deemed to have a *right* to equality of treatment, except when some recognized social expediency requires the reverse. And hence all social inequalities which have ceased to be considered expedient assume the character, not of simple inexpediency, but of injustice, and appear so tyrannical that people are apt to wonder how they ever could have been tolerated — forgetful that they themselves, perhaps, tolerate other inequalities under an equally mistaken notion of expediency, the correction of which would make that which they approve seem quite as monstrous as what they have at last

learned to condemn. The entire history of social improvement has been a series of transitions by which one custom or institution after another, from being a supposed primary necessity of social existence, has passed into the rank of a universally stigmatized injustice and tyranny. So it has been with the distinctions of slaves and freemen, nobles and serfs, patricians and plebeians; and so it will be, and in part already is, with the aristocracies of color, race, and sex.

It appears from what has been said that justice is a name for certain moral requirements which, regarded collectively, stand higher in the scale of social utility, and are therefore of more paramount obligation, than any others, though particular cases may occur in which some other social duty is so important as to overrule any one of the general maxims of justice. Thus, to save a life, it may not only be allowable, but a duty, to steal or take by force the necessary food or medicine, or to kidnap and compel to officiate the only qualified medical practitioner. In such cases, as we do not call anything justice which is not a virtue, we usually say, not that justice must give way to some other moral principle, but that what is just in ordinary cases is, by reason of that other principle, not just in the particular case. By this useful accommodation of language, the character of indefeasibility attributed to justice is kept up, and we are saved from the necessity of maintaining that there can be laudable injustice.

The considerations which have not been adduced resolve, I conceive, the only real difficulty in the utilitarian theory of morals. It has always been evident that all cases of justice are also cases of expediency; the difference is in the peculiar sentiment which attaches to the former, as contradistinguished from the latter. If this characteristic sentiment has been sufficiently accounted for; if there is no necessity to assume for it any peculiarity of origin; if it is simply the natural feeling of resentment, moralized by being made co-extensive with the demands of social good; and if this feeling not only does but ought to exist in all the classes of cases to which the idea of justice corresponds — that idea no longer presents itself as a stumbling block to the utilitarian ethics. Justice remains the appropriate name for certain social utilities which are vastly more important, and therefore more absolute and imperative, than any others are as a class (though not more so than others may be in particular cases); and which, therefore, ought to be, as well as naturally are, guarded by a sentiment, not only different in degree, but also in kind; distinguished from the milder feeling which attaches to the mere idea of promoting human pleasure or convenience at once by the more definite nature of its commands and by the sterner character of its sanctions.

On Liberty

The grand, leading principle, towards which every argument unfolded in these pages directly converges, is the absolute and essential importance of human development in its richest diversity

—Wilhelm von Humboldt: *Sphere and Duties of Government*.¹

To the beloved and deplored memory of her who was the inspirer, and in part the author, of all that is best in my writings — the friend and wife whose exalted sense of truth and right was my strongest incitement, and whose approbation was my chief reward — I dedicate this volume. Like all that I have written for many years, it belongs as much to her as to me; but the work as it stands has had, in a very insufficient degree, the inestimable advantage of her revision; some of the most important portions having been reserved for a more careful re-examination, which they are now never destined to receive. Were I but capable of interpreting to the world one half the great thoughts and noble feelings which are buried in her grave, I should be the medium of a greater benefit to it, than is ever likely to arise from anything that I can write, unprompted and unassisted by her all but unrivaled wisdom.

CHAPTER I

Introductory

... The object of this essay is to assert one very simple principle, as entitled to govern absolutely the dealings of society with the individual in the way of compulsion and control, whether the means used be physical force in the form of legal penalties or the moral coercion of public opinion. That principle is that the sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of their number is self-protection. That the only purpose for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. He cannot rightfully be compelled to do or forbear because it will be better for him to do so, because it will make him happier, because, in the opinions of others, to do so would be wise or even right. These are good reasons for remonstrating with him, or reasoning with him, or persuading him, or entreating him, but not for compelling him or visiting him with any evil in case he do otherwise. To justify that, the conduct from which it is desired to deter him must be calculated to produce evil to someone else. The only part of the conduct of anyone for which he is amenable to society is that which concerns others. In the part which merely concerns himself, his independence is, of right, absolute. Over himself, over his own body and mind, the individual is sovereign...

This, then, is the appropriate region of human liberty. It comprises, first, the inward domain of consciousness, demanding liberty of conscience in the most comprehensive sense, liberty of thought and feeling, absolute freedom of opinion and sentiment on all subjects, practical or speculative, scientific, moral, or theological. The liberty of expressing and publishing opinions may seem to fall under a different principle, since it belongs to that part of the conduct of an individual which concerns other people, but, being almost of as much importance as the liberty of thought itself and resting in great part on the same reasons, is practically inseparable from it. Secondly, the principle requires liberty of tastes and pursuits, of framing the plan of our life to suit our own character, of doing as we like, subject to such consequences as may follow, without impediment from our fellow creatures, so long as what we do does not harm them, even though they should think our conduct foolish, perverse, or wrong. Thirdly, from this liberty of each individual follows the liberty, within the same limits, of combination among individuals; freedom to unite for any purpose not involving harm to others: the persons combining being supposed to be of full age and not forced or deceived...

It will be convenient for the argument if, instead of at once entering upon the general thesis, we confine ourselves in the first instance to a single branch of it on which the principle here stated is, if not fully, yet to a certain point, recognized by the current opinions. This one branch is the Liberty of Thought, from which it is impossible to separate the cognate liberty of speaking and of writing. Although these liberties, to some considerable amount, form part of the political morality of all countries which profess religious toleration and free institutions, the grounds, both philosophical and practical, on which they rest are perhaps not so familiar to the general mind, nor so thoroughly appreciated by many, even of the leaders of opinion, as might have been expected. Those grounds, when rightly understood, are of much wider application than to only one division of the subject, and a thorough consideration of this part of the question will be found the best introduction to the remainder. Those to whom nothing which I am about to say will be new may therefore, I hope, excuse me if on a subject which for now three centuries has been so often discussed I venture on one discussion more.

CHAPTER II

Of the Liberty of Thought and Discussion

The time, it is to be hoped, is gone by when any defense would be necessary of the “liberty of the press” as one of the securities against corrupt or tyrannical government. No argument, we may suppose, can now be needed against permitting a legislature or an executive, not identified in interest with the people, to prescribe opinions to them and determine what doctrines or what arguments they shall be allowed to hear. This aspect of the question, besides, has been so often and so triumphantly enforced by preceding writers that it needs not be specially insisted on in this place. Though the law of England, on the subject of the press, is as servile to this day as it was in the time of the Tudors, there is little danger of its being actually put in force against political discussion except during some temporary panic when fear of insurrection drives ministers and judges from their propriety; and, speaking generally, it is not, in constitutional countries, to be apprehended that the government, whether completely responsible to the people or not, will often attempt to control the expression of opinion, except when in doing so it makes itself the organ of the general intolerance of the public. Let us suppose, therefore, that the government is entirely at one with the people, and never thinks of exerting any power of coercion unless in agreement with what it conceives to be their voice. But I deny the right of the people to exercise such coercion, either by themselves or by their government. The power itself is illegitimate. The best government has no more title to it than the worst. It is as noxious, or more noxious, when exerted in accordance with public opinion than when in opposition to it. If all mankind minus one were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person than he, if he had the power, would be justified in silencing mankind. Were an opinion a personal possession of no value except to the owner, if to be obstructed in the enjoyment of it were simply a private injury, it would make some difference whether the injury was inflicted only on a few persons or on many. But the peculiar evil of silencing the expression of an opinion is that it is robbing the human race, posterity as well as the existing generation—those who dissent from the opinion, still more than those who hold it. If the opinion is right, they are deprived of the opportunity of exchanging error for truth; if wrong, they lose, what is almost as great a benefit, the clearer perception and livelier impression of truth produced by its collision with error.

It is necessary to consider separately these two hypotheses, each of which has a distinct branch of the argument corresponding to it. We can never be sure that the opinion we are endeavoring to stifle is a false opinion; and if we were sure, stifling it would be an evil still.

First, the opinion which it is attempted to suppress by authority may possibly be true. Those who desire to suppress it, of course, deny its truth; but they are not infallible. They have no authority to decide the question for all mankind and exclude every other person from the means of judging. To refuse a hearing to an opinion because they are sure that it is false is to assume that *their* certainty is the same thing as *absolute* certainty. All silencing of discussion is an assumption of infallibility. Its condemnation may be allowed to rest on this common argument, not the worse for being common.

Unfortunately for the good sense of mankind, the fact of their fallibility is far from carrying the weight in their practical judgment which is always allowed to it in theory; for while everyone well knows himself to be fallible, few think it necessary to take any precautions against their own fallibility, or admit the supposition that any opinion of which they feel very certain may be one of the examples of the error to which they acknowledge themselves to be liable. Absolute princes, or others who are accustomed to unlimited deference, usually feel this complete confidence in their own opinions on nearly all subjects. People more happily situated, who sometimes hear their opinions disputed and are not wholly unused to be set right when they are wrong, place the same unbounded reliance only on such of their opinions as are shared by all who surround them, or to whom they habitually defer; for in proportion to a man’s want of confidence in his own solitary judgment does he usually repose, with implicit trust, on the infallibility of “the world” in general. And the world, to each individual, means the part of it with which he comes in contact: his party, his sect, his church, his class of society; the man may be called, by comparison, almost liberal and large-minded to whom it means anything so comprehensive as his own country or his own age. Nor is his faith in this collective authority at all shaken by his being aware that other ages, countries, sects, churches, classes, and parties have thought, and even now think, the exact reverse. He devolves upon his own world the responsibility of being in the right against the dissentient worlds of other people; and it never troubles him that mere accident has decided which

of these numerous worlds is the object of his reliance, and that the same causes which make him a churchman in London would have made him a Buddhist or a Confucian in Peking. Yet it is as evident in itself, as any amount of argument can make it, that ages are no more infallible than individuals — every age having held many opinions which subsequent ages have deemed not only false but absurd; and it is as certain that many opinions, now general, will be rejected by future ages, as it is that many, once general, are rejected by the present.

The objection likely to be made to this argument would probably take some such form as the following. There is no greater assumption of infallibility in forbidding the propagation of error than in any other thing which is done by public authority on its own judgment and responsibility. Judgment is given to men that they may use it. Because it may be used erroneously, are men to be told that they ought not to use it at all? To prohibit what they think pernicious is not claiming exemption from error, but fulfilling the duty incumbent on them, although fallible, of acting on their conscientious conviction. If we were never to act on our opinions, because those opinions may be wrong, we should leave all our interests uncared for, and all our duties unperformed. An objection which applies to all conduct can be no valid objection to any conduct in particular. It is the duty of governments, and of individuals, to form the truest opinions they can; to form them carefully, and never impose them upon others unless they are quite sure of being right. But when they are sure (such reasoners may say), it is not conscientiousness but cowardice to shrink from acting on their opinions and allow doctrines which they honestly think dangerous to the welfare of mankind, either in this life or in another, to be scattered abroad without restraint, because other people, in less enlightened times, have persecuted opinions now believed to be true. Let us take care, it may be said, not to make the same mistake; but governments and nations have made mistakes in other things which are not denied to be fit subjects for the exercise of authority: they have laid on bad taxes, made unjust wars. Ought we therefore to lay on no taxes and, under whatever provocation, make no wars? Men and governments must act to the best of their ability. There is no such thing as absolute certainty, but there is assurance sufficient for the purposes of human life. We may, and must, assume our opinion to be true for the guidance of our own conduct; and it is assuming no more when we forbid bad men to pervert society by the propagation of opinions which we regard as false and pernicious.

I answer, that it is assuming very much more. There is the greatest difference between presuming an opinion to be true because, with every opportunity for contesting it, it has not been refuted, and assuming its truth for the purpose of not permitting its refutation. Complete liberty of contradicting and disproving our opinion is the very condition which justifies us in assuming its truth for purposes of action; and on no other terms can a being with human faculties have any rational assurance of being right.

When we consider either the history of opinion or the ordinary conduct of human life, to what is it to be ascribed that the one and the other are no worse than they are? Not certainly to the inherent force of the human understanding, for on any matter not self-evident there are ninety-nine persons totally incapable of judging of it for one who is capable; and the capacity of the hundredth person is only comparative, for the majority of the eminent men of every past generation held many opinions now known to be erroneous, and did or approved numerous things which no one will now justify. Why is it, then, that there is on the whole a preponderance among mankind of rational opinions and rational conduct? If there really is this preponderance — which there must be unless human affairs are, and have always been, in an almost desperate state — it is owing to a quality of the human mind, the source of everything respectable in man either as an intellectual or as a moral being, namely, that his errors are corrigible. He is capable of rectifying his mistakes by discussion and experience. Not by experience alone. There must be discussion to show how experience is to be interpreted. Wrong opinions and practices gradually yield to fact and argument; but facts and arguments, to produce any effect on the mind, must be brought before it. Very few facts are able to tell their own story, without comments to bring out their meaning. The whole strength and value, then, of human judgment depending on the one property, that it can be set right when it is wrong, reliance can be placed on it only when the means of setting it right are kept constantly at hand. In the case of any person whose judgment is really deserving of confidence, how has it become so? Because he has kept his mind open to criticism of his opinions and conduct. Because it has been his practice to listen to all that could be said against him; to profit by as much of it as was just, and to expound to himself, and upon occasion to others, the fallacy of what was fallacious. Because he has felt that the only way in which a human being can make some approach to knowing the whole of a subject is by hearing what can be said about it by persons of every variety of opinion, and studying all modes in which it can be looked at by every character of mind. No wise man ever acquired his wisdom in any mode but this; nor is it in the nature of human intellect to become wise in any other manner. The steady habit of correcting and completing his own opinion by collating it with those of others, so far from causing doubt and hesitation in carrying it into practice, is the only stable foundation for a just reliance on it;

for, being cognizant of all that can, at least obviously, be said against him, and having taken up his position against all gain-sayers—knowing that he has sought for objections and difficulties instead of avoiding them, and has shut out no light which can be thrown upon the subject from any quarter—he has a right to think his judgment better than that of any person, or any multitude, who have not gone through a similar process... .

In order more fully to illustrate the mischief of denying a hearing to opinions because we, in our own judgment, have condemned them, it will be desirable to fix down the discussion to a concrete case; and I choose, by preference, the cases which are least favorable to me—in which the argument against freedom of opinion, both on the score of truth and on that of utility, is considered the strongest. Let the opinions impugned be the belief in a God and in a future state, or any of the commonly received doctrines of morality. To fight the battle on such ground gives a great advantage to an unfair antagonist, since he will be sure to say (and many who have no desire to be unfair will say it internally), Are these the doctrines which you do not deem sufficiently certain to be taken under the protection of law? Is the belief in a God one of the opinions to feel sure of which you hold to be assuming infallibility? But I must be permitted to observe that it is not the feeling sure of a doctrine (be it what it may) which I call an assumption of infallibility. It is the undertaking to decide that question *for others*, without allowing them to hear what can be said on the contrary side. And I denounce and reprobate this pretension not the less if put forth on the side of my most solemn convictions. However positive anyone's persuasion may be, not only of the falsity but of the pernicious consequences—not only of the pernicious consequences, but (to adopt expressions which I altogether condemn) the immorality and impiety of an opinion—yet if, in pursuance of that private judgment, though backed by the public judgment of his country or his contemporaries, he prevents the opinion from being heard in its defense, he assumes infallibility. And so far from the assumption being less objectionable or less dangerous because the opinion is called immoral or impious, this is the case of all others in which it is most fatal. These are exactly the occasions on which the men of one generation commit those dreadful mistakes which excite the astonishment and horror of posterity. It is among such that we find the instances memorable in history, when the arm of the law has been employed to root out the best men and the noblest doctrines; with deplorable success as to the men, though some of the doctrines have survived to be (as if in mockery) invoked in defense of similar conduct toward those who dissent from *them*, or from their received interpretation.

Mankind can hardly be too often reminded that there was once a man called Socrates, between whom and the legal authorities and public opinion of his time there took place a memorable collision. Born in an age and country abounding in individual greatness, this man has been handed down to us by those who best knew both him and the age as the most virtuous man in it; while *we* know him as the head and prototype of all subsequent teachers of virtue, the source equally of the lofty inspiration of Plato and the judicious utilitarianism of Aristotle, "*i maestri di color che sanno*,"² the two headsprings of ethical as of all other philosophy. This acknowledged master of all the eminent thinkers who have since lived—whose fame, still growing after more than two thousand years, all but outweighs the whole remainder of the names which make his native city illustrious—was put to death by his countrymen, after a judicial conviction, for impiety and immorality. Impiety, in denying the gods recognized by the State; indeed, his accuser asserted (see the *Apologia*) that he believed in no gods at all. Immorality, in being, by his doctrines and instructions, a "corruptor of youth." Of these charges the tribunal, there is every ground for believing, honestly found him guilty, and condemned the man who probably of all then born had deserved best of mankind to be put to death as a criminal.

To pass from this to the only other instance of judicial iniquity, the mention of which, after the condemnation of Socrates, would not be an anticlimax: the event which took place on Calvary rather more than eighteen hundred years ago. The man who left on the memory of those who witnessed his life and conversation such an impression of his moral grandeur that eighteen subsequent centuries have done homage to him as the Almighty in person, was ignominiously put to death, as what? As a blasphemer. Men did not merely mistake their benefactor, they mistook him for the exact contrary of what he was and treated him as that prodigy of impiety which they themselves are now held to be for their treatment of him. The feelings with which mankind now regard these lamentable transactions, especially the later of the two, render them extremely unjust in their judgment of the unhappy actors. These were, to all appearance, not bad men—not worse than men commonly are, but rather the contrary; men who possessed in a full, or somewhat more than a full measure, the religious, moral, and patriotic feelings of their time and people: the very kind of men who, in all times, our own included, have every chance of passing through life blameless and respected. The high priest who rent his garments when the words were pronounced, which, according to all the ideas of his country, constituted the blackest guilt, was in all probability quite as sincere in his horror and indignation as the generality of respectable and pious men now are in the religious and moral sentiments they profess; and

most of those who now shudder at his conduct, if they had lived in his time, and been born Jews, would have acted precisely as he did. Orthodox Christians who are tempted to think that those who stoned to death the first martyrs must have been worse men than they themselves are ought to remember that one of those persecutors was Saint Paul... .

Let us now pass to the second division of the argument, and dismissing the supposition that any of the received opinions may be false, let us assume them to be true and examine into the worth of the manner in which they are likely to be held when their truth is not freely and openly canvassed. However unwillingly a person who has a strong opinion may admit the possibility that his opinion may be false, he ought to be moved by the consideration that, however true it may be, if it is not fully, frequently, and fearlessly discussed, it will be held as a dead dogma, not a living truth.

There is a class of persons (happily not quite so numerous as formerly) who think it enough if a person assents undoubtingly to what they think true, though he has no knowledge whatever of the grounds of the opinion and could not make a tenable defense of it against the most superficial objections. Such persons, if they can once get their creed taught from authority, naturally think that no good, and some harm, comes of its being allowed to be questioned. Where their influence prevails, they make it nearly impossible for the received opinion to be rejected wisely and considerately, though it may still be rejected rashly and ignorantly; for to shut out discussion entirely is seldom possible, and when it once gets in, beliefs not grounded on conviction are apt to give way before the slightest semblance of an argument. Waiving, however, this possibility — assuming that the true opinion abides in the mind, but abides as a prejudice, a belief independent of, and proof against, argument—this is not the way in which truth ought to be held by a rational being. This is not knowing the truth. Truth, thus held, is but one superstition the more, accidentally clinging to the words which enunciate a truth.

If the intellect and judgment of mankind ought to be cultivated, a thing which Protestants at least do not deny, on what can these faculties be more appropriately exercised by anyone than on the things which concern him so much that it is considered necessary for him to hold opinions on them? If the cultivation of the understanding consists in one thing more than in another, it is surely in learning the grounds of one's own opinions. Whatever people believe, on subjects on which it is of the first importance to believe rightly, they ought to be able to defend against at least the common objections. But, someone may say, "Let them be *taught* the grounds of their opinions. It does not follow that opinions must be merely parroted because they are never heard controverted. Persons who learn geometry do not simply commit the theorems to memory, but understand and learn likewise the demonstrations; and it would be absurd to say that they remain ignorant of the grounds of geometrical truths because they never hear anyone deny and attempt to disprove them." Undoubtedly: and such teaching suffices on a subject like mathematics, where there is nothing at all to be said on the wrong side of the question. The peculiarity of the evidence of mathematical truths is that all the argument is on one side. There are no objections, and no answers to objections. But on every subject on which difference of opinion is possible, the truth depends on a balance to be struck between two sets of conflicting reasons. Even in natural philosophy, there is always some other explanation possible of the same facts; some geocentric theory instead of heliocentric, some phlogiston instead of oxygen; and it has to be shown why that other theory cannot be the true one; and until this is shown, and until we know how it is shown, we do not understand the grounds of our opinion. But when we turn to subjects infinitely more complicated, to morals, religion, politics, social relations, and the business of life, three-fourths of the arguments for every disputed opinion consist in dispelling the appearance which favor some opinion different from it. The greatest orator, save one, of antiquity, has left it on record that he always studied his adversary's case with as great, if not still greater, intensity than even his own. What Cicero³ practiced as the means of forensic success requires to be imitated by all who study any subject in order to arrive at the truth. He who knows only his own side of the case knows little of that. His reasons may be good, and no one may have been able to refute them. But if he is equally unable to refute the reasons on the opposite side, if he does not so much as know what they are, he has no ground for preferring either opinion. The rational position for him would be suspension of judgment, and unless he contents himself with that, he is either led by authority or adopts, like the generality of the world, the side to which he feels most inclination. Nor is it enough that he should hear the arguments of adversaries from his own teachers, presented as they state them, and accompanied by what they offer as refutations. That is not the way to do justice to the arguments or bring them into real contact with his own mind. He must be able to hear them from persons who actually believe them, who defend them in earnest and do their very utmost for them. He must know them in their most plausible and persuasive form; he must feel the whole force of the difficulty which the true view of the subject has to encounter and dispose of, else he will never really possess himself of the portion of truth which meets and removes that difficulty. Ninety-nine in a

hundred of what are called educated men are in this condition, even of those who can argue fluently for their opinions. Their conclusion may be true, but it might be false for anything they know; they have never thrown themselves into the mental position of those who think differently from them, and considered what such persons may have to say; and, consequently, they do not, in any proper sense of the word, know the doctrine which they themselves profess... .

We have now recognized the necessity to the mental well-being of mankind (on which all their other well-being depends) of freedom of opinion, and freedom of the expression of opinion, on four distinct grounds, which we will now briefly recapitulate:

First, if any opinion is compelled to silence, that opinion may, for aught we can certainly know, be true. To deny this is to assume our own infallibility.

Secondly, though the silenced opinion be an error, it may, and very commonly does, contain a portion of truth; and since the general or prevailing opinion on any subject is rarely or never the whole truth, it is only by the collision of adverse opinions that the remainder of the truth has any chance of being supplied.

Thirdly, even if the received opinion be not only true, but the whole truth; unless it is suffered to be, and actually is, vigorously and earnestly contested, it will, by most of those who receive it, be held in the manner of a prejudice, with little comprehension or feeling of its rational grounds. And not only this, but, fourthly, the meaning of the doctrine itself will be in danger of being lost or enfeebled, and deprived of its vital effect on the character and conduct: the dogma becoming a mere formal profession, inefficacious for good, but cumbering the ground and preventing the growth of any real and heartfelt conviction from reason or personal experience.

1. [Regarding Protagoras, see Hume's *Enquiry*, n.60. — S.M.C.]

2. The author of this essay has reason for believing himself to be the first person who brought the word "utilitarian" into use. He did not invent it, but adopted it from a passing expression in Mr. Galt's *Annals of the Parish*. [John Galt (1779–1839) was a Scottish novelist.] After using it as a designation for several years, he and others abandoned it from a growing dislike to anything resembling a badge or watchword of sectarian distinction. But as a name for one single opinion, not a set of opinions — to denote the recognition of utility as a standard, not any particular way of applying it—the term supplies a want in the language, and offers, in many cases, a convenient mode of avoiding tiresome circumlocutions.

3. [Thomas Carlyle (1795–1881) was a Scottish author and social critic who wrote a multivolume history of the French Revolution. His theistic view stressed the essential spirituality of the world and its leaders.]

4. [Pseudonym of Friedrich Leopold Freiherr von Hardenberg (1771–1801), a German romantic poet.]

5. [Transcendentalism was a literary and philosophical movement that flourished in New England from about 1835 to 1860. It emphasized intuition as the source of knowledge and enlightened individualism as the basis of ethics. Its leading spokesmen were Ralph Waldo Emerson (1803–1882) and Henry David Thoreau (1817–1862).]

6. An opponent, whose intellectual and moral fairness it is a pleasure to acknowledge (the Rev. J. Llewellyn Davies), has objected to this passage, saying, "Surely the rightness or wrongness of saving a man from drowning does depend very much upon the motive with which it is done. Suppose that a tyrant, when his enemy jumped into the sea to escape from him, saved him from drowning simply in order that he might inflict upon him more exquisite tortures, would it tend to clearness to speak of that rescue as 'a morally right action'? Or suppose again, according to one of the stock illustrations of ethical inquiries, that a man betrayed a trust received from a friend, because the discharge of it would fatally injure that friend himself or someone belonging to him, would utilitarianism compel one to call the betrayal 'a crime' as much as if it had been done from the meanest motive?"

*I submit that he who saves another from drowning in order to kill him by torture afterwards does not differ only in motive from him who does the same thing from duty or benevolence; the act itself is different. The rescue of the man is, in the case supposed, only the necessary first step of an act far more atrocious than leaving him to drown would have been. Had Mr. Davies said, "The rightness or wrongness of saving a man from drowning does depend very much" — not upon the motive, but—"upon the *intention*," no utilitarian would have differed from him. Mr. Davies, by an oversight too common not to be quite venial, has in this case confounded the very different ideas of Motive and Intention. There is no point which utilitarian thinkers (and Bentham pre-eminently) have taken more pains to illustrate than this. The morality of the action depends entirely upon the intention—that is, upon what the agent *wills to do*. But the motive, that is, the feeling which makes him will so to do, if it makes no difference in the act, makes none in the morality: though it makes a great difference in our moral estimation of the agent, especially if it indicates a good or a bad habitual *disposition* — a bent of character from which useful, or from which hurtful actions are likely to arise.

[This note appeared in the second edition of *Utilitarianism* but not in subsequent ones.]

7. [Auguste Comte (1798–1857) was the French philosopher who founded positivism, a view that denies the sense of speculative metaphysics and stresses the role of scientific observation in achieving understanding. As a social reformer he called for a moral order in which all people and

nations could live in harmony. The work referred to is his *Treatise of Positive Polity*.]

8. [John Horne Tooke (1736–1812) was an English politician and philologist who supported both the American and French revolutions.]

9. See this point enforced and illustrated by Professor Bain, in an admirable chapter (entitled “The Ethical Emotions, or the Moral Sense”), of the second of the two treatises composing his elaborate and profound work on the Mind. [Alexander Bain (1818–1903) was a Scottish philosopher and psychologist. The work referred to is his *The Emotions and the Will*.]

10. [Robert Owen (1771–1858) was a British social reformer who believed that individual character is determined by environment. He proposed the formation of self-sufficient cooperative communities, one of which was established in 1825 in New Harmony, Indiana, but lasted only a few years.]

11. This implication, in the first principle of the utilitarian scheme, of perfect impartiality between persons is regarded by Mr. Herbert Spencer (in his *Social Statics*) as a disproof of the pretensions of utility to be a sufficient guide to right; since (he says) the principle of utility presupposes the anterior principle that everybody has an equal right to happiness. It may be more correctly described as supposing that equal amounts of happiness are equally desirable, whether felt by the same or different persons. This, however, is not a presupposition, not a premise needful to support the principle of utility, but the very principle itself; for what is the principle of utility if it be not that “happiness” and “desirable” are synonymous terms? If there is any anterior principle implied, it can be no other than this, that the truths of arithmetic are applicable to the valuation of happiness, as of all other measurable quantities.

(Mr. Herbert Spencer, in a private communication on the subject of the preceding note, objects to being considered an opponent of utilitarianism and states that he regards happiness as the ultimate end of morality; but deems that end only partially attainable by empirical generalizations from the observed results of conduct, and completely attainable only by deducing, from the laws of life and the conditions of existence, what kinds of action necessarily tend to produce happiness, and what kinds to produce unhappiness. With the exception of the word “necessarily,” I have no dissent to express from this doctrine; and (omitting that word) I am not aware that any modern advocate of utilitarianism is of a different opinion. Bentham, certainly, to whom in the *Social Statics* Mr. Spencer particularly referred, is, least of all writers, chargeable with unwillingness to deduce the effect of actions on happiness from the laws of human nature and the universal conditions of human life. The common charge against him is of relying too exclusively upon such deductions and declining altogether to be bound by the generalizations from specific experience which Mr. Spencer thinks that utilitarians generally confine themselves to. My own opinion (and, as I collect, Mr. Spencer’s) is that in ethics, as in all other branches of scientific study, the consilience of the results of both these processes, each corroborating and verifying the other, is requisite to give to any general proposition the kind and degree of evidence which constitutes scientific proof.)

1. [Wilhelm Freiherr von Humboldt (1767–1835), German statesman and philologist, was a liberal reformer and a founder of the University of Berlin. — S.M.C.]

2. [The master of them that know.]

3. [Regarding Cicero, see Locke’s *Essay*, n.8.]

Friedrich Nietzsche

Friedrich Nietzsche was born in 1844 in a small town in Prussia. He studied classical philology at the universities of Bonn and Leipzig, where he proved to be such an extraordinary student that, even without a completed doctoral thesis, he was appointed professor of classical philology at the University of Basel at the age of twenty-five. At Basel, he read Schopenhauer and Greek philosophy, and for a few years he was enthralled by the composer Richard Wagner. Somewhat shy and withdrawn by nature, Nietzsche was severely myopic and subject to migraine headaches. By 1879 his poor health led him to resign his professorship, and he spent the next ten years composing the works that make up his mature philosophy (five books, including *Twilight of the Idols* and *The Antichrist*, appeared in the last year of his productive life, 1888). At the age of forty-four he suffered a complete mental collapse that left him a helpless invalid until his death in 1900.

The key to Nietzsche's philosophy is his most famous one-liner, "God is dead." What this means is not that people are living more secular lives, but that all the traditional ideas of an "absolute" in Western civilization—ideas about a transcendent basis for finding direction and meaning in life—have collapsed, and there are no prospects of new absolutes arising in the future. So the term "God" in this remark refers not just to the deity of the Judeo-Christian tradition, but also to such god-terms as the Greek *cosmos*, the Enlightenment concept of Reason, and even our scientific idea of a law-governed nature.

Much of Nietzsche's thought is devoted to working out the consequences of this recognition of the loss of absolutes. If God is dead, then there is no way we can arrive at a "God's-eye view" of reality as it is in itself, independent of any perspective or interpretation. Nietzsche rejects the "doctrine of immaculate perception," the assumption that we can perceive things as they are in themselves. Instead, he holds that our beliefs about the world are always conditioned by our own point of view as specific sorts of creatures located in a particular place and time. This "perspectivism" in turn implies that we have no access to any timeless truths about our own essence as humans. It is pointless to try to find a "proper way to be human" or a fixed table of values that determines good or evil for all people at all times. In the end, it is up to us to create our own values in life. In Nietzsche's view, the ideal person is one who is freed from the old "craving for metaphysical comfort," one who understands that "truth" is nothing but "a mobile army of metaphors" that is always subject to revision.

Twilight of the Idols presents a vivid overview of Nietzsche's mature philosophy. A central aim of *Twilight* is to attack what Nietzsche sees as one of the chief enemies of life-affirmation in the West: the Platonic dream of an "other," better world—a world of transcendent Forms—beyond the sensory, material world in which we find ourselves. In Nietzsche's view, the belief in a "true world" distinct from our familiar material world arises because of Plato's fascination with reason and his distaste for our "animal" appetites and drives. To help shake us out of the unquestioning assumption that reason is the highest good for humans, Nietzsche employs a sort of thought-experiment about what might have motivated Platonism at its inception. Suppose it were the case, he suggests, that Socrates and Plato, far from embodying everything fine and noble about the Greeks, were in fact misfits and decadents who were unable to enjoy the sensuous, spontaneous life of the more "noble" Greeks described by Homer. On this supposition, their prejudice in favor of reason would be a form of sour grapes, a symptom of sickly, bitter minds that are incapable of fulfilling their natural, healthy drives. Rationalism would then be a symptom of decline and decadence, not a step toward the improvement of the human race.

Nietzsche toys with the idea that the Platonic glorification of reason results from a peculiarity of philosophers: their fear of change. Unable to stomach the uncertainties of a world of "becoming," philosophers turn away from the transient material objects that make up the actual world and instead focus on their own concepts of things. The fateful move comes when philosophers assume that their abstract concepts (for example, "being," "substance," "God") actually correspond to entities that exist in reality—things that are more real than the concrete, changing items in the material world we see around us.

The criticisms of Platonism carry consequences for all Western thought. Christianity, which Nietzsche calls "Platonism for the masses," reproduces Plato's "two-world" view in its distinction between heaven and earth. And even modern science presupposes Platonic dualism in its distinction between observable phenomena and underlying forces. These different conceptions of a distinction between "appearance" and "reality" are deposited in our language, and they make up a hardened "mythology" we pass along from generation to generation. Nietzsche's aim is to destabilize and undercut these assumptions. In his view, there is only *one* world—the world we find around us—and calling that world an "apparent" world just buys into the

kind of invidious contrast that got Platonism going in the first place.

• • •

Valuable early works on Nietzsche include Arthur C. Danto, *Nietzsche as Philosopher* (New York: Macmillan, 1965) and Walter Kaufmann, *Nietzsche: Philosopher, Psychologist, Antichrist* (Princeton: Princeton University Press, 1974). Some especially helpful studies are Richard Schacht, *Nietzsche* (London: Routledge, 1983); Alexander Nehamas, *Nietzsche: Life as Literature* (Cambridge, Mass.: Harvard University Press, 1983); and Graham Parke, *Composing the Soul* (Chicago: University of Chicago Press, 1994). For Nietzsche's impact on postmodern movements, see David B. Allison, ed., *The New Nietzsche* (Cambridge, Mass.: MIT Press, 1985). Good collections of essays are Robert C. Solomon and Kathleen M. Higgins, eds., *Reading Nietzsche* (New York: Oxford University Press, 1988) and Bernd Magnus and Kathleen Higgins, eds., *The Cambridge Companion to Nietzsche* (Cambridge: Cambridge University Press, 1996).

Charles Guignon

*Twilight of the Idols: Or, How to Philosophize with the Hammer**

The Problem of Socrates

1

The wisest sages of all times have come to the same judgment about life: *it is good for nothing*. Always and everywhere we have heard the same sound escape their mouths — a sound full of diffidence, full of melancholy, full of fatigue with life, full of hostility to life. Even Socrates said, as he died, “Living — that means being sick a long time. I owe a rooster to the savior Asclepius.”¹ Even Socrates had had enough.

What does that *demonstrate*? What does that *indicate*? In the past one would have said (oh, one has said it, and loud enough, especially our pessimists!): “Here there must be something true in any case! The *consensus sapientium* [agreement of the wise] demonstrates the truth.” Shall we still speak this way today? *May* we do so? “Here there must be some *sickness* in any case” — that’s *our* answer; these wisest sages of all times, one should first take a close look at them! Were they perhaps, all of them, no longer steady on their legs? Worn out? Shaky? *Décadents*? Does wisdom perhaps appear on Earth as a scavenger bird, excited by the scent of rotting meat?

In my own case this disrespectful thought—that the great sages are *declining types* — first occurred to me precisely in regards to an instance where learned and unlearned prejudice most strongly opposes it. I recognized Socrates and Plato as symptoms of decay, as instruments of the Greek dissolution, as pseudo-Greek, as anti-Greek (*Birth of Tragedy*, 1872). That *consensus sapientium*—this I grasped better and better—demonstrates least of all that they were right about what they agreed on. Rather, it demonstrates that they themselves, these wisest ones, were somehow in *physiological* agreement, so that they took the same negative stance toward life—and *had* to take it.

Judgments, value judgments about life, for or against, can in the final analysis never be true; they have value only as symptoms, they come into consideration only as symptoms—in themselves, such judgments are stupidities. One absolutely must reach out and try to grasp this astounding *finesse*, *that the value of life cannot be assessed*. Not by the living, since they are parties to the dispute—in fact, they are the objects of contention, and not the judges; not by the dead, for another reason. Thus, when philosophers see a problem in the *value* of life, this even amounts to an objection to them, a question mark attached to their wisdom, an unwisdom.—What? And all these great sages — are we saying they were not only *décadents*, but they were not even wise to begin with? But here I come back to the problem of Socrates.

Socrates belonged by origin to the lowest folk; Socrates was rabble. One knows, one can still see for oneself, how ugly he was. But ugliness, which in itself is an objection, was among the Greeks virtually a refutation. Was Socrates a Greek at all? Ugliness is often enough the expression of a blocked development, a development *hampered* by interbreeding. Otherwise, it comes to light as a development in *decline*. Forensic anthropologists tell us that the typical criminal is ugly: *monstrum in fronte, monstrum in animo* [monster in the face, monster in the soul]. But the criminal is a *décadent*. Was Socrates a typical criminal? — At any rate this would not clash with that well-known judgment of a physiognomist which sounded so offensive to Socrates' friends. A visitor who knew about faces, when he passed through Athens, said to Socrates' face that he *was* a *monstrum* — that he contained all bad vices and cravings within him. And Socrates simply answered: "You know me, sir!"

Socrates' *décadence* is signaled not only by the confessed depravity and anarchy of his instincts, but also by the overdevelopment of the logical and that *arthritic nastiness* that characterizes him. And let us not forget those auditory hallucinations which have been interpreted in religious terms as "Socrates' *daimonion* [divine sign]." Everything about him is exaggerated, *buffo*, a caricature; everything is at the same time covert, subliminal, ulterior. — I am trying to grasp from what idiosyncrasy that Socratic equation — reason = virtue = happiness — stems, the most bizarre equation that there is, and one which in particular has all the instincts of the older Hellenes against it.

With Socrates, Greek taste takes a turn in favor of dialectic. What is actually happening there? Primarily, a *noble* taste is thereby defeated; with dialectic, the rabble rises to the top. Before Socrates, dialectical manners were rejected in good society. They were taken to be bad manners, they were a compromising exposure. One warned the youth against them. And all such presentation of one's reasons was mistrusted. Respectable things, like respectable people, just don't carry their reasons around on their sleeves like that. It is improper to show your whole hand. Whatever has to get itself proved in advance is not worth much. Wherever authority is still considered good form, so that one does not "give reasons" but commands, the dialectician is a sort of clown. One laughs at him; one does not take him seriously. — Socrates was the clown who *succeeded in making people take him seriously*; what actually happened there?

Dialectic is chosen only as a last resort. It is well-known that it creates mistrust, that it is not very convincing. Nothing can be wiped away more easily than a dialectician's effect; this is proven by the experience of every gathering where people speak. It can only be a *last resort* deployed by those who have no other weapons. One needs to get one's rights by *force*; otherwise, one makes no use of it. This is why the Jews were dialecticians. Reynard the Fox was one. What? And Socrates was one too?

Is Socrates' irony an expression of revolt? of the rabble's *ressentiment*?² Does he, as one of the oppressed, relish his own ferocity in the knife-thrusts of the syllogism? Does he take *revenge* on the nobles whom he fascinates? As dialectician, one has a merciless instrument at hand; one can play the tyrant with it; one compromises by conquering. The dialectician lays on his opponent the burden of proving that he is not an idiot. He infuriates, and at the same time paralyzes. The dialectician *disempowers* the intellect of his opponent.—What? Is dialectic just a form of *revenge* in Socrates?

I have made it understandable how Socrates could be repulsive. Now it is all the more necessary to explain why he was *fascinating*.—The fact that he discovered a new kind of *agon* [contest], that in this contest he served as the first fencing master for the noble circles of Athens, is the first point. He fascinated by stimulating the combative drive of the Hellenes: he introduced a variant into the wrestling match between young men and youths. Socrates was also a great *erotic*.

But Socrates surmised even more. He saw *past* his noble Athenians; he grasped that *his* case, his idiosyncratic case, was already not exceptional. The same kind of degeneration was silently preparing itself everywhere; the old Athens was coming to an end. And Socrates understood that all the world had *need* of him — his means, his cure, his personal device for self-preservation. Everywhere, the instincts were in anarchy; everywhere, one was five steps away from excess; the *monstrum in animo* was the general threat. “The drives want to play the tyrant; a *counter-tyrant* who is stronger must be invented.”

When that physiognomist had exposed to Socrates who he was, a cave of all bad cravings, the great ironist allowed himself another word that gives us the key to him. “That is true,” he said, “but I became the master of them all.” *How* did Socrates become master of *himself*? His case was at bottom only the extreme case, only the most striking example of what began at that time to be the general emergency: the fact that no one was master of himself any more, that the instincts were turning *against* each other. He was fascinating as this extreme case — his fearsome ugliness displayed him as such to every eye. He was even more fascinating, of course, as an answer, as a solution, as the semblance of a *cure* for this case.

When one finds it necessary to make a tyrant out of *reason*, as Socrates did, then there must be no small danger that something else should play the tyrant. Rationality was at that time surmised to be a *savior*; neither Socrates nor his “sick patients” were rational by free choice — it was *de rigueur*, it was their *final* means. The fanaticism with which all Greek speculation throws itself at rationality betrays a situation of emergency—they were in danger, they had to make *this* choice: either to be destroyed, or—to be *absurdly rational*.

The moralism of the Greek philosophers from Plato on is pathologically conditioned; likewise their assessment of dialectic. Reason = virtue = happiness simply means: one must imitate Socrates and produce a permanent *daylight* against the dark desires—the daylight of reason. One must be cunning, sharp, clear at all costs; every acquiescence to the instincts, to the unconscious, leads *downward*.

I have made it understandable how Socrates was fascinating: he appeared to be a doctor, a savior. Is it necessary to go on to point out the error which lay in his belief in “rationality at all costs”? — It is a self-deception on the part of philosophers and moralists to think that they can escape from *décadence* merely by making war against it. Such an escape is beyond their strength. What they choose as a means, as salvation, is itself just another expression of *décadence* — they *alter* its expression, they do not do away with it itself. Socrates was a misunderstanding; *the whole morality of betterment, that of Christianity included, was a misunderstanding*. The most glaring daylight, rationality at all costs, a life bright, cold, careful, aware, without instinct, in resistance to the instincts, was itself just a sickness, another sickness—and not at all a way back to “virtue,” to “health,” to happiness. To *have* to fight the instincts — that is the formula for *décadence*. As long as life *is ascending*, happiness is the same as instinct.

Did he himself still grasp that, this most cunning of all self-outwitters? Did he tell himself this in the end, in the *wisdom* of his courage in the face of death? Socrates *wanted* to die—not Athens, but *he* gave himself the poison cup, he forced Athens to give him the poison cup. “Socrates is no doctor,” he said to himself softly, “death is the only doctor here ... Socrates himself has just been sick for a long time... .”

“Reason” in Philosophy

1

You ask me what is idiosyncratic about philosophers? ... There is, for instance, their lack of a sense of history, their hatred for the very notion of becoming, their Egyptianism. They think they are *honoring* a thing if they de-historicize it, see it *sub specie aeterni*³ — if they make a mummy out of it. Everything that philosophers have handled, for thousands of years now, has been a conceptual mummy; nothing real escaped their hands alive. They kill and stuff whatever they worship, these gentlemen who idolize concepts; they endanger the life of whatever they worship. In their view, death, change, and age, like procreation and growth, are objections — refutations, even. That which is, does not *become*; that which becomes, *is* not.

Now, they all believe, desperately even, in that which is. But since they fail to get it into their grasp, they look for the reason why it withholds itself from them. “There must be an illusion, a trick, at work that prevents us from perceiving that which is; where’s the trickster?” — “We’ve got the trickster!” they cry happily, “it’s sensation! These senses, *which are so immoral anyway*, trick us about the *true* world. The moral is: free yourself from the senses’ trickery, from becoming, from history, from the lie; history is nothing but belief in the senses, belief in the lie. The moral is: say No to everything that lends credence to the senses, to all the rest of humanity; all that is merely ‘the masses.’ Be a philosopher, be a mummy, portray monotonothism with a gravedigger’s pantomime!—And above all, away with the *body*, this pathetic *idée fixe* [pet idea] of the senses, afflicted with every logical error there is, refuted, even impossible— although it has the nerve to behave as if it were real!” ...

I set aside with great respect the name of *Heraclitus*. While the rest of the mass of philosophers were rejecting the testimony of their senses, because they displayed plurality and change, he rejected the testimony of the senses because they displayed things as if they had duration and unity. Heraclitus did not do justice to the senses either. They do not lie either in the way the Eleatics⁴ thought, or in the way that he thought— they do not lie at all. What we *make* of their testimony is what first introduces the lie — for instance, the lie of unity, the lie of thinghood, of substance, of duration... . “Reason” is what causes us to falsify the testimony of the senses. Insofar as the senses display becoming, passing away, and change, they do not lie. But Heraclitus will always be in the right for saying that being is an empty fiction. The “apparent” world is the only world; the “true world” is merely *added to it by a lie*.

And what fine tools of observation we have in our senses! This nose, for instance, of which no philosopher has yet spoken with admiration and gratitude, is in fact the most delicate instrument at our disposal; it can register minimal differences in motion which even the spectroscope fails to register. The extent to which we possess science today is precisely the extent to which we have decided to *accept* the testimony of the senses—and learned to sharpen them, arm them, and think them through to their end. The rest is a miscarriage and not-yet-science—that is, metaphysics, theology, psychology, epistemology. *Or* it is formal science, a theory of signs, such as logic and that applied logic, mathematics. In these formal sciences, reality makes no appearance at all, not even as a problem; nor is there any hint of the question of what value such a convention of signs has in the first place.

The *other* idiosyncrasy of philosophers, which is no less dangerous, consists in confusing what is first with what is last. They posit what comes at the end— unfortunately, for it should never come at all!—the “highest concepts,” that is, the most universal and emptiest concepts, the final wisp of evaporating reality—these they posit at the beginning *as* the beginning. This, again, just expresses their way of honoring something: the higher is not *permitted* to grow out of the lower, is not *permitted* to have grown at all.

The moral is: everything that is of the first rank must be *causa sui* [cause of itself]. Origination from something else counts as an objection that casts doubt on the value of what has so originated. All the supreme values are of the first rank; all the highest concepts — that which *is*, the unconditional, the good, the true, the perfect—all this cannot have become, and *must* consequently be *causa sui*. But all this cannot be at odds with itself either, cannot contradict itself. That’s where they get their stupendous concept “God.” The last, the thinnest, the emptiest concept is posited as the first, as a cause in itself, as *ens realissimum* [the most real being]. To think that humanity has had to take seriously the mental distortions of sickly web-spinners!—And it has paid dearly for having done so!

Let us, finally, present the opposing way in which *we* (I politely say *we*) view the problem of error and illusion. It used to be that one took alteration, change, becoming in general as a proof of illusion, as a sign that something must be there, leading us astray. Today, in contrast, it is precisely to the extent that we are compelled by the prejudice of reason to posit unity, identity, duration, substance, cause, thinghood, being, that we see ourselves, as it were, entangled in error, *forced* into error — so sure are we, on the basis of a rigorous self-examination, that it is here that the error lies.

This case is just like the supposed motions of our great star. In that case, error has our eyes as its constant advocates, whereas in the first case, its advocate is our *language*. In its origin, language belongs to the time of the most rudimentary type of psychology; we encounter a crude set of fetishes when we pay attention to the basic presuppositions of the metaphysics of language — or, to put it plainly, *reason*. *Reason* sees actors and actions everywhere; it believes in the will as an absolute cause; it believes in the “I,” in the I as a being, in the I as a substance, and *projects* its belief in the I-substance onto all things—that is how it first *creates* the concept “thing.” Being is thought into things everywhere as a cause, is *imputed* to things; from the conception “I” there follows the derivative concept “being.” At the beginning there stands the great and fatal error of thinking that the will is something that *acts* — that will is an *ability*. Today we know that it is merely a word.

Much, much later, in a world that was more enlightened by a thousandfold, philosophers were startled to become aware of their *certitude*, their subjective *certainty* in manipulating the categories of reason; they concluded that these categories could not come from experience—all experience stands in contradiction to them, after all. *So where did they come from?* — And in India, as in Greece, they made the same mistake: “We must already have been at home in a higher world”—instead of *in a far lower* one, which would have been the truth!—“we must have been divine, *since* we have reason!”

In fact, nothing up to now has been more naively persuasive than the error of being, as it was formulated by the Eleatics, for instance; after all, it has on its side every word, every sentence we speak! Even the opponents of the Eleatics fell prey to the seduction of their concept of being — among others, Democritus did so in inventing his *atom*. “Reason” in language: oh, what a tricky old woman she is! I’m afraid we’re not rid of God because we still believe in grammar.

One will be thankful to me if I condense such an essential and new insight into four theses; I thus make it easier to understand, and I challenge you to argue against it.

First proposition. The grounds on which “this” world has been designated as apparent are, rather, grounds for its reality; *another* kind of reality is absolutely indemonstrable.

Second proposition. The distinguishing marks which one has given to the “true being” of things are the distinguishing marks of nonbeing, of *nothing*. The “true world” has been constructed by contradicting the actual world—this “true world” is in fact an apparent world, insofar as it is merely a *moral-optical* illusion.

Third proposition. It makes no sense whatsoever to tell fables about “another” world than this one, provided that the instinct to slander, trivialize, and look down upon life is not powerful in us; in that case, we *revenge* ourselves on life with the phantasmagorias of “another,” “better” life.

Fourth proposition. To divide the world into a “true” and an “apparent” world, whether in the style of Christianity or in the style of Kant (a *sneaky* Christian to the end) is merely a sign of *décadence* — a symptom of *declining* life.—The fact that the artist prizes appearance over reality is no objection to this proposition. For “appearance” here means reality *once again*, but in the form of a selection, an emphasis, and a correction. Tragic artists are *not* pessimists— in fact, they say *Yes* to everything questionable and terrible itself; they are *Dionysian*.

How the “True World” Finally Became a Fiction History of an Error

1. The true world, attainable for those who are wise, devout, virtuous—they live in it, *they are it*.
(Oldest form of the idea, relatively clever, simple, convincing. Paraphrase of the assertion, “I, Plato, *am* the truth.”)
2. The true world, unattainable for now, but promised to those who are wise, devout, virtuous (“to the sinner who does penance”).
(Progress of the idea: it becomes more refined, more devious, more mystifying — *it becomes woman*, it becomes Christian.)
3. The true world, unattainable, unprovable, unpromisable, but a consolation, an obligation, an imperative, merely by virtue of being thought.
(The old sun basically, but glimpsed through fog and skepticism; the idea become sublime, pallid, Nordic, Königsbergian.⁵)
4. The true world — unattainable? In any case, unattained. And if it is unattained, it is also *unknown*. Hence it is also not consoling, redeeming, obligating; to what could something unknown obligate us?
(Grey dawn. First yawnings of reason. Rooster’s crow of positivism.)
5. The “true world” — an idea that is useful for nothing anymore, no longer even obligating—an idea become useless, superfluous, *hence* a refuted idea; let us do away with it!
(Bright day; breakfast; return of *bon sens* [good sense] and cheerfulness; Plato’s blush; pandemonium of all free spirits.)
6. We have done away with the true world; what world is left over? The apparent one, maybe? ... But no! *Along with the true world, we have also done away with the apparent!*
(Midday; moment of the shortest shadow; end of the longest error; high point of humanity; INCIPIT ZARATHUSTRA [here begins Zarathustra].)

Morality as Anti-Nature

1

All passions have a time when they are merely fatal, when they drag their victim down with the heaviness of their stupidity—and a later, much later time when they marry the spirit, they “spiritualize” themselves. It used to be that on account of the stupidity in passion, one made war against passion itself; one conspired to destroy it. All the old moral monsters are of one mind on this point: “*il faut tuer les passions*” [the passions must be killed]. The best-known formula for this is in the New Testament, in that Sermon on the Mount in which, by the way, things are not contemplated *from a height* at all. For instance, there it is said with reference to sexuality, “if your eye offends you, pluck it out.” Fortunately, no Christian acts according to this prescription.

To *destroy* the passions and desires, merely in order to protect oneself against their stupidity and the disagreeable consequences of their stupidity, seems to us today to be itself an acute form of stupidity. We no longer admire dentists who *pull out* teeth so that they won’t hurt anymore. But on the other hand, it is only fair to concede that on the soil from which Christianity grew, the concept of “*spiritualizing* the passions” was simply inconceivable. After all, the early Church fought, as is known, *against* the “intellectuals,” on behalf of those who were “poor in spirit”; how could one expect the Church to wage an intelligent war against passion? The Church fights passion by cutting it out, in every sense; its practice, its “therapy” is *castration*. It never asks, “How does one spiritualize, beautify, deify a desire?”—its discipline has always emphasized eradication—eradication of sensuality, pride, ambition to rule, covetousness, venge-fulness. But ripping out the passions by the root means ripping out life by the root; the practice of the Church is *hostile to life*.

The same means—castration, eradication—is instinctively chosen in the struggle against a desire by those who are too weak-willed, too degenerate to moderate their own desire—by those natures who need La Trappe,⁶ to use a metaphor (and not to use one), some ultimate declaration of war, an *abyss* between themselves and a passion. Radical means are indispensable only for degenerates; to have a weak will, or, put more precisely, to be incapable of *not* reacting to a stimulus, is itself just another form of degeneration. Radical enmity, enmity to the death against sensuality, is always a symptom that repays reflection; it justifies one's suspicions about the general condition of one who goes to this type of extreme.

By the way, this enmity, this hatred reaches its peak only when such natures no longer have enough stamina even for the radical therapy, for the repudiation of their "devil." Survey the whole history of priests and philosophers, and artists too: the most poisonous words against the senses have come *not* from the impotent, *not* even from the ascetics, but from the impossible ascetics, from those who were in need of being ascetics.

The spiritualization of sensuality is known as *love*; it is a great triumph over Christianity. Another triumph is our spiritualization of *enmity*. It consists in a deep grasp of the value of having enemies; in short, our way of acting and drawing conclusions is the reverse of what it used to be. In every age, the Church wanted its enemies to be destroyed; we, we immoralists and anti-Christians, see our own advantage in the Church's continued existence. In the political sphere, too, enmity has now become more spiritual — much more clever, much more reflective, much more *considerate*. Almost every party grasps that its own interest, its own self-preservation, depends on the opposing party's not losing its strength. The same applies to politics on the large scale. Above all, a new creation, such as the new *Reich*,⁷ needs enemies more than it needs friends; only in opposition does it feel that it is necessary, only in opposition does it *become* necessary.

We conduct ourselves no differently as regards the "inner enemy": here, too, we have spiritualized enmity; here, too, we have realized its *value*. One is *fruitful* only at the price of being rich in oppositions; one remains *young* only under the condition that the soul not slacken, not yearn for peace. Nothing has become more alien to us than that former object of desire, "peace of the soul," the *Christian* object of desire; nothing makes us less envious than the morality-cow and the fat contentment of good conscience. One has relinquished *great* life when one relinquishes war.

In many cases, of course, "peace of the soul" is just a misunderstanding—something *else* which simply does not know how to call itself by a more honest name. Without delay and without prejudice, here are a couple of cases. For instance, "peace of the soul" can be an animal richness, gently radiating into the moral (or the religious) realm. Or the beginning of fatigue, the first shadow cast by the evening, every sort of evening. Or a sign that the air is humid, that southern winds are on their way. Or unconscious thankfulness for good digestion (sometimes called "love of humanity"). Or the growing calm of the convalescent to whom all things taste new, and who is awaiting... . Or the condition that follows a powerful gratification of our dominant passion, the good feeling of a rare satisfaction. Or the senile feebleness of our will, our desires, our vices. Or laziness, convinced by vanity to dress itself up in morality. Or the arrival of a certainty, even a terrible certainty, after a long, suspenseful period of being tortured by uncertainty. Or the expression of ripeness and mastery in the midst of doing, creating, working, willing—unhurried breathing, the *attained* "freedom of the will"... . *Twilight of the Idols*: who knows? Maybe this, too, is just a kind of "peace of the soul."

I shall put a principle into a formula. All naturalism in morality, that is, all *healthy* morality, is ruled by an instinct of life; some decree of life is fulfilled by a particular canon of “shall” and “shall not,” some restriction and hostility on life’s path is thereby shoved aside. *Anti-natural* morality — that is, almost every morality that has been taught, honored and preached up to now—turns, in contrast, precisely *against* the instincts of life; it is a sometimes stealthy, sometimes loud and bold *condemnation* of these instincts. By saying, “God looks into the heart,” it says No to the lowest and highest desires of life, and takes God to be the *enemy of life*. The saint in whom God takes delight is the ideal eunuch. Life ends where the “kingdom of God” *begins*.

Once one has grasped the impiety of a revolt against life such as has become nearly sacrosanct in Christian morality, one has, fortunately, also grasped something else: the uselessness, illusiveness, absurdity, and *mendacity* of such a revolt. A condemnation of life by one who is alive is, in the end, just a symptom of a particular kind of life; the question of whether the condemnation is justified or unjustified has not been raised here at all. One would have to occupy a position *outside* life, and on the other hand, to know life as well as one who has lived it — as many, as all who have lived it—in order to be allowed even to touch upon the problem of the *value* of life. These are reasons enough to grasp that this problem is, for us, an inaccessible problem. When we speak of values, we speak under the inspiration and optics of life; life itself is forcing us to posit values, life itself is valuing by means of us, *when* we posit values.

It follows from this that even that *anti-nature of a morality* that takes God as the counter-concept and condemnation of life is itself just one of the value judgments of life.—A judgment of *which* life? Of *which* kind of life? — But I already gave the answer: of declining, weakened, tired, and condemned life. Morality as it has been understood up to now — as it was finally formulated once more by Schopenhauer, as “negation of the will to life”—is the *décadence-instinct* itself, making itself into an imperative. “*Perish!*” it says — it is the condemnation decreed by the condemned.

Finally, let us consider how naive it is in the first place to say, "Human beings *should* be such and such!" Reality shows us a captivating treasury of types, the exuberance of an evanescent play and alteration of forms. And some pathetic bystander of a moralist says to all this, "No! Human beings should be *different*?" He even knows *how* human beings should be, this sniveling bigot; he paints himself on the wall and pronounces, "*Ecce homo!*"⁸

But even if the moralist simply turns to the individual and says, "You should be such and such!" he does not stop making himself ridiculous. The individual is a slice of fate, both ahead and behind—one more law, one more necessity for everything that is coming and will be. To say to the individual, "change yourself," means wishing that everything should change itself, even retroactively. And there really have been consistent moralists; they wanted human beings to be different, namely virtuous, they wanted them made in their own image, namely as bigots. To this end, they *denied* the world! No small lunacy! No modest sort of immodesty!

Morality, insofar as it *condemns* on its own grounds, and *not* from the point of view of life's perspectives and objectives, is a specific error for which one should have no sympathy, an *idiosyncrasy of degenerates* which has done an unspeakable amount of harm! In contrast, we others, we immoralists, have opened our hearts wide to every form of understanding, comprehending, *approving*. We do not easily deny, we seek our honor in being those who *affirm*. Our eyes have been opened more and more to that economy that needs and knows how to use all that the holy craziness of the priest, the *sick* reason in the priest rejects — that economy in the law of life that draws its advantage even from the repulsive species of the bigot, the priest, the virtuous. *What* advantage? — But we ourselves, we immoralists, are the answer here.

The Four Great Errors

1

Error of confusing cause and effect

There is no error more dangerous than *confusing the effect with the cause*; I call it the genuine ruination of reason. Nevertheless, this error belongs among both the oldest and most contemporary customs of humanity; it has even been made sacred among us, it bears the names of “religion” and “morality.” *Every* statement formulated by religion and morality contains it; priests and moral lawgivers are the ones who originated this ruination of reason.

I offer an example. Everyone knows the book of the famous Cornaro⁹ in which he promotes his skimpy diet as a prescription for a long, happy life — and a virtuous one. Few books have been read so widely; still today, in England, it is printed by the thousands of copies every year. I have no doubt that hardly any book (the Bible excepted, as is only fair) has done as much damage, has *shortened* as many lives as this curiosity which was so well-meaning. The reason: confusing effect and cause. The honorable Italian saw in his diet the *cause* of his long life, whereas in fact, the preconditions of his long life — extraordinary metabolic slowness, low expenditure of energy—were the cause of his skimpy diet. He was not at liberty to eat a little *or* a lot, his frugality was *not* “freely willed”; he got sick if he ate more. But for whoever is not a cold fish, not only does it do good, but it is necessary to eat *properly*. Scholars of *our* day, with their rapid expenditure of nervous energy, would destroy themselves if they followed Cornaro’s regimen. *Crede experto* [believe the one with experience].

The most general formula that lies at the basis of every religion and morality is, “Do such and such, don’t do such and such — that will make you happy! Or else... .” Every morality, every religion *is* this imperative; I call it the great original sin of reason, the *immortal unreason*. In my mouth, this formula changes into its opposite — *first* example of my “revaluation of all values”: well-constituted people, “happy” ones, *must* do certain acts and instinctively shrink away from other acts; they import their characteristic physiological order into their relations to people and things. In a formula: their virtue is the *effect* of their happiness.

Long life and many offspring are *not* the reward of virtue; virtue itself is rather that slow metabolism that, among other things, also has a long life, many offspring, and, in short, *Cornarism* as its consequence. The Church and morality say, “A race, a people is destroyed by vice and luxury.” My *reconstituted* reason says: when a people is perishing, physiologically degenerating, the *effects* of this are vice and luxury (that is, the need for ever stronger and ever more frequent stimuli, of the sort that is familiar to every exhausted nature). This young man becomes prematurely pale and flabby. His friends say: such and such a sickness is responsible for this. I say: the fact *that* he got sick, *that* he did not resist the sickness, was already the effect of an impoverished life, an inherited exhaustion. The newspaper reader says: this party is destroying itself by making such a mistake. My *higher* politics says: a party that makes such mistakes is over—it no longer has sure instincts.

Every mistake, in every sense, is the effect of degenerate instincts, of a disintegrated will; this virtually defines the *bad*. Everything *good* is instinct — and consequently is easy, necessary, free. Exertion is an objection; the *god* is typically different from the hero (in my language: *light* feet are the first attribute of godliness).

Error of a false causality

In every age we have believed that we know what a cause is. But where did we get our knowledge, or more precisely, our belief that we know about this? From the realm of the famous “internal facts,” none of which has up to now proved to be factual. We believed that we ourselves were causal in the act of willing; there, at least, we thought that we were *catching causality in the act*.

Likewise, we never doubted that all the antecedents of an action, its causes, were to be sought in consciousness, and could be discovered there if we looked for them—discovered as “motives”; otherwise, one would not have been free *for* the action, responsible *for* it. Finally, who would have disputed the claim that a thought is caused? That the “I” causes the thought?—Of these three “interior facts” by which causality seemed to vouch for itself, the first and most convincing is the “fact” of *will as cause*; the conception of a consciousness (“mind”) as cause, and still later of the “I” (the “subject”) as cause were merely born later, after the will had firmly established causality as given, as an *empirical fact*.

In the meantime, we have thought better of this. Today we believe not a word of all that anymore. The “internal world” is full of optical illusions and false flashes; the will is one of them. The will no longer moves anything, and consequently no longer explains anything either; it merely accompanies events, and can even be absent. The so-called “motive”: another error—just a surface phenomenon of consciousness, an accessory to the act, which rather conceals the antecedents of an act than represents them. And as for the “I”! That has become a fable, a fiction, a play on words; it has completely and utterly ceased to think, to feel, and to will! What is the consequence of this? There are no mental causes at all! The whole supposed empirical evidence for them has gone to the devil! *That’s* the consequence!

And we had made a fine misuse of this “evidence”; we had *created* the world on that basis as a world of causes, a world of wills, a world of minds. The oldest and most long-standing psychology was at work here, and it did nothing else at all; all happening was for it a doing, all doing the effect of a willing; the world became for it a plurality of doers, a doer (a “subject”) was imputed to all that happened. Human beings projected their three “internal facts,” the objects of their firmest belief—will, mind, “I” — beyond themselves; they first derived the concept of being from the concept “I,” they posited “things” as existing in their own image, according to their concept of the “I” as a cause. No wonder that they later rediscovered in things only *what they had put into them!* — The thing itself—to say it once again—the concept of a thing is a mere reflex of the belief in the “I” as a cause. And even your atom, my dear mechanists and physicists—how much error, how much rudimentary psychology remains in your atom!—Not to mention the “thing in itself,” the *horrendum pudendum* [horrible, shameful thing] of the metaphysicians! The error of mind as cause confused with reality! And made into the measure of reality! And called *God!*

Error of imaginary causes

I begin from dreams: a particular sensation — for instance, the result of a distant cannon shot—subsequently has a cause imputed to it (often a whole little story in which precisely the dreamer is the protagonist). Meanwhile, the sensation persists in a kind of resonance; it waits, as it were, until the drive for causes allows it to come into the foreground—not as an accident anymore, but as “meaning.” The cannon shot shows up in a *causal* way, in an apparent reversal of time. What is later, the motivation, is experienced first, often with a hundred particularities which flash by like lightning; the shot *follows*.—What has happened? The representations *generated* by a certain state of affairs were misunderstood as the cause of this state of affairs.

In fact, we do just the same thing when we are awake. Most of our common feelings—every sort of inhibition, pressure, tension, explosion in the play and counter-play of the organs, particularly including the state of our sympathetic nervous system—arouse our drive to find causes; we want to have a *reason* for finding ourselves in *such and such* a state — a bad state or a good state. It is never enough for us simply to ascertain the mere fact *that* we find ourselves in such and such a state; we admit this fact—become *conscious* of it— *if* we have given it some kind of motivation. Memory, which is activated in such cases without our knowing it, calls up earlier states of the same kind, and the causal interpretations that are rooted in them—but *not* their causation. To be sure, the belief that the representations, the accompanying occurrences in consciousness, were the causes is also called up by the memory. Thus we become *accustomed* to a particular interpretation of causes that in fact inhibits and even excludes an *investigation* of the cause.

A psychological explanation of this error

Tracing something unfamiliar back to something familiar alleviates us, calms us, pacifies us, and furthermore provides a feeling of power. The unfamiliar brings with it danger, unrest, and care; our first instinct is directed at *doing away with* these painful conditions. First principle: some explanation is better than none. Since at bottom it is only a matter of wanting to free oneself from oppressive representations, one is not exactly stringent about the means of freeing oneself from them; the first representation that serves to explain the unfamiliar as familiar is so beneficial that one “takes it to be true.” Proof of *pleasure* (“strength”) as criterion of truth.

The drive to find causes is thus conditioned and aroused by the feeling of fear. The “why?” should, whenever possible, not so much provide the cause for its own sake, but rather provide a *type of cause*— a calming, pacifying, alleviating cause. The fact that something already *familiar*, experienced, inscribed in memory, is posited as the cause, is the first consequence of this requirement. The new, the unexperienced, the alien, is excluded as a cause. Thus, not only is one type of explanation sought as the cause, but there is a type of explanation that is *singled out* and *preferred*, the type which does away with the feeling of the alien, new, and unexperienced, as quickly and as frequently as possible — the most *customary* explanations.

Consequence: one kind of cause-positing becomes more and more prevalent, concentrates itself into a system, and finally comes to the fore as *dominant*, that is, as simply *excluding* any *other* causes and explanations. The banker thinks right away about “business,” the Christian about “sin,” the girl about her love.

The entire realm of morality and religion belongs under this concept of imaginary causes

“Explanation” of the *unpleasant* common feelings. These feelings are brought about by beings that are our enemies (evil spirits — the most famous case — misunderstanding of hysterics as witches). They are brought about by unacceptable actions (the feeling of “sin,” of “sinfulness,” is imputed to a physiological unease — one always finds reasons to be dissatisfied with oneself). They are brought about as punishments, as payment for something that we ought not to have done, that we ought not to have *been*. (Impudently generalized by Schopenhauer into a statement in which morality appears as what it is, as something that really poisons and despises life: “every great pain, be it bodily or spiritual, expresses what we deserve, for it could not come to us if we did not deserve it.” — *The World as Will and Representation*, II.) They are brought about as the effects of thoughtless actions that turned out badly (the emotions, the senses, are posited as a cause, as “responsible”; physiological crises are interpreted as “deserved” with the help of *other* crises).

“Explanation” of the *pleasant* common feelings. These feelings are brought about by trust in God. They are brought about by our awareness of good actions (the so-called “good conscience,” a physiological condition that sometimes looks so similar to a good digestion that it might be confused with it). They are brought about by the successful outcome of our enterprises (naively false conclusion: the successful outcome of an enterprise does not at all create pleasant common feelings for a hypochondriac or a Pascal).¹⁰ They are brought about by faith, love, hope—the Christian virtues.

In truth, all these supposed explanations are *subsequent* states and translations, so to speak, of feelings of pleasure or displeasure into a false dialect. One is in a state of hope *because* the basic physiological feeling is once again strong and rich; one trusts in God *because* the feeling of fullness and strength gives one calm. Morality and religion totally belong to the *psychology of error*: in every single case, cause and effect are confused, or truth is confused with the effect of what is *believed* to be true, or a state of consciousness is confused with the causation of this state.

Error of free will

Today we no longer have any sympathy for the concept of “free will.” We know only too well what it is: the most disreputable of all the theologians’ artifices, the aim of which is to make humanity “responsible” in the theologians’ sense, that is, *to make it dependent on them*. — Here, I am simply offering the psychology of all making-responsible. Wherever responsibilities are sought, what tends to be doing the seeking is the instinct of *wanting to punish and rule*. One has stripped becoming of its innocence when some state of being-such-and-such is traced back to will, to intentions, to acts; the doctrine of the will was essentially invented for the purpose of punishment, that is, for the purpose of *wanting to find people guilty*. All the old psychology, the psychology of will, has its precondition in the fact that its originators, the priests in the elites of old communities, wanted to create a *right* for themselves to inflict punishments — or wanted to create a right for God to do so. Human beings were thought to be “free” so that they could be ruled, so that they could be punished—so that they could become *guilty*.

Consequently, every action *had* to be thought as willed, the origin of every action *had* to be thought to lie in consciousness (and thus the *most fundamental* act of counterfeiting *in psychologics* [in psychological matters] was itself made into the principle of psychology). Today, when we have initiated the *reverse* movement, when we immoralists seek with all our strength to get the concepts of guilt and punishment back out of the world, and to purge psychology, history, nature, social institutions, and sanctions of these concepts, there is in our eyes no opposition more radical than that of the theologians, who, with the concept of the “moral order of the world,” go on infecting the innocence of becoming by means of “punishment” and “guilt.” Christianity is a metaphysics of the hangman.

What is the only doctrine that can be *ours*? — That nobody *gives* human beings their qualities, neither God, nor society, nor their parents and ancestors, nor *they themselves* (the nonsense of the last notion we have rejected was taught by Kant as “intelligible freedom,” and perhaps already taught by Plato as well). *Nobody* is responsible for the fact that we are here at all, that we are constituted in such and such a way, that we are in these circumstances, in this environment. The fatality of our essence is not to be resolved by the fatality of all that was and that will be. We are *not* the consequence of a special intention, a will, a goal; we are *not* being used in an attempt to reach an “ideal of humanity,” or an “ideal of happiness,” or an “ideal of morality” — it is absurd to want to *divert* our essence towards some goal. *We* have invented the concept “goal”; in reality, goals are *absent*.

One is necessary, one is a piece of fate, one belongs to the whole, one *is* in the whole. There is nothing that could rule, measure, compare, judge our being, for that would mean ruling, measuring, comparing, and judging the whole— *but there is nothing outside the whole!* — That nobody is made responsible anymore, that no way of being may be traced back to a *causa prima* [first cause], that the world is not a unity either as sensorium or as “spirit,” *this alone is the great liberation*—thus the *innocence* of becoming is restored.—The concept “God” was up to now the greatest *objection* against existence. We deny God, and in denying God we deny responsibility; only *thus* do we redeem the world.

What I Owe to the Ancients

1

In closing, a word about that world to which I have sought access, to which I have perhaps found a new access — the ancient world. My taste, which may be the opposite of a tolerant taste, is far, here too, from saying Yes to just anything; it does not like to say Yes at all, it prefers to say No, and what it likes best is to say nothing at all This applies to entire cultures, it applies to books—it also applies to places and landscapes.

Ultimately it is a very small number of ancient books that count in my life; the most famous are not among them. My feeling for style, for the epigram as a style, awoke almost instantly when I came into contact with Sallust. I have not forgotten the amazement of my honored teacher Corsen when he had to give the very first grade to the worst of his Latin students — I had finished in one blow. Concise, severe, founded on as much substance as possible, with a cold spite against the “beautiful word” and the “beautiful feeling”—I discovered myself in this. One will recognize in me, even in my *Zarathustra*, a very earnest ambition for the *Roman* style, for the “*aere perennius*”¹¹ in style.

It was no different upon my first contact with Horace. Even today I have never derived as much artistic delight from any poet as I got from the start from a Horatian Ode. In certain languages, what is attained here is not even *desirable*. This mosaic of words in which every word pours out its force as sound, as place, as concept to the right and to the left and over the whole, this minimum in the range and number of signs, this maximum in the energy of the signs which is thus achieved — all that is Roman, and, if one wishes to believe me, *noble par excellence*. All remaining verse is, as compared to this, somewhat too popular — just emotional verbosity.

To the Greeks I owe no impressions that are comparably strong. And, to come right out and say it, they *cannot* be for us what the Romans are. One does not *learn* from the Greeks — their way is too alien, and also too fluid, to have an imperative effect, a “classical” effect. Who would ever have learned to write from a Greek! Who would ever have learned it *without* the Romans!

Please do not bring up Plato as an objection to me. In relation to Plato I am fundamentally a skeptic, and was always incapable of joining in the admiration for Plato the *artist* which is traditional among scholars. In this case, I ultimately have on my side the most refined arbiters of taste among the ancients themselves. As it seems to me, Plato mixes all the stylistic forms together; thus he is one of the *first décadents* in style. He has something similar on his conscience to what the Cynics¹² had, who invented the *satura Menippea*.¹³ In order for the Platonic dialogue, this repulsively self-satisfied and childish kind of dialectic, to exert its charm, one must never have read good French authors — for instance, Fontenelle.¹⁴ Plato is boring. Ultimately, my mistrust in the case of Plato reaches into the depths; I find him so divergent from all the fundamental instincts of the Hellenes, so over-moralized, such a Christian before his time — he already takes the concept “good” to be the highest concept—that in regards to the whole Plato phenomenon I would rather use the harsh expression “exalted swindle”—or if it sounds better, idealism—than any other. We have paid dearly for the fact that this Athenian went to school with the Egyptians (or with the Jews in Egypt? ...). In the great disaster of Christianity, Plato is that ambiguity and fascination called the “ideal” which made it possible for the nobler natures of antiquity to misunderstand themselves and to step on the *bridge* that led to the “cross.” — And how much Plato there still is in the concept “Church,” in the structure, system, and practice of the Church!

My recreation, my predilection, my *cure* for all Platonism has always been *Thucydides*.¹⁵ Thucydides and, perhaps, Machiavelli’s¹⁶ *Prince* are most closely related to me by their unconditional will to fabricate nothing and to see reason in *reality*— *not* in “reason,” and still less in “morality.” There is no cure more fundamental than Thucydides for the Greeks’ miserable prettification of things into the ideal, a prettification which the “classically educated” youth brings with him into life as the reward for his school training. One must turn Thucydides over line by line and read his background thoughts as clearly as his words; there are few thinkers so rich in background thoughts. In him, the *culture of the sophists*, which means the *culture of the realists*, reaches its perfect expression — this invaluable movement in the midst of the Socratic schools’ moralistic and idealistic swindle, which was then breaking out on every side. Greek philosophy as the *décadence* of Greek instinct; Thucydides as the great summation, the final appearance of that strong, strict, hard factuality that was a matter of instinct for the older Hellenes. *Courage* in the face of reality is, in the final analysis, the point of difference between natures such as Thucydides and Plato. Plato is a coward in the face of reality — *consequently* he flees into the ideal; Thucydides has control over *himself*—consequently he also has control over things.

Smelling out “beautiful souls” in the Greeks, “golden means” and other perfections, admiring in them, for instance, calm in grandeur, an ideal disposition, elevated simplicity—I was protected from this “elevated simplicity,” which is in the end *niaiserie allemande* [German foolishness], by the psychologist in me. I saw their strongest instinct, the will to power; I saw them tremble before the boundless force of this drive; I saw all their institutions arise from rules of security, in order to make themselves safe in the face of each other’s inner *explosives*. The immense internal tension then discharged itself in frightful and ruthless external hostility; the city-states ripped each other to shreds so that the citizens might, each of them, attain peace with themselves. It was necessary to be strong; danger was nearby — it lay in ambush everywhere. The wonderfully supple bodily character, the bold realism and immoralism that characterizes the Hellenes was a *necessity*, not their “nature.” It was a consequence to begin with, it was not there from the start. And with their festivals and arts, they wanted nothing but to feel *superior*, to *show* that they were superior; these were means of glorifying themselves, and in certain circumstances, of making themselves frightening.

To judge the Greeks, in the German fashion, by their philosophers, to use, say, the simpleminded uprightness of the Socratic schools to elucidate *what* is essentially Hellenic —! After all, the philosophers are the *décadents* of the Greek world, the counter-movement against the old, noble taste (against the combative instinct, against the polis, against the value of the race, against the authority of tradition). The Socratic virtues were preached *because* the Greeks had lost them; excitable, fearful, inconstant comedians all of them, they had a couple of reasons too many to let morality be preached at them. Not that it was any help — but big words and attitudes suit *décadents* so well.

For the sake of understanding the older, the still rich and even overflowing Hellenic instinct, I was the first to take seriously that wonderful phenomenon that bears the name of Dionysus;¹⁷ it is explainable only in terms of *too much* energy. Whoever investigated the Greeks—such as that deepest living connoisseur of their culture, Jacob Burckhardt of Basel¹⁸ — knew right away that I had achieved something; Burckhardt included a special section on this phenomenon in his *Civilization of the Greeks*. If one wants to see the opposite, one should look at the almost amusing poverty of instinct of the German philologists when they come close to the Dionysian. The famous Lobeck,¹⁹ in particular, who crept into this world of enigmas with the respectable self-assurance of a worm dried out between books, and convinced himself that being nauseatingly flippant and childish made him scientific — Lobeck made it known, sparing no expense on learned accoutrements, that there was really nothing to all these curiosities. Of course, the priests might have communicated to the participants in such orgies some things not devoid of value—for instance, that wine excites desire, that people can survive eating fruit under certain circumstances, that plants bloom in the spring and wither in the fall. As for the bewildering wealth of rites, symbols, and myths of orgiastic origin with which the ancient world was quite literally overgrown, Lobeck finds an opportunity here to increase his cleverness by another notch. “The Greeks,” he says (*Aglaophamus* I, 672), “when they had nothing else to do, used to laugh, jump, and race around—or, since people sometimes have this desire too, they sat down, wept and wailed. *Others* then came along and sought some reason for this remarkable activity. And thus, as explanations of these customs, arose those countless sagas and myths. On the other hand, one believed that this *comical behavior* which now took place on festival days also necessarily belonged to the festivities, and took it to be an indispensable part of the worship.”

That is despicable blather; one will not for a single moment take a Lobeck seriously. We are affected quite differently when we test the concept “Greek” that Winckelmann²⁰ and Goethe²¹ developed, and find it incompatible with that element out of which grows Dionysian art—the orgy. In fact, I have no doubt that Goethe would have excluded anything of the sort in principle from the possibilities of the Greek soul. *Consequently, Goethe did not understand the Greeks*. For only in the Dionysian mysteries, in the psychology of the Dionysian condition, does the *fundamental fact* of the Hellenic instinct express itself—its “will to life.” *What* did the Hellene procure in these mysteries? *Eternal* life, the eternal recurrence of life; the future promised and made sacred in the past; the triumphant Yes to life beyond death and change; *true* life as collective survival through procreation, through the mysteries of sexuality. Thus, for the Greeks the *sexual* symbol was the ultimate revered symbol, the authentic, deep meaning in all ancient piety. Every element of the act of procreation, of pregnancy and birth, awoke the highest and most festive feelings. In the teachings of the mysteries, *pain* is declared holy; the “pangs of the childbearer” make pain in general holy—all becoming and growth, everything that vouches for the future *requires* pain. For there to be the eternal joy of creation, for the will to life to affirm itself eternally, there *must* also eternally be the “torment of the childbearer.” ... All this is signified by the name Dionysus; I know no higher symbolism than this *Greek* symbolism, the symbolism of the Dionysian rites. In them, the deepest instinct of life, the instinct for the future of life, for the eternity of life, is religiously experienced—the very way to life, procreation, as the *holy way*. It was Christianity, on the basis of its *ressentiment against* life, that first made something unclean out of sexuality; it threw *filth* on the beginning, on the precondition of our life.

The psychology of the orgy as an overflowing feeling of life and energy, within which even pain works as a stimulant, gave me the key to the concept of the *tragic* feeling, which was misunderstood as much by Aristotle as, especially, by our pessimists. Tragedy is so far from giving any evidence for the pessimism of the Hellenes in Schopenhauer's sense that it rather has to count as the decisive rejection of and *counter-authority* to such pessimism. Saying Yes to life even in its most strange and intractable problems, the will to life, celebrating its own inexhaustibility by *sacrificing* its highest types— *that* is what I called Dionysian, *that* is what I found as the bridge to the psychology of the *tragic* poet. *Not* in order to be released from terror and pity, not in order to purify oneself of a dangerous emotion through its vehement discharge — thus Aristotle understood it—but rather, beyond terror and pity, to *be* oneself the eternal joy of becoming, that joy that also includes in itself the *joy of destruction*... . And thus I touch again upon the spot from which I first set out — *The Birth of Tragedy* was my first revaluation of all values. Thus I take my stand again upon the ground from which grows my willing, my being *able* — I, the final follower of the philosopher Dionysus—I, the teacher of the eternal recurrence... .

Charles Sanders Peirce

Widely esteemed as America's most versatile and original philosopher, and renowned as the founder of pragmatism, Charles Sanders Peirce was born in Cambridge, Massachusetts in 1839. He was the second son of Benjamin Peirce, one of America's leading mathematicians, from whom he received much of his early education and acquired an intensely intellectual discipline. He was educated at Harvard College, graduating in 1859 and thereafter receiving the M.A. at Harvard in 1862, and the Sc.B. degree in chemistry, *summa cum laude*, in 1863. In 1861, he began work as a physical scientist with the U.S. Coast and Geodetic Survey, a relationship that continued intermittently until 1891.

Despite his brilliance and his pioneering contributions to metaphysics, the history and philosophy of science, the theory of signs, and the development of symbolic logic, Peirce never succeeded in gaining a permanent university position; the only extended teaching he did was on a logic lectureship at the Johns Hopkins University from 1879 to 1884.

In 1887 Peirce retired to Milford, Pennsylvania, where he spent the rest of his life in almost complete isolation, striving to complete a comprehensive work of philosophy. He never produced any systematic philosophical books, although he continued to labor on difficult theoretical problems and to write prolifically on specialized topics. He died in 1914, "a frustrated, isolated man, still working on his logic, without a publisher, with scarcely a disciple, unknown to the public at large" (*Dictionary of American Biography*).

Nevertheless, his fame and influence have continued to grow with the years, stimulated by the continuing study of the huge collection of manuscripts left at his death. The study of Peirce has indeed by now become a worldwide scholarly industry, ramifying into virtually every academic discipline.

The first of the papers to follow, "The Fixation of Belief," appeared in 1877. It presents Peirce's theory of inquiry. Doubt, for him, is not the mere absence of belief. Rather, it is "an uneasy and dissatisfied state from which we struggle to free ourselves and pass into the state of belief ... a calm and satisfactory state which we do not wish to avoid, or to change to a belief in anything else." Belief is in the nature of habit, representing a regular association between our circumstances and our actions. Inquiry is, for Peirce, the struggle to overcome the irritation of doubt and to attain belief. Peirce compares four methods for the fixation of belief: the method of tenacity, the method of authority, the *a priori* method, and the method of science.

Tenacity is largely a matter of reiterating the belief in question and turning away from all contrary evidence. It is, however, he argues, ineffective, for when confronted with the contrary beliefs of others, our confidence in our own tenaciously held beliefs is shaken, unsettling our beliefs. The method of authority, essentially adoption of tenacity by a whole group using the group's institutions to enforce the preferred doctrines, is more effective than the previous method but is also ineffective, since no society can regulate all opinion within, nor prevent awareness of contrary opinions without. Again unsettlement ensues.

The *a priori* method rejects both the "willful adherence to a belief, and the arbitrary forcing of it upon others," allowing beliefs to form through the natural inclination to adopt whatever seems "agreeable to reason." This method assimilates inquiry to the development of taste, subject to pendulum swings and never reaching a stable agreement. Peirce considers, finally, the method of science, which settles opinion not by willfulness, force, or taste, but by reference to external permanencies with properties "independent of our opinions about them." It is the only method of the four that is self-corrective, allowing the possibility of errors in application corrigible by the very use of the method in question, whereas the pursuit of any of the other methods is necessarily correct by the method itself, so that errors cannot even be admitted, much less be open to correction.

Peirce's argument for the method of science is open to the charge that it is science itself that unsettles belief more rapidly than any of the other methods, holding all its theories to be provisional and subjecting all to the test of continuing experience. Indeed Peirce's essay seems to shift ground from considering the unsettlement of *beliefs* to the unsettlement of *methods*. He seems in the end to be arguing that because science is self-corrective, it is itself, as a method, capable of remaining firm while continuing to enable us to learn from experience.

"How to Make Our Ideas Clear" appeared in 1878. It applies his theory of inquiry to the development of what has been called his pragmatic maxim, as a method for the clarification of ideas. Since, as Peirce argues, the function of thought is to attain belief, the essence of which is "the establishment of a habit," we develop

the meaning of an idea by determining “what habits it involves.”

The pragmatic maxim, appearing at the end of Section II of the paper, thus reads: “Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then our conception of these effects is the whole of our conception of the object.” An *effect with practical bearings* being, more precisely, a perceptible consequence contingent on our action, Peirce’s idea is now to sum up all such action-contingent consequences of the object. Our conception of these consequences, he concludes, is our very conception of the object.

To clarify the notion of hardness, we are thus instructed not to seek some image of this property by introspection, nor to construct some abstract definition of it. Rather, we are to ask what perceptible effects habitually result from various operations upon hard things: A hard thing will, for example, “not be scratched by other substances,” will make a noise if struck, will offer a certain resistance if pushed, and so on. The idea of hardness is then nothing more than the idea of these action-contingent affects. Moreover, in believing that an object is hard, we are set habitually to act toward it in accordance with its supposed trait of hardness, in pursuit of our purposes. Our belief in its hardness embodies a conditional prediction of its behavior, testable by the senses.

The meaning of an idea is, of course, independent of its truth; both false and true statements have meaning. But Peirce believes that the processes of inquiry, carried on by an open and ideal community of scientific investigators, continually weed out the false beliefs and in the long run converge on the true. In a celebrated passage he defines truth and reality in terms of such ultimate convergence: “The opinion which is fated to be ultimately agreed to by all who investigate is what we mean by the truth, and the object represented in this opinion is the real.”

• • •

A biography of Peirce is available in Joseph Brent, *Charles Sanders Peirce: A Life* (Bloomington: Indiana University Press, 1993). Useful interpretive discussions of Peirce are Murray G. Murphey, *The Development of Peirce’s Philosophy* (Cambridge, Mass.: Harvard University Press, 1961); W. B. Gallie, *Peirce and Pragmatism* (New York: Dover, 1966); and Peter Skagestad, *The Road of Inquiry: Charles Peirce’s Pragmatic Realism* (New York: Columbia University Press, 1981). For a general discussion of Peirce as well as the other pragmatic philosophers, see H. S. Thayer, *Meaning and Action: A Critical History of Pragmatism* (Indianapolis: Bobbs-Merrill, 1968) and Israel Scheffler, *Four Pragmatisms* (London: Routledge, 1974). A collection of critical articles on Peirce by the dean of American Peirce scholars is K. L. Ketner and C. Kloesel, eds., *Peirce, Semiotic, and Pragmatism: Essays by Max H. Fisch* (Bloomington: Indiana University Press, 1986).

*The Fixation of Belief**

I

Few persons care to study logic, because everybody conceives himself to be proficient enough in the art of reasoning already. But I observe that this satisfaction is limited to one's own ratiocination, and does not extend to that of other men.

We come to the full possession of our power of drawing inferences the last of all our faculties, for it is not so much a natural gift as a long and difficult art. The history of its practice would make a grand subject for a book. The mediasval schoolman, following the Romans, made logic the earliest of a boy's studies after grammar, as being very easy. So it was as they understood it. Its fundamental principle, according to them, was that all knowledge rests on either authority or reason; but that whatever is deduced by reason depends ultimately on a premise derived from authority. Accordingly, as soon as a boy was perfect in the syllogistic procedure, his intellectual kit of tools was held to be complete.

To Roger Bacon,¹ that remarkable mind who in the middle of the thirteenth century was almost a scientific man, the schoolmen's conception of reasoning appeared only an obstacle to truth. He saw that experience alone teaches anything — a proposition which to us seems easy to understand, because a distinct conception of experience has been handed down to us from former generations; which to him also seemed perfectly clear, because its difficulties had not yet unfolded themselves. Of all kinds of experience, the best, he thought, was interior illumination, which teaches many things about nature which the external senses could never discover, such as the transubstantiation of bread.

Four centuries later, the more celebrated Bacon,² in the first book of his *Novum Organum*, gave his clear account of experience as something which must be opened to verification and re-examination. But, superior as Lord Bacon's conception is to earlier notions, a modern reader who is not in awe of his grandiloquence is chiefly struck by the inadequacy of his view of scientific procedure. That we have only to make some crude experiments, to draw up briefs of the results in certain blank forms, to go through these by rule, checking off everything disproved and setting down the alternatives, and that thus in a few years physical science would be finished up — what an idea! "He wrote on science like a Lord Chancellor," indeed, as Harvey,³ a genuine man of science, said.

The early scientists, Copernicus,⁴ Tycho Brahe,⁵ Kepler,⁶ Galileo,⁷ Harvey, and Gilbert,⁸ had methods more like those of their modern brethren. Kepler undertook to draw a curve through the places of Mars; and his greatest service to science was in impressing on men's minds that this was the thing to be done if they wished to improve astronomy; that they were not to content themselves with inquiring whether one system of epicycles was better than another but that they were to sit down by the figures and find out what the curve, in truth, was. He accomplished this by his incomparable energy and courage, blundering along in the most inconceivable way (to us), from one irrational hypothesis to another, until, after trying twenty-two of these, he fell, by the mere exhaustion of his invention, upon the orbit which a mind well furnished with the weapons of modern logic would have tried almost at the outset.

In the same way, every work of science great enough to be remembered for a few generations affords some exemplification of the defective state of the art of reasoning of the time when it was written; and each chief step in science has been a lesson in logic. It was so when Lavoisier⁹ and his contemporaries took up the study of Chemistry. The old chemist's maxim had been *Lege, lege, lege, labora, ora, et relege*.¹⁰ Lavoisier's method was not to read and pray, not to dream that some long and complicated chemical process would have a certain effect, to put it into practice with dull patience, after its inevitable failure to dream that with some modification it would have another result, and to end by publishing the last dream as a fact: his way was to carry his mind into his laboratory, and to make of his alembics and cucurbits instruments of thought, giving a new conception of reasoning as something which was to be done with one's eyes open, by manipulating real

things instead of words and fancies.

The Darwinian controversy is, in large part, a question of logic. Mr. Darwin¹¹ proposed to apply the statistical method to biology. The same thing has been done in a widely different branch of science, the theory of gases. Though unable to say what the movement of any particular molecule of gas would be on a certain hypothesis regarding the constitution of this class of bodies, Clausius¹² and Maxwell¹³ were yet able, by the application of the doctrine of probabilities, to predict that in the long run such and such a proportion of the molecules would, under given circumstances, acquire such and such velocities; that there would take place, every second, such and such a number of collisions, etc.; and from these propositions they were able to deduce certain properties of gases, especially in regard to their heat-relations. In like manner, Darwin, while unable to say what the operation of variation and natural selection in every individual case will be, demonstrates that in the long run they will adapt animals to their circumstances. Whether or not existing animal forms are due to such action, or what position the theory ought to take, forms the subject of a discussion in which questions of fact and questions of logic are curiously interlaced.

II

The object of reasoning is to find out, from the consideration of what we already know, something else which we do not know. Consequently, reasoning is good if it be such as to give a true conclusion from true premises, and not otherwise. Thus, the question of validity is purely one of fact and not of thinking. A being the premises and B being the conclusion, the question is, whether these facts are really so related that if A is, B is. If so, the inference is valid; if not, not. It is not in the least the question whether, when the premises are accepted by the mind, we feel an impulse to accept the conclusion also. It is true that we do generally reason correctly by nature. But that is an accident; the true conclusion would remain true if we had no impulse to accept it; and the false one would remain false, though we could not resist the tendency to believe in it.

We are, doubtless, in the main logical animals, but we are not perfectly so. Most of us, for example, are naturally more sanguine and hopeful than logic would justify. We seem to be so constituted that in the absence of any facts to go upon we are happy and self-satisfied; so that the effect of experience is continually to counteract our hopes and aspirations. Yet a lifetime of the application of this corrective does not usually eradicate our sanguine disposition. Where hope is unchecked by any experience, it is likely that our optimism is extravagant. Logicality in regard to practical matters is the most useful quality an animal can possess, and might, therefore, result from the action of natural selection; but outside of these it is probably of more advantage to the animal to have his mind filled with pleasing and encouraging visions, independently of their truth; and thus, upon unpractical subjects, natural selection might occasion a fallacious tendency of thought.

That which determines us, from given premises, to draw one inference rather than another is some habit of mind, whether it be constitutional or acquired. The habit is good or otherwise, according as it produces true conclusions from true premises or not; and an inference is regarded as valid or not, without reference to the truth or falsity of its conclusion specially, but according as the habit which determines it is such as to produce true conclusions in general or not. The particular habit of mind which governs this or that inference may be formulated in a proposition whose truth depends on the validity of the inferences which the habit determines; and such a formula is called a *guiding principle* of inference. Suppose, for example, that we observe that a rotating disk of copper quickly comes to rest when placed between the poles of a magnet, and we infer that this will happen with every disk of copper. The guiding principle is that what is true of one piece of copper is true of another. Such a guiding principle with regard to copper would be much safer than with regard to many other substances — brass, for example.

A book might be written to signalize all the most important of these guiding principles of reasoning. It would probably be, we must confess, of no service to a person whose thought is directed wholly to practical subjects, and whose activity moves along thoroughly beaten paths. The problems which present themselves to such a mind are matters of routine which he has learned once for all to handle in learning his business. But let a man venture into an unfamiliar field, or where his results are not continually checked by experience, and all history shows that the most masculine intellect will oft times lose his orientation and waste his efforts in directions which bring him no nearer to his goal, or even carry him entirely astray. He is like a ship on the open sea, with no one on board who understands the rules of navigation. And in such a case some general study of the guiding principles of reasoning would be sure to be found useful.

The subject could hardly be treated, however, without being first limited; since almost any fact may serve as a guiding principle. But it so happens that there exists a division among facts, such that in one class are all those which are absolutely essential as guiding principles, while in the other are all those which have any other interest as objects of research. This division is between those which are necessarily taken for granted in asking whether a certain conclusion follows from certain premises, and those which are not implied in that question. A moment's thought will show that a variety of facts are already assumed when the logical question is first asked. It is implied, for instance, that there are such states of mind as doubt and belief—that a passage from one to the other is possible, the object of thought remaining the same, and that this transition is subject to some rules which all minds are alike bound by. As these are facts which we must already know before we can have any clear conception of reasoning at all, it cannot be supposed to be any longer of much interest to inquire into their truth or falsity. On the other hand, it is easy to believe that those rules of reasoning which are deduced from the very idea of the process are the ones which are the most essential; and, indeed, that so long as it conforms to these it will, at least, not lead to false conclusions from true premises. In point of fact, the importance of what may be deduced from the assumptions involved in the logical question turns out to be greater than might be supposed, and this for reasons which it is difficult to exhibit at the outset. The only one which I shall here mention is that conceptions which are really products of logical reflections, without being

readily seen to be so, mingle with our ordinary thoughts, and are frequently the causes of great confusion. This is the case, for example, with the conception of quality. A quality as such is never an object of observation. We can see that a thing is blue or green, but the quality of being blue and the quality of being green are not things which we see; they are products of logical reflections. The truth is that common sense, or thought as it first emerges above the level of the narrowly practical, is deeply imbued with that bad logical quality to which the epithet *metaphysical* is commonly applied; and nothing can clear it up but a severe course of logic.

III

We generally know when we wish to ask a question and when we wish to pronounce a judgment, for there is a dissimilarity between the sensation of doubting and that of believing.

But this is not all which distinguishes doubt from belief. There is a practical difference. Our beliefs guide our desires and shape our actions. The Assassins, or followers of the Old Man of the Mountain, used to rush into death at his least command, because they believed that obedience to him would insure everlasting felicity. Had they doubted this, they would not have acted as they did. So it is with every belief, according to its degree. The feeling of believing is a more or less sure indication of there being established in our nature some habit which will determine our actions. Doubt never has such an effect.

Nor must we overlook a third point of difference. Doubt is an uneasy and dissatisfied state from which we struggle to free ourselves and pass into the state of belief; while the latter is a calm and satisfactory state which we do not wish to avoid, or to change to a belief in anything else. On the contrary, we cling tenaciously, not merely to believing, but to believing just what we do believe.

Thus, both doubt and belief have positive effects upon us, though very different ones. Belief does not make us act at once, but puts us into such a condition that we shall behave in a certain way, when the occasion arises. Doubt has not the least effect of this sort, but stimulates us to action until it is destroyed. This reminds us of the irritation of a nerve and the reflex action produced thereby; while for the analogue of belief, in the nervous system, we must look to what are called nervous associations — for example, to that habit of the nerves in consequence of which the smell of a peach will make the mouth water.

IV

The irritation of doubt causes a struggle to attain a state of belief. I shall term this struggle *inquiry*, though it must be admitted that this is sometimes not a very apt designation.

The irritation of doubt is the only immediate motive for the struggle to attain belief. It is certainly best for us that our beliefs should be such as may truly guide our actions so as to satisfy our desires; and this reflection will make us reject any belief which does not seem to have been so formed as to insure this result. But it will only do so by creating a doubt in the place of that belief. With the doubt, therefore, the struggle begins, and with the cessation of doubt it ends. Hence, the sole object of inquiry is the settlement of opinion. We may fancy that this is not enough for us, and that we seek not merely an opinion, but a true opinion. But put this fancy to the test, and it proves groundless; for as soon as a firm belief is reached we are entirely satisfied, whether the belief be false or true. And it is clear that nothing out of the sphere of our knowledge can be our object, for nothing which does not affect the mind can be a motive for a mental effort. The most that can be maintained is that we seek for a belief that we shall *think* to be true. But we think each one of our beliefs to be true, and, indeed, it is mere tautology to say so.

That the settlement of opinion is the sole end of inquiry is a very important proposition. It sweeps away, at once, various vague and erroneous conceptions of proof. A few of these may be noticed here.

1. Some philosophers have imagined that to start an inquiry it was only necessary to utter a question or set it down on paper, and have even recommended us to begin our studies with questioning everything! But the mere putting of a proposition into the interrogative form does not stimulate the mind to any struggle after belief. There must be a real and living doubt, and without all this, discussion is idle.
2. It is a very common idea that a demonstration must rest on some ultimate and absolutely indubitable propositions. These, according to one school, are first principles of a general nature; according to another, are first sensations. But, in point of fact, an inquiry, to have that completely satisfactory result called demonstration, has only to start with propositions perfectly free from all actual doubt. If the premises are not in fact doubted at all, they cannot be more satisfactory than they are.
3. Some people seem to love to argue a point after all the world is fully convinced of it. But no further advance can be made. When doubt ceases, mental action on the subject comes to an end; and, if it did go on, it would be without a purpose, except that of self-criticism.

V

If the settlement of opinion is the sole object of inquiry, and if belief is of the nature of a habit, why should we not attain the desired end, by taking any answer to a question, which we may fancy, and constantly reiterating it to ourselves, dwelling on all which may conduce to that belief, and learning to turn with contempt and hatred from anything which might disturb it? This simple and direct method is really pursued by many men. I remember once being entreated not to read a certain newspaper lest it might change my opinion upon free-trade. "Lest I might be entrapped by its fallacies and misstatements" was the form of expression. "You are not," my friend said, "a special student of political economy. You might, therefore, easily be deceived by fallacious arguments upon the subject. You might, then, if you read this paper, be led to believe in protection. But you admit that free-trade is the true doctrine; and you do not wish to believe what is not true." I have often known this system to be deliberately adopted. Still oftener, the instinctive dislike of an undecided state of mind, exaggerated into a vague dread of doubt, makes men cling spasmodically to the views they already take. The man feels that if he only holds to his belief without wavering, it will be entirely satisfactory. Nor can it be denied that a steady and immovable faith yields great peace of mind. It may, indeed, give rise to inconveniences, as if a man should resolutely continue to believe that fire would not burn him, or that he would be eternally damned if he received his *ingesta* otherwise than through a stomach-pump. But then the man who adopts this method will not allow that its inconveniences are greater than its advantages. He will say, "I hold steadfastly to the truth and the truth is always wholesome." And in many cases it may very well be that the pleasure he derives from his calm faith overbalances any inconveniences resulting from its deceptive character. Thus, if it be true that death is annihilation, then the man who believes that he will certainly go straight to heaven when he dies, provided he have fulfilled certain simple observances in this life, has a cheap pleasure which will not be followed by the least disappointment. A similar consideration seems to have weight with many persons in religious topics, for we frequently hear it said, "Oh, I could not believe so-and-so, because I should be wretched if I did." When an ostrich buries its head in the sand as danger approaches, it very likely takes the happiest course. It hides the danger, and then calmly says there is no danger; and, if it feels perfectly sure there is none, why should it raise its head to see? A man may go through life, systematically keeping out of view all that might cause a change in his opinions, and if he only succeeds — basing his method, as he does, on two fundamental psychological laws—I do not see what can be said against his doing so. It would be an egotistical impertinence to object that his procedure is irrational, for that only amounts to saying that his method of settling belief is not ours. He does not propose to himself to be rational, and indeed, will often talk with scorn of man's weak and illusive reason. So let him think as he pleases.

But this method of fixing belief, which may be called the *method of tenacity*, will be unable to hold its ground in practice. The social impulse is against it. The man who adopts it will find that other men think differently from him, and it will be apt to occur to him in some saner moment that their opinions are quite as good as his own, and this will shake his confidence in his belief. This conception, that another man's thought or sentiment may be equivalent to one's own, is a distinctly new step, and a highly important one. It arises from an impulse too strong in man to be suppressed, without danger of destroying the human species. Unless we make ourselves hermits, we shall necessarily influence each other's opinions; so that the problem becomes how to fix belief, not in the individual merely, but in the community.

Let the will of the state act, then, instead of that of the individual. Let an institution be created which shall have for its object to keep correct doctrines before the attention of the people, to reiterate them perpetually, and to teach them to the young; having at the same time power to prevent contrary doctrines from being taught, advocated, or expressed. Let all possible causes of a change of mind be removed from men's apprehensions. Let them be kept ignorant, lest they should learn of some reason to think otherwise than they do. Let their passions be enlisted, so that they may regard private and unusual opinions with hatred and horror. Then, let all men who reject the established belief be terrified into silence. Let the people turn out and tar-and-feather such men, or let inquisitions be made into the manner of thinking of suspected persons, and, when they are found guilty of forbidden beliefs, let them be subjected to some signal punishment. When complete agreement could not otherwise be reached, a general massacre of all who have not thought in a certain way has proved a very effective means of settling opinion in a country. If the power to do this be wanting, let a list of opinions be drawn up, to which no man of the least independence of thought can assent, and let the faithful be required to accept all these propositions, in order to segregate them as radically as possible from the influence of the rest of the world.

This method has, from the earliest times, been one of the chief means of upholding correct theological and

political doctrines, and of preserving their universal or catholic character. In Rome, especially, it has been practiced from the days of Numa Pompilius¹⁴ to those of Pius Nonus.¹⁵ This is the most perfect example in history; but wherever there is a priesthood— and no religion has been without one — this method has been more or less made use of. Wherever there is aristocracy, or a guild, or any association of a class of men whose interests depend or are supposed to depend on certain propositions, there will be inevitably found some traces of this natural product of social feeling. Cruelties always accompany this system; and when it is consistently carried out, they become atrocities of the most horrible kind in the eyes of any rational man. Nor should this occasion surprise, for the officer of a society does not feel justified in surrendering the interests of that society for the sake of mercy, as he might his own private interests. It is natural, therefore, that sympathy and fellowship should thus produce a most ruthless power.

In judging this method of fixing belief, which may be called the *method of authority*, we must, in the first place, allow its immeasurable mental and moral superiority to the method of tenacity. Its success is proportionally greater; and in fact it has over and over again worked the most majestic results. The mere structures of stone which it has caused to be put together — in Siam, for example, in Egypt, and in Europe — have many of them a sublimity hardly more than rivaled by the greatest works of nature. And, except the geological epochs, there are no periods of time so vast as those which are measured by some of these organized faiths. If we scrutinize the matter closely, we shall find that there has not been one of their creeds which has remained always the same; yet the change is so slow as to be imperceptible during one person's life, so that individual belief remains sensibly fixed. For the mass of mankind, then, there is perhaps no better method than this. If it is their highest impulse to be intellectual slaves, then slaves they ought to remain.

But no institution can undertake to regulate opinions upon every subject. Only the most important ones can be attended to, and on the rest men's minds must be left to the action of natural causes. This imperfection will be no source of weakness so long as men are in such a state of culture that one opinion does not influence another—that is, so long as they cannot put two and two together. But in the most priest-ridden states some individuals will be found who are raised above that condition. These men possess a wider sort of social feeling; they see that men in other countries and in other ages have held to very different doctrines from those which they themselves have been brought up to believe; and they cannot help seeing that it is the mere accident of their having been taught as they have, and of their having been surrounded with the manners and associations they have, that has caused them to believe as they do and not far differently. And their candor cannot resist the reflection that there is no reason to rate their own views at a higher value than those of other nations and other centuries; and this gives rise to doubts in their minds.

They will further perceive that such doubts as these must exist in their minds with reference to every belief which seems to be determined by the caprice either of themselves or of those who originated the popular opinions. The willful adherence to a belief, and the arbitrary forcing of it upon others, must, therefore, both be given up and a new method of settling opinions must be adopted, which shall not only produce an impulse to believe, but shall also decide what proposition it is which is to be believed. Let the action of natural preferences be unimpeded, then, and under their influence let men conversing together and regarding matters in different lights, gradually develop beliefs in harmony with natural causes. This method resembles that by which conceptions of art have been brought to maturity. The most perfect example of it is to be found in the history of metaphysical philosophy. Systems of this sort have not usually rested upon observed facts, at least not in any great degree. They have been chiefly adopted because their fundamental proposition seemed "agreeable to reason." This is an apt expression; it does not mean that which agrees with experience, but that which we find ourselves inclined to believe. Plato, for example, finds it agreeable to reason that the distances of the celestial spheres from one another should be proportional to the different lengths of strings which produce harmonious chords. Many philosophers have been led to their main conclusions by considerations like this; but this is the lowest and least developed form which the method takes, for it is clear that another man might find Kepler's theory, that the celestial spheres are proportional to the inscribed and circumscribed spheres of the different regular solids, more agreeable to *his* reason. But the shock of opinions will soon lead men to rest on preferences of a far more universal nature. Take, for example, the doctrine that man only acts selfishly—that is, from the consideration that acting one way will afford him more pleasure than acting in another. This rests on no fact in the world, but it has had a wide acceptance as being the only reasonable theory.

This method is far more intellectual and respectable from the point of view of reason than either of the others which we have noticed. But its failure has been the most manifest. It makes of inquiry something similar to the development of taste; but taste, unfortunately, is always more or less a matter of fashion, and accordingly, metaphysicians have never come to any fixed agreement, but the pendulum has swung backward

and forward between a more material and a more spiritual philosophy, from the earliest times to the latest. And so from this, which has been called the *a priori method*, we are driven, in Lord Bacon's phrase, to a true induction. We have examined into this *a priori* method as something which promised to deliver our opinions from their accidental and capricious element. But development, while it is a process which eliminates the effect of some casual circumstances, only magnifies that of others. This method, therefore, does not differ in a very essential way from that of authority. The government may not have lifted its finger to influence my convictions; I may have been left outwardly quite free to choose, we will say, between monogamy and polygamy, and appealing to my conscience only, I may have concluded that the latter practice is in itself licentious. But when I come to see that the chief obstacle to the spread of Christianity among a people of as high culture as the Hindoos has been a conviction of the immorality of our way of treating women, I cannot help seeing that, though governments do not interfere, sentiments in their development will be very greatly determined by accidental causes. Now, there are some people, among whom I must suppose that my reader is to be found, who, when they see that any belief of theirs is determined by any circumstance extraneous to the facts, will from that moment not merely admit in words that that belief is doubtful, but will experience a real doubt of it, so that it ceases in some degree at least to be a belief.

To satisfy our doubts, therefore, it is necessary that a method should be found by which our beliefs may be caused by nothing human, but by some external permanency—by something upon which our thinking has no effect. Some mystics imagine that they have such a method in a private inspiration from on high. But that is only a form of the method of tenacity, in which the conception of truth as something public is not yet developed. Our external permanency would not be external, in our sense, if it was restricted in its influence to one individual. It must be something which affects, or might affect, every man. And, though these affections are necessarily as various as are individual conditions, yet the method must be such that the ultimate conclusion of every man shall be the same, or would be the same if inquiry were sufficiently persisted in. Such is the method of science. Its fundamental hypothesis, restated in more familiar language, is this: There are real things, whose characters are entirely independent of our opinions about them; those realities affect our senses according to regular laws, and, though our sensations are as different as our relations to the objects, yet, by taking advantage of the laws of perception, we can ascertain by reasoning how things really are, and any man, if he have sufficient experience and reason enough about it, will be led to the one true conclusion. The new conception here involved is that of reality. It may be asked how I know that there are any realities. If this hypothesis is the sole support of my method of inquiry, my method of inquiry must not be used to support my hypothesis. The reply is this: (1) If investigation cannot be regarded as proving that there are real things, it at least does not lead to a contrary conclusion; but the method and the conception on which it is based remain ever in harmony. No doubts of the method, therefore, necessarily arise from its practice, as is the case with all the others. (2) The feeling which gives rise to any method of fixing belief is a dissatisfaction at two repugnant propositions. But here already is a vague concession that there is some *one* thing to which a proposition should conform. Nobody, therefore, can really doubt that there are realities, or, if he did, doubt would not be a source of dissatisfaction. The hypothesis, therefore, is one which every mind admits. So that the social impulse does not cause men to doubt it. (3) Everybody uses the scientific method about a great many things, and only ceases to use it when he does not know how to apply it. (4) Experience of the method has not led us to doubt it, but, on the contrary, scientific investigation has had the most wonderful triumphs in the way of settling opinion. These afford the explanation of my not doubting the method or the hypothesis which it supposes; and not having any doubt, nor believing that anybody else whom I could influence has, it would be the merest babble for me to say more about it. If there be anybody with a living doubt upon the subject, let him consider it.

To describe the method of scientific investigation is the object of this series of papers. At present I have only room to notice some points of contrast between it and other methods of fixing belief.

This is the only one of the four methods which presents any distinction of a right and a wrong way. If I adopt the method of tenacity and shut myself out from all influences, whatever I think necessary to doing this is necessary according to that method. So with the method of authority: the state may try to put down heresy by means which, from a scientific point of view, seem very ill-calculated to accomplish its purposes; but the only test *on that method* is what the state thinks, so that it cannot pursue the method wrongly. So with the *a priori* method. The very essence of it is to think as one is inclined to think. All metaphysicians will be sure to do that, however they may be inclined to judge each other to be perversely wrong. The Hegelian system recognizes every natural tendency of thought as logical, although it is certain to be abolished by countertendencies. Hegel thinks there is a regular system in the succession of these tendencies, in consequence of which, after drifting one way and the other for a long time, opinion will at last go right. And it is true that metaphysicians get the right ideas at last; Hegel's system of Nature represents tolerably the science of his day;

and one may be sure that whatever scientific investigation has put out of doubt will presently receive *a priori* demonstration on the part of the metaphysicians. But with the scientific method the case is different. I may start with known and observed facts to proceed to the unknown; and yet the rules which I follow in doing so may not be such as investigation would approve. The test of whether I am truly following the method is not an immediate appeal to my feelings and purposes, but, on the contrary, itself involves the application of the method. Hence it is that bad reasoning as well as good reasoning is possible; and this fact is the foundation of the practical side of logic.

It is not to be supposed that the first three methods of settling opinion present no advantage whatever over the scientific method. On the contrary, each has some peculiar convenience of its own. The *a priori* method is distinguished for its comfortable conclusions. It is the nature of the process to adopt whatever belief we are inclined to, and there are certain flatteries to one's vanities which we all believe by nature, until we are awakened from our pleasing dream by rough facts. The method of authority will always govern the mass of mankind; and those who wield the various forms of organized force in the state will never be convinced that dangerous reasoning ought not to be suppressed in some way. If liberty of speech is to be untrammelled from the grosser forms of constraint, then uniformity of opinion will be secured by a moral terrorism to which the respectability of society will give its thorough approval. Following the method of authority is the path of peace. Certain non-conformities are permitted; certain others (considered unsafe) are forbidden. These are different in different countries and in different ages; but, wherever you are let it be known that you seriously hold a tabooed belief, and you may be perfectly sure of being treated with a cruelty no less brutal but more refined than hunting you like a wolf. Thus, the greatest intellectual benefactors of mankind have never dared, and dare not now, to utter the whole of their thought; and thus a shade of *prima facie* doubt is cast upon every proposition which is considered essential to the security of society. Singularly enough, the persecution does not all come from without; but a man torments himself and is oftentimes most distressed at finding himself believing propositions which he has been brought up to regard with aversion. The peaceful and sympathetic man will, therefore, find it hard to resist the temptation to submit his opinions to authority. But most of all I admire the method of tenacity for its strength, simplicity, and directness. Men who pursue it are distinguished for their decision of character, which becomes very easy with such a mental rule. They do not waste time in trying to make up their minds to what they want, but, fastening like lightning upon whatever alternative comes first, they hold to it to the end, whatever happens, without an instant's irresolution. This is one of the splendid qualities which generally accompany brilliant, unlasting success. It is impossible not to envy the man who can dismiss reason, although we know how it must turn out at last.

Such are the advantages which the other methods of settling opinions have over scientific investigation. A man should consider well of them; and then he should consider that, after all, he wishes his opinions to coincide with the fact, and that there is no reason why the results of those first three methods should do so. To bring about this effect is the prerogative of the method of science. Upon such considerations he has to make his choice — a choice which is far more than the adoption of any intellectual opinion, which is one of the ruling decisions of his life, to which when once made he is bound to adhere. The force of habit will sometimes cause a man to hold on to old beliefs after he is in a condition to see that they have no sound basis. But reflection upon the state of the case will overcome these habits, and he ought to allow reflection full weight. People sometimes shrink from doing this, having an idea that beliefs are wholesome which they cannot help feeling rest on nothing. But let such persons suppose an analogous though different case from their own. Let them ask themselves what they would say to a reformed Mussulman who should hesitate to give up his old notions in regard to the relations of the sexes; or to a reformed Catholic who should still shrink from the Bible. Would they not say that these persons ought to consider the matter fully, and clearly understand the new doctrine, and then ought to embrace it in its entirety? But, above all, let it be considered that what is more wholesome than any particular belief is integrity of belief; and that to avoid looking into the support of any belief from a fear that it may turn out rotten is quite as immoral as it is disadvantageous. The person who confesses that there is such a thing as truth, which is distinguished from falsehood simply by this, that if acted on it should, on full consideration, carry us to the point we aim at and not astray, and then, though convinced of this, dares not know the truth and seeks to avoid it, is in a sorry state of mind, indeed.

Yes, the other methods do have their merits: a clear logical conscience does cost something — just as any virtue, just as all that we cherish, costs us dear. But, we should not desire it to be otherwise. The genius of a man's logical method should be loved and revered as his bride, whom he has chosen from all the world. He need not condemn the others; on the contrary, he may honor them deeply, and in doing so he only honors her the more. But she is the one that he has chosen, and he knows that he was right in making that choice. And having made it, he will work and fight for her, and will not complain that there are blows to take, hoping that there may be as many and as hard to give, and will strive to be the worthy knight and champion of her from

the blaze of whose splendors he draws his inspiration and his courage.

*How to Make Our Ideas Clear**

I

Whoever has looked into a modern treatise on logic of the common sort, will doubtless remember the two distinctions between *clear* and *obscure* conceptions, and between *distinct* and *confused* conceptions. They have lain in the books now for nigh two centuries, unimproved and unmodified, and are generally reckoned by logicians as among the gems of their doctrine.

A clear idea is defined as one which is so apprehended that it will be recognized wherever it is met with, and so that no other will be mistaken for it. If it fails of this clearness, it is said to be obscure.

This is rather a neat bit of philosophical terminology; yet, since it is clearness that they were defining, I wish the logicians had made their definition a little more plain. Never to fail to recognize an idea, and under no circumstances to mistake another for it, let it come in how recondite a form it may, would indeed imply such prodigious force and clearness of intellect as is seldom met with in this world. On the other hand, merely to have such an acquaintance with the idea as to have become familiar with it, and to have lost all hesitancy in recognizing it in ordinary cases, hardly seems to deserve the name of clearness of apprehension, since after all it only amounts to a subjective feeling of mastery which may be entirely mistaken. I take it, however, that when the logicians speak of "clearness," they mean nothing more than such a familiarity with an idea, since they regard the quality as but a small merit, which needs to be supplemented by another, which they call *distinctness*.

A distinct idea is defined as one which contains nothing which is not clear. This is technical language; by the *contents* of an idea logicians understand whatever is contained in its definition. So that an idea is *distinctly* apprehended, according to them, when we can give a precise definition of it, in abstract terms. Here the professional logicians leave the subject; and I would not have troubled the reader with what they have to say if it were not such a striking example of how they have been slumbering through ages of intellectual activity, listlessly disregarding the enginery of modern thought, and never dreaming of applying its lessons to the improvement of logic. It is easy to show that the doctrine that familiar use and abstract distinctness make the perfection of apprehension, has its only true place in philosophies which have long been extinct; and it is now time to formulate the method of attaining to a more perfect clearness of thought, such as we see and admire in the thinkers of our own time.

When Descartes set about the reconstruction of philosophy, his first step was to (theoretically) permit skepticism and to discard the practice of the schoolmen of looking to authority as the ultimate source of truth. That done, he sought a more natural fountain of true principles, and professed to find it in the human mind; thus passing, in the directest way, from the method of authority to that of apriority, as described in my first paper. Self-consciousness was to furnish us with our fundamental truths, and to decide what was agreeable to reason. But since, evidently, not all ideas are true, he was led to note, as the first condition of infallibility, that they must be clear. The distinction between an idea *seeming* clear and really being so, never occurred to him. Trusting to introspection, as he did, even for a knowledge of external things, why should he question its testimony in respect to the contents of our own minds? But then, I suppose, seeing men, who seemed to be quite clear and positive, holding opposite opinions upon fundamental principles, he was further led to say that clearness of ideas is not sufficient, but that they need also to be distinct, i.e., to have nothing unclear about them. What he probably meant by this (for he did not explain himself with precision) was that they must sustain the test of dialectical examination; that they must not only seem clear at the outset, but that discussion must never be able to bring to light points of obscurity connected with them.

Such was the distinction of Descartes, and one sees that it was precisely on the level of his philosophy. It was somewhat developed by Leibniz. This great and singular genius was as remarkable for what he failed to see as for what he saw. That a piece of mechanism could not do work perpetually without being fed with power in some form, was a thing perfectly apparent to him; yet he did not understand that the machinery of the mind can only transform knowledge, but never originate it, unless it be fed with facts of observation. He

thus missed the most essential point of the Cartesian philosophy, which is, that to accept propositions which seem perfectly evident to us is a thing which, whether it be logical or illogical, we cannot help doing. Instead of regarding the matter in this way, he sought to reduce the first principles of science to formulas which cannot be denied without self-contradiction, and was apparently unaware of the great difference between his position and that of Descartes. So he reverted to the old formalities of logic, and, above all, abstract definitions played a great part in his philosophy. It was quite natural, therefore, that on observing that the method of Descartes labored under the difficulty that we may seem to ourselves to have clear apprehensions of ideas which in truth are very hazy, no better remedy occurred to him than to require an abstract definition of every important term. Accordingly, in adopting the distinction of *clear* and *distinct* notions, he described the latter quality as the clear apprehension of everything contained in the definition; and the books have ever since copied his words. There is no danger that his chimerical scheme will ever again be overvalued. Nothing new can ever be learned by analyzing definitions. Nevertheless, our existing beliefs can be set in order by this process, and order is an essential element of intellectual economy, as of every other. It may be acknowledged, therefore, that the books are right in making familiarity with a notion the first step toward clearness of apprehension, and the defining of it the second. But in omitting all mention of any higher perspicuity of thought, they simply mirror a philosophy which was exploded a hundred years ago. That much-admired “ornament of logic” — the doctrine of clearness and distinctness — may be pretty enough, but it is high time to relegate to our cabinet of curiosities the antique *bijou*, and to wear about us something better adapted to modern uses.

The very first lesson that we have a right to demand that logic shall teach us is how to make our ideas clear; and a most important one it is, depreciated only by minds who stand in need of it. To know what we think, to be masters of our own meaning, will make a solid foundation for great and weighty thought. It is most easily learned by those whose ideas are meager and restricted; and far happier they than such as wallow helplessly in a rich mud of conceptions. A nation, it is true, may, in the course of generations, overcome the disadvantage of an excessive wealth of language and its natural concomitant, a vast, unfathomable deep of ideas. We may see it in history, slowly perfecting its literary forms, sloughing at length its metaphysics, and, by virtue of the untirable patience which is often a compensation, attaining great excellence in every branch of mental acquirement. The page of history is not yet unrolled which is to tell us whether such a people will or will not in the long run prevail over one whose ideas (like the words of their language) are few, but which possesses a wonderful mastery over those which it has. For an individual, however, there can be no question that a few clear ideas are worth more than many confused ones. A young man would hardly be persuaded to sacrifice the greater part of his thoughts to save the rest; and the muddled head is the least apt to see the necessity of such a sacrifice. Him we can usually only commiserate, as a person with a congenital defect. Time will help him, but intellectual maturity with regard to clearness comes rather late, an unfortunate arrangement of nature, inasmuch as clearness is of less use to a man settled in life, whose errors have in great measure had their effect, than it would be to one whose path lies before him. It is terrible to see how a single unclear idea, a single formula without meaning, lurking in a young man’s head, will sometimes act like an obstruction of inert matter in an artery, hindering the nutrition of the brain, and condemning its victim to pine away in the fullness of his intellectual vigor and in the midst of intellectual plenty. Many a man has cherished for years as his hobby some vague shadow of an idea, too meaningless to be positively false; he has, nevertheless, passionately loved it, has made it his companion by day and by night, and has given to it his strength and his life, leaving all other occupations for its sake, and in short has lived with it and for it, until it has become, as it were, flesh of his flesh and bone of his bone; and then he has waked up some bright morning to find it gone, clean vanished away like the beautiful Melusina of the fable,¹ and the essence of his life gone with it. I have myself known such a man; and who can tell how many histories of circle-squarers, metaphysicians, astrologers, and what not, may not be told in the old German story?

II

The principles set forth in the first of these papers lead, at once, to a method of reaching a clearness of thought of a far higher grade than the "distinctness" of the logicians. We have there found that the action of thought is excited by the irritation of doubt, and ceases when belief is attained; so that the production of belief is the sole function of thought. All these words, however, are too strong for my purpose. It is as if I had described the phenomena as they appear under a mental microscope. Doubt and Belief, as the words are commonly employed, relate to religious or other grave discussions. But here I use them to designate the starting of any question, no matter how small or how great, and the resolution of it. If, for instance, in a horsecar, I pull out my purse and find a five-cent nickel and five coppers, I decide, while my hand is going to the purse, in which way I will pay my fare. To call such a question Doubt, and my decision Belief, is certainly to use words very disproportionate to the occasion. To speak of such a doubt as causing an irritation which needs to be appeased, suggests a temper which is uncomfortable to the verge of insanity. Yet, looking at the matter minutely, it must be admitted that, if there is the least hesitation as to whether I shall pay the five coppers or the nickel (as there will be sure to be, unless I act from some previously contracted habit in the matter), though irritation is too strong a word, yet I am excited to such small mental activity as may be necessary to deciding how I shall act. Most frequently doubts arise from some indecision, however momentary, in our action. Sometimes it is not so. I have, for example, to wait in a railway-station, and to pass the time I read the advertisements on the walls. I compare the advantages of different trains and different routes which I never expect to take, merely fancying myself to be in a state of hesitancy, because I am bored with having nothing to trouble me. Feigned hesitancy, whether feigned for mere amusement or with a lofty purpose, plays a great part in the production of scientific inquiry. However the doubt may originate, it stimulates the mind to an activity which may be slight or energetic, calm or turbulent. Images pass rapidly through consciousness, one incessantly melting into another, until at last, when all is over — it may be in a fraction of a second, in an hour, or after long years — we find ourselves decided as to how we should act under such circumstances as those which occasioned our hesitation. In other words, we have attained belief.

In this process we observe two sorts of elements of consciousness, the distinction between which may best be made clear by means of an illustration. In a piece of music there are the separate notes, and there is the air. A single tone may be prolonged for an hour or a day, and it exists as perfectly in each second of that time as in the whole taken together; so that, as long as it is sounding, it might be present to a sense from which everything in the past was as completely absent as the future itself. But it is different with the air, the performance of which occupies a certain time, during the portions of which only portions of it are played. It consists in an orderliness in the succession of sounds which strike the ear at different times; and to perceive it there must be some continuity of consciousness which makes the events of a lapse of time present to us. We certainly only perceive the air by hearing the separate notes; yet we cannot be said to directly hear it, for we hear only what is present at the instant, and an orderliness of succession cannot exist in an instant. These two sorts of objects, what we are *immediately* conscious of and what we are *mediately* conscious of, are found in all consciousness. Some elements (the sensations) are completely present at every instant so long as they last, while others (like thought) are actions having beginning, middle, and end, and consist in a congruence in the succession of sensations which flow through the mind. They cannot be immediately present to us, but must cover some portion of the past or future. Thought is a thread of melody running through the succession of our sensations.

We may add that just as a piece of music may be written in parts, each part having its own air, so various systems of relationship of succession subsist together between the same sensations. These different systems are distinguished by having different motives, ideas, or functions. Thought is only one such system; for its sole motive, idea, and function is to produce belief, and whatever does not concern that purpose belongs to some other system of relations. The action of thinking may incidentally have other results. It may serve to amuse us, for example, and among *dilettanti* it is not rare to find those who have so perverted thought to the purposes of pleasure that it seems to vex them to think that the questions upon which they delight to exercise it may ever get finally settled; and a positive discovery which takes a favorite subject out of the arena of literary debate is met with ill-concealed dislike. This disposition is the very debauchery of thought. But the soul and meaning of thought, abstracted from the other elements which accompany it, though it may be voluntarily thwarted, can never be made to direct itself toward anything but the production of belief. Thought in action has for its only possible motive the attainment of thought at rest; and whatever does not refer to belief is no part of the thought itself.

And what, then, is belief? It is the demi-cadence which closes a musical phrase in the symphony of our intellectual life. We have seen that it has just three properties: first, it is something that we are aware of; second, it appeases the irritation of doubt; and, third, it involves the establishment in our nature of a rule of action, or, say for short, a *habit*. As it appeases the irritation of doubt, which is the motive for thinking, thought relaxes, and comes to rest for a moment when belief is reached. But, since belief is a rule for action, the application of which involves further doubt and further thought, at the same time that it is a stopping-place, it is also a new starting-place for thought. That is why I have permitted myself to call it thought at rest, although thought is essentially an action. The *final* upshot of thinking is the exercise of volition, and of this thought no longer forms a part; but belief is only a stadium of mental action, an effect upon our nature due to thought, which will influence future thinking.

The essence of belief is the establishment of a habit, and different beliefs are distinguished by the different modes of action to which they give rise. If beliefs do not differ in this respect, if they appease the same doubt by producing the same rule of action, then no mere differences in the manner of consciousness of them can make them different beliefs, any more than playing a tune in different keys is playing different tunes. Imaginary distinctions are often drawn between beliefs which differ only in their mode of expression — the wrangling which ensues is real enough, however. To believe that any objects are arranged among themselves as in Fig. 1, and to believe that they are arranged as in Fig. 2, are one and the same belief; yet it is conceivable that a man should assert one proposition and deny the other. Such false distinctions do as much harm as the confusion of beliefs really different, and are among the pitfalls of which we ought constantly to beware, especially when we are upon metaphysical ground. One singular deception of this sort, which often occurs, is to mistake the sensation produced by our own unclearness of thought for a character of the object we are thinking. Instead of perceiving that the obscurity is purely subjective, we fancy that we contemplate a quality of the object which is essentially mysterious; and if our conception be afterward presented to us in a clear form we do not recognize it as the same, owing to the absence of the feeling of unintelligibility. So long as this deception lasts, it obviously puts an impassable barrier in the way of perspicuous thinking; so that it equally interests the opponents of rational thought to perpetuate it, and its adherents to guard against it.

FIG. 1

FIG. 2

Another such deception is to mistake a mere difference in the grammatical construction of two words for a distinction between the ideas they express. In this pedantic age, when the general mob of writers attend so much more to words than to things, this error is common enough. When I just said that thought is an *action*, and that it consists in a *relation*, although a person performs an action but not a relation, which can only be the result of an action, yet there was no inconsistency in what I said, but only a grammatical vagueness.

From all these sophisms we shall be perfectly safe so long as we reflect that the whole function of thought is to produce habits of action; and that whatever there is connected with a thought, but irrelevant to its

purpose, is an accretion to it, but no part of it. If there be a unity among our sensations which has no reference to how we shall act on a given occasion, as when we listen to a piece of music, why, we do not call that thinking. To develop its meaning, we have, therefore, simply to determine what habits it produces, for what a thing means is simply what habits it involves. Now, the identity of a habit depends on how it might lead us to act, not merely under such circumstances as are likely to arise, but under such as might possibly occur, no matter how improbable they may be. What the habit is depends on *when* and *how* it causes us to act. As for the *when*, every stimulus to action is derived from perception; as for the *how*, every purpose of action is to produce some sensible result. Thus, we come down to what is tangible and practical as the root of every real distinction of thought, no matter how subtle it may be; and there is no distinction of meaning so fine as to consist in anything but a possible difference of practice.

To see what this principle leads to, consider in the light of it such a doctrine as that of transubstantiation. The Protestant churches generally hold that the elements of the sacrament are flesh and blood only in a tropical sense; they nourish our souls as meat and the juice of it would our bodies. But the Catholics maintain that they are literally just that, meat and blood; although they possess all the sensible qualities of wafer-cakes and diluted wine. But we can have no conception of wine except what may enter into a belief, either —

1. That this, that, or the other, is wine; or,
2. That wine possesses certain properties.

Such beliefs are nothing but self-notifications that we should, upon occasion, act in regard to such things as we believe to be wine according to the qualities which we believe wine to possess. The occasion of such action would be some sensible perception, the motive of it to produce some sensible result. Thus our action has exclusive reference to what affects the senses, our habit has the same bearing as our action, our belief the same as our habit, our conception the same as our belief; and we can consequently mean nothing by wine but what has certain effects, direct or indirect, upon our senses; and to talk of something as having all the sensible characters of wine, yet being in reality blood, is senseless jargon. Now, it is not my object to pursue the theological question; and having used it as a logical example I drop it, without caring to anticipate the theologian's reply. I only desire to point out how impossible it is that we should have an idea in our minds which relates to anything but conceived sensible effects of things. Our idea of anything *is* our idea of its sensible effects; and if we fancy that we have any other we deceive ourselves, and mistake a mere sensation accompanying the thought for a part of the thought itself. It is absurd to say that thought has any meaning unrelated to its only function. It is foolish for Catholics and Protestants to fancy themselves in disagreement about the elements of the sacrament, if they agree in regard to all their sensible effects, here or hereafter.

It appears, then, that the rule for attaining the third grade of clearness of apprehension is as follows: consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object.

III

Let us illustrate this rule by some examples; and, to begin with the simplest one possible, let us ask what we mean by calling a thing *hard*. Evidently that it will not be scratched by many other substances. The whole conception of this quality, as of every other, lies in its conceived effects. There is absolutely no difference between a hard thing and a soft thing so long as they are not brought to the test. Suppose, then, that a diamond could be crystallized in the midst of a cushion of soft cotton, and should remain there until it was finally burned up. Would it be false to say that that diamond was soft? This seems a foolish question, and would be so, in fact, except in the realm of logic. There such questions are often of the greatest utility as serving to bring logical principles into sharper relief than real discussions ever could. In studying logic we must not put them aside with hasty answers, but must consider them with attentive care, in order to make out the principles involved. We may, in the present case, modify our question, and ask what prevents us from saying that all hard bodies remain perfectly soft until they are touched, when their hardness increases with the pressure until they are scratched. Reflection will show that the reply is this: there would be no *falsity* in such modes of speech. They would involve a modification of our present usage of speech with regard to the words “hard” and “soft,” but not of their meanings. For they represent no fact to be different from what it is; only they involve arrangements of facts which would be exceedingly maladroit. This leads us to remark that the question of what would occur under circumstances which do not actually arise is not a question of fact, but only of the most perspicuous arrangement of them. For example, the question of free-will and fate in its simplest form, stripped of verbiage, is something like this: I have done something of which I am ashamed; could I, by an effort of the will, have resisted the temptation, and done otherwise? The philosophical reply is that this is not a question of fact, but only of the [possible] arrangement of facts. Arranging them so as to exhibit what is particularly pertinent to my question — namely, that I ought to blame myself for having done wrong—it is perfectly true to say that, if I had willed to do otherwise than I did, I should have done otherwise. On the other hand, arranging the facts so as to exhibit another important consideration, it is equally true that when a temptation has once been allowed to work, it will, if it has a certain force, produce its effect, let me struggle how I may. There is no objection to a contradiction in what would result from a false supposition. The *reductio ad absurdum* consists in showing that contradictory results would follow from a hypothesis which is consequently judged to be false. Many questions are involved in the free-will discussion, and I am far from desiring to say that both sides are equally right. On the contrary, I am of opinion that one side [determinism] denies important facts, and that the other does not. But what I do say is that the above single question was the origin of the whole doubt; that, had it not been for this question, the controversy would never have arisen; and that this question is perfectly solved in the manner which I have indicated.

Let us next seek a clear idea of Weight. This is another very easy case. To say that a body is heavy means simply that, in the absence of opposing force, it will fall. This (neglecting certain specifications of how it will fall, etc., which exist in the mind of the physicist who uses the word) is evidently the whole conception of weight. It is a fair question whether some particular facts may not *account* for gravity; but what we mean by the force itself is completely involved in its effects.

This leads us to undertake an account of the idea of Force in general. This is the great conception which, developed in the early part of the seventeenth century from the rude idea of a cause, and, constantly improved upon since, has shown us how to explain all the changes of motion which bodies experience, and how to think about all physical phenomena; which has given birth to modern science, and changed the face of the globe; and which, aside from its more special uses, has played a principal part in directing the course of modern thought, and in furthering modern social development. It is, therefore, worth some pains to comprehend it. According to our rule, we must begin by asking what is the immediate use of thinking about force; and the answer is that we thus account for changes of motion. If bodies were left to themselves, without the intervention of forces, every motion would continue unchanged both in velocity and in direction. Furthermore, change of motion never takes place abruptly; if its direction is changed, it is always through a curve without angles; if its velocity alters, it is by degrees. The gradual changes which are constantly taking place are conceived by geometers to be compounded together according to the rules of the parallelogram of forces. If the reader does not already know what this is, he will find it, I hope, to his advantage to endeavor to follow the following explanation; but if mathematics are insupportable to him, pray let him skip three paragraphs rather than that we should part company here.

A *path* is a line whose beginning and end are distinguished. Two paths are considered to be equivalent, which, beginning at the same point, lead to the same point. Thus the two paths, *A B C D E* and *A F G H E*

(Fig. 3), are equivalent. Paths which do *not* begin at the same point are considered to be equivalent, provided that, on moving either of them without turning it, but keeping it always parallel to its original position, [so that] when its beginning coincides with that of the other path, the ends also coincide. Paths are considered as geometrically added together, when one begins where the other ends; thus the path AE is conceived to be a sum of AB , BC , CD , and DE . In the parallelogram of Fig. 4 the diagonal AC is the sum of AB and BC ; or, since AD is geometrically equivalent to BC , AC is the geometrical sum of AB and AD .

FIG. 3

FIG. 4

All this is purely conventional. It simply amounts to this: that we choose to call paths having the relations I have described equal or added. But, though it is a convention, it is a convention with a good reason. The rule for geometrical addition may be applied not only to paths, but to any other things which can be represented by paths. Now, as a path is determined by the varying direction and distance of the point which moves over it from the starting-point, it follows that anything which from its beginning to its end is determined by a varying direction and a varying magnitude is capable of being represented by a line. Accordingly, *velocities* may be represented by lines, for they have only directions and rates. The same thing is true of *accelerations*, or changes of velocities. This is evident enough in the case of velocities; and it becomes evident for accelerations if we consider that precisely what velocities are to positions — namely, states of change of them — that accelerations are to velocities.

The so-called “parallelogram of forces” is simply a rule for compounding accelerations. The rule is, to represent the accelerations by paths, and then to geometrically add the paths. The geometers, however, not only use the “parallelogram of forces” to compound different accelerations, but also to resolve one acceleration into a sum of several. Let AB (Fig. 5) be the path which represents a certain acceleration—say, such a change in the motion of a body that at the end of one second the body will, under the influence of that change, be in a position different from what it would have had if its motion had continued unchanged, such that a path equivalent to AB would lead from the latter position to the former. This acceleration may be considered as the sum of the accelerations represented by AC and CB . It may also be considered as the sum of the very different accelerations represented by AD and DB , where AD is almost the opposite of AC . And it is clear that there is an immense variety of ways in which AB might be resolved into the sum of two accelerations.

FIG. 5

After this tedious explanation, which I hope, in view of the extraordinary interest of the conception of force, may not have exhausted the reader's patience, we are prepared at last to state the grand fact which this

conception embodies. This fact is that if the actual changes of motion which the different particles of bodies experience are each resolved in its appropriate way, each component acceleration is precisely such as is prescribed by a certain law of Nature, according to which bodies in the relative positions which the bodies in question actually have at the moment always receive certain accelerations, which, being compounded by geometrical addition, give the acceleration which the body actually experiences.

This is the only fact which the idea of force represents and whoever will take the trouble clearly to apprehend what this fact is perfectly comprehends what force is. Whether we ought to say that a force *is* an acceleration, or that it *causes* an acceleration, is a mere question of propriety of language, which has no more to do with our real meaning than the difference between the French idiom "*Il fait froid*" and its English equivalent "*It is cold.*" Yet it is surprising to see how this simple affair has muddled men's minds. In how many profound treatises is not force spoken of as a "mysterious entity," which seems to be only a way of confessing that the author despairs of ever getting a clear notion of what the word means! In a recent, admired work on *Analytic Mechanics*² it is stated that we understand precisely the effect of force, but what force itself is we do not understand! This is simply a self-contradiction. The idea which the word "force" excites in our minds has no other function than to affect our actions, and these actions can have no reference to force otherwise than through its effects. Consequently, if we know what the effects of force are, we are acquainted with every fact which is implied in saying that a force exists, and there is nothing more to know. The truth is, there is some vague notion afloat that a question may mean something which the mind cannot conceive; and when some hair-splitting philosophers have been confronted with the absurdity of such a view, they have invented an empty distinction between positive and negative conceptions, in the attempt to give their nonidea a form not obviously nonsensical. The nullity of it is sufficiently plain from the considerations given a few pages back; and, apart from those considerations, the quibbling character of the distinction must have struck every mind accustomed to real thinking.

IV

Let us now approach the subject of logic, and consider a conception which particularly concerns it, that of *reality*. Taking clearness in the sense of familiarity, no idea could be clearer than this. Every child uses it with perfect confidence, never dreaming that he does not understand it. As for clearness in its second grade, however, it would probably puzzle most men, even among those of a reflective turn of mind, to give an abstract definition of the real. Yet such a definition may perhaps be reached by considering the points of difference between reality and its opposite, fiction. A figment is a product of somebody's imagination; it has such characters as his thought impresses upon it. That those characters are independent of how you or I think is an external reality. There are, however, phenomena within our own minds, dependent upon our thought, which are at the same time real in the sense that we really think them. But though their characters depend on how we think, they do not depend on what we think those characters to be. Thus, a dream has a real existence as a mental phenomenon, if somebody has really dreamt it; that he dreamt so and so, does not depend on what anybody thinks was dreamt, but is completely independent of all opinion on the subject. On the other hand, considering, not the fact of dreaming, but the thing dreamt, it retains its peculiarities by virtue of no other fact than that it was dreamt to possess them. Thus we may define the real as that whose characters are independent of what anybody may think them to be.

But, however satisfactory such a definition may be found, it would be a great mistake to suppose that it makes the idea of reality perfectly clear. Here, then, let us apply our rules. According to them, reality, like every other quality, consists in the peculiar, sensible effects which things partaking of it produce. The only effect which real things have is to cause belief, for all the sensations which they excite emerge into consciousness in the form of beliefs. The question, therefore, is, how is true belief (or belief in the real) distinguished from false belief (or belief in fiction). Now, as we have seen in the former paper, the ideas of truth and falsehood, in their full development, appertain exclusively to the scientific method of settling opinion. A person who arbitrarily chooses the propositions which he will adopt can use the word truth only to emphasize the expression of his determination to hold on to his choice. Of course, the method of tenacity never prevailed exclusively; reason is too natural to men for that. But in the literature of the Dark Ages we find some fine examples of it. When Scotus Erigena³ is commenting upon a poetical passage in which hellebore is spoken of as having caused the death of Socrates, he does not hesitate to inform the inquiring reader that Helleborus and Socrates were two eminent Greek philosophers, and that the latter having been overcome in argument by the former took the matter to heart and died of it! What sort of an idea of truth could a man have who could adopt and teach, without the qualification of a "perhaps," an opinion taken so entirely at random? The real spirit of Socrates, who I hope would have been delighted to have been "overcome in argument," because he would have learned something by it, is in curious contrast with the naïve idea of the glossist, for whom (as for the "born missionary" of today) discussion would seem to have been simply a struggle. When philosophy began to awake from its long slumber, and before theology completely dominated it, the practice seems to have been for each professor to seize upon any philosophical position he found unoccupied and which seemed a strong one, to intrench himself in it, and to sally forth from time to time to give battle to the others. Thus, even the scanty records we possess of those disputes enable us to make out a dozen or more opinions held by different teachers at one time concerning the question of nominalism and realism. Read the opening part of the *Historia Calamitatum* of Abélard,⁴ who was certainly as philosophical as any of his contemporaries, and see the spirit of combat which it breathes. For him, the truth is simply his particular stronghold. When the method of authority prevailed, the truth meant little more than the Catholic faith. All the efforts of the scholastic doctors are directed toward harmonizing their faith in Aristotle and their faith in the Church, and one may search their ponderous folios through without finding an argument which goes any further. It is noticeable that where different faiths flourish side by side, renegades are looked upon with contempt even by the party whose belief they adopt; so completely has the idea of loyalty replaced that of truth-seeking. Since the time of Descartes, the defect in the conception of truth has been less apparent. Still, it will sometimes strike a scientific man that the philosophers have been less intent on finding out what the facts are than on inquiring what belief is most in harmony with their system. It is hard to convince a follower of the *a priori* method by adducing facts; but show him that an opinion he is defending is inconsistent with what he has laid down elsewhere, and he will be very apt to retract it. These minds do not seem to believe that disputation is ever to cease; they seem to think that the opinion which is natural for one man is not so for another, and that belief will, consequently, never be settled. In contenting themselves with fixing their own opinions by a method which would lead another man to a different result, they betray their feeble hold of the

conception of what truth is.

On the other hand, all the followers of science are fully persuaded that the processes of investigation, if only pushed far enough, will give one certain solution to each question to which they can be applied. One man may investigate the velocity of light by studying the transits of Venus and the aberration of the stars; another by the oppositions of Mars and the eclipses of Jupiter's satellites; a third by the method of Fizeau;⁵ a fourth by that of Foucault;⁶ a fifth by the motions of the curves of Lissajous;⁷ a sixth, a seventh, an eighth, and a ninth, may follow the different methods of comparing the measures of statical and dynamical electricity. They may at first obtain different results, but, as each perfects his method and his processes, the results will move steadily together toward a destined center. So with all scientific research. Different minds may set out with the most antagonistic views, but the progress of investigation carries them by a force outside of themselves to one and the same conclusion. This activity of thought by which we are carried, not where we wish, but to a foreordained goal, is like the operation of destiny. No modification of the point of view taken, no selection of other facts for study, no natural bent of mind even, can enable a man to escape the predestinate opinion. This great law is embodied in the conception of truth and reality. The opinion which is fated to be ultimately agreed to by all who investigate is what we mean by the truth, and the object represented in this opinion is the real. That is the way I would explain reality.

But it may be said that this view is directly opposed to the abstract definition which we have given of reality, inasmuch as it makes the characters of the real depend on what is ultimately thought about them. But the answer to this is that, on the one hand, reality is independent, not necessarily of thought in general, but only of what you or I or any finite number of men may think about it; and that, on the other hand, though the object of the final opinion depends on what that opinion is, yet what that opinion is does not depend on what you or I or any man thinks. Our perversity and that of others may indefinitely postpone the settlement of opinion; it might even conceivably cause an arbitrary proposition to be universally accepted as long as the human race should last. Yet even that would not change the nature of the belief, which alone could be the result of investigation carried sufficiently far; and if, after the extinction of our race, another should arise with faculties and disposition for investigation, that true opinion must be the one which they would ultimately come to. "Truth crushed to earth shall rise again," and the opinion which would finally result from investigation does not depend on how anybody may actually think. But the reality of that which is real does depend on the real fact that investigation is destined to lead, at last, if continued long enough, to a belief in it.

But I may be asked what I have to say to all the minute facts of history, forgotten never to be recovered, to the lost books of the ancients, to the buried secrets.

Full many a gem of purest ray serene
The dark, unfathomed caves of ocean bear;
Full many a flower is born to blush unseen,
And waste its sweetness on the desert air.⁸

Do these things not really exist because they are hopelessly beyond the reach of our knowledge? And then, after the universe is dead (according to the prediction of some scientists), and all life has ceased forever, will not the shock of atoms continue though there will be no mind to know it? To this I reply that, though in no possible state of knowledge can any number be great enough to express the relation between the amount of what rests unknown to the amount of the known, yet it is unphilosophical to suppose that, with regard to any given question (which has any clear meaning), investigation would not bring forth a solution of it, if it were carried far enough. Who would have said, a few years ago, that we could ever know of what substances stars are made whose light may have been longer in reaching us than the human race has existed? Who can be sure of what we shall not know in a few hundred years? Who can guess what would be the result of continuing the pursuit of science for ten thousand years, with the activity of the last hundred? And if it were to go on for a million, or a billion, or any number of years you please, how is it possible to say that there is any question which might not ultimately be solved?

But it may be objected, "Why make so much of these remote considerations, especially when it is your principle that only practical distinctions have a meaning?" Well, I must confess that it makes very little difference whether we say that a stone on the bottom of the ocean, in complete darkness, is brilliant or not — that is to say, that it *probably* makes no difference, remembering always that that stone *may* be fished up tomorrow. But that there are gems at the bottom of the sea, flowers in the untraveled desert, etc., are propositions which, like that about a diamond being hard when it is not pressed, concern much more the arrangement of our language than they do the meaning of our ideas.

It seems to me, however, that we have, by the application of our rule, reached so clear an apprehension of what we mean by reality, and of the fact which the idea rests on, that we should not, perhaps, be making a pretension so presumptuous as it would be singular, if we were to offer a metaphysical theory of existence for universal acceptance among those who employ the scientific method of fixing belief. However, as metaphysics is a subject much more curious than useful, the knowledge of which, like that of a sunken reef, serves chiefly to enable us to keep clear of it, I will not trouble the reader with any more Ontology at this moment. I have already been led much further into that path than I should have desired; and I have given the reader such a dose of mathematics, psychology, and all that is most abstruse, that I fear he may already have left me, and that what I am now writing is for the compositor and proofreader exclusively. I trusted to the importance of the subject. There is no royal road to logic, and really valuable ideas can only be had at the price of close attention. But I know that in the matter of ideas the public prefer the cheap and nasty; and in my next paper I am going to return to the easily intelligible, and not wander from it again. The reader who has been at the pains of wading through this paper shall be rewarded in the next one by seeing how beautifully what has been developed in this tedious way can be applied to the ascertainment of the rules of scientific reasoning.

We have, hitherto, not crossed the threshold of scientific logic. It is certainly important to know how to make our ideas clear, but they may be ever so clear without being true. How to make them so, we have next to study. How to give birth to those vital and procreative ideas which multiply into a thousand forms and diffuse themselves everywhere, advancing civilization and making the dignity of man, is an art not yet reduced to rules, but of the secret of which the history of science affords some hints.

William James

William James (1842–1910), brother of the novelist Henry James, was the eldest of five children. His father, Henry James, Sr., was a man of independent means who provided a rich but unconventional education for the children, sometimes in Europe and sometimes in the United States. For somewhat mysterious medical reasons, neither William nor Henry served in the Civil War, although their two younger brothers served with distinction. William found it difficult to decide on a career. He tried painting but found that he was not sufficiently talented. Also, he earned an M.D. but never practiced medicine. Instead, in 1873, he became an instructor of physiology at Harvard, where he remained until his retirement in 1907. He was America's leading psychologist, establishing both the first psychological laboratory and writing the leading textbook, *The Principles of Psychology*, and its abridged version, *Psychology: The Briefer Course*. He published his first paper in philosophy in 1878. Together with Charles Sanders Peirce, James is regarded as a founder of pragmatism, for reasons that he sets forth in the first paper to follow, "What Pragmatism Means." That paper was the second of eight public lectures delivered in the winter of 1906–1907 and published under the title *Pragmatism: A New Name for Some Old Ways of Thinking*. This particular lecture introduces all aspects of James' pragmatism.

As a young man, James suffered from a deep depression. He recovered when, stimulated by reading the French philosopher Charles Renouvier, he affirmed his belief in free will. For James, moral effort requires a belief in free will, a belief that the world needs to be and can be improved, and, for the utmost effort, a belief in a God who is on the side of good. But these are not beliefs that can be established by scientific methods; indeed, they cannot be established at all. However, since so much hangs on whether one has these beliefs, James defended one's right to them in the second paper to follow, "The Will to Believe." This paper, which also was first presented as a lecture, precedes "What Pragmatism Means" by ten years. It is, however, easily misunderstood without a clear understanding of James' pragmatic theory of truth.

What, then, is pragmatism? According to James, it is both a method for settling what would otherwise be interminable metaphysical disputes and a theory of truth. Pragmatism settles metaphysical disputes by clarifying the meaning of the concepts involved. It is interesting that James restates Peirce's maxim as "to develop a thought's meaning, we need only determine what conduct it is fitted to produce: that conduct is for us its sole significance," although James follows that statement with an almost verbatim quote of Peirce's formulation. In fact, James takes the maxim in a very wide sense, so that it does not eliminate, say, religious hypotheses but rather finds their point in the behavior they encourage.

Although pragmatism is a form of empiricism, it differs from earlier empiricisms, such as that of Hume, in three respects. (1) James does not regard the mind as a passive receptacle. We all bring to experience a set of concepts that have been developed by humans over the millennia, concepts such as space, time, cause, and thing. We may also bring to experience specialized concepts developed in the sciences, the arts, or religion. What we experience depends on these concepts as well as on the world, and, in turn, our experience may lead us to modify our concepts. (2) James held that we experience relations between things and their properties. He considered this to be the crucial difference between his empiricism and that of his predecessors. (3) For James "sensations" include not only the deliverances of the five senses but also feelings and emotions. Because the mind is not a passive receptacle, theories are not mere summaries of past experiences nor the deliverances of an a priori reason, but are *instruments*; they "become true just in so far as they help us to get into satisfactory relation with other parts of our experience."

What, then, is the pragmatist theory of truth? It is an attempt to clarify what is involved in the claim that truth is agreement with reality, which is itself a mere truism. Unlike other philosophers, pragmatists hold that there are many relations of agreement. Sometimes a mental image copies what one has just seen. But in almost all cases, belief leads to expectations of future experiences, and when these are not disappointed, or as long as these are not disappointed, we regard the belief as true. Since our existence in the world is precarious, true beliefs are of the utmost importance; they are good to believe. But that does *not* mean that they are pleasant to believe or are satisfying at the moment. We are not free to believe what we want. Our beliefs must harmonize with past experience; they must be logically coherent and prove themselves throughout the indefinite future. The latter is what James meant by saying that beliefs "become true."

James concluded "What Pragmatism Means" by applying it to his conception of God and to the contrasting conception of the Absolute of his Idealist colleagues. He held that a belief in his God—a God who, with our help, strives to make this a better world—would help us lead a better life, and that, therefore, it

would be better for us to have that belief unless it clashes with other vital beliefs. That last proviso prevents us from believing whatever we like. But James has been accused of permitting, indeed encouraging, just that approach, an accusation based primarily on a careless reading of “The Will to Believe.”

At times one has to believe “ahead of the evidence.” If you do not trust a new acquaintance, your chance for a friendship will be lost forever. If you do not believe in a Jamesean deity, you will not have that maximum of moral energy. What characterizes the situations in question is that (a) the choice is momentous, and much hangs on it; (b) it is impossible to wait for further evidence— not choosing is to choose the other alternative; and (c) both alternatives are “live” for us, that is, we can see ourselves making either choice. In such cases, and only in such cases, James insists on our right to believe, that is, to choose. James himself exercised that right when he chose to believe in free will. Making that choice enabled him to emerge from a deep depression. Scientists exercise that right when they choose to devote themselves to a line of research, believing that the research will yield good results. Of course, beliefs so chosen are subject to the same verification/falsification processes as are all other beliefs.

• • •

The most readable introduction to James’ philosophy is Jacques Barzun, *A Stroll with William James* (New York: Harper & Row, 1983). Gerald E. Myers, *William James: His Life and Thought* (New Haven: Yale University Press, 1986) is a massive, excellent study. Ruth Anna Putnam, ed., *The Cambridge Companion to William James* (Cambridge: Cambridge University Press, 1997) provides multiple perspectives on various aspects of James’ philosophy.

Ruth Anna Putnam

*What Pragmatism Means**

Some years ago, being with a camping party in the mountains, I returned from a solitary ramble to find everyone engaged in a ferocious metaphysical dispute. The *corpus* of the dispute was a squirrel — a live squirrel supposed to be clinging to one side of a tree-trunk; while over against the tree's opposite side a human being was imagined to stand. This human witness tries to get sight of the squirrel by moving rapidly round the tree, but no matter how fast he goes, the squirrel moves as fast in the opposite direction, and always keeps the tree between himself and the man, so that never a glimpse of him is caught. The resultant metaphysical problem now is this: *Does the man go round the squirrel or not?* He goes round the tree, sure enough, and the squirrel is on the tree; but does he go round the squirrel? In the unlimited leisure of the wilderness, discussion had been worn threadbare. Everyone had taken sides, and was obstinate; and the numbers on both sides were even. Each side, when I appeared, therefore appealed to me to make it a majority. Mindful of the scholastic adage that whenever you meet a contradiction you must make a distinction, I immediately sought and found one, as follows: "Which party is right," I said, "depends on what you *practically mean* by 'going round' the squirrel. If you mean passing from the north of him to the east, then to the south, then to the west, and then to the north of him again, obviously the man does go round him, for he occupies these successive positions. But if on the contrary you mean being first in front of him, then on the right of him, then behind him, then on his left, and finally in front again, it is quite as obvious that the man fails to go round him, for by the compensating movements the squirrel makes, he keeps his belly turned towards the man all the time, and his back turned away. Make the distinction, and there is no occasion for any farther dispute. You are both right and both wrong according as you conceive the verb 'to go round' in one practical fashion or the other."

Altho one or two of the hotter disputants called my speech a shuffling evasion, saying they wanted no quibbling or scholastic hair-splitting, but meant just plain honest English 'round,' the majority seemed to think that the distinction had assuaged the dispute.

I tell this trivial anecdote because it is a peculiarly simple example of what I wish now to speak of as *the pragmatic method*. The pragmatic method is primarily a method of settling metaphysical disputes that otherwise might be interminable. Is the world one or many?—fated or free?—material or spiritual?—here are notions either of which may or may not hold good of the world; and disputes over such notions are unending. The pragmatic method in such cases is to try to interpret each notion by tracing its respective practical consequences. What difference would it practically make to anyone if this notion rather than that notion were true? If no practical difference whatever can be traced, then the alternatives mean practically the same thing, and all dispute is idle. Whenever a dispute is serious, we ought to be able to show some practical difference that must follow from one side or the other's being right.

A glance at the history of the idea will show you still better what pragmatism means. The term is derived from the same Greek word *πράγμα*,¹ meaning action, from which our words 'practice' and 'practical' come. It was first introduced into philosophy by Mr. Charles Peirce in 1878. In an article entitled 'How to Make Our Ideas Clear,' in the 'Popular Science Monthly' for January of that year² Mr. Peirce, after pointing out that our beliefs are really rules for action, said that, to develop a thought's meaning, we need only determine what conduct it is fitted to produce: that conduct is for us its sole significance. And the tangible fact at the root of all our thought-distinctions, however subtle, is that there is no one of them so fine as to consist in anything but a possible difference of practice. To attain perfect clearness in our thoughts of an object, then, we need only consider what conceivable effects of a practical kind the object may involve — what sensations we are to expect from it, and what reactions we must prepare. Our conception of these effects, whether immediate or remote, is then for us the whole of our conception of the object, so far as that conception has positive significance at all.

This is the principle of Peirce, the principle of pragmatism. It lay entirely unnoticed by anyone for twenty years, until I, in an address before Professor Howison's³ philosophical union at the university of California, brought it forward again and made a special application of it to religion. By that date (1898) the times seemed ripe for its reception. The word 'pragmatism' spread, and at present it fairly spots the pages of the philosophic

journals. On all hands we find the 'pragmatic movement' spoken of, sometimes with respect, sometimes with contumely, seldom with clear understanding. It is evident that the term applies itself conveniently to a number of tendencies that hitherto have lacked a collective name, and that it has 'come to stay.'

To take in the importance of Peirce's principle, one must get accustomed to applying it to concrete cases. I found a few years ago that Ostwald, the illustrious Leipzig chemist,⁴ had been making perfectly distinct use of the principle of pragmatism in his lectures on the philosophy of science, tho he had not called it by that name.

"All realities influence our practice," he wrote me, "and that influence is their meaning for us. I am accustomed to put questions to my class in this way: In what respects would the world be different if this alternative or that were true? If I can find nothing that would become different, then the alternative has no sense."

That is, the rival views mean practically the same thing, and meaning, other than practical, there is for us none. Ostwald in a published lecture gives this example of what he means. Chemists have long wrangled over the inner constitution of certain bodies called 'tautomers.' Their properties seemed equally consistent with the notion that an instable hydrogen atom oscillates inside of them, or that they are instable mixtures of two bodies. Controversy raged; but never was decided. "It would never have begun," says Ostwald, "if the combatants had asked themselves what particular experimental fact could have been made different by one or the other view being correct. For it would then have appeared that no difference of fact could possibly ensue; and the quarrel was as unreal as if, theorizing in primitive times about the raising of dough by yeast, one party should have invoked a 'brownie,' while another insisted on an 'elf' as the true cause of the phenomenon."⁵

It is astonishing to see how many philosophical disputes collapse into insignificance the moment you subject them to this simple test of tracing a concrete consequence. There can *be* no difference anywhere that doesn't *make* a difference elsewhere — no difference in abstract truth that doesn't express itself in a difference in concrete fact and in conduct consequent upon that fact, imposed on somebody, somehow, somewhere and somewhen. The whole function of philosophy ought to be to find out what definite difference it will make to you and me, at definite instants of our life, if this world-formula or that world-formula be the true one.

There is absolutely nothing new in the pragmatic method. Socrates was an adept at it. Aristotle used it methodically. Locke, Berkeley and Hume made momentous contributions to truth by its means. Shadworth Hodgson⁶ keeps insisting that realities are only what they are 'known-as.' But these forerunners of pragmatism used it in fragments: they were preluders only. Not until in our time has it generalized itself, become conscious of a universal mission, pretended to a conquering destiny. I believe in that destiny, and I hope I may end by inspiring you with my belief.

Pragmatism represents a perfectly familiar attitude in philosophy, the empiricist attitude, but it represents it, as it seems to me, both in a more radical and in a less objectionable form than it has ever yet assumed. A pragmatist turns his back resolutely and once for all upon a lot of inveterate habits dear to professional philosophers. He turns away from abstraction and insufficiency, from verbal solutions, from bad *a priori* reasons, from fixed principles, closed systems, and pretended absolutes and origins. He turns towards concreteness and adequacy, towards facts, towards action, and towards power. That means the empiricist temper regnant, and the rationalist temper sincerely given up. It means the open air and possibilities of nature, as against dogma, artificiality and the pretence of finality in truth.

At the same time it does not stand for any special results. It is a method only. But the general triumph of that method would mean an enormous change in what I called in my last lecture the 'temperament' of philosophy. Teachers of the ultra-rationalistic type would be frozen out, much as the courtier type is frozen out in republics, as the ultramontane type of priest is frozen out in protestant lands. Science and metaphysics would come much nearer together, would in fact work absolutely hand in hand.

Metaphysics has usually followed a very primitive kind of quest. You know how men have always hankered after unlawful magic, and you know what a great part, in magic, *words* have always played. If you have his name, or the formula of incantation that binds him, you can control the spirit, genie, afrite, or whatever the power may be. Solomon knew the names of all the spirits, and having their names, he held them subject to his will. So the universe has always appeared to the natural mind as a kind of enigma, of which the key must be sought in the shape of some illuminating or power-bringing word or name. That word names the universe's *principle*, and to possess it is, after a fashion, to possess the universe itself. 'God,' 'Matter,' 'Reason,' 'the Absolute,' 'Energy,' are so many solving names. You can rest when you have them. You are at the end of your metaphysical quest.

But if you follow the pragmatic method, you cannot look on any such word as closing your quest. You

must bring out of each word its practical cash-value, set it at work within the stream of your experience. It appears less as a solution, then, than as a program for more work, and more particularly as an indication of the ways in which existing realities may be *changed*.

Theories thus become instruments, not answers to enigmas, in which we can rest. We don't lie back upon them, we move forward, and, on occasion, make nature over again by their aid. Pragmatism unstiffens all our theories, limbers them up and sets each one at work. Being nothing essentially new, it harmonizes with many ancient philosophic tendencies. It agrees with nominalism for instance, in always appealing to particulars; with utilitarianism in emphasizing practical aspects; with positivism in its disdain for verbal solutions, useless questions, and metaphysical abstractions.

All these, you see, are *anti-intellectualist* tendencies. Against rationalism as a pretension and a method, pragmatism is fully armed and militant. But, at the outset, at least, it stands for no particular results. It has no dogmas, and no doctrines save its method. As the young Italian pragmatist Papini has well said, it lies in the midst of our theories, like a corridor in a hotel. Innumerable chambers open out of it. In one you may find a man writing an atheistic volume; in the next someone on his knees praying for faith and strength; in a third a chemist investigating a body's properties. In a fourth a system of idealistic metaphysics is being excogitated; in a fifth the impossibility of metaphysics is being shown. But they all own the corridor, and all must pass through it if they want a practicable way of getting into or out of their respective rooms.

No particular results then, so far, but only an attitude of orientation, is what the pragmatic method means. *The attitude of looking away from first things, principles, 'categories,' supposed necessities; and of looking toward last things, fruits, consequences, facts.*

So much for the pragmatic method! You may say that I have been praising it rather than explaining it to you, but I shall presently explain it abundantly enough by showing how it works on some familiar problems. Meanwhile the word pragmatism has come to be used in a still wider sense, as meaning also a certain *theory of truth*. I mean to give a whole lecture to the statement of that theory, after first paving the way, so I can be very brief now. But brevity is hard to follow, so I ask for your redoubled attention for a quarter of an hour. If much remains obscure, I hope to make it clearer in the later lectures.

One of the most successfully cultivated branches of philosophy in our time is what is called inductive logic, the study of the conditions under which our sciences have evolved. Writers on this subject have begun to show a singular unanimity as to what the laws of nature and elements of fact mean, when formulated by mathematicians, physicists and chemists. When the first mathematical, logical and natural uniformities, the first *laws*, were discovered, men were so carried away by the clearness, beauty and simplification that resulted, that they believed themselves to have deciphered authentically the eternal thoughts of the Almighty. His mind also thundered and reverberated in syllogisms. He also thought in conic sections, squares and roots and ratios, and geometrized like Euclid.⁷ He made Kepler's⁸ laws for the planets to follow; he made velocity increase proportionally to the time in falling bodies; he made the law of the sines for light to obey when refracted; he established the classes, orders, families and genera of plants and animals, and fixed the distances between them. He thought the archetypes of all things, and devised their variations; and when we rediscover any one of these his wondrous institutions, we seize his mind in its very literal intention.

But as the sciences have developed farther, the notion has gained ground that most, perhaps all, of our laws are only approximations. The laws themselves, moreover, have grown so numerous that there is no counting them; and so many rival formulations are proposed in all the branches of science that investigators have become accustomed to the notion that no theory is absolutely a transcript of reality, but that any one of them may from some point of view be useful. Their great use is to summarize old facts and to lead to new ones. They are only a man-made language, a conceptual shorthand, as someone calls them, in which we write our reports of nature; and languages, as is well known, tolerate much choice of expression and many dialects.

Thus human arbitrariness has driven divine necessity from scientific logic. If I mention the names of Sigwart,⁹ Mach,¹⁰ Ostwald, Pearson,¹¹ Milhaud,¹² Poincare,¹³ Duhem,¹⁴ Ruysen,¹⁵ those of you who are students will easily identify the tendency I speak of, and will think of additional names.

Riding now on the front of this wave of scientific logic Messrs. Schiller¹⁶ and Dewey¹⁷ appear with their pragmatistic account of what truth everywhere signifies. Everywhere, these teachers say, 'truth' in our ideas and beliefs means the same thing that it means in science. It means, they say, nothing but this, *that ideas (which themselves are but parts of our experience) become true just in so far as they help us to get into satisfactory relation with other parts of our experience*, to summarize them and get about among them by conceptual shortcuts instead of following the interminable succession of particular phenomena. Any idea upon which we can ride, so to speak; any idea that will carry us prosperously from any one part of our experience to any other part,

linking things satisfactorily, working securely, simplifying, saving labor; is true for just so much, true in so far forth, true *instrumentally*. This is the 'instrumental' view of truth taught so successfully at Chicago, the view that truth in our ideas means their power to 'work,' promulgated so brilliantly at Oxford.

Messrs. Dewey, Schiller and their allies, in reaching this general conception of all truth, have only followed the example of geologists, biologists and philologists. In the establishment of these other sciences, the successful stroke was always to take some simple process actually observable in operation — as denudation by weather, say, or variation from parental type, or change of dialect by incorporation of new words and pronunciations—and then to generalize it, making it apply to all times, and produce great results by summing its effects through the ages.

The observable process which Schiller and Dewey particularly singled out for generalization is the familiar one by which any individual settles into *new opinions*. The process here is always the same. The individual has a stock of old opinions already, but he meets a new experience that puts them to a strain. Somebody contradicts them; or in a reflective moment he discovers that they contradict each other; or he hears of facts with which they are incompatible; or desires arise in him which they cease to satisfy. The result is an inward trouble to which his mind till then had been a stranger, and from which he seeks to escape by modifying his previous mass of opinions. He saves as much of it as he can, for in this matter of belief we are all extreme conservatives. So he tries to change first this opinion, and then that (for they resist change very variously), until at last some new idea comes up which he can graft upon the ancient stock with a minimum of disturbance of the latter, some idea that mediates between the stock and the new experience and runs them into one another most felicitously and expediently.

This new idea is then adopted as the true one. It preserves the older stock of truths with a minimum of modification, stretching them just enough to make them admit the novelty, but conceiving that in ways as familiar as the case leaves possible. An *outrée* explanation, violating all our preconceptions, would never pass for a true account of a novelty. We should scratch round industriously till we found something less excentric. The most violent revolutions in an individual's beliefs leave most of his old order standing. Time and space, cause and effect, nature and history, and one's own biography remain untouched. New truth is always a go-between, a smoother-over of transitions. It marries old opinion to new fact so as ever to show a minimum of jolt, a maximum of continuity. We hold a theory true just in proportion to its success in solving this 'problem of maxima and minima.' But success in solving this problem is eminently a matter of approximation. We say this theory solves it on the whole more satisfactorily than that theory; but that means more satisfactorily to ourselves, and individuals will emphasize their points of satisfaction differently. To a certain degree, therefore, everything here is plastic.

The point I now urge you to observe particularly is the part played by the older truths. Failure to take account of it is the source of much of the unjust criticism leveled against pragmatism. Their influence is absolutely controlling. Loyalty to them is the first principle—in most cases it is the only principle; for by far the most usual way of handling phenomena so novel that they would make for a serious rearrangement of our preconceptions is to ignore them altogether, or to abuse those who bear witness for them.

You doubtless wish examples of this process of truth's growth, and the only trouble is their superabundance. The simplest case of new truth is of course the mere numerical addition of new kinds of facts, or of new single facts of old kinds, to our experience—an addition that involves no alteration in the old beliefs. Day follows day, and its contents are simply added. The new contents themselves are not true, they simply *come* and *are*. Truth is *what we say about* them, and when we say that they have come, truth is satisfied by the plain additive formula.

But often the day's contents oblige a rearrangement. If I should now utter piercing shrieks and act like a maniac on this platform, it would make many of you revise your ideas as to the probable worth of my philosophy. 'Radium' came the other day as part of the day's content, and seemed for a moment to contradict our ideas of the whole order of nature, that order having come to be identified with what is called the conservation of energy. The mere sight of radium paying heat away indefinitely out of its own pocket seemed to violate that conservation. What to think? If the radiations from it were nothing but an escape of unsuspected 'potential' energy, pre-existent inside of the atoms, the principle of conservation would be saved. The discovery of 'helium' as the radiation's outcome, opened a way to this belief. So Ramsay's¹⁸ view is generally held to be true, because, altho it extends our old ideas of energy, it causes a minimum of alteration in their nature.

I need not multiply instances. A new opinion counts as 'true' just in proportion as it gratifies the individual's desire to assimilate the novel in his experience to his beliefs in stock. It must both lean on old

truth and grasp new fact; and its success (as I said a moment ago) in doing this, is a matter for the individual's appreciation. When old truth grows, then, by new truth's addition, it is for subjective reasons. We are in the process and obey the reasons. That new idea is truest which performs most felicitously its function of satisfying our double urgency. It makes itself true, gets itself classed as true, by the way it works; grafting itself then upon the ancient body of truth, which thus grows much as a tree grows by the activity of a new layer of cambium.

Now Dewey and Schiller proceed to generalize this observation and to apply it to the most ancient parts of truth. They also once were plastic. They also were called true for human reasons. They also mediated between still earlier truths and what in those days were novel observations. Purely objective truth, truth in whose establishment the function of giving human satisfaction is marrying previous parts of experience with newer parts played no role whatever, is nowhere to be found. The reasons why we call things true is the reason why they *are* true, for 'to be true' *means* only to perform this marriage-function.

The trail of the human serpent is thus over everything. Truth independent; truth that we *find* merely; truth no longer malleable to human need; truth incorrigible, in a word; such truth exists indeed superabundantly — or is supposed to exist by rationalistically minded thinkers; but then it means only the dead heart of the living tree, and its being there means only that truth also has its paleontology and its 'prescription,' and may grow stiff with years of veteran service and petrified in men's regard by sheer antiquity. But how plastic even the oldest truths nevertheless really are has been vividly shown in our day by the transformation of logical and mathematical ideas, a transformation which seems even to be invading physics. The ancient formulas are reinterpreted as special expressions of much wider principles, principles that our ancestors never got a glimpse of in their present shape and formulation.

Mr. Schiller still gives to all this view of truth the name of 'Humanism,' but, for this doctrine too, the name of pragmatism seems fairly to be in the ascendant, so I will treat it under the name of pragmatism in these lectures.

Such then would be the scope of pragmatism— first, a method; and second, a genetic theory of what is meant by truth. And these two things must be our future topics.

What I have said of the theory of truth will, I am sure, have appeared obscure and unsatisfactory to most of you by reason of its brevity. I shall make amends for that hereafter. In a lecture on 'common sense' I shall try to show what I mean by truths grown petrified by antiquity. In another lecture I shall expatiate on the idea that our thoughts become true in proportion as they successfully exert their go-between function. In a third I shall show how hard it is to discriminate subjective from objective factors in Truth's development. You may not follow me wholly in these lectures; and if you do, you may not wholly agree with me. But you will, I know, regard me at least as serious, and treat my effort with respectful consideration.

You will probably be surprised to learn, then, that Messrs. Schiller's and Dewey's theories have suffered a hailstorm of contempt and ridicule. All rationalism has risen against them. In influential quarters Mr. Schiller, in particular, has been treated like an impudent schoolboy who deserves a spanking. I should not mention this, but for the fact that it throws so much sidelight upon that rationalistic temper to which I have opposed the temper of pragmatism. Pragmatism is uncomfortable away from facts. Rationalism is comfortable only in the presence of abstractions. This pragmatist talk about truths in the plural, about their utility and satisfactoriness, about the success with which they 'work,' etc., suggests to the typical intellectualist mind a sort of coarse lame second-rate makeshift article of truth. Such truths are not real truth. Such tests are merely subjective. As against this, objective truth must be something non-utilitarian, haughty, refined, remote, august, exalted. It must be an absolute correspondence of our thoughts with an equally absolute reality. It must be what we *ought* to think, unconditionally. The conditioned ways in which we *do* think are so much irrelevance and matter for psychology. Down with psychology, up with logic, in all this question!

See the exquisite contrast of the types of mind! The pragmatist clings to facts and concreteness, observes truth at its work in particular cases, and generalizes. Truth, for him, becomes a class-name for all sorts of definite working-values in experience. For the rationalist it remains a pure abstraction, to the bare name of which we must defer. When the pragmatist undertakes to show in detail just *why* we must defer, the rationalist is unable to recognize the concretes from which his own abstraction is taken. He accuses us of *denying* truth; whereas we have only sought to trace exactly why people follow it and always ought to follow it. Your typical ultra-abstractionist fairly shudders at concreteness: other things equal, he positively prefers the pale and spectral. If the two universes were offered, he would always choose the skinny outline rather than the rich thicket of reality. It is so much purer, clearer, nobler.

I hope that as these lectures go on, the concreteness and closeness to facts of the pragmatism which they

advocate may be what approves itself to you as its most satisfactory peculiarity. It only follows here the example of the sister-sciences, interpreting the unobserved by the observed. It brings old and new harmoniously together. It converts the absolutely empty notion of a static relation of 'correspondence' (what that may mean we must ask later) between our minds and reality, into that of a rich and active commerce (that anyone may follow in detail and understand) between particular thoughts of ours, and the great universe of other experiences in which they play their parts and have their uses.

But enough of this at present? The justification of what I say must be postponed. I wish now to add a word in further explanation of the claim I made at our last meeting, that pragmatism may be a happy harmonizer of empiricist ways of thinking, with the more religious demands of human beings.

Men who are strongly of the fact-loving temperament, you may remember me to have said, are liable to be kept at a distance by the small sympathy with facts which that philosophy from the present-day fashion of idealism offers them. It is far too intellectualistic. Old fashioned theism was bad enough, with its notion of God as an exalted monarch, made up of a lot of unintelligible or preposterous 'attributes'; but, so long as it held strongly by the argument from design, it kept some touch with concrete realities. Since, however, darwinism has once for all displaced design from the minds of the 'scientific,' theism has lost that foothold; and some kind of an immanent or pantheistic deity working *in* things rather than above them is, if any, the kind recommended to our contemporary imagination. Aspirants to a philosophic religion turn, as a rule, more hopefully nowadays towards idealistic pantheism than towards the older dualistic theism, in spite of the fact that the latter still counts able defenders.

But, as I said in my first lecture, the brand of pantheism offered is hard for them to assimilate if they are lovers of facts, or empirically minded. It is the absolutistic brand, spurning the dust and reared upon pure logic. It keeps no connexion whatever with concreteness. Affirming the Absolute Mind, which is its substitute for God, to be the rational presupposition of all particulars of fact, whatever they may be, it remains supremely indifferent to what the particular facts in our world actually are. Be they what they may, the Absolute will father them. Like the sick lion in Esop's fable, all footprints lead into his den, but *nulla vestigia retrorsum*.¹⁹ You cannot redescend into the world of particulars by the Absolute's aid, or deduce any necessary consequences of detail important for your life from your idea of his nature. He gives you indeed the assurance that all is well with *Him*, and for his eternal way of thinking; but thereupon he leaves you to be finitely saved by your own temporal devices.

Far be it from me to deny the majesty of this conception, or its capacity to yield religious comfort to a most respectable class of minds. But from the human point of view, no one can pretend that it doesn't suffer from the faults of remoteness and abstractness. It is eminently a product of what I have ventured to call the rationalistic temper. It disdains empiricism's needs. It substitutes a pallid outline for the real world's richness. It is dapper; it is noble in the bad sense, in the sense in which to be noble is to be inapt for humble service. In this real world of sweat and dirt, it seems to me that when a view of things is 'noble,' that ought to count as a presumption against its truth, and as a philosophic disqualification. The prince of darkness may be a gentleman, as we are told he is, but whatever the God of earth and heaven is, he can surely be no gentleman. His menial services are needed in the dust of our human trials, even more than his dignity is needed in the empyrean.

Now pragmatism, devoted tho she be to facts, has no such materialistic bias as ordinary empiricism labors under. Moreover, she has no objection whatever to the realizing of abstractions, so long as you get about among particulars with their aid and they actually carry you somewhere. Interested in no conclusions but those which our minds and our experiences work out together, she has no *a priori* prejudices against theology. *If theological ideas prove to have a value for concrete life, they will be true, for pragmatism, in the sense of being good for so much. For how much more they are true, will depend entirely on their relations to the other truths that also have to be acknowledged.*

What I said just now about the Absolute of transcendental idealism is a case in point. First, I called it majestic and said it yielded religious comfort to a class of minds, and then I accused it of remoteness and sterility. But so far as it affords such comfort, it surely is not sterile; it has that amount of value; it performs a concrete function. As a good pragmatist, I myself ought to call the Absolute true 'in so far forth,' then; and I unhesitatingly now do so.

But what does *true in so far forth* mean in this case? To answer, we need only apply the pragmatic method. What do believers in the Absolute mean by saying that their belief affords them comfort? They mean that

since in the Absolute finite evil is 'overruled' already, we may, therefore, whenever we wish, treat the temporal as if it were potentially the eternal, be sure that we can trust its outcome, and, without sin, dismiss our fear and drop the worry of our finite responsibility. In short, they mean that we have a right ever and anon to take a moral holiday, to let the world wag in its own way, feeling that its issues are in better hands than ours and are none of our business.

The universe is a system of which the individual members may relax their anxieties occasionally, in which the don't-care mood is also right for men, and moral holidays in order — that, if I mistake not, is part, at least, of what the Absolute is 'known-as,' that is the great difference in our particular experiences which his being true makes for us, that is part of his cash-value when he is pragmatically interpreted. Farther than that the ordinary lay-reader in philosophy who thinks favorably of absolute idealism does not venture to sharpen his conceptions. He can use the Absolute for so much, and so much is very precious. He is pained at hearing you speak incredulously of the Absolute, therefore, and disregards your criticisms because they deal with aspects of the conception that he fails to follow.

If the Absolute means this, and means no more than this, who can possibly deny the truth of it? To deny it would be to insist that men should never relax, and that holidays are never in order.

I am well aware how odd it must seem to some of you to hear me say that an idea is 'true' so long as to believe it is profitable to our lives. That it is *good*, for as much as it profits, you will gladly admit. If what we do by its aid is good, you will allow the idea itself to be good in so far forth, for we are the better for possessing it. But is it not a strange misuse of the word 'truth,' you will say, to call ideas also 'true' for this reason?

To answer this difficulty fully is impossible at this stage of my account. You touch here upon the very central point of Messrs. Schiller's, Dewey's and my own doctrine of truth, which I cannot discuss with detail until my sixth lecture. Let me now say only this, that truth is *one species of good*, and not, as is usually supposed, a category distinct from good, and co-ordinate with it. *The true is the name of whatever proves itself to be good in the way of belief and good, too, for definite, assignable reasons.* Surely you must admit this, that if there were *no* good for life in true ideas, or if the knowledge of them were positively disadvantageous and false ideas the only useful ones, then the current notion that truth is divine and precious, and its pursuit a duty, could never have grown up or become a dogma. In a world like that, our duty would be to *shun* truth, rather. But in this world, just as certain foods are not only agreeable to our taste, but good for our teeth, our stomach and our tissues; so certain ideas are not only agreeable to think about, or agreeable as supporting other ideas that we are fond of, but they are also helpful in life's practical struggles. If there be any life that it is really better we should lead, and if there be any idea which, if believed in, would help us to lead that life, then it would be really *better for us* to believe in that idea, *unless, indeed, belief in it incidentally clashed with other greater vital benefits.*

'What would be better for us to believe!' This sounds very like a definition of truth. It comes very near to saying 'what we *ought* to believe': and in *that* definition none of you would find any oddity. Ought we ever not to believe what it is *better for us* to believe? And can we then keep the notion of what is better for us and what is true for us, permanently apart?

Pragmatism says no, and I fully agree with her. Probably you also agree, so far as the abstract statement goes, but with a suspicion that if we practically did believe everything that made for good in our own personal lives, we should be found indulging all kinds of fancies about this world's affairs, and all kinds of sentimental superstitions about a world hereafter. Your suspicion here is undoubtedly well founded, and it is evident that something happens when you pass from the abstract to the concrete, that complicates the situation.

I said just now that what is better for us to believe is true *unless the belief incidentally clashes with some other vital benefit.* Now in real life what vital benefits is any particular belief of ours most liable to clash with? What indeed except the vital benefits yielded by *other beliefs* when these prove incompatible with the first ones? In other words, the greatest enemy of any one of our truths may be the rest of our truths. Truths have once for all this desperate instinct of self-preservation and of desire to extinguish whatever contradicts them. My belief in the Absolute, based on the good it does me, must run the gauntlet of all my other beliefs. Grant that it may be true in giving me a moral holiday. Nevertheless, as I conceive it,— and let me speak now confidentially, as it were, and merely in my own private person,—it clashes with other truths of mine whose benefits I hate to give up on its account. It happens to be associated with a kind of logic of which I am the enemy, I find that it entangles me in metaphysical paradoxes that are unacceptable, etc., etc. But as I have enough trouble in life already without adding the trouble of carrying these intellectual inconsistencies, I personally just give up the Absolute. I just *take* my moral holidays; or else as a professional philosopher, I try to justify them by some other principle.

If I could restrict my notion of the Absolute to its bare holiday-giving value, it wouldn't clash with my other truths. But we cannot easily thus restrict our hypotheses. They carry supernumerary features, and these it is that clash so. My disbelief in the Absolute means then disbelief in those other supernumerary features, for I fully believe in the legitimacy of taking moral holidays.

You see by this what I meant when I called pragmatism a mediator and reconciler and said, borrowing the word from Papini,²⁰ that she 'unstiffens' our theories. She has in fact no prejudices whatever, no obstructive dogmas, no rigid canons of what shall count as proof. She is completely genial. She will entertain any hypothesis, she will consider any evidence. It follows that in the religious field she is at a great advantage both over positivistic empiricism, with its anti-theological bias, and over religious rationalism, with its exclusive interest in the remote, the noble, the simple, and the abstract in the way of conception.

In short, she widens the field of search for God. Rationalism sticks to logic and the empyrean. Empiricism sticks to the external senses. Pragmatism is willing to take anything, to follow either logic or the senses, and to count the humblest and most personal experiences. She will count mystical experiences if they have practical consequences. She will take a God who lives in the very dirt of private fact—if that should seem a likely place to find him.

Her only test of probable truth is what works best in the way of leading us, what fits every part of life best and combines with the collectivity of experience's demands, nothing being omitted. If theological ideas should do this, if the notion of God, in particular, should prove to do it, how could pragmatism possibly deny God's existence? She could see no meaning in treating as 'not true' a notion that was pragmatically so successful. What other kind of truth could there be, for her, than all this agreement with concrete reality?

In my last lecture I shall return again to the relations of pragmatism with religion. But you see already how democratic she is. Her manners are as various and flexible, her resources as rich and endless, and her conclusions as friendly as those of mother nature.

The Will to Believe

In the recently published *Life* by Leslie Stephen¹ of his brother, Fitzjames,² there is an account of a school to which the latter went when he was a boy. The teacher, a certain Mr. Guest, used to converse with his pupils in this wise: "Gurney, what's the difference between justification and sanctification? — Stephen, prove the Omnipotence of God!" etc. In the midst of our Harvard freethinking and indifference we are prone to imagine that here at your good old orthodox College conversation continues to be somewhat upon this order; and to show you that we at Harvard have not lost all interest in these vital subjects, I have brought with me to-night something like a sermon on justification by faith to read to you — I mean an essay in justification *of* faith, a defence of our right to adopt a believing attitude in religious matters, in spite of the fact that our merely logical intellect may not have been coerced. "The Will to Believe," accordingly, is the title of my paper.

I have long defended to my own students the lawfulness of voluntarily adopted faith; but as soon as they have got well imbued with the logical spirit, they have as a rule refused to admit my contention to be lawful philosophically, even though in point of fact they were personally all the time chock-full of some faith or other themselves. I am all the while, however, so profoundly convinced that my own position is correct, that your invitation has seemed to me a good occasion to make my statements more clear. Perhaps your minds will be more open than those with which I have hitherto had to deal. I will be as little technical as I can, though I must begin by setting up some technical distinctions that will help us in the end.

I

Let us give the name of *hypothesis* to anything that may be proposed to our belief; and just as the electricians speak of live and dead wires, let us speak of any hypothesis as either *live* or *dead*. A live hypothesis is one which appeals as a real possibility to him to whom it is proposed. If I ask you to believe in the Mahdi,³ the notion makes no electric connection with your nature—it refuses to scintillate with any credibility at all. As an hypothesis it is completely dead. To an Arab, however (even if he be not one of the Mahdi's followers), the hypothesis is among the mind's possibilities: it is alive. This shows that deadness and liveness in an hypothesis are not intrinsic properties, but relations to the individual thinker. They are measured by his willingness to act. The maximum of liveness in an hypothesis means willingness to act irrevocably. Practically, that means belief; but there is some believing tendency wherever there is willingness to act at all.

Next, let us call the decision between two hypotheses an *option*. Options may be of several kinds. They may be— 1, *living* or *dead*; 2, *forced* or *avoidable*; 3, *momentous* or *trivial*; and for our purposes we may call an option a *genuine* option when it is of the forced, living and momentous kind.

1. A living option is one in which both hypotheses are live ones. If I say to you: "Be a theosophist or be a mahomedan," it is probably a dead option, because for you neither hypothesis is likely to be alive. But if I say "Be an agnostic or be a Christian," it is otherwise: trained as you are, each hypothesis makes some appeal, however small, to your belief.

2. Next, if I say to you: "Choose between going out with your umbrella or without it," I do not offer you a genuine option, for it is not forced. You can easily avoid it by not going out at all. Similarly, if I say "Either love me or hate me," "Either call my theory true or call it false," your option is avoidable. You may remain indifferent to me, neither loving nor hating, and you may decline to offer any judgment as to my theory. But if I say "Either accept this truth or go without it," I put on you a forced option, for there is no standing place outside of the alternative. Every dilemma based on a complete logical disjunction, with no possibility of not choosing, is an option of this forced kind.

3. Finally, if I were Dr. Nansen⁴ and proposed to you to join my North Pole expedition, your option would be momentous; for this would probably be your only similar opportunity, and your choice now would either exclude you from the North Pole sort of immortality altogether or put at least the chance of it into your hands. He who refuses to embrace a unique opportunity loses the prize as surely as if he tried and failed. *Per contra*,⁵ the option is trivial when the opportunity is not unique, when the stake is insignificant, or when the decision is reversible if it later proves unwise. Such trivial options abound in the scientific life. A chemist finds an hypothesis live enough to spend a year in its verification: he believes in it to that extent. But if his experiments prove inconclusive either way, he is quit for his loss of time, no vital harm being done.

It will facilitate our discussion if we keep all these distinctions well in mind.

II

The next matter to consider is the actual psychology of human opinion. When we look at certain facts, it seems as if our passional and volitional nature lay at the root of all our convictions. When we look at others, it seems as if they could do nothing when the intellect had once said its say. Let us take the latter facts up first.

Does it not seem preposterous on the very face of it to talk of our opinions being modifiable at will? Can our will either help or hinder our intellect in its perceptions of truth? Can we, by just willing it, believe that Abraham Lincoln's existence is a myth, and that the portraits of him in *McClure's Magazine* are all of someone else? Can we, by any effort of our will, or by any strength of wish that it were true, believe ourselves well and about when we are roaring with rheumatism in bed, or feel certain that the sum of the two one-dollar bills in our pocket must be a hundred dollars? We can *say* any of these things, but we are absolutely impotent to believe them; and of just such things is the whole fabric of the truths that we do believe in made up — matters of fact, immediate or remote, as Hume said, and relations between ideas, which are either there or not there for us if we see them so, and which if not there cannot be put there by any action of our own.

In Pascal's⁶ *Thoughts* there is a celebrated passage known in literature as Pascal's wager. In it he tries to force us into Christianity by reasoning as if our concern with truth resembled our concern with the stakes in a game of chance. Translated freely his words are these: You must either believe or not believe that God is — which will you do? Your human reason cannot say. A game is going on between you and the nature of things which at the day of judgment will bring out either heads or tails. Weigh what your gains and your losses would be if you should stake all you have on heads, or God's existence: If you win in such case, you gain eternal beatitude; if you lose, you lose nothing at all. If there were an infinity of chances, and only one for God in this wager, still you ought to stake your all on God; for though you surely risk a finite loss by this procedure, any finite loss is reasonable, even a certain one is reasonable, if there is but the possibility of infinite gain. Go, then, and take holy water, and have masses said; belief will come and stupefy your scruples — *Cela vous fera croire et vous abêtira*.⁷ Why should you not? At bottom, what have you to lose?

You probably feel that when religious faith expresses itself thus, in the language of the gaming-table, it is put to its last trumps. Surely Pascal's own personal belief in masses and holy water had far other springs; and this celebrated page of his is but an argument for others, a last desperate snatch at a weapon against the hardness of the unbelieving heart. We feel that a faith in masses and holy water adopted willfully after such a mechanical calculation would lack the inner soul of faith's reality; and if we were ourselves in the place of the Deity, we should probably take particular pleasure in cutting off believers of this pattern from their infinite reward. It is evident that unless there be some pre-existing tendency to believe in masses and holy water, the option offered to the will by Pascal is not a living option. Certainly no Turk ever took to masses and holy water on its account; and even to us Protestants these means of salvation seem such foregone impossibilities that Pascal's logic, invoked for them specifically, leaves us unmoved. As well might the Mahdi write to us, saying "I am the Expected One whom God has created in his effulgence. You shall be infinitely happy if you confess me; otherwise you shall be cut off from the light of the sun. Weigh, then, your infinite gain if I am genuine against your finite sacrifice if I am not!" His logic would be that of Pascal; but he would vainly use it on us, for the hypothesis he offers us is dead. No tendency to act on it exists in us to any degree.

The talk of believing by our volition seems, then, from one point of view, simply silly. From another point of view it is worse than silly, it is vile. When one turns to the magnificent edifice of the physical sciences, and sees how it was reared; what thousands of disinterested moral lives of men lie buried in its mere foundations; what patience and postponement, what choking down of preference, what submission to the icy laws of outer fact are wrought into its very stones and mortar; how absolutely impersonal it stands in its vast augustness — then how besotted and contemptible seems every little sentimentalist who comes blowing his voluntary smoke-wreaths, and pretending to decide things from out of his private dream! Can we wonder if those bred in the rugged and manly school of science should feel like spewing such subjectivism out of their mouths? The whole system of loyalties which grow up in the schools of science go dead against its toleration; so that it is only natural that those who have caught the scientific fever should pass over to the opposite extreme, and write sometimes as if the incorruptibly truthful intellect ought positively to prefer bitterness and unacceptableness to the heart in its cup.

"It fortifies my soul to know

That, though I perish, Truth is so—"

sings Clough,⁸ whilst Huxley⁹ exclaims: “My only consolation lies in the reflection that, however bad our posterity may become, so long as they hold by the plain rule of not pretending to believe what they have no reason to believe because it may be to their advantage so to pretend [the word ‘pretend’ is surely here redundant], they will not have reached the lowest depths of immorality.” And that delicious *enfant terrible*¹⁰ Clifford¹¹ writes: “Belief is desecrated when given to unproved and unquestioned statements, for the solace and private pleasure of the believer... . Whoso would deserve well of his fellows in this matter will guard the purity of his belief with a very fanaticism of jealous care, lest at any time it should rest on an unworthy object, and catch a stain which can never be wiped away... . If [a] belief has been accepted on insufficient evidence [even though the belief be true, as Clifford on the same page explains], the pleasure is a stolen one... . It is sinful, because it is stolen in defiance of our duty to mankind. That duty is to guard ourselves from such beliefs as from a pestilence, which may shortly master our own body and then spread to the rest of the town... . It is wrong always, everywhere, and for anyone, to believe anything upon insufficient evidence.”

III

All this strikes one as healthy, even when expressed, as by Clifford, with somewhat too much of robustious pathos in the voice. Free-will and simple wishing do seem, in the matter of our credences, to be only fifth wheels to the coach. Yet if anyone should thereupon assume that intellectual insight is what remains after wish and will and sentimental preference have taken wing, or that pure reason is what then settles our opinions, he would fly quite as directly in the teeth of the facts.

It is only our already dead hypotheses that our willing nature is unable to bring to life again. But what has made them dead for us is for the most part a previous action of our willing nature of an antagonistic kind. When I say "willing nature," I do not mean only such deliberate volitions as may have set up habits of belief that we cannot now escape from — I mean all such factors of belief as fear and hope, prejudice and passion, imitation and partisanship, the circumpressure of our caste and set. As a matter of fact we find ourselves believing, we hardly know how or why. Mr. Balfour¹² gives the name of "authority" to all those influences, born of the intellectual climate, that make hypotheses possible or impossible for us, alive or dead. Here in this room, we all of us believe in molecules and the conservation of energy, in democracy and necessary progress, in Protestant Christianity and the duty of fighting for "the doctrine of the immortal Monroe,"¹³ all for no reasons worthy of the name. We see into these matters with no more inner clearness, and probably with much less, than any disbeliever in them might possess. His unconventionality would probably have some grounds to show for its conclusions; but for us, not insight, but the *prestige* of the opinions, is what makes the spark shoot from them and light up our sleeping magazines of faith. Our reason is quite satisfied, in nine hundred and ninety-nine cases out of every thousand of us, if it can find a few arguments that will do to recite in case our credulity is criticized by someone else. Our faith is faith in someone else's faith, and in the greatest matters this is most the case. Our belief in truth itself, for instance, that there is a truth, and that our minds and it are made for each other — what is it but a passionate affirmation of desire, in which our social system backs us up? We want to have a truth; we want to believe that our experiments and studies and discussions must put us in a continually better and better position towards it; and on this line we agree to fight out our thinking lives. But if a pyrrhonic sceptic asks us *how we know* all this, can our logic find a reply? No! Certainly it cannot. It is just one volition against another—we are willing to go in for life upon a trust or assumption which he, for his part, does not care to make.¹⁴

As a rule we disbelieve all facts and theories for which we have no use. Clifford's cosmic emotions find no use for Christian feelings. Huxley belabors the bishops because there is no use for sacerdotalism in his scheme of life. Newman,¹⁵ on the contrary, goes over to Romanism, and finds all sorts of reasons good for staying there, because a priestly system is for him an organic need and delight. Why do so few "scientists" even look at the evidence for telepathy, so called? Because they think, as a leading biologist, now dead, once said to me, that even if such a thing were true, scientists ought to band together to keep it suppressed and concealed. It would undo the uniformity of Nature and all sorts of other things without which scientists cannot carry on their pursuits. But if this very man had been shown something which as a scientist he might *do* with telepathy, he might not only have examined the evidence, but even have found it good enough. This very law which the logicians would impose upon us — if I may give the name of logicians to those who would rule out our willing nature here—is based on nothing but their own natural wish to exclude all elements for which they, in their professional quality of logicians, can find no use.

Evidently, then, our non-intellectual nature does influence our convictions. There are passional tendencies and volitions which run before and others which come after belief, and it is only the latter that are too late for the fair; and they are not too late when the previous passional work has been already in their own direction. Pascal's argument, instead of being powerless, then seems a regular clincher, and is the last stroke needed to make our faith in masses and holy water complete. The state of things is evidently far from simple; and pure insight and logic, whatever they might do ideally, are not the only things that really do produce our creeds.

IV

Our next duty, having recognized this mixed-up state of affairs, is to ask whether it be simply reprehensible and pathological, or whether, on the contrary, we must treat it as a normal element in making up our minds. The thesis I defend is, briefly stated, this: *Our passionate nature not only lawfully may, but must, decide an option between propositions, whenever it is a genuine option that cannot by its nature be decided on intellectual grounds; for to say, under such circumstances, "Do not decide, but leave the question open," is itself a passionate decision — just like deciding yes or no — and is attended with the same risk of losing the truth.* The thesis thus abstractly expressed will, I trust, soon become quite clear. But I must first indulge in a bit more of preliminary work.

V

It will be observed that for the purposes of this discussion we are on “dogmatic” ground — ground, I mean, which leaves systematic philosophical scepticism altogether out of account. The postulate that there is truth, and that it is the destiny of our minds to attain it, we are deliberately resolving to make, though the sceptic will not make it. We part company with him, therefore, absolutely, at this point. But the faith that truth exists, and that our minds can find it, may be held in two ways. We may talk of the *empiricist* way and of the *absolutist* way of believing in truth. The absolutists in this matter say that we not only can attain to knowing truth, but we can *know when* we have attained to knowing it; whilst the empiricists think that although we may attain it, we cannot infallibly know when. To *know* is one thing, and to know for certain *that* we know is another. One may hold to the first being possible without the second; hence the empiricists and the absolutists, although neither of them is a sceptic in the usual philosophic sense of the term, show very different degrees of dogmatism in their lives.

If we look at the history of opinions, we see that the empiricist tendency has largely prevailed in science, whilst in philosophy the absolutist tendency has had everything its own way. The characteristic sort of happiness, indeed, which philosophies yield has mainly consisted in the conviction felt by each successive school or system that by it bottom-certitude had been attained. “Other philosophies are collections of opinions, mostly false; *my* philosophy gives standing-ground forever”—who does not recognize in this the key-note of every system worthy of the name? A system, to be a system at all, must come as a *closed* system, reversible in this or that detail, perchance, but in its essential features never!

Scholastic orthodoxy, to which one must always go when one wishes to find perfectly clear statement, has beautifully elaborated this absolutist conviction in a doctrine which it calls that of “objective evidence.” If, for example, I am unable to doubt that I now exist before you, that two is less than three, or that if all men are mortal then I am mortal too, it is because these things illumine my intellect irresistibly. The final ground of this objective evidence possessed by certain propositions is the *adæquatio intellectus nostri cum re*.¹⁶ The certitude it brings involves an *aptitudinem ad extorquendum certum assensum*¹⁷ on the part of the truth envisaged, and on the side of the subject a *quietem in cognitione*,¹⁸ when once the object is mentally received, that leaves no possibility of doubt behind; and in the whole transaction nothing operates but the *entitas ipsa*¹⁹ of the object and the *entitas ipsa* of the mind. We slouchy modern thinkers dislike to talk in Latin — indeed, we dislike to talk in set terms at all; but at bottom our own state of mind is very much like this whenever we uncritically abandon ourselves: You believe in objective evidence, and I do. Of some things we feel that we are certain: we know, and we know that we do know. There is something that gives a click inside of us, a bell that strikes twelve, when the hands of our mental clock have swept the dial and meet over the meridian hour. The greatest empiricists among us are only empiricists on reflection: when left to their instincts, they dogmatize like infallible popes. When the Cliffords tell us how sinful it is to be Christians on such “insufficient evidence,” insufficiency is really the last thing they have in mind. For them the evidence is absolutely sufficient, only it makes the other way. They believe so completely in an anti-Christian order of the universe that there is no living option: Christianity is a dead hypothesis from the start.

VI

But now, since we are all such absolutists by instinct, what in our quality of students of philosophy ought we to do about the fact? Shall we espouse and indorse it? Or shall we treat it as a weakness of our nature from which we must free ourselves, if we can?

I sincerely believe that the latter course is the only one we can follow as reflective men. Objective evidence and certitude are doubtless very fine ideals to play with, but where on this moonlit and dream-visited planet are they found? I am, therefore, myself a complete empiricist so far as my theory of human knowledge goes. I live, to be sure, by the practical faith that we must go on experiencing and thinking over our experience, for only thus can our opinions grow more true; but to hold any one of them — I absolutely do not care which — as if it never could be re-interpretable or corrigible, I believe to be a tremendously mistaken attitude, and I think that the whole history of philosophy will bear me out. There is but one indefectibly certain truth, and that is the truth that pyrrhonistic scepticism itself leaves standing—the truth that the present phenomenon of consciousness exists. That, however, is the bare starting-point of knowledge, the mere admission of a stuff to be philosophized-about. The various philosophies are but so many attempts at expressing what this stuff really is. And if we repair to our libraries what disagreement do we discover! Where is a certainly true answer found? Apart from abstract propositions of comparison (such as two and two are the same as four), propositions which tell us nothing by themselves about concrete reality, we find no proposition ever regarded by anyone as evidently certain that has not either been called a falsehood, or at least had its truth sincerely questioned by someone else. The transcending of the axioms of geometry, not in play but in earnest, by certain of our contemporaries (As Zöllner²⁰ and Charles H. Hinton²¹), and the rejection of the whole aristotelian logic by the Hegelians, are striking instances in point.

No concrete test of what is really true has ever been agreed upon. Some make the criterion external to the moment of perception, putting it either in revelation, the *consensus gentium*,²² the instincts of the heart, or the systematized experience of the race. Others make the perceptive moment its own test— Descartes, for instance, with his clear and distinct ideas guaranteed by the veracity of God; Reid²³ with his “common-sense”; and Kant with his forms of synthetic judgment *a priori*. The inconceivability of the opposite; the capacity to be verified by sense; the possession of complete organic unity or self-relation, realized when a thing is its own other—are standards which, in turn, have been used. The much lauded objective evidence is never triumphantly there; it is a mere aspiration or *Grenzbegriff*,²⁴ marking the infinitely remote ideal of our thinking life. To claim that certain truths now possess it, is simply to say that when you think them true and they *are* true, then their evidence is objective, otherwise it is not. But practically one’s conviction that the evidence one goes by is of the real objective brand, is only one more subjective opinion added to the lot. For what a contradictory array of opinions have objective evidence and absolute certitude been claimed! The world is rational through and through—its existence is an ultimate brute fact; there is a personal God—a personal God is inconceivable; there is an extramental physical world immediately known—the mind can only know its own ideas; a moral imperative exists—obligation is only the resultant of desires; a permanent spiritual principle is in everyone—there are only shifting states of mind; there is an endless chain of causes — there is an absolute first cause; an eternal necessity—a freedom; a purpose—no purpose; a primal One — a primal Many; a universal continuity—an essential discontinuity in things; an infinity—no infinity. There is this — there is that; there is indeed nothing which someone has not thought absolutely true, whilst his neighbor deemed it absolutely false; and not an absolutist among them seems ever to have considered that the trouble may all the time be essential, and that the intellect, even with truth directly in its grasp, may have no infallible signal for knowing whether it be truth or no. When, indeed, one remembers that the most striking practical application to life of the doctrine of objective certitude has been the conscientious labors of the Holy Office of the Inquisition, one feels less tempted than ever to lend the doctrine a respectful ear.

But please observe, now, that when as empiricists we give up the doctrine of objective certitude, we do not thereby give up the quest or hope of truth itself. We still pin our faith on its existence, and still believe that we gain an ever better position towards it by systematically continuing to roll up experiences and think. Our great difference from the scholastic lies in the way we face. The strength of his system lies in the principles, the origin, the *terminus a quo*²⁵ of his thought; for us the strength is in the outcome, the upshot, the *terminus ad quem*.²⁶ Not where it comes from but what it leads to is to decide. It matters not to an empiricist from what quarter an hypothesis may come to him: he may have acquired it by fair means or by foul; passion may have

whispered or accident suggested it; but if the total drift of thinking continues to confirm it, that is what he means by its being true.

VII

One more point, small but important, and our preliminaries are done. There are two ways of looking at our duty in the matter of opinion—ways entirely different, and yet ways about whose difference the theory of knowledge seems hitherto to have shown very little concern. *We must know the truth*; and *we must avoid error* — these are our first and great commandments as would-be knowers; but they are not two ways of stating an identical commandment, they are two separable laws. Although it may indeed happen that when we believe the truth *A*, we escape as an incidental consequence from believing the falsehood *B*, it hardly ever happens that by merely disbelieving *B* we necessarily believe *A*. We may in escaping *B* fall into believing other falsehoods, *C* or *D*, just as bad as *B*; or we may escape *B* by not believing anything at all, not even *A*.

Believe truth! Shun error! — these, we see, are two materially different laws; and by choosing between them we may end by colouring differently our whole intellectual life. We may regard the chase for truth as paramount, and the avoidance of error as secondary; or we may, on the other hand, treat the avoidance of error as more imperative, and let truth take its chance. Clifford, in the instructive passage which I have quoted, exhorts us to the latter course. Believe nothing, he tells us, keep your mind in suspense forever, rather than by closing it on insufficient evidence incur the awful risk of believing lies. You, on the other hand, may think that the risk of being in error is a very small matter when compared with the blessings of real knowledge, and be ready to be duped many times in your investigation rather than postpone indefinitely the chance of guessing true. I myself find it impossible to go with Clifford. We must remember that these feelings of our duty about either truth or error are in any case only expressions of our passional life. Biologically considered, our minds are as ready to grind out falsehood as veracity, and he who says “Better go without belief forever than believe a lie!” merely shows his own preponderant private horror of becoming a dupe. He may be critical of many of his desires and fears, but this fear he slavishly obeys. He cannot imagine anyone questioning its binding force. For my own part, I have also a horror of being duped; but I can believe that worse things than being duped may happen to a man in this world: so Clifford’s exhortation has to my ears a thoroughly fantastic sound. It is like a general informing his soldiers that it is better to keep out of battle forever than to risk a single wound. Not so are victories either over enemies or over nature gained. Our errors are surely not such awfully solemn things. In a world where we are so certain to incur them in spite of all our caution, a certain lightness of heart seems healthier than this excessive nervousness on their behalf. At any rate, it seems the fittest thing for the empiricist philosopher.

VIII

And now, after all this introduction, let us go straight at our question. I have said, and now repeat it, that not only as a matter of fact do we find our passionate nature influencing us in our opinions, but that there are some options between opinions in which this influence must be regarded both as an inevitable and as a lawful determinant of our choice.

I fear here that some of you my hearers will begin to scent danger, and lend an inhospitable ear. Two first steps of passion you have indeed had to admit as necessary — we must think so as to avoid dupery, and we must think so as to gain truth; but the surest path to those ideal consummations, you will probably consider, is from now onwards to take no farther passionate step.

Well, of course I agree as far as the facts will allow. Wherever the option between losing truth and gaining it is not momentous, we can throw the chance of *gaining truth* away, and at any rate save ourselves from any chance of *believing falsehood*, by not making up our minds at all till objective evidence has come. In scientific questions, this is almost always the case; and even in human affairs in general, the need of acting is seldom so urgent that a false belief to act on is better than no belief at all. Law courts, indeed, have to decide on the best evidence attainable for the moment, because a judge's duty is to make law as well as to ascertain it, and (as a learned judge once said to me) few cases are worth spending much time over: the great thing is to have them decided on *any* acceptable principle, and got out of the way. But in our dealings with objective nature we obviously are recorders, not makers, of the truth; and decisions for the mere sake of deciding promptly and getting on to the next business would be wholly out of place. Throughout the breadth of physical nature facts are what they are quite independently of us, and seldom is there any such hurry about them that the risks of being duped by believing a premature theory need be faced. The questions here are always trivial options, the hypotheses are hardly living (at any rate not living for us spectators), the choice between believing truth or falsehood is seldom forced. The attitude of sceptical balance is therefore the absolutely wise one if we would escape mistakes. What difference, indeed, does it make to most of us whether we have or have not a theory of the Röntgen²⁷ rays, whether we believe or not in mind-stuff, or have a conviction about the causality of conscious states? It makes no difference. Such options are not forced on us. On every account it is better not to make them, but still keep weighing reasons *pro et contra*²⁸ with an indifferent hand.

I speak, of course, here of the purely judging mind. For purposes of discovery such indifference is to be less highly recommended, and science would be far less advanced than she is if the passionate desires of individuals to get their own faiths confirmed had been kept out of the game. See for example the sagacity which Spencer²⁹ and Weismann³⁰ now display. On the other hand, if you want an absolute duffer in an investigation, you must, after all, take the man who has no interest whatever in its results: he is the warranted incapable, the positive fool. The most useful investigator, because the most sensitive observer, is always he whose eager interest in one side of the question is balanced by an equally keen nervousness lest he become deceived.³¹ Science has organized this nervousness into a regular *technique*, her so-called method of verification; and she has fallen so deeply in love with the method that one may even say she has ceased to care for truth by itself at all. It is only truth as technically verified that interests her. The truth of truths might come in merely affirmative form, and she would decline to touch it. Such truth as that, she might repeat with Clifford, would be stolen in defiance of her duty to mankind. Human passions, however, are stronger than technical rules. "Le coeur a ses raisons," as Pascal says, "que la raison ne connaît point";³² and however indifferent to all but the bare rules of the game the umpire, the abstract intellect, may be, the concrete players who furnish him the materials to judge of are usually, each one of them, in love with some pet "live hypothesis" of his own. Let us agree, however, that wherever there is no forced option, the dispassionately judicial intellect with no pet hypothesis, saving us, as it does, from dupery at any rate, ought to be our ideal.

The question next arises: Are there not somewhere forced options in our speculative questions, and can we (as men who may be interested at least as much in positively gaining truth as in merely escaping dupery) always wait with impunity till the coercive evidence shall have arrived? It seems *a priori* improbable that the truth should be so nicely adjusted to our needs and powers as that. In the great boarding-house of nature, the cakes and the butter and the syrup seldom come out so even and leave the plates so clean. Indeed, we should view them with scientific suspicion if they did.

IX

Moral questions immediately present themselves as questions whose solution cannot wait for sensible proof. A moral question is a question not of what sensibly exists, but of what is good, or would be good if it did exist. Science can tell us what exists; but to compare the *worths*, both of what exists and of what does not exist, we must consult not science, but what Pascal calls our heart. Science herself consults her heart when she lays it down that the infinite ascertainment of fact and correction of false belief are the supreme goods for man. Challenge the statement and science can only repeat it oracularly, or else prove it by showing that such ascertainment and correction bring man all sorts of other goods which man's heart in turn declares. The question of having moral beliefs at all or not having them is decided by our will. Are our moral preferences true or false, or are they only odd biological phenomena, making things good or bad for us, but in themselves indifferent? How can your pure intellect decide? If your heart does not *want* a world of moral reality, your head will assuredly never make you believe in one. Mephistophelian scepticism, indeed, will satisfy the head's play-instincts much better than any rigorous idealism can. Some men (even at the student age) are so naturally cool-hearted that the moralistic hypothesis never has for them any pungent life, and in their supercilious presence the hot young moralist always feels strangely ill at ease. The appearance of knowingness is on their side, of *naïveté* and gullibility on his. Yet, in the inarticulate heart of him, he clings to it that he is not a dupe, and that there is a realm in which (as Emerson³³ says) all their wit and intellectual superiority is no better than the cunning of a fox. Moral scepticism can no more be refuted or proved by logic than intellectual scepticism can. When we stick to it that there *is* truth (be it of either kind), we do so with our whole nature, and resolve to stand or fall by the results. The sceptic with his whole nature adopts the doubting attitude; but which of us is the wiser, Omniscience only knows.

Turn now from these wide questions of good to a certain class of questions of fact, questions concerning personal relations, states of mind between one man and another. *Do you like me or not?* — for example. Whether you do or not depends, in countless instances, on whether I meet you half-way, am willing to assume that you must like me, and show you trust and expectation. The previous faith on my part in your liking's existence is in such cases what makes your liking come. But if I stand aloof, and refuse to budge an inch until I have objective evidence, until you shall have done something apt, as the absolutists say, *ad extorquendum assensum meum*,³⁴ ten to one your liking never comes. How many women's hearts are vanquished by the mere sanguine insistence of some man that they *must* love him! he will not consent to the hypothesis that they cannot. The desire for a certain kind of truth here brings about that special truth's existence; and so it is in innumerable cases of other sorts. Who gains promotions, boons, appointments, but the man in whose life they are seen to play the part of live hypotheses, who discounts them, sacrifices other things for their sake before they have come, and takes risks for them in advance? His faith acts on the powers above him as a claim, and creates its own verification.

A social organism of any sort whatever, large or small, is what it is because each member proceeds to his own duty with a trust that the other members will simultaneously do theirs. Wherever a desired result is achieved by the co-operation of many independent persons, its existence as a fact is a pure consequence of the precursive faith in one another of those immediately concerned. A government, an army, a commercial system, a ship, a college, an athletic team, all exist on this condition, without which not only is nothing achieved, but nothing is even attempted. A whole train of passengers (individually brave enough) will be looted by a few highwaymen, simply because the latter can count on one another, while each passenger fears that if he makes a movement of resistance, he will be shot before anyone else backs him up. If we believed that the whole car-full would rise at once with us, we should each severally rise, and train-robbing would never even be attempted. There are, then, cases where a fact cannot come at all unless a preliminary faith exists in its coming. *And where faith in a fact can help create the fact*, that would be an insane logic which should say that faith running ahead of scientific evidence is the "lowest kind of immorality" into which a thinking being can fall. Yet such is the logic by which our scientific absolutists pretend to regulate our lives!

X

In truths dependent on our personal action, then, faith based on desire is certainly a lawful and possibly an indispensable thing.

But now, it will be said, these are all childish human cases, and have nothing to do with great cosmical matter, like the question of religious faith. Let us then pass on to that. Religions differ so much in their accidents that in discussing the religious question we must make it very generic and broad. What then do we now mean by the religious hypothesis? Science says things are; morality says some things are better than other things; and religion says essentially two things.

First, she says that the best things are the more eternal things, the overlapping things, the things in the universe that throw the last stone, so to speak, and say the final word. "Perfection is eternal" — this phrase of Charles Secretan³⁵ seems a good way of putting this first affirmation of religion, an affirmation which obviously cannot yet be verified scientifically at all.

The second affirmation of religion is that we are better off even now if we believe her first affirmation to be true.

Now let us consider what the logical elements of this situation are *in case the religious hypothesis in both its branches be really true*. (Of course, we must admit that possibility at the outset. If we are to discuss the question at all, it must involve a living option. If for any of you religion be a hypothesis that cannot, by any living possibility be true, then you need go no farther. I speak to the "saving remnant" alone.) So proceeding, we see, first, that religion offers itself as a *momentous* option. We are supposed to gain, even now, by our belief, and to lose by our non-belief, a certain vital good. Secondly, religion is a *forced* option, so far as that good goes. We cannot escape the issue by remaining sceptical and waiting for more light, because, although we do avoid error in that way *if religion be untrue*, we lose the good, *if it be true*, just as certainly as if we positively chose to disbelieve. It is as if a man should hesitate indefinitely to ask a certain woman to marry him because he was not perfectly sure that she would prove an angel after he brought her home. Would he not cut himself off from that particular angel-possibility as decisively as if he went and married someone else? Scepticism, then, is not avoidance of option; it is option of a certain particular kind of risk. *Better risk loss of truth than chance of error*—that is your faith-vetoer's exact position. He is actively playing his stake as much as the believer is; he is backing the field against the religious hypothesis, just as the believer is backing the religious hypothesis against the field. To preach scepticism to us as a duty until "sufficient evidence" for religion be found, is tantamount therefore to telling us, when in presence of the religious hypothesis, that to yield to our fear of its being error is wiser and better than to yield to our hope that it may be true. It is not intellect against all passions, then; it is only intellect with one passion laying down its law. And by what, forsooth, is the supreme wisdom of this passion warranted? Dupery for dupery, what proof is there that dupery through hope is so much worse than dupery through fear? I, for one, can see no proof; and I simply refuse obedience to the scientist's command to imitate his kind of option, in a case where my own stake is important enough to give me the right to choose my own form of risk. If religion be true and the evidence for it be still insufficient, I do not wish, by putting your extinguisher upon my nature (which feels to me as if it had after all some business in this matter), to forfeit my sole chance in life of getting upon the winning side — that chance depending, of course, on my willingness to run the risk of acting as if my passional need of taking the world religiously might be prophetic and right.

All this is on the supposition that it really may be prophetic and right, and that, even to us who are discussing the matter, religion is a live hypothesis which may be true. Now to most of us religion comes in a still farther way that makes a veto on our active faith even more illogical. The more perfect and more eternal aspect of the universe is represented in our religions as having personal form. The universe is no longer a mere *It* to us, but a *Thou*, if we are religious; and any relation that may be possible from person to person might be possible here. For instance, although in one sense we are passive portions of the universe, in another we show a curious autonomy, as if we were small active centers on our own account. We feel, too, as if the appeal of religion to us were made to our own active good-will, as if evidence might be forever withheld from us unless we met the hypothesis half-way. To take a trivial illustration: just as a man who in a company of gentlemen made no advances, asked a warrant for every concession, and believed no one's word without proof, would cut himself off by such churlishness from all the social rewards that a more trusting spirit would earn—so here, one who should shut himself up in snarling logicity and try to make the gods extort his recognition willy-nilly, or not get it at all, might cut himself off forever from his only opportunity of making the gods'

acquaintance. This feeling, forced on us we know not whence, that by obstinately believing that there are gods (although not to do so would be so easy both for our logic and our life) we are doing the universe the deepest service we can, seems part of the living essence of the religious hypothesis. If the hypothesis *were* true in all its parts, including this one, then pure intellectualism, with its veto on our making willing advances, would be an absurdity; and some participation of our sympathetic nature would be logically required. I, therefore, for one, cannot see my way to accepting the agnostic rules for truth-seeking, or willfully agree to keep my willing nature out of the game. I cannot do so for this plain reason, that *a rule of thinking which would absolutely prevent me from acknowledging certain kinds of truth if those kinds of truth were really there, would be an irrational rule*. That for me is the long and short of the formal logic of the situation, no matter what the kinds of truth might materially be.

I confess I do not see how this logic can be escaped. But sad experience makes me fear that some of you may still shrink from radically saying with me, *in abstracto*, that we have the right to believe at our own risk any hypothesis that is live enough to tempt our will. I suspect, however, that if this is so, it is because you have got away from the abstract logical point of view altogether, and are thinking (perhaps without realizing it) of some particular religious hypothesis which for you is dead. The freedom to “believe what we will” you apply to the case of some patent superstition; and the faith you think of is the faith defined by the schoolboy when he said, “Faith is when you believe something that you know ain’t true.” I can only repeat that this is misapprehension. *In concreto*³⁶ the freedom to believe can only cover living options which the intellect of the individual cannot by itself resolve; and living options never seem absurdities to him who has them to consider. When I look at the religious question as it really puts itself to concrete men and when I think of all the possibilities which both practically and theoretically it involves then this command that we shall put a stopper on our heart instincts and courage and *wait*—acting of course meanwhile more or less as if religion were *not* true³⁷ — till doomsday, or till such time as our intellect and senses working together may have raked in evidence enough — this command, I say, seems to me the queerest idol ever manufactured in the philosophic cave. Were we scholastic absolutists, there might be more excuse. If we had an infallible intellect with its objective certitudes, we might feel ourselves disloyal to such a perfect organ of knowledge in not trusting to it exclusively, in not waiting for its releasing word. But if we are empiricists, if we believe that no bell in us tolls to let us know for certain when truth is in our grasp, then it seems a piece of idle fantasticality to preach so solemnly our duty of waiting for the bell. Indeed we *may* wait if we will — I hope you do not think that I am denying that—but if we do so, we do so at our peril as much as if we believed. In either case we *act*, taking our life in our hands. No one of us ought to issue vetoes to the other, nor should we bandy words of abuse. We ought, on the contrary, delicately and profoundly to respect one another’s mental freedom—then only shall we bring about the intellectual republic; then only shall we have that spirit of inner tolerance without which all our outer tolerance is soulless, and which is empiricism’s glory; then only shall we live and let live, in speculative as well as in practical things.

I began by a reference to Fitzjames Stephen; let me end by a quotation from him. “What do you think of yourself? What do you think of the world? ... These are questions with which all must deal as it seems good to them. They are riddles of the Sphinx, and in some way or other we must deal with them... . In all important transactions of life we have to take a leap in the dark... . If we decide to leave the riddles unanswered, that is a choice. If we waver in our answer, that too is a choice; but whatever choice we make, we make it at our peril. If a man chooses to turn his back altogether on God and the future, no one can prevent him. No one can show beyond reasonable doubt that he is mistaken. If a man thinks otherwise, and acts as he thinks, I do not see how any one can prove that *he* is mistaken. Each must act as he thinks best, and if he is wrong so much the worse for him. We stand on a mountain pass in the midst of whirling snow and blinding mist, through which we get glimpses now and then of paths which may be deceptive. If we stand still, we shall be frozen to death. If we take the wrong road, we shall be dashed to pieces. We do not certainly know whether there is any right one. What must we do? ‘Be strong and of a good courage.’ Act for the best, hope for the best, and take what comes... . If death ends all, we cannot meet death better.”³⁸

37. Since belief is measured by action, he who forbids us to believe religion to be true, necessarily also forbids us to act as we should if we did believe it to be true. The whole defence of religious faith hangs upon action. If the action required or inspired by the religious hypothesis is in no way different from that dictated by the naturalistic hypothesis, then religious faith is a pure superfluity, better pruned away, and controversy about its legitimacy is a piece of idle trifling, unworthy of serious minds. I myself believe, of course, that the religious hypothesis gives to the world an expression which specifically determines our reactions, and makes them in a large part unlike what they might be on a purely naturalistic scheme of belief.

Bertrand Russell

Bertrand Russell (1872–1970) was one of the leading thinkers of the twentieth century. He was born into a prominent English family and inherited the title of Earl Russell from his brother. John Stuart Mill was his godfather. Russell received degrees in mathematics and philosophy from Cambridge University in 1893–1894, returning to Cambridge shortly afterward. He took up the project of showing that mathematics could be derived from logic; to this end, he collaborated with Alfred North Whitehead on the development of modern symbolic logic, which was an achievement of signal importance. At Cambridge, Russell was also closely associated with G. E. Moore and Ludwig Wittgenstein, themselves major twentieth-century philosophers.

Russell did not confine his activities to the academy. He was on familiar terms with many of the leading intellectuals and writers of his day, including D. H. Lawrence, Joseph Conrad, Virginia Woolf, and T. S. Eliot (who wrote a poem about him). Russell spent the period from 1938 to 1944 in the United States, where his liberal views about marriage and religion aroused controversy. Russell was an important and courageous public figure, who was willing to go to jail for what he believed in. He was tried and convicted for an article he wrote in opposition to Britain's role in World War I, and at age 88 he was arrested for his role in civil disobedience to promote nuclear disarmament.

Russell's philosophy combined the resources of modern logic with a staunch commitment to empiricism (the view that all knowledge of the world is derived from sense experience). Thus, Russell did much to set the pattern for the way philosophy has been done in English-speaking countries, and as it is practiced today. His contributions were honored with the award of a Nobel Prize for Literature in 1950.

Some of Russell's most important philosophical works are *The Philosophy of Leibniz* (1900), *The Principles of Mathematics* (1903), *Principia Mathematica* with Whitehead (1910–1913), *The Problems of Philosophy* (1912), *Introduction to Mathematical Philosophy* (1919), *The Analysis of Mind* (1921), *The Analysis of Matter* (1927), *An Inquiry into Meaning and Truth* (1940), and *Human Knowledge, Its Scope and Limits* (1948).

The Problems of Philosophy is an introduction to some central questions about the nature of knowledge and reality. In this book Russell undertakes to set out what the issues are, outlining his own views simply and briefly. (He pursues these matters much more fully in his other writings.) Russell's starting point is the natural supposition that what is real are physical objects, and that we gain knowledge about these things by perceiving them. This outlook is not wrong, but it needs to be examined and spelled out with care. For example, depending on where we are, the shape of a coin may look oval to you and circular to me. So, strictly speaking, you and I are experiencing different things: your experience confronts you with something oval, while my experience confronts me with something circular. Since one and the same thing can't be both oval and circular, the items we experience must be different from one another, and different from the coin as well. Russell calls these items "sense-data."

If experience informs us directly about our own sense-data, and not about physical objects, why should we suppose that there are any physical objects at all? Why not say that all there is, and all we know about, are our sense-data? A view like this one, which Russell calls "idealism," was adopted by Berkeley in the eighteenth century, and versions of idealism were prevalent in Britain when Russell came upon the philosophical scene. Russell presents some telling criticisms of the idealists' position. He also makes the positive point that our sense-data exhibit various patterns and regularities. A good explanation of the order in our sense-data is that they are caused by physical objects that exist independently of them. Russell's overthrow of idealism was a turning point in twentieth-century philosophy.

Although Russell maintains that we can have knowledge pertaining to physical objects as well as to sense-data, he distinguishes two different sorts of knowledge, namely *knowledge by acquaintance* and *knowledge by description*. The former is knowledge of *things*, the latter is knowledge of *truths*. All knowledge by description depends on or is derived from knowledge by acquaintance. Russell holds that we may know sense-data by acquaintance, since we experience them directly, but we know physical objects only by description. The scope of our acquaintance not only determines what we can know; it also sets the limits of what we can say or think. Russell writes, "Every proposition which we can understand must be composed wholly of constituents with which we are acquainted."

For Russell, philosophy begins with our ordinary beliefs and tries to clear away vagueness and confusion. Whatever insight we achieve is obtained by thinking as closely, precisely, and rigorously as we can, making use of the resources of logic and science. This conception of philosophy is itself among Russell's most significant

and lasting contributions.

An excellent introduction is A. J. Ayer, *Russell* (New York: Viking Press, 1972). At a more advanced level are A. J. Ayer, *Russell and Moore: The Analytical Heritage* (Cambridge, Mass.: Harvard University Press, 1971); David Pears, *Bertrand Russell and the British Tradition in Philosophy* (New York: Random House, 1967); R. M. Sainsbury, *Russell* (London: Routledge and Kegan Paul, 1979); and Peter Hylton, *Russell, Idealism, and the Emergence of Analytical Philosophy* (New York: Oxford University Press, 1990). An important contemporary critique of the theory of sense-data is J. L. Austin, *Sense and Sensibilia* (excerpted in this volume).

Jonathan Vogel

*The Problems of Philosophy**

CHAPTER I

Appearance and Reality

Is there any knowledge in the world which is so certain that no reasonable man could doubt it? This question, which at first sight might not seem difficult, is really one of the most difficult that can be asked. When we have realized the obstacles in the way of a straightforward and confident answer, we shall be well launched on the study of philosophy—for philosophy is merely the attempt to answer such ultimate questions, not carelessly and dogmatically, as we do in ordinary life and even in the sciences, but critically, after exploring all that makes such questions puzzling, and after realizing all the vagueness and confusion that underlie our ordinary ideas.

In daily life, we assume as certain many things which, on a closer scrutiny, are found to be so full of apparent contradictions that only a great amount of thought enables us to know what it is that we really may believe. In the search for certainty, it is natural to begin with our present experiences, and in some sense, no doubt, knowledge is to be derived from them. But any statement as to what it is that our immediate experiences make us know is very likely to be wrong. It seems to me that I am now sitting in a chair, at a table of a certain shape, on which I see sheets of paper with writing or print. By turning my head I see out of the window buildings and clouds and the sun. I believe that the sun is about ninety-three million miles from the earth; that it is a hot globe many times bigger than the earth; that, owing to the earth's rotation, it rises every morning, and will continue to do so for an indefinite time in the future. I believe that, if any other normal person comes into my room, he will see the same chairs and tables and books and papers as I see, and that the table which I see is the same as the table which I feel pressing against my arm. All this seems to be so evident as to be hardly worth stating, except in answer to a man who doubts whether I know anything. Yet all this may be reasonably doubted, and all of it requires much careful discussion before we can be sure that we have stated it in a form that is wholly true.

To make our difficulties plain, let us concentrate attention on the table. To the eye it is oblong, brown and shiny, to the touch it is smooth and cool and hard; when I tap it, it gives out a wooden sound. Any one else who sees and feels and hears the table will agree with this description, so that it might seem as if no difficulty would arise; but as soon as we try to be more precise our troubles begin. Although I believe that the table is 'really' of the same colour all over, the parts that reflect the light look much brighter than the other parts, and some parts look white because of reflected light. I know that, if I move, the parts that reflect the light will be different, so that the apparent distribution of colours on the table will change. It follows that if several people are looking at the table at the same moment, no two of them will see exactly the same distribution of colours, because no two can see it from exactly the same point of view, and any change in the point of view makes some change in the way the light is reflected.

For most practical purposes these differences are unimportant, but to the painter they are all-important: the painter has to unlearn the habit of thinking that things seem to have the colour which common sense says they 'really' have, and to learn the habit of seeing things as they appear. Here we have already the beginning of one of the distinctions that cause most trouble in philosophy—the distinction between 'appearance' and 'reality', between what things seem to be and what they are. The painter wants to know what things seem to be, the practical man and the philosopher want to know what they are; but the philosopher's wish to know this is stronger than the practical man's, and is more troubled by knowledge as to the difficulties of answering the question.

To return to the table. It is evident from what we have found, that there is no colour which preeminently appears to be *the* colour of the table, or even of any one particular part of the table — it appears to be of different colours from different points of view, and there is no reason for regarding some of these as more really its colour than others. And we know that even from a given point of view the colour will seem different by artificial light, or to a colour-blind man, or to a man wearing blue spectacles, while in the dark there will be no colour at all, though to touch and hearing the table will be unchanged. This colour is not something which is inherent in the table, but something depending upon the table and the spectator and the way the light falls on the table. When, in ordinary life, we speak of *the* colour of the table, we only mean the sort of colour which it will seem to have to a normal spectator from an ordinary point of view under usual conditions of light. But the other colours which appear under other conditions have just as good a right to be considered real; and therefore, to avoid favouritism, we are compelled to deny that, in itself, the table has any one particular colour.

The same thing applies to the texture. With the naked eye one can see the grain, but otherwise the table looks smooth and even. If we looked at it through a microscope, we should see roughnesses and hills and valleys, and all sorts of differences that are imperceptible to the naked eye. Which of these is the 'real' table? We are naturally tempted to say that what we see through the microscope is more real, but that in turn would be changed by a still more powerful microscope. If, then, we cannot trust what we see with the naked eye, why should we trust what we see through a microscope? Thus, again, the confidence in our senses with which we began deserts us.

The *shape* of the table is no better. We are all in the habit of judging as to the 'real' shapes of things, and we do this so unreflectingly that we come to think we actually see the real shapes. But, in fact, as we all have to learn if we try to draw, a given thing looks different in shape from every different point of view. If our table is 'really' rectangular, it will look, from almost all points of view, as if it had two acute angles and two obtuse angles. If opposite sides are parallel, they will look as if they converged to a point away from the spectator; if they are of equal length, they will look as if the nearer side were longer. All these things are not commonly noticed in looking at a table, because experience has taught us to construct the 'real' shape from the apparent shape, and the 'real' shape is what interests us as practical men. But the 'real' shape is not what we see; it is something inferred from what we see. And what we see is constantly changing in shape as we move about the room; so that here again the senses seem not to give us the truth about the table itself, but only about the appearance of the table.

Similar difficulties arise when we consider the sense of touch. It is true that the table always gives us a sensation of hardness, and we feel that it resists pressure. But the sensation we obtain depends upon how hard we press the table and also upon what part of the body we press with; thus the various sensations due to various pressures or various parts of the body cannot be supposed to reveal *directly* any definite property of the table, but at most to be *signs* of some property which perhaps *causes* all the sensations, but is not actually apparent in any of them. And the same applies still more obviously to the sounds which can be elicited by rapping the table.

Thus it becomes evident that the real table, if there is one, is not the same as what we immediately experience by sight or touch or hearing. The real table, if there is one, is not *immediately* known to us at all, but must be an inference from what is immediately known. Hence, two very difficult questions at once arise; namely, (1) Is there a real table at all? (2) If so, what sort of object can it be?

It will help us in considering these questions to have a few simple terms of which the meaning is definite and clear. Let us give the name of 'sense-data' to the things that are immediately known in sensation: such things as colours, sounds, smells, hardnesses, roughnesses, and so on. We shall give the name 'sensation' to the experience of being immediately aware of these things. Thus, whenever we see a colour, we have a sensation *of* colour, but the colour itself is a sense-datum, not a sensation. The colour is that *of* which we are immediately aware, and the awareness itself is the sensation. It is plain that if we are to know anything about the table, it must be by means of the sense-data—brown colour, oblong shape, smoothness, etc.—which we associate with the table; but, for the reasons which have been given, we cannot say that the table *is* the sense-data, or even that the sense-data are directly properties of the table. Thus a problem arises as to the relation of the sense-data to the real table, supposing there is such a thing.

The real table, if it exists, we will call a 'physical object'. Thus we have to consider the relation of sense-data to physical objects. The collection of all physical objects is called 'matter'. Thus our two questions may be re-stated as follows: (1) Is there any such thing as matter? (2) If so, what is its nature?

The philosopher who first brought prominently forward the reasons for regarding the immediate objects of our senses as not existing independently of us was Bishop Berkeley (1685–1753). His *Three Dialogues between Hylas and Philonous, in Opposition to Sceptics and Atheists*, undertake to prove that there is no such thing as matter at all, and that the world consists of nothing but minds and their ideas. Hylas has hitherto believed in matter, but he is no match for Philonous, who mercilessly drives him into contradictions and paradoxes, and makes his own denial of matter seem, in the end, as if it were almost common sense. The arguments employed are of very different value: some are important and sound, others are confused or quibbling. But Berkeley retains the merit of having shown that the existence of matter is capable of being denied without absurdity, and that if there are any things that exist independently of us they cannot be the immediate objects of our sensations.

There are two different questions involved when we ask whether matter exists, and it is important to keep them clear. We commonly mean by 'matter' something which is opposed to 'mind', something which we think of as occupying space and as radically incapable of any sort of thought or consciousness. It is chiefly in this sense that Berkeley denies matter; that is to say, he does not deny that the sense-data which we commonly

take as signs of the existence of the table are really signs of the existence of *something* independent of us, but he does deny that this something is non-mental, that it is neither mind nor ideas entertained by some mind. He admits that there must be something which continues to exist when we go out of the room or shut our eyes, and that what we call seeing the table does really give us reason for believing in something which persists even when we are not seeing it. But he thinks that this something cannot be radically different in nature from what we see, and cannot be independent of seeing altogether, though it must be independent of *our* seeing. He is thus led to regard the 'real' table as an idea in the mind of God. Such an idea has the required permanence and independence of ourselves, without being — as matter would otherwise be — something quite unknowable, in the sense that we can only infer it, and can never be directly and immediately aware of it.

Other philosophers since Berkeley have also held that, although the table does not depend for its existence upon being seen by me, it does depend upon being seen (or otherwise apprehended in sensation) by *some* mind — not necessarily the mind of God, but more often the whole collective mind of the universe. This they hold, as Berkeley does, chiefly because they think there can be nothing real—or at any rate nothing known to be real—except minds and their thoughts and feelings. We might state the argument by which they support their view in some such way as this: 'Whatever can be thought of is an idea in the mind of the person thinking of it; therefore nothing can be thought of except ideas in minds; therefore anything else is inconceivable, and what is inconceivable cannot exist.'

Such an argument, in my opinion, is fallacious; and of course those who advance it do not put it so shortly or so crudely. But whether valid or not, the argument has been very widely advanced in one form or another; and very many philosophers, perhaps a majority, have held that there is nothing real except minds and their ideas. Such philosophers are called 'idealists'. When they come to explaining matter, they either say, like Berkeley, that matter is really nothing but a collection of ideas, or they say, like Leibniz (1646–1716), that what appears as matter is really a collection of more or less rudimentary minds.

But these philosophers, though they deny matter as opposed to mind, nevertheless, in another sense, admit matter. It will be remembered that we asked two questions; namely, (1) Is there a real table at all? (2) If so, what sort of object can it be? Now both Berkeley and Leibniz admit that there is a real table, but Berkeley says it is certain ideas in the mind of God, and Leibniz says it is a colony of souls. Thus both of them answer our first question in the affirmative, and only diverge from the views of ordinary mortals in their answer to our second question. In fact, almost all philosophers seem to be agreed that there is a real table: they almost all agree that, however much our sense-data — colour, shape, smoothness, etc. — may depend upon us, yet their occurrence is a sign of something existing independently of us, something differing, perhaps, completely from our sense-data, and yet to be regarded as causing those sense-data whenever we are in a suitable relation to the real table.

Now obviously this point in which the philosophers are agreed — the view that there *is* a real table, whatever its nature may be—is vitally important, and it will be worth while to consider what reasons there are for accepting this view before we go on to the further question as to the nature of the real table. Our next chapter, therefore, will be concerned with the reasons for supposing that there is a real table at all.

Before we go farther it will be well to consider for a moment what it is that we have discovered so far. It has appeared that, if we take any common object of the sort that is supposed to be known by the senses, what the senses *immediately* tell us is not the truth about the object as it is apart from us, but only the truth about certain sense-data which, so far as we can see, depend upon the relations between us and the object. Thus what we directly see and feel is merely 'appearance', which we believe to be a sign of some 'reality' behind. But if the reality is not what appears, have we any means of knowing whether there is any reality at all? And if so, have we any means of finding out what it is like?

Such questions are bewildering, and it is difficult to know that even the strangest hypotheses may not be true. Thus our familiar table, which has roused but the slightest thoughts in us hitherto, has become a problem full of surprising possibilities. The one thing we know about it is that it is not what it seems. Beyond this modest result, so far, we have the most complete liberty of conjecture. Leibniz tells us it is a community of souls: Berkeley tells us it is an idea in the mind of God; sober science, scarcely less wonderful, tells us it is a vast collection of electric charges in violent motion.

Among these surprising possibilities, doubt suggests that perhaps there is no table at all. Philosophy, if it cannot *answer* so many questions as we could wish, has at least the power of *asking* questions which increase the interest of the world, and show the strangeness and wonder lying just below the surface even in the commonest things of daily life.

CHAPTER II

The Existence of Matter

In this chapter we have to ask ourselves whether, in any sense at all, there is such a thing as matter. Is there a table which has a certain intrinsic nature, and continues to exist when I am not looking, or is the table merely a product of my imagination, a dream-table in a very prolonged dream? This question is of the greatest importance. For if we cannot be sure of the independent existence of the objects, we cannot be sure of the independent existence of other people's bodies, and therefore still less of other people's minds, since we have no grounds for believing in their minds except such as are derived from observing their bodies. Thus if we cannot be sure of the independent existence of objects, we shall be left alone in a desert—it may be that the whole outer world is nothing but a dream, and that we alone exist. This is an uncomfortable possibility; but although it cannot be strictly *proved* to be false, there is not the slightest reason to suppose that it is true. In this chapter we have to see why this is the case.

Before we embark upon doubtful matters, let us try to find some more or less fixed point from which to start. Although we are doubting the physical existence of the table, we are not doubting the existence of the sense-data which made us think there was a table; we are not doubting that, while we look, a certain colour and shape appear to us, and while we press, a certain sensation of hardness is experienced by us. All this, which is psychological, we are not calling in question. In fact, whatever else may be doubtful, some at least of our immediate experiences seem absolutely certain.

Descartes (1596–1650), the founder of modern philosophy, invented a method which may still be used with profit — the method of systematic doubt. He determined that he would believe nothing which he did not see quite clearly and distinctly to be true. Whatever he could bring himself to doubt, he would doubt, until he saw reason for not doubting it. By applying this method he gradually became convinced that the only existence of which he could be *quite* certain was his own. He imagined a deceitful demon, who presented unreal things to his senses in a perpetual phantasmagoria; it might be very improbable that such a demon existed, but still it was possible, and therefore doubt concerning things perceived by the senses was possible.

But doubt concerning his own existence was not possible, for if he did not exist, no demon could deceive him. If he doubted, he must exist; if he had any experiences whatever, he must exist. Thus, his own existence was an absolute certainty to him. '*I think, therefore I am,*' he said (*Cogito, ergo sum*); and on the basis of this certainty he set to work to build up again the world of knowledge which his doubt had laid in ruins. By inventing the method of doubt, and by showing that subjective things are the most certain, Descartes performed a great service to philosophy, and one which makes him still useful to all students of the subject.

But some care is needed in using Descartes' argument. '*I think, therefore I am*' says rather more than is strictly certain. It might seem as though we were quite sure of being the same person to-day as we were yesterday, and this is no doubt true in some sense. But the real Self is as hard to arrive at as the real table, and does not seem to have that absolute, convincing certainty that belongs to particular experiences. When I look at my table and see a certain brown colour, what is quite certain at once is not '*I am seeing a brown colour*', but rather, '*a brown colour is being seen*'. This of course involves something (or somebody) which (or who) sees the brown colour; but it does not of itself involve that more or less permanent person whom we call '*I*'. So far as immediate certainty goes, it might be that the something which sees the brown colour is quite momentary, and not the same as the something which has some different experience the next moment.

Thus it is our particular thoughts and feelings that have primitive certainty. And this applies to dreams and hallucinations as well as to normal perceptions: when we dream or see a ghost, we certainly do have the sensations we think we have, but for various reasons it is held that no physical object corresponds to these sensations. Thus the certainty of our knowledge of our own experiences does not have to be limited in any way to allow for exceptional cases. Here, therefore, we have, for what it is worth, a solid basis from which to begin our pursuit of knowledge.

The problem we have to consider is this: Granted that we are certain of our own sense-data, have we any reason for regarding them as signs of the existence of something else, which we can call the physical object? When we have enumerated all the sense-data which we should naturally regard as connected with the table, have we said all there is to say about the table, or is there still something else — something not a sense-datum, something which persists when we go out of the room? Common sense unhesitatingly answers that there is. What can be bought and sold and pushed about and have a cloth laid on it, and so on, cannot be a *mere*

collection of sense-data. If the cloth completely hides the table, we shall derive no sense-data from the table, and therefore, if the table were merely sense-data, it would have ceased to exist, and the cloth would be suspended in empty air, resting, by a miracle, in the place where the table formerly was. This seems plainly absurd; but whoever wishes to become a philosopher must learn not to be frightened by absurdities.

One great reason why it is felt that we must secure a physical object in addition to the sense-data, is that we want the *same* object for different people. When ten people are sitting round a dinner-table, it seems preposterous to maintain that they are not seeing the same tablecloth, the same knives and forks and spoons and glasses. But the sense-data are private to each separate person; what is immediately present to the sight of one is not immediately present to the sight of another: they all see things from slightly different points of view, and therefore see them slightly differently. Thus, if there are to be public neutral objects, which can be in some sense known to many different people, there must be something over and above the private and particular sense-data which appear to various people. What reason, then, have we for believing that there are such public neutral objects?

The first answer that naturally occurs to one is that, although different people may see the table slightly differently, still they all see more or less similar things when they look at the table, and the variations in what they see follow the laws of perspective and reflection of light, so that it is easy to arrive at a permanent object underlying all the different people's sense-data. I bought my table from the former occupant of my room; I could not buy *his* sense-data, which died when he went away, but I could and did buy the confident expectation of more or less similar sense-data. Thus it is the fact that different people have similar sense-data, and that one person in a given place at different times has similar sense-data, which makes us suppose that over and above the sense-data there is a permanent public object which underlies or causes the sense-data of various people at various times.

Now in so far as the above considerations depend upon supposing that there are other people besides ourselves, they beg the very question at issue. Other people are represented to me by certain sense-data, such as the sight of them or the sound of their voices, and if I had no reason to believe that there were physical objects independent of my sense-data, I should have no reason to believe that other people exist except as part of my dream. Thus, when we are trying to show that there must be objects independent of our own sense-data, we cannot appeal to the testimony of other people, since this testimony itself consists of sense-data, and does not reveal other people's experiences unless our own sense-data are signs of things existing independently of us. We must therefore, if possible, find, in our own purely private experiences, characteristics which show, or tend to show, that there are in the world things other than ourselves and our private experiences.

In one sense it must be admitted that we can never *prove* the existence of things other than ourselves and our experiences. No logical absurdity results from the hypothesis that the world consists of myself and my thoughts and feelings and sensations, and that everything else is mere fancy. In dreams a very complicated world may seem to be present, and yet on waking we find it was a delusion; that is to say, we find that the sense-data in the dream do not appear to have corresponded with such physical objects as we should naturally infer from our sense-data. (It is true that, when the physical world is assumed, it is possible to find physical causes for the sense-data in dreams: a door banging, for instance, may cause us to dream of a naval engagement. But although, in this case, there is a physical *cause* for the sense-data, there is not a physical object *corresponding* to the sense-data in the way in which an actual naval battle would correspond.) There is no logical impossibility in the supposition that the whole of life is a dream, in which we ourselves create all the objects that come before us. But although this is not logically impossible, there is no reason whatever to suppose that it is true; and it is, in fact, a less simple hypothesis, viewed as a means of accounting for the facts of our own life, than the common-sense hypothesis that there really are objects independent of us, whose action on us causes our sensations.

The way in which simplicity comes in from supposing that there really are physical objects is easily seen. If the cat appears at one moment in one part of the room, and at another in another part, it is natural to suppose that it has moved from the one to the other, passing over a series of intermediate positions. But if it is merely a set of sense-data, it cannot have ever been in any place where I did not see it; thus we shall have to suppose that it did not exist at all while I was not looking, but suddenly sprang into being in a new place. If the cat exists whether I see it or not, we can understand from our own experience how it gets hungry between one meal and the next; but if it does not exist when I am not seeing it, it seems odd that appetite should grow during non-existence as fast as during existence. And if the cat consists only of sense-data, it cannot be *hungry*, since no hunger but my own can be a sense-datum to me. Thus the behaviour of the sense-data which represent the cat to me, though it seems quite natural when regarded as an expression of hunger, becomes utterly inexplicable when regarded as mere movements and changes of patches of colour, which are as

incapable of hunger as a triangle is of playing football.

But the difficulty in the case of the cat is nothing compared to the difficulty in the case of human beings. When human beings speak — that is, when we hear certain noises which we associate with ideas, and simultaneously see certain motions of lips and expressions of face — it is very difficult to suppose that what we hear is not the expression of a thought, as we know it would be if we emitted the same sounds. Of course similar things happen in dreams, where we are mistaken as to the existence of other people. But dreams are more or less suggested by what we call waking life, and are capable of being more or less accounted for on scientific principles if we assume that there really is a physical world. Thus every principle of simplicity urges us to adopt the natural view, that there really are objects other than ourselves and our sense-data which have an existence not dependent upon our perceiving them.

Of course it is not by argument that we originally come by our belief in an independent external world. We find this belief ready in ourselves as soon as we begin to reflect: it is what may be called an *instinctive* belief. We should never have been led to question this belief but for the fact that, at any rate in the case of sight, it seems as if the sense-datum itself were instinctively believed to be the independent object, whereas argument shows that the object cannot be identical with the sense-datum. This discovery, however— which is not at all paradoxical in the case of taste and smell and sound, and only slightly so in the case of touch—leaves undiminished our instinctive belief that there *are* objects *corresponding* to our sense-data. Since this belief does not lead to any difficulties, but on the contrary tends to simplify and systematize our account of our experiences, there seems no good reason for rejecting it. We may therefore admit—though with a slight doubt derived from dreams—that the external world does really exist, and is not wholly dependent for its existence upon our continuing to perceive it.

The argument which has led us to this conclusion is doubtless less strong than we could wish, but it is typical of many philosophical arguments, and it is therefore worth while to consider briefly its general character and validity. All knowledge, we find, must be built up upon our instinctive beliefs, and if these are rejected, nothing is left. But among our instinctive beliefs some are much stronger than others, while many have, by habit and association, become entangled with other beliefs, not really instinctive, but falsely supposed to be part of what is believed instinctively.

Philosophy should show us the hierarchy of our instinctive beliefs, beginning with those we hold most strongly, and presenting each as much isolated and as free from irrelevant additions as possible. It should take care to show that, in the form in which they are finally set forth, our instinctive beliefs do not clash, but form a harmonious system. There can never be any reason for rejecting one instinctive belief except that it clashes with others; thus, if they are found to harmonize, the whole system becomes worthy of acceptance.

It is of course *possible* that all or any of our beliefs may be mistaken, and therefore all ought to be held with at least some slight element of doubt. But we cannot have *reason* to reject a belief except on the ground of some other belief. Hence, by organizing our instinctive beliefs and their consequences, by considering which among them is most possible, if necessary, to modify or abandon, we can arrive, on the basis of accepting as our sole data what we instinctively believe, at an orderly systematic organization of our knowledge, in which, though the *possibility* of error remains, its likelihood is diminished by the interrelation of the parts and by the critical scrutiny which has preceded acquiescence.

This function, at least, philosophy can perform. Most philosophers, rightly or wrongly, believe that philosophy can do much more than this—that it can give us knowledge, not otherwise attainable, concerning the universe as a whole, and concerning the nature of ultimate reality. Whether this be the case or not, the more modest function we have spoken of can certainly be performed by philosophy, and certainly suffices, for those who have once begun to doubt the adequacy of common sense, to justify the arduous and difficult labours that philosophical problems involve.

CHAPTER III

The Nature of Matter

In the preceding chapter we agreed, though without being able to find demonstrative reasons, that it is rational to believe that our sense-data—for example, those which we regard as associated with my table—are really signs of the existence of something independent of us and our perceptions. That is to say, over and above the sensations of colour, hardness, noise, and so on, which make up the appearance of the table to me, I assume that there is something else, *of* which these things are appearances. The colour ceases to exist if I shut my eyes, the sensation of hardness ceases to exist if I remove my arm from contact with the table, the sound ceases to exist if I cease to rap the table with my knuckles. But I do not believe that when all these things cease the table ceases. On the contrary, I believe that it is because the table exists continuously that all these sense-data will reappear when I open my eyes, replace my arm, and begin again to rap with my knuckles. The question we have to consider in this chapter is: What is the nature of this real table, which persists independently of my perception of it?

To this question physical science gives an answer, somewhat incomplete it is true, and in part still very hypothetical, but yet deserving of respect so far as it goes. Physical science, more or less unconsciously, has drifted into the view that all natural phenomena ought to be reduced to motions. Light and heat and sound are all due to wave-motions, which travel from the body emitting them to the person who sees light or feels heat or hears sound. That which has the wave-motion is either aether or 'gross matter', but in either case is what the philosopher would call matter. The only properties which science assigns to it are position in space, and the power of motion according to the laws of motion. Science does not deny that it *may* have other properties; but if so, such other properties are not useful to the man of science, and in no way assist him in explaining the phenomena.

It is sometimes said that 'light *is* a form of wave-motion', but this is misleading, for the light which we immediately see, which we know directly by means of our senses, is *not* a form of wave-motion, but something quite different — something which we all know if we are not blind, though we cannot describe it so as to convey our knowledge to a man who is blind. A wave-motion, on the contrary, could quite well be described to a blind man, since he can acquire a knowledge of space by the sense of touch; and he can experience a wave-motion by a sea voyage almost as well as we can. But this, which a blind man can understand, is not what we mean by *light*: we mean by *light* just that which a blind man can never understand, and which we can never describe to him.

Now this something, which all of us who are not blind know, is not, according to science, really to be found in the outer world: it is something caused by the action of certain waves upon the eyes and nerves and brain of the person who sees the light. When it is said that light *is* waves, what is really meant is that waves are the physical cause of our sensations of light. But light itself, the thing which seeing people experience and blind people do not, is not supposed by science to form any part of the world that is independent of us and our senses. And very similar remarks would apply to other kinds of sensations.

It is not only colours and sounds and so on that are absent from the scientific world of matter, but also *space* as we get it through sight or touch. It is essential to science that its matter should be in *a* space, but the space in which it is cannot be exactly the space we see or feel. To begin with, space as we see it is not the same as space as we get it by the sense of touch; it is only by experience in infancy that we learn how to touch things we see, or how to get a sight of things which we feel touching us. But the space of science is neutral as between touch and sight; thus it cannot be either the space of touch or the space of sight.

Again, different people see the same object as of different shapes, according to their point of view. A circular coin, for example, though we should always *judge* it to be circular, will *look* oval unless we are straight in front of it. When we judge that it *is* circular, we are judging that it has a real shape which is not its apparent shape, but belongs to it intrinsically apart from its appearance. But this real shape, which is what concerns science, must be in a real space, not the same as anybody's *apparent* space. The real space is public, the apparent space is private to the percipient. In different people's *private* spaces the same object seems to have different shapes; thus the real space, in which it has its real shape, must be different from the private spaces. The space of science, therefore, though *connected* with the spaces we see and feel, is not identical with them, and the manner of its connexion requires investigation.

We agreed provisionally that physical objects cannot be quite like our sense-data, but may be regarded as

causing our sensations. These physical objects are in the space of science, which we may call 'physical' space. It is important to notice that, if our sensations are to be caused by physical objects, there must be a physical space containing these objects and our sense-organs and nerves and brain. We get a sensation of touch from an object when we are in contact with it; that is to say, when some part of our body occupies a place in physical space quite close to the space occupied by the object. We see an object (roughly speaking) when no opaque body is between the object and our eyes in physical space. Similarly, we only hear or smell or taste an object when we are sufficiently near to it, or when it touches the tongue, or has some suitable position in physical space relatively to our body. We cannot begin to state what different sensations we shall derive from a given object under different circumstances unless we regard the object and our body as both in one physical space, for it is mainly the relative positions of the object and our body that determine what sensations we shall derive from the object.

Now our sense-data are situated in our private spaces, either the space of sight or the space of touch or such vaguer spaces as other senses may give us. If, as science and common sense assume, there is one public all-embracing physical space in which physical objects are, the relative positions of physical objects in physical space must more or less correspond to the relative positions of sense-data in our private spaces. There is no difficulty in supposing this to be the case. If we see on a road one house nearer to us than another, our other senses will bear out the view that it is nearer; for example, it will be reached sooner if we walk along the road. Other people will agree that the house which looks nearer to us is nearer; the Ordnance map will take the same view; and thus everything points to a spatial relation between the houses corresponding to the relation between the sense-data which we see when we look at the houses. Thus we may assume that there is a physical space in which physical objects have spatial relations corresponding to those which the corresponding sense-data have in our private spaces. It is this physical space which is dealt with in geometry and assumed in physics and astronomy.

Assuming that there is physical space, and that it does thus correspond to private spaces, what can we know about it? We can know *only* what is required in order to secure the correspondence. That is to say, we can know nothing of what it is like in itself, but we can know the sort of arrangement of physical objects which results from their spatial relations. We can know, for example, that the earth and moon and sun are in one straight line during an eclipse, though we cannot know what a physical straight line is in itself, as we know the look of a straight line in our visual space. Thus we come to know much more about the *relations* of distances in physical space than about the distances themselves; we may know that one distance is greater than another, or that it is along the same straight line as the other, but we cannot have that immediate acquaintance with physical distances that we have with distances in our private spaces, or with colours or sounds or other sense-data. We can know all those things about physical space which a man born blind might know through other people about the space of sight; but the kind of things which a man born blind could never know about the space of sight we also cannot know about physical space. We can know the properties of the relations required to preserve the correspondence with sense-data, but we cannot know the nature of the terms between which the relations hold.

With regard to time, our *feeling* of duration or of the lapse of time is notoriously an unsafe guide as to the time that has elapsed by the clock. Times when we are bored or suffering pain pass slowly, times when we are agreeably occupied pass quickly, and times when we are sleeping pass almost as if they did not exist. Thus, in so far as time is constituted by duration, there is the same necessity for distinguishing a public and a private time as there was in the case of space. But in so far as time consists in an *order* of before and after, there is no need to make such a distinction; the time-order which events seem to have is, so far as we can see, the same as the time-order which they do have. At any rate no reason can be given for supposing that the two orders are not the same. The same is usually true of space: if a regiment of men are marching along a road, the *shape* of the regiment will look different from different points of view, but the men will appear arranged in the same *order* from all points of view. Hence we regard the *order* as true also in physical space, whereas the *shape* is only supposed to correspond to the physical space so far as is required for the preservation of the order.

In saying that the time-order which events *seem to have* is the same as the time-order which they *really have*, it is necessary to guard against a possible misunderstanding. It must not be supposed that the various states of different physical objects have the same time-order as the sense-data which constitute the perceptions of those objects. Considered as physical objects, the thunder and lightning are simultaneous; that is to say, the lightning is simultaneous with the disturbance of the air in the place where the disturbance begins, namely, where the lightning is. But the sense-datum which we call hearing the thunder does not take place until the disturbance of the air has travelled as far as to where we are. Similarly, it takes about eight minutes for the sun's light to reach us; thus, when we see the sun we are seeing the sun of eight minutes ago. So far as our

sense-data afford evidence as to the physical sun they afford evidence as to the physical sun of eight minutes ago; if the physical sun had ceased to exist within the last eight minutes, that would make no difference to the sense-data which we call 'seeing the sun'. This affords a fresh illustration of the necessity of distinguishing between sense-data and physical objects.

What we have found as regards space is much the same as what we find in relation to the correspondence of the sense-data with their physical counterparts. If one object looks blue and another red, we may reasonably presume that there is some corresponding difference between the physical objects; if two objects both look blue, we may presume a corresponding similarity. But we cannot hope to be acquainted directly with the quality in the physical object which makes it look blue or red. Science tells us that this quality is a certain sort of wave-motion, and this sounds familiar, because we think of wave-motions in the space we see. But the wave-motions must really be in physical space, with which we have no direct acquaintance; thus the real wave-motions have not that familiarity which we might have supposed them to have. And what holds for colours is closely similar to what holds for other sense-data. Thus we find that, although the *relations* of physical objects have all sorts of knowable properties, derived from their correspondence with the relations of sense-data, the physical objects themselves remain unknown in their intrinsic nature, so far at least as can be discovered by means of the senses. The question remains whether there is any other method of discovering the intrinsic nature of physical objects.

The most natural, though not ultimately the most defensible, hypothesis to adopt in the first instance, at any rate as regards visual sense-data, would be that, though physical objects cannot, for the reasons we have been considering, be *exactly* like sense-data, yet they may be more or less like. According to this view, physical objects will, for example, really have colours, and we might, by good luck, see an object as of the colour it really is. The colour which an object seems to have at any given moment will in general be very similar, though not quite the same, from many different points of view; we might thus suppose the 'real' colour to be a sort of medium colour, intermediate between the various shades which appear from the different points of view.

Such a theory is perhaps not capable of being definitely refuted, but it can be shown to be groundless. To begin with, it is plain that the colour we see depends only upon the nature of the light-waves that strike the eye, and is therefore modified by the medium intervening between us and the object, as well as by the manner in which light is reflected from the object in the direction of the eye. The intervening air alters colours unless it is perfectly clear, and any strong reflection will alter them completely. Thus the colour we see is a result of the ray as it reaches the eye, and not simply a property of the object from which the ray comes. Hence, also, provided certain waves reach the eye, we shall see a certain colour, whether the object from which the waves start has any colour or not. Thus it is quite gratuitous to suppose that physical objects have colours, and therefore there is no justification for making such a supposition. Exactly similar arguments will apply to other sense-data.

It remains to ask whether there are any general philosophical arguments enabling us to say that, if matter is real, it *must* be of such and such a nature. As explained above, very many philosophers, perhaps most, have held that whatever is real must be in some sense mental, or at any rate that whatever we can know anything about must be in some sense mental. Such philosophers are called 'idealists'. Idealists tell us that what appears as matter is really something mental; namely, either (as Leibniz held) more or less rudimentary minds, or (as Berkeley contended) ideas in the minds which, as we should commonly say, 'perceive' the matter. Thus idealists deny the existence of matter as something intrinsically different from mind, though they do not deny that our sense-data are signs of something which exists independently of our private sensations. In the following chapter we shall consider briefly the reasons — in my opinion fallacious — which idealists advance in favour of their theory.

CHAPTER IV

Idealism

The word 'idealism' is used by different philosophers in somewhat different senses. We shall understand by it the doctrine that whatever exists, or at any rate whatever can be known to exist, must be in some sense mental. This doctrine, which is very widely held among philosophers, has several forms, and is advocated on several different grounds. The doctrine is so widely held, and so interesting in itself, that even the briefest survey of philosophy must give some account of it.

Those who are unaccustomed to philosophical speculation may be inclined to dismiss such a doctrine as obviously absurd. There is no doubt that common sense regards tables and chairs and the sun and moon and material objects generally as something radically different from minds and the contents of minds, and as having an existence which might continue if minds ceased. We think of matter as having existed long before there were any minds, and it is hard to think of it as a mere product of mental activity. But whether true or false, idealism is not to be dismissed as obviously absurd.

We have seen that, even if physical objects do have an independent existence, they must differ very widely from sense-data, and can only have a *correspondence* with sense-data, in the same sort of way in which a catalogue has a correspondence with the things catalogued. Hence common sense leaves us completely in the dark as to the true intrinsic nature of physical objects, and if there were good reason to regard them as mental, we could not legitimately reject this opinion merely because it strikes us as strange. The truth about physical objects *must* be strange. It *may* be unattainable, but if any philosopher believes that he has attained it, the fact that what he offers as the truth is strange ought not to be made a ground of objection to his opinion.

The grounds on which idealism is advocated are generally grounds derived from the theory of knowledge, that is to say, from a discussion of the conditions which things must satisfy in order that we may be able to know them. The first serious attempt to establish idealism on such grounds was that of Bishop Berkeley. He proved first, by arguments which were largely valid, that our sense-data cannot be supposed to have an existence independent of us, but must be, in part at least, 'in' the mind, in the sense that their existence would not continue if there were no seeing or hearing or touching or smelling or tasting. So far, his contention was almost certainly valid, even if some of his arguments were not so. But he went on to argue that sense-data were the only things of whose existence our perceptions could assure us, and that to be known is to be 'in' a mind, and therefore to be mental. Hence he concluded that nothing can ever be known except what is in some mind, and that whatever is known without being in my mind must be in some other mind.

In order to understand his argument, it is necessary to understand his use of the word 'idea'. He gives the name 'idea' to anything which is *immediately* known, as, for example, sense-data are known. Thus a particular colour which we see is an idea; so is a voice which we hear, and so on. But the term is not wholly confined to sense-data. There will also be things remembered or imagined, for with such things also we have immediate acquaintance at the moment of remembering or imaging. All such immediate data he calls 'ideas'.

He then proceeds to consider common objects, such as a tree, for instance. He shows that all we know immediately when we 'perceive' the tree consists of ideas in his sense of the word, and he argues that there is not the slightest ground for supposing that there is anything real about the tree except what is perceived. Its being, he says, consists in being perceived: in the Latin of the schoolmen its '*esse*' is *percipi*'. He fully admits that the tree must continue to exist even when we shut our eyes or when no human being is near it. But this continued existence, he says, is due to the fact that God continues to perceive it; the 'real' tree, which corresponds to what we call the physical object, consists of ideas in the mind of God, ideas more or less like those we have when we see the tree, but differing in the fact that they are permanent in God's mind so long as the tree continues to exist. All our perceptions, according to him, consist in a partial participation in God's perceptions, and it is because of this participation that different people see more or less the same tree. Thus apart from minds and their ideas there is nothing in the world, nor is it possible that anything else should ever be known, since whatever is known is necessarily an idea.

There are in this argument a good many fallacies which have been important in the history of philosophy, and which it will be as well to bring to light. In the first place, there is a confusion engendered by the use of the word 'idea'. We think of an idea as essentially something *in* somebody's mind, and thus when we are told a tree consists entirely of ideas, it is natural to suppose that, if so, the tree must be entirely in minds. But the notion of being 'in' the mind is ambiguous. We speak of bearing a person in mind, not meaning that the

person is in our minds, but that a thought of him is in our minds. When a man says that some business he had to arrange went clean out of his mind, he does not mean to imply that the business itself was ever in his mind, but only that a thought of the business was formerly in his mind, but afterwards ceased to be in his mind. And so when Berkeley says that the tree must be in our minds if we can know it, all that he really has a right to say is that a thought of the tree must be in our minds. To argue that the tree itself must be in our minds is like arguing that a person whom we bear in mind is himself in our minds. This confusion may seem too gross to have been really committed by any competent philosopher, but various attendant circumstances rendered it possible. In order to see how it was possible, we must go more deeply into the question as to the nature of ideas.

Before taking up the general question of the nature of ideas, we must disentangle two entirely separate questions which arise concerning sense-data and physical objects. We saw that, for various reasons of detail, Berkeley was right in treating the sense-data which constitute our perception of the tree as more or less subjective, in the sense that they depend upon us as much as upon the tree, and would not exist if the tree were not being perceived. But this is an entirely different point from the one by which Berkeley seeks to prove that whatever can be immediately known *must* be in a mind. For this purpose arguments of detail as to the dependence of sense-data upon us are useless. It is necessary to prove, generally, that by being known, things are shown to be mental. This is what Berkeley believes himself to have done. It is this question, and not our previous question as to the difference between sense-data and the physical object, that must now concern us.

Taking the word 'idea' in Berkeley's sense, there are two quite distinct things to be considered whenever an idea is before the mind. There is on the one hand the thing of which we are aware — say the colour of my table — and on the other hand the actual awareness itself, the mental act of apprehending the thing. The mental act is undoubtedly mental, but is there any reason to suppose that the thing apprehended is in any sense mental? Our previous arguments concerning the colour did not prove it to be mental; they only proved that its existence depends upon the relation of our sense organs to the physical object—in our case, the table. That is to say, they proved that a certain colour will exist, in a certain light, if a normal eye is placed at a certain point relatively to the table. They did not prove that the colour is in the mind of the percipient.

Berkeley's view, that obviously the colour *must* be in the mind, seems to depend for its plausibility upon confusing the thing apprehended with the act of apprehension. Either of these might be called an apprehension. Either of these might be called an 'idea'; probably either would have been called an idea by Berkeley. The act is undoubtedly in the mind; hence, when we are thinking of the act, we readily assent to the view that ideas must be in the mind. Then, forgetting that this was only true when ideas were taken as acts of apprehension, we transfer the proposition that 'ideas are in the mind' to ideas in the other sense, i.e., to the things apprehended by our acts of apprehension. Thus, by an unconscious equivocation, we arrive at the conclusion that whatever we can apprehend must be in our minds. This seems to be the true analysis of Berkeley's argument, and the ultimate fallacy upon which it rests.

This question of the distinction between act and object in our apprehending of things is vitally important, since our whole power of acquiring knowledge is bound up with it. The faculty of being acquainted with things other than itself is the main characteristic of a mind. Acquaintance with objects essentially consists in a relation between the mind and something other than the mind; it is this that constitutes the mind's power of knowing things. If we say that the things known must be in the mind, we are either unduly limiting the mind's power of knowing, or we are uttering a mere tautology. We are uttering a mere tautology if we mean by '*in the mind*' the same as by '*before the mind*', i.e., if we mean merely being apprehended by the mind. But if we mean this, we shall have to admit that what, *in this sense*, is in the mind, may nevertheless be not mental. Thus when we realize the nature of knowledge, Berkeley's argument is seen to be wrong in substance as well as in form, and his grounds for supposing that ideas'—i.e., the objects apprehended — must be mental, are found to have no validity whatever. Hence his grounds in favour of idealism may be dismissed. It remains to see whether there are any other grounds.

It is often said, as though it were a self-evident truism, that we cannot know that anything exists which we do not know. It is inferred that whatever can in any way be relevant to our experience must be at least capable of being known by us; whence it follows that if matter were essentially something with which we could not become acquainted, matter would be something which we could not know to exist, and which could have for us no importance whatever. It is generally also implied, for reasons which remain obscure, that what can have no importance for us cannot be real, and that therefore matter, if it is not composed of minds or of mental ideas, is impossible and a mere chimera.

To go into this argument fully at our present stage would be impossible, since it raises points requiring a considerable preliminary discussion; but certain reasons for rejecting the argument may be noticed at once. To

begin at the end: there is no reason why what cannot have any *practical* importance for us should not be real. It is true that, if *theoretical* importance is included, everything real is of *some* importance to us, since, as persons desirous of knowing the truth about the universe, we have some interest in everything that the universe contains. But if this sort of interest is included, it is not the case that matter has no importance for us, provided it exists, even if we cannot know that it exists. We can, obviously, suspect that it may exist, and wonder whether it does; hence it is connected with our desire for knowledge, and has the importance of either satisfying or thwarting this desire.

Again, it is by no means a truism, and is in fact false, that we cannot know that anything exists which we do not know. The word 'know' is here used in two different senses. (1) In its first use it is applicable to the sort of knowledge which is opposed to error, the sense in which what we know is *true*, the sense which applies to our beliefs and convictions, i.e., to what are called *judgments*. In this sense of the word we know *that* something is the case. This sort of knowledge may be described as knowledge of *truths*. (2) In the second use of the word 'know' above, the word applies to our knowledge of *things*, which we may call *acquaintance*. This is the sense in which we know sense data. (The distinction involved is roughly that between *savoir* and *connaître* in French, or between *wissen* and *kennen* in German.)

Thus the statement which seemed like a truism becomes, when re-stated, the following: 'We can never truly judge that something with which we are not acquainted exists.' This is by no means a truism, but on the contrary a palpable falsehood. I have not the honour to be acquainted with the Emperor of China, but I truly judge that he exists. It may be said, of course, that I judge this because of other people's acquaintance with him. This, however, would be an irrelevant retort, since, if the principle were true, I could not know that any one else is acquainted with him. But further: there is no reason why I should not know of the existence of something with which *nobody* is acquainted. This point is important, and demands elucidation.

If I am acquainted with a thing which exists, my acquaintance gives me the knowledge that it exists. But it is not true that, conversely, whenever I can know that a thing of a certain sort exists, I or some one else must be acquainted with the thing. What happens, in cases where I have true judgement without acquaintance, is that the thing is known to me by *description*, and that, in virtue of some general principle, the existence of a thing answering to this description can be inferred from the existence of something with which I am acquainted. In order to understand this point fully, it will be well first to deal with the difference between knowledge by acquaintance and knowledge by description, and then to consider what knowledge of general principles, if any, has the same kind of certainty as our knowledge of the existence of our own experiences. These subjects will be dealt with in the following chapters.

CHAPTER V

Knowledge by Acquaintance and Knowledge by Description

In the preceding chapter we saw that there are two sorts of knowledge: knowledge of things, and knowledge of truths. In this chapter we shall be concerned exclusively with knowledge of things, of which in turn we shall have to distinguish two kinds. Knowledge of things, when it is of the kind we call knowledge by *acquaintance*, is essentially simpler than any knowledge of truths, and logically independent of knowledge of truths, though it would be rash to assume that human beings ever, in fact, have acquaintance with things without at the same time knowing some truth about them. Knowledge of things by *description*, on the contrary, always involves, as we shall find in the course of the present chapter, some knowledge of truths as its source and ground. But first of all we must make clear what we mean by 'acquaintance' and what we mean by 'description'.

We shall say that we have *acquaintance* with anything of which we are directly aware, without the intermediary of any process of inference or any knowledge of truths. Thus in the presence of my table I am acquainted with the sense-data that make up the appearance of my table — its colour, shape, hardness, smoothness, etc.; all these are things of which I am immediately conscious when I am seeing and touching my table. The particular shade of colour that I am seeing may have many things said about it—I may say that it is brown, that it is rather dark, and so on. But such statements, though they make me know truths *about* the colour, do not make me know the colour itself any better than I did before: so far as concerns knowledge of the colour itself, as opposed to knowledge of truths about it, I know the colour perfectly and completely when I see it, and no further knowledge of it itself is even theoretically possible. Thus the sense-data which make up the appearance of my table are things with which I have acquaintance, things immediately known to me just as they are.

My knowledge of the table as a physical object, on the contrary, is not direct knowledge. Such as it is, it is obtained through acquaintance with the sense-data that make up the appearance of the table. We have seen that it is possible, without absurdity, to doubt whether there is a table at all, whereas it is not possible to doubt the sense-data. My knowledge of the table is of the kind which we shall call 'knowledge by description'. The table is 'the physical object which causes such-and-such sense-data'. This *describes* the table by means of the sense-data. In order to know anything at all about the table, we must know truths connecting it with things with which we have acquaintance: we must know that 'such-and-such sense-data are caused by a physical object'. There is no state of mind in which we are directly aware of the table; all our knowledge of the table is really knowledge of *truths*, and the actual thing which is the table is not, strictly speaking, known to us at all. We know a description, and we know that there is just one object to which this description applies, though the object itself is not directly known to us. In such a case, we say that our knowledge of the object is knowledge by description.

All our knowledge, both knowledge of things and knowledge of truths, rests upon acquaintance as its foundation. It is therefore important to consider what kinds of things there are with which we have acquaintance.

Sense-data, as we have already seen, are among the things with which we are acquainted; in fact, they supply the most obvious and striking example of knowledge by acquaintance. But if they were the sole example, our knowledge would be very much more restricted than it is. We should only know what is now present to our senses: we could not know anything about the past—not even that there was a past—nor could we know any truths about our sense-data, for all knowledge of truths, as we shall show, demands acquaintance with things which are of an essentially different character from sense-data, the things which are sometimes called 'abstract ideas', but which we shall call 'universals'. We have therefore to consider acquaintance with other things besides sense-data if we are to obtain any tolerably adequate analysis of our knowledge.

The first extension beyond sense-data to be considered is acquaintance by *memory*. It is obvious that we often remember what we have seen or heard or had otherwise present to our senses, and that in such cases we are still immediately aware of what we remember, in spite of the fact that it appears as past and not as present. This immediate knowledge by memory is the source of all our knowledge concerning the past: without it, there could be no knowledge of the past by inference, since we should never know that there was anything past to be inferred.

The next extension to be considered is acquaintance by *introspection*. We are not only aware of things, but we are often aware of being aware of them. When I see the sun, I am often aware of my seeing the sun; thus

'my seeing the sun' is an object with which I have acquaintance. When I desire food, I may be aware of my desire for food; thus 'my desiring food' is an object with which I am acquainted. Similarly we may be aware of our feeling pleasure or pain, and generally of the events which happen in our minds. This kind of acquaintance, which may be called self-consciousness, is the source of all our knowledge of mental things. It is obvious that it is only what goes on in our own minds that can be thus known immediately. What goes on in the minds of others is known to us through our perception of their bodies, that is, through the sense-data in us which are associated with their bodies. But for our acquaintance with the contents of our own minds, we should be unable to imagine the minds of others, and therefore we could never arrive at the knowledge that they have minds. It seems natural to suppose that self-consciousness is one of the things that distinguish men from animals: animals, we may suppose, though they have acquaintance with sense-data, never become aware of this acquaintance. I do not mean that they *doubt* whether they exist, but that they have never become conscious of the fact that they have sensations and feelings, nor therefore of the fact that they, the subjects of their sensations and feelings, exist.

We have spoken of acquaintance with the contents of our minds as self-consciousness, but it is not, of course, consciousness of our *self*: it is consciousness of particular thoughts and feelings. The question whether we are also acquainted with our bare selves, as opposed to particular thoughts and feelings, is a very difficult one, upon which it would be rash to speak positively. When we try to look into ourselves we always seem to come upon some particular thought or feeling, and not upon the 'I' which has the thought or feeling. Nevertheless there are some reasons for thinking that we are acquainted with the 'I', though the acquaintance is hard to disentangle from other things. To make clear what sort of reason there is, let us consider for a moment what our acquaintance with particular thoughts really involves.

When I am acquainted with 'my seeing the sun', it seems plain that I am acquainted with two different things in relation to each other. On the one hand there is the sense-datum which represents the sun to me, on the other hand there is that which sees this sense-datum. All acquaintance, such as my acquaintance with the sense-datum which represents the sun, seems obviously a relation between the person acquainted and the object with which the person is acquainted. When a case of acquaintance is one with which I can be acquainted (as I am acquainted with my acquaintance with the sense-datum representing the sun), it is plain that the person acquainted is myself. Thus, when I am acquainted with my seeing the sun, the whole fact with which I am acquainted is 'Self-acquainted-with-sense-datum'.

Further, we know the truth 'I am acquainted with this sense-datum'. It is hard to see how we could know this truth, or even understand what is meant by it, unless we were acquainted with something which we call 'I'. It does not seem necessary to suppose that we are acquainted with a more or less permanent person, the same to-day as yesterday, but it does seem as though we must be acquainted with that thing, whatever its nature, which sees the sun and has acquaintance with sense-data. Thus, in some sense it would seem we must be acquainted with our Selves as opposed to our particular experiences. But the question is difficult, and complicated arguments can be adduced on either side. Hence, although acquaintance with ourselves seems *probably* to occur, it is not wise to assert that it undoubtedly does occur.

We may therefore sum up as follows what has been said concerning acquaintance with things that exist. We have acquaintance in sensation with the data of the outer senses, and in introspection with the data of what may be called the inner sense — thoughts, feelings, desires, etc.; we have acquaintance in memory with things which have been data either of the outer senses or of the inner sense. Further, it is probable, though not certain, that we have acquaintance with Self, as that which is aware of things or has desires towards things.

In addition to our acquaintance with particular existing things, we also have acquaintance with what we shall call *universals*, that is to say, general ideas, such as *whiteness*, *diversity*, *brotherhood*, and so on. Every complete sentence must contain at least one word which stands for a universal, since all verbs have a meaning which is universal. We shall return to universals later on ...; for the present, it is only necessary to guard against the supposition that whatever we can be acquainted with must be something particular and existent. Awareness of universals is called *conceiving*, and a universal of which we are aware is called a *concept*.

It will be seen that among the objects with which we are acquainted are not included physical objects (as opposed to sense-data), nor other people's minds. These things are known to us by what I call 'knowledge by description', which we must now consider.

By a 'description' I mean any phrase of the form 'a so-and-so' or 'the so-and-so'. A phrase of the form 'a so-and-so' I shall call an 'ambiguous' description; a phrase of the form 'the so-and-so' (in the singular) I shall call a 'definite' description. Thus 'a man' is an ambiguous description, and 'the man with the iron mask' is a definite description. There are various problems connected with ambiguous descriptions, but I pass them by, since they do not directly concern the matter we are discussing, which is the nature of our knowledge

concerning objects in cases where we know that there is an object answering to a definite description, though we are not *acquainted* with any such object. This is a matter which is concerned exclusively with *definite* descriptions. I shall therefore, in the sequel, speak simply of 'descriptions' when I mean 'definite descriptions'. Thus a description will mean any phrase of the form 'the so-and-so' in the singular.

We shall say that an object is 'known by description' when we know that it is 'the so-and-so', i.e., when we know that there is one object, and no more, having a certain property; and it will generally be implied that we do not have knowledge of the same object by acquaintance. We know that the man with the iron mask existed, and many propositions are known about him; but we do not know who he was. We know that the candidate who gets the most votes will be elected, and in this case we are very likely also acquainted (in the only sense in which one can be acquainted with some one else) with the man who is, in fact, the candidate who will get most votes; but we do not know which of the candidates he is, i.e., we do not know any proposition of the form 'A is the candidate who will get most votes' where A is one of the candidates by name. We shall say that we have 'merely descriptive knowledge' of the so-and-so when, although we know that the so-and-so exists, and although we may possibly be acquainted with the object which is, in fact, the so-and-so, yet we do not know any proposition '*a* is the so-and-so', where *a* is something with which we are acquainted.

When we say 'the so-and-so exists', we mean that there is just one object which is the so-and-so. The proposition '*a* is the so-and-so' means that *a* has the property so-and-so, and nothing else has. 'Mr. A. is the Unionist candidate for this constituency' means 'Mr. A. is a Unionist candidate for this constituency, and no one else is'. 'The Unionist candidate for this constituency exists' means 'some one is a Unionist candidate for this constituency, and no one else is'. Thus, when we are acquainted with an object which is the so-and-so, we know that the so-and-so exists; but we may know that the so-and-so exists when we are not acquainted with any object which we know to be the so-and-so, and even when we are not acquainted with any object which, in fact, is the so-and-so.

Common words, even proper names, are usually really descriptions. That is to say, the thought in the mind of a person using a proper name correctly can generally only be expressed explicitly if we replace the proper name by a description. Moreover, the description required to express the thought will vary for different people, or for the same person at different times. The only thing constant (so long as the name is rightly used) is the object to which the name applies. But so long as this remains constant, the particular description involved usually makes no difference to the truth or falsehood of the proposition in which the name appears.

Let us take some illustrations. Suppose some statement made about Bismarck. Assuming that there is such a thing as direct acquaintance with oneself, Bismarck himself might have used his name directly to designate the particular person with whom he was acquainted. In this case, if he made a judgement about himself, he himself might be a constituent of the judgement. Here the proper name has the direct use which it always wishes to have, as simply standing for a certain object, and not for a description of the object. But if a person who knew Bismarck made a judgement about him, the case is different. What this person was acquainted with were certain sense-data which he connected (rightly, we will suppose) with Bismarck's body. His body, as a physical object, and still more his mind, were only known as the body and the mind connected with these sense-data. That is, they were known by description. It is, of course, very much a matter of chance which characteristics of a man's appearance will come into a friend's mind when he thinks of him; thus the description actually in the friend's mind is accidental. The essential point is that he knows that the various descriptions all apply to the same entity, in spite of not being acquainted with the entity in question.

When we, who did not know Bismarck, make a judgement about him, the description in our minds will probably be some more or less vague mass of historical knowledge — far more, in most cases, than is required to identify him. But, for the sake of illustration, let us assume that we think of him as 'the first Chancellor of the German Empire'. Here all the words are abstract except 'German'. The word 'German' will, again, have different meanings for different people. To some it will recall travels in Germany, to some the look of Germany on the map, and so on. But if we are to obtain a description which we know to be applicable, we shall be compelled, at some point, to bring in a reference to a particular with which we are acquainted. Such reference is involved in any mention of past, present, and future (as opposed to definite dates), or of here and there, or of what others have told us. Thus it would seem that, in some way or other, a description known to be applicable to a particular must involve some reference to a particular with which we are acquainted, if our knowledge about the thing described is not to be merely what follows *logically* from the description. For example, 'the most long-lived of men' is a description involving only universals, which must apply to some man, but we can make no judgements concerning this man which involve knowledge about him beyond what the description gives. If, however, we say, 'The first Chancellor of the German Empire was an astute diplomatist', we can only be assured of the truth of our judgement in virtue of something with which we are

acquainted—usually a testimony heard or read. Apart from the information we convey to others, apart from the fact about the actual Bismarck, which gives importance to our judgement, the thought we really have contains the one or more particulars involved, and otherwise consists wholly of concepts.

All names of places — London, England, Europe, the Earth, the Solar System—similarly involve, when used, descriptions which start from some one or more particulars with which we are acquainted. I suspect that even the Universe, as considered by metaphysics, involves such a connexion with particulars. In logic, on the contrary, where we are concerned not merely with what does exist, but with whatever might or could exist or be, no reference to actual particulars is involved.

It would seem that, when we make a statement about something only known by description, we often *intend* to make our statement, not in the form involving the description, but about the actual thing described. That is to say, when we say anything about Bismarck, we should like, if we could, to make the judgement which Bismarck alone can make, namely, the judgment of which he himself is a constituent. In this we are necessarily defeated, since the actual Bismarck is unknown to us. But we know that there is an object B, called Bismarck, and that B was an astute diplomatist. We can thus *describe* the proposition we should like to affirm, namely, 'B was an astute diplomatist', where B is the object which was Bismarck. If we are describing Bismarck as 'the first Chancellor of the German Empire', the proposition we should like to affirm may be described as 'the proposition asserting, concerning the actual object which was the first Chancellor of the German Empire, that this object was an astute diplomatist'. What enables us to communicate in spite of the varying descriptions we employ is that we know there is a true proposition concerning the actual Bismarck, and that however we may vary the description (so long as the description is correct) the proposition described is still the same. This proposition, which is described and is known to be true, is what interests us; but we are not acquainted with the proposition itself, and do not know *it*, though we know it is true.

It will be seen that there are various stages in the removal from acquaintance with particulars: there is Bismarck to people who knew him; Bismarck to those who only know of him through history; the man with the iron mask; the longest-lived of men. These are progressively further removed from acquaintance with particulars; the first comes as near to acquaintance as is possible in regard to another person; in the second, we shall still be said to know 'who Bismarck was'; in the third, we do not know who was the man with the iron mask, though we can know many propositions about him which are not logically deducible from the fact that he wore an iron mask; in the fourth, finally, we know nothing beyond what is logically deducible from the definition of the man. There is a similar hierarchy in the region of universals. Many universals, like many particulars, are only known to us by description. But here, as in the case of particulars, knowledge concerning what is known by description is ultimately reducible to knowledge concerning what is known by acquaintance.

The fundamental principle in the analysis of propositions containing descriptions is this: *Every proposition which we can understand must be composed wholly of constituents with which we are acquainted.*

We shall not at this stage attempt to answer all the objections which may be urged against this fundamental principle. For the present, we shall merely point out that, in some way or other, it must be possible to meet these objections, for it is scarcely conceivable that we can make a judgement or entertain a supposition without knowing what it is that we are judging or supposing about. We must attach *some* meaning to the words we use, if we are to speak significantly and not utter mere noise; and the meaning we attach to our words must be something with which we are acquainted. Thus when, for example, we make a statement about Julius Caesar, it is plain that Julius Caesar himself is not before our minds, since we are not acquainted with him. We have in mind some *description* of Julius Caesar: 'the man who was assassinated on the Ides of March', 'the founder of the Roman Empire', or, perhaps, merely 'the man whose name was *Julius Caesar*'. (In this last description, *Julius Caesar* is a noise or shape with which we are acquainted.) Thus our statement does not mean quite what it seems to mean, but means something involving, instead of Julius Caesar, some description of him which is composed wholly of particulars and universals with which we are acquainted.

The chief importance of knowledge by description is that it enables us to pass beyond the limits of our private experience. In spite of the fact that we can only know truths which are wholly composed of terms which we have experienced in acquaintance, we can yet have knowledge by description of things which we have never experienced. In view of the very narrow range of our immediate experience, this result is vital, and until it is understood, much of our knowledge must remain mysterious and therefore, doubtful.

*Reprinted from *The Problems of Philosophy* by Bertrand Russell (1912) by permission of Oxford University Press.

Edmund Husserl

Born in what is now the Czech Republic, Edmund Husserl (1859–1938) is the seminal figure in twentieth-century German and French philosophy. His philosophical approach, phenomenology, powerfully influenced such continental luminaries as Martin Heidegger, Jean-Paul Sartre, and Maurice Merleau-Ponty, and has increasingly come to influence important thinkers in the Anglo-American philosophical tradition. Early in his career, Husserl was predominantly concerned with the philosophies of mathematics and logic, but problems concerning the foundations of these disciplines drove him toward larger epistemological questions concerning all “objects of consciousness” (“logical” and “empirical”), thus giving rise to his renowned phenomenological approach. His most influential books include *Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Psychology, Book I* (1913), or simply *Ideas I*; the *Cartesian Meditations* (1929), an expanded version of his *Paris Lectures*; and *The Crisis of the European Sciences and Transcendental Phenomenology*, which was published after his death in 1938.

Husserl’s phenomenology is based on the desire to get back to “the things themselves”—namely, the way in which objects are immediately apprehended by consciousness. In certain respects, this approach sounds a good deal like empiricism, and, like the empiricists, Husserl not only believes that all knowledge is based on experience but also that the paradigmatic way in which knowledge is acquired is through perception. Husserl believes, nevertheless, that the empiricists fail to adequately attend to the essential features of the perceptual experience itself. As an initial matter, empiricism, at least as it has historically unfolded, gives methodological priority to language rather than experience. Moreover, he believes, even when empiricists attend to the experience itself, they tend to falsify it by focusing solely on the image produced by the object perceived instead of the way in which the object is necessarily experienced by consciousness. For the empiricists, the “sensory data” that comprises the object of which we have an image (for example, its color, shape, and texture) is all that is experienced, but this fails to take into account that this sensory data is actually experienced as a particular object. When I see the cover of a book in the distance, for example, my experience is of a book, even if the sensory data that comprises this perception does not actually warrant this conclusion. Perception thus sketches a “horizon of expectations” in which the experience goes beyond the sensory data, and only based on ensuing perceptions (that is, on further inspection) can I confirm whether I have perceived an actual book—or, as Husserl articulates it, whether my ensuing perceptions “fulfill” the “unfulfilled” or “empty” aspects that augmented my prior perceptual experience. This attribution of empty aspects to experience suggests that, like the rationalists (and in contrast to Locke’s notion of the mind as a “blank slate”), Husserl believes that the mind is active in constituting the world of its experience.

According to Husserl, the fundamental feature of consciousness is that it is “intentional,” or marked by “intentionality.” This means not only that consciousness is always consciousness of something (i.e., that it is always about some object) but also that the mind actively, although typically unconsciously, “intends” the objects of its experience. Thus, when I see the book cover in the distance, and absent other disconfirming perceptions, I simply take it to be the case that a book is there. “Intending” an object as a particular object therefore involves a complex interplay of presence and absence, of fulfilled and unfulfilled aspects: given the necessarily perspectival nature of all perception, all objects are presented to consciousness as mere “profiles.” Moreover, what enables me to intend a particular object, notwithstanding the fact that the perceptions I have of it at any given time may not be sufficiently fulfilled for this identification, is that experience itself unfolds in time. For Husserl, consciousness is essentially temporal in nature, as “before,” “now,” and “after” interpenetrate one another. My horizon of expectations with respect to an object is formed by prior perceptions and can be continually modified by futures ones. What Husserl calls “retentions” (past perceptions that form the ground of my horizon of expectations) and “protentions” (expected perceptions in the immediate future based on past perceptions) are constantly changing, as I am continuously confronted with new sensory data within the perpetual stream of “nows.” So, too, consciousness constantly synthesizes the perceptual states that make up this perpetual stream of “nows”—that is, it ties together conscious states over time to give rise to a unified sense of experience that I can identify as my own.

Ultimately, Husserl is concerned with providing indubitable foundations for our experience rather than simply examining it from the “natural” or “ordinary” standpoint. Like Descartes, he wants to ensure the truth of our perceptions to pave the way for a rigorous science (combating skepticism), and, like Descartes, he believes that the only way to do this is to call into question all knowledge of the world and return to the one thing that cannot be called into question: the ego. Going beyond Descartes, however, Husserl argues that the

ego is not a substance to be contrasted with matter nor is the ego an “inside” whose task it is to link up with a world that is (mistakenly) viewed as an “outside.” What’s more, the ego that cannot be called into question is not the empirical ego or self that we ordinarily associate with persons (that is, the qualities that we ordinarily use to describe someone) but is a “transcendental” ego, which is the ultimate ground of subjectivity and, as such for Husserl, the ultimate ground of truth and knowledge. The transcendental ego can never be the object of experience like the empirical ego but (like Kant’s transcendental ego) is the condition for the possibility of any experience: it is, therefore, the transcendental ego, pure consciousness or consciousness *as such* that synthesizes our experiences over time. To get to indubitable knowledge, which for Husserl is knowledge that is necessary for any experiencing consciousness, various so-called reductions are needed, the most crucial of which is the phenomenological reduction or *epoché*. With the phenomenological reduction, we bracket or put out of play “the natural attitude,” with all its biases, and attend to the object of consciousness as it purely presents itself to consciousness. This step furnishes the foundation on which our more elaborate constitutions of the world (including the natural sciences) are based.

Good introductions to Husserl’s phenomenology are Maurice Nathanson, *Husserl: Philosopher of Infinite Tasks* (Evanston: Northwestern University Press, 1973) and Robert Sokolowski, *Introduction to Phenomenology* (Cambridge: Cambridge University Press, 2000). A thorough introduction to Husserl’s *Cartesian Meditations* (the expanded version of the *Paris Lectures*) is A. D. Smith, *Husserl and the Cartesian Meditations* (London: Routledge, 2003). A more advanced approach to Husserl’s thought is David Bell, *Husserl* (London: Routledge & Kegan Paul, 1991). A more advanced topical discussion of the central themes in Husserl’s thought is Barry Smith and David Woodruff Smith, eds., *The Cambridge Companion to Husserl* (Cambridge: Cambridge University Press, 1995).

David Sherman

Paris Lectures*

I am filled with joy at the opportunity to talk about the new phenomenology at this most venerable place of French learning, and for very special reasons.¹ No philosopher of the past has affected the sense of phenomenology as decisively as Rene Descartes, France's greatest thinker. Phenomenology must honor him as its genuine patriarch. It must be said explicitly that the study of Descartes' *Meditations* has influenced directly the formation of the developing phenomenology and given it its present form, to such an extent that phenomenology might almost be called a new, a twentieth century, Cartesianism.

Under these circumstances I may have advance assurance of your interest, especially if I start with those themes in the *Meditationes de prima philo-sophia*² which are timeless, and if through them I point out the transformations and new concepts which give birth to what is characteristic of the phenomenological method and its problems.

Every beginner in philosophy is familiar with the remarkable train of thought in the *Meditations*. Their goal, as we remember, is a complete reform of philosophy, including all the sciences, since the latter are merely dependent members of the one universal body of knowledge which is philosophy. Only through systematic unity can the sciences achieve genuine rationality, which, as they have developed so far, is missing. What is needed is a radical reconstruction which will *satisfy* the ideal of philosophy as being the *universal unity of knowledge* by means of a unitary and *absolutely rational foundation*. Descartes carries out the demand for reconstruction in terms of a subjectively oriented philosophy. This subjective turn is carried out in two steps.

First, anyone who seriously considers becoming a philosopher must once in his life withdraw into himself and then, from within attempt to destroy and rebuild all previous learning. Philosophy is the supremely personal affair of the one who philosophizes. It is the question of *his sapientia universalis*, the aspiration of *his* knowledge for the universal. In particular, the philosopher's quest is for truly scientific knowledge, knowledge for which he can assume — from the very beginning and in every subsequent step — complete responsibility by using *his* own absolutely self-evident justifications. I can become a genuine philosopher only by freely choosing to focus my life on this goal. Once I am thus committed and have accordingly chosen to begin with total poverty and destruction, my first problem is to discover an absolutely secure starting point and rules of procedure, when, in actual fact, I lack any support from the existing disciplines. Consequently, the Cartesian meditations must not be viewed as the private affair of the philosopher Descartes, but as the necessary prototype for the meditations of any beginning philosopher whatsoever.

When we now turn our attention to the content of the *Meditations*, a content which appears rather strange to us today, we notice immediately a *return to the philosophizing ego* in a second and deeper sense. It is the familiar and epoch-making return to the ego as subject of his pure *cogitationes*.³ It is the ego which, while it suspends all beliefs about the reality of the world on the grounds that these are not indubitable, discovers itself as the only apodictically certain being.

The ego is engaged, first of all, in philosophizing that is seriously solipsistic. He looks for apodictically certain and yet purely subjective procedures through which an objective external world can be deduced. Descartes does this in a well-known manner. He first infers both the existence and *veracitas*⁴ of God. Then, through their mediation, he deduces objective reality as a dualism of substances. In this way he reaches the objective ground of knowledge and the particular sciences themselves as well. All his inferences are based on immanent principles, i.e., principles which are innate to the Ego.

So much for Descartes. We now ask, is it really worthwhile to hunt critically for the eternal significance of these thoughts? Can these infuse life into our age?

Doubt is raised, in any event, by the fact that the positive sciences, for which the meditations were to have served as absolutely rational foundation, have paid so very little attention to them. Nonetheless, and despite the brilliant development experienced by the sciences over the last three centuries, they feel themselves today seriously limited by the obscurity of their foundations. But it scarcely occurs to them to refer to the Cartesian meditations for the reformulation of their foundations.

On the other hand, serious consideration must be given to the fact that the meditations constitute an altogether unique and epochal event in the history of philosophy, specifically because of their return to the *ego cogito*.⁵ As a matter of fact, Descartes inaugurates a completely new type of philosophy. Philosophy, with its style now changed altogether, experiences a radical conversion from naive objectivism to *transcendental subjectivism*. This subjectivism strives toward a pure end-form through efforts that are constantly renewed yet always remain unsatisfactory. Might it not be that this continuing tendency has eternal significance? Perhaps it is a vast task assigned to us by history itself, invoking our collective cooperation.

The splintering of contemporary philosophy and its aimless activity make us pause. Must this situation not be traced back to the fact that the motivations from which Descartes' meditations emanate have lost their original vitality? Is it not true that the only fruitful renaissance is one which reawakens these meditations, not in order to accept them, but to reveal the profound truth in the radicalism of a return to the *ego cogito* with the external values that reside therein?

In any case, this is the path that led to transcendental phenomenology.

Let us now pursue this path together. In true Cartesian fashion, we shall become philosophers meditating in a radical sense, with, of course, frequent and critical modifications of the older Cartesian meditations. What was merely germinal in them must be freely developed here.

We thus begin, everyone for himself and in himself, with the decision to disregard all our present knowledge. We do not give up Descartes' guiding goal of an absolute foundation for knowledge. At the beginning, however, to presuppose even the possibility of that goal would be prejudice. We are satisfied to discover the goal and nature of science by submerging ourselves in scientific activity. It is the spirit of science to count nothing as really scientific which cannot be fully justified by the evidence. In other words, science demands proof by *reference to the things and facts themselves, as these are given in actual experience and intuition*. Thus guided, we, the beginning philosophers make it a rule to judge only by the evidence. Also, the evidence itself must be subjected to critical verification, and that on the basis, of course, of further available evidence. Since from the beginning we have disregarded the sciences, we operate within our pre-scientific life, which is likewise filled with immediate and mediate evidences. This, and nothing else, is first given to us.

Herein arises our first question. Can we find evidence that is both immediate and apodictic? Can we find evidence that is primitive, in the sense that it must by necessity precede all other evidence?

As we meditate on this question one thing does, in fact, emerge as both prior to all evidence and as apodictic. It is the existence of the world. All science refers to the world, and before that, our ordinary life already makes reference to it. *That the being of the world precedes everything is so obvious* that no one thinks to articulate it in a sentence. Our experience of the world is continuous, incessant, and unquestionable. But is it true that this experiential evidence, even though taken for granted, is really apodictic and primary to all other evidence? We will have to deny both. Is it not the case that occasionally something manifests itself as a sensory illusion? Has not the coherent and unified totality of our experience been at times debased as a mere dream? We will ignore Descartes' attempt to prove that, notwithstanding the fact of its being constantly experienced, the world's nonbeing can be conceived. His proof is carried out by a much too superficial criticism of sensory experience. We will keep this much: experiential evidence that is to serve as radical foundation for knowledge needs, above all, a critique of its validity and range. It cannot be accepted as apodictic without question and qualification. Therefore, merely to disregard all knowledge and to treat the sciences as prejudices is not enough. Even the experience of the world as the true universal ground of knowledge becomes an unacceptably naive belief. We can no longer accept the reality of the world as a fact to be taken for granted. *It is a hypothesis that needs verification.*

Does there remain a ground of being? Do we still have a basis for all judgments and evidences, a basis on which a universal philosophy can rest apodictically? Is not "world" the name for the totality of all that is? Might it not turn out that the world is not the truly ultimate basis for judgment, but instead that its existence presupposes a prior ground of being?

Here, specifically following Descartes, we make the great shift which, properly carried out, leads to *transcendental subjectivity*. This is the shift to the *ego cogito*, as the apodictically certain and *last basis for judgment* upon which all radical philosophy must be grounded.

Let us consider: as radically meditating philosophers we now have neither knowledge that is valid for us nor a world that exists for us. We can no longer say that the world is real — a belief that is natural enough in our ordinary experience —; instead, it merely makes a claim to reality. This skepticism also applies to other selves, so that we rightly should not speak communicatively, that is, in the plural. Other people and animals are, of course, given to me only through sensory experience. Since I have questioned the validity of the latter I

cannot avail myself of it here. With the loss of other minds I lose, of course, all forms of sociability and culture. In short, the entire concrete world ceases to have reality for me and becomes instead mere appearance. However, whatever may be the veracity of the claim to being made by phenomena, whether they represent reality or appearance, phenomena in themselves cannot be disregarded as mere “nothing.” On the contrary, it is precisely the phenomena themselves which, without exception, render possible for me the very existence of both reality and appearance. Again, I may freely abstain from entertaining any belief about experience—which I did. This simply means that I refuse to assert the reality of the world. Nonetheless, we must be careful to realize that this epistemological abstention is still what it is: it includes the whole stream of experienced life and all its particulars, the appearances of objects, other people, cultural situations, etc. Nothing changes, except that I no longer accept the world simply as real; I no longer judge regarding the distinction between reality and appearance. I must similarly abstain from any other of my opinions, judgments, and valuations about the world, since these likewise assume the reality of the world. But for these, as for other phenomena, epistemological abstention does not mean their disappearance, at least not as pure phenomena.

This ubiquitous detachment from any point of view regarding the objective world we term the *phenomenological epoché*. It is the methodology through which I come to understand myself as that ego and life of consciousness in which and through which the entire objective world exists for me, and is for me precisely as it is. Everything in the world, all spatio-temporal being, exists for me because I experience it, because I perceive it, remember it, think of it in any way, judge it, value it, desire it, etc. It is well known that Descartes designates all this by the term *cogito*. For me the world is nothing other than what I am aware of and what appears valid in such *cogitations*. *The whole meaning and reality of the world rests exclusively on such cogitationes*. My entire worldly life takes its course within these. I cannot live, experience, think, value, and act in any world which is not in some sense in me, and derives its meaning and truth from me. If I place myself above that entire life and if I abstain from any commitment about reality, specifically one which accepts the world as existing, and if I view that life exclusively as consciousness of the world, then I reveal myself as the pure ego with its pure stream of *cogitationes*.

I certainly do not discover myself as one item among others in the world, since I have altogether suspended judgment about the world. I am not the ego of an individual man. I am the ego in whose stream of consciousness the world itself—including myself as an object in it, a man who exists in the world — first acquires meaning and reality.

We have reached a dangerous point. It seems simple indeed to understand the pure ego with its *cogitationes* by following Descartes. And yet it is as if we were on the brink of a precipice, where the ability to step calmly and surely decides between philosophic life and philosophic death. Descartes was thoroughly sincere in his desire to be radical and presuppositionless. However, we know through recent researches — particularly the fine and penetrating work of Messrs. Gilson⁶ and Koyre⁷ — that a great deal of Scholasticism is hidden in Descartes’ meditations as unarticulated prejudice. But this is not all. We must above all avoid the prejudices, hardly noticed by us, which derive from our emphasis on the mathematically oriented natural sciences. These prejudices make it appear as if the phrase *ego cogito* refers to an apodictic and primitive axiom, one which, in conjunction with others to be derived from it, provides the foundation for a deductive and universal science, a science *ordine geometrico*.⁸ In relation to this we must under no circumstances take for granted that, with our apodictic and pure ego, we have salvaged a small corner of the world as the single indubitable fact about the world which can be utilized by the philosophizing ego. It is not true that all that now remains to be done is to infer the rest of the world through correct deductive procedures according to principles that are innate to the ego.

Unfortunately, Descartes commits this error, in the apparently insignificant yet fateful transformation of the ego to a *substantia cogitans*⁹ to an independent human *animus*,¹⁰ which then becomes the point of departure for conclusions by means of the principle of causality. In short, this is the transformation which made Descartes the father of the rather absurd transcendental realism. We will keep aloof from all this if we remain true to radicalism in our self-examination and with it to the principle of pure intuition. We must regard nothing as veridical except the pure immediacy and givenness in the field of the *ego cogito* which the *epoché*¹¹ has opened up to us. In other words, we must not make assertions about that which we do not ourselves see. In these matters Descartes was deficient. It so happens that he stands before the greatest of all discoveries—in a sense he has already made it—yet fails to see its true significance, that of transcendental subjectivity. He does not pass through the gateway that leads into genuine transcendental philosophy.

The independent *epoché* with regard to the nature of the world as it appears and is real to me—that is, “real” to the previous and natural point of view — discloses the greatest and most magnificent of all facts: I

and my life remain—in my sense of reality—untouched by whichever way we decide the issue of whether the world is or is not. To say, in my natural existence, “I am, I think, I live,” means that I am one human being among others in the world, that I am related to nature through my physical body, and that in this body my *cogitationes*, perceptions, memories, judgments, etc. are incorporated as psycho-physical facts. Conceived in this way, I, we, humans, and animals are subject-matter for the objective sciences, that is, for biology, anthropology, and zoology, and also for psychology. The life of the psyche, which is the subject-matter of all psychology, is understood only as the psychic life in the world. The methodology of a purified Cartesianism demands of me, the one who philosophizes, the phenomenological *epoché*. The *epoché* eliminates as worldly facts from my field of judgment both the reality of the objective world in general and the sciences of the world. *Consequently, for me there exists no “I” and there are no psychic actions, that is, psychic phenomena in the psychological sense.* To myself I do not exist as a human being, [nor] do my *cogitationes* exist as components of a psycho-physical world. But through all this I have discovered my true self. I have discovered that I alone am the pure ego, with pure existence and pure capacities (for example, the obvious capacity to abstain from judging). Through this ego alone does *the being of the world*, and, for that matter, any being whatsoever, make sense *to me* and has possible validity. The world — whose conceivable nonbeing does not extinguish my pure being but rather presupposes it — is termed *transcendent*, whereas my pure being or my pure ego is termed *transcendental*. Through the phenomenological *epoché* the natural human ego, specifically my own, is reduced to the transcendental ego. This is the meaning of the phenomenological reduction.

Further steps are needed so that what has been developed up to this point can be adequately applied. What is the philosophic use of the transcendental ego? To be sure, for me, the one who philosophizes, it obviously precedes, in an epistemological sense, all objective reality. In a way, it is the basis for all objective knowledge, be it good or bad. But does the fact that the transcendental ego precedes and presupposes all objective knowledge mean also that it is an epistemological ground in the ordinary sense? The thought is tempting. All realistic theories are guilty of it. But the temptation to look in the transcendental subjectivity for premises guaranteeing the existence of the subjective world evanesces once we realize that all arguments, considered in themselves, exist already in transcendental subjectivity itself. Furthermore, all proofs for the world have their criteria set in the world just as it is given and justified in experience. However, these considerations must not be construed as a rejection of the great Cartesian idea that the ultimate basis for objective science and the reality of the objective world is to be sought in transcendental subjectivity. Otherwise — our criticisms aside — we would not be true to Descartes’ method of meditation. However, the Cartesian discovery of the ego may perhaps open up a *new concept of foundation, namely, a transcendental foundation*.

In point of fact, instead of using the *ego cogito* merely as an apodictic proposition and as an absolutely primitive premise, we notice that the phenomenological *epoché* has uncovered for us (or for me, the one who philosophizes), through the apodictic *I am*, a new kind and an endless sphere of being. This is the sphere of a new kind of experience: transcendental experience. And herewith also arises the possibility of both transcendental epistemology and transcendental science.

A most extraordinary epistemological situation is disclosed here. The phenomenological *epoché* reduces me to my transcendental and pure ego. I am, thus, at least *prima facie*, in a certain sense *solus ipse*¹² but not in the ordinary sense, in which one might say that a man survived a universal holocaust in a world which itself remained unaffected. Once I have banished from my sphere of judgments the world, as one which receives its being from me and within me, then I, as the transcendental ego which is prior to the world, am *the sole source and object capable of judgment*. And now I am supposed to develop an unheard-of and unique science, since it is one that is created exclusively by and inside my transcendental subjectivity! Furthermore, this science is meant to apply, at least at the outset, to my transcendental subjectivity alone. It thus becomes a transcendental-solipsistic science. It is therefore not the *ego cogito*, but a science about the ego—a pure *egology*—which becomes the ultimate foundation of philosophy in the Cartesian sense of a universal science, and which must provide at least the cornerstone for its absolute foundation. In actual fact this science exists already as the lowest transcendental phenomenology. And I mean the lowest, not the fully developed phenomenology, because to the latter, of course, belongs the further development from transcendental solipsism to transcendental inter subjectivity.

To make all this intelligible it is first necessary to do what was neglected by Descartes, namely, to describe the endless field of the ego’s transcendental experience itself. His own experience, as is well known, and especially when he judged it to be apodictic, plays a role in the philosophy of Descartes. But he neglected to describe the ego in the full concretion of its transcendental being and life, nor did he regard it as an unlimited work-project to be pursued systematically. It is an insight central to a philosopher that, by introducing the transcendental reduction, he can reflect truthfully on his *cogitationes* and on their pure phenomenological

content. In this way he can uncover all aspects of his transcendental being with respect to both his transcendental-temporal life and also his capabilities. We are clearly dealing with a train of thought parallel to what the world-centered psychologist calls inner experience or experience of the self.

One thing of the greatest, even decisive, importance remains. One cannot lightly dismiss the fact— even Descartes has so remarked on occasion — that the *epoché* changes nothing in the world. All experience is still his experience, all consciousness, still his consciousness. The expression *ego cogito* must be expanded by one term. Every *cogito* contains a meaning: its *cogitatum*. The experience of a house, as I experience it, and ignoring theories of perception, is precisely an experience of this and only this house, a house which appears in such-and-such a way, and has certain specific determinations when seen from the side, from near-by, and from afar. Similarly, a clear or a vague recollection is the recollection of a vaguely or clearly apprehended house. Even the most erroneous judgment means a judgment about such-and-such factual content, and so on. *The essence of consciousness, in which I live as my own self, is the so-called intentionality.* Consciousness is always consciousness of something. The nature of consciousness includes, as modes of being, presentations, probabilities, and non-being, and also the modes of appearance, goodness, and value, etc. Phenomenological experience as reflection must avoid any interpretative constructions. Its descriptions must reflect accurately the concrete contents of experience, precisely as these are experienced.

To interpret consciousness as a complex of sense data and then to bring forth gestalt-like qualities out of these — which are subsequently equated with the totality—is a sensualist invention. This interpretation is a basic error even from the worldly and psychological perspective, and much more so from the transcendental point of view. It is true that in the process of phenomenological analyses sense data do occur, and something is, in fact, disclosed about them. But what phenomenological analysis fails to find as primary is the “perception of an external world.” The honest description of the unadulterated data of experience must disclose what appears first of all, i.e., the *cogito*. For example, we must describe closely the perception of a house in terms of what it means as object and its modes of appearing. The same applies to all forms of consciousness.

When phenomenology examines objects of consciousness—regardless of what kind, whether real or ideal — it deals with these exclusively as objects of the immediate consciousness. The description—which attempts to grasp the concrete and rich phenomena of the *cogitationes* — must constantly glance back from the side of the object to the side of consciousness and pursue the general existing connections. For example, if I consider the perception of a hexahedron, then I notice in pure reflection that the hexahedron is given as a continuous and unitary object together with a many-formed and determinate manifold of modes of appearance. It is the same hexahedron, the same appearance, regardless of whether viewed from this side or that one, from this or that perspective, from close or from afar, with greater or with lesser distinctness and determinateness. Nonetheless, if we see any hexahedral surface, any edge or corner, any spot of color, in short, any aspect of the objective sense, then we notice the same thing in every case: it is the unity of a manifold with constantly changing modes of appearance, a unity of its particular perspectives and of the particular differentiations of the subjective here and there. If we look uncritically we find a color that is always identical and unchanging. But if we reflect on the mode in which it appears we recognize that the color is nothing other, nor can it be thought as anything other, than that which presents itself now as this and now as that shade of color. Unity is always unity of representations, which is the representation of the spontaneous presentation of color or the presentation of an edge... .

Intentional analysis is thus something altogether different from analysis in the ordinary sense. The life of consciousness is neither a mere aggregate of data, nor a heap of psychic atoms, nor a whole composed of elements united through gestalt-like qualities. This is true also of pure introspective psychology, as a parallel to transcendental phenomenology. *Intentional analysis is the disclosure of the actualities and potentialities in which objects constitute themselves as perceptual units.* Furthermore, all perceptual analysis takes place in the transition from real events to the intentional horizons suggested by them.

This late insight prescribes to phenomenological analysis and description an altogether new methodology, It is a methodology which goes into action whenever objects and meanings, questions about being, questions about possibilities, questions of origin, and questions of right are to be considered seriously. Every intentional analysis reaches beyond the immediately and actually given events of the immanent sphere, and in such a way that the analysis discloses potentialities — which are now given actually and whose horizons have been sketched — and brings out manifold aspects of new experiences in which are made manifest what earlier was meant only implicitly and in this way was already present intentionally. When I see a hexahedron I say, in reality and in truth I see it only from one side. It is nonetheless evident that what I now experience is in reality more. The perception includes a nonsensory belief through which the visible side can be understood to be a

mere side in the first place. But how does this belief, that there is more, disclose itself? How does it become obvious that I mean more? It occurs through the transition to a synthetic sequence of possible perceptions, perceptions I would have—as indeed I can—were I to walk around the object. Phenomenology always explains meanings, that is, intentionality, by producing these sense-fulfilling syntheses. The tremendous task placed on description is to expound the universal structure of transcendental consciousness in its reference to and creation of meanings... .

The conceptual fixation of an intentional object-class leads, in intentional researches, as one soon recognizes, to an organization or order. In other words, transcendental subjectivity is not a chaos of intentional experiences, but it is a unity through synthesis. It is a many-levelled synthesis in which always new classes and individuals are constituted. However, every object expresses a *rule structured within transcendental subjectivity*... .

An object exists for me; that is to say, it has reality for me in consciousness. But this reality is reality for me only as long as I believe that I can confirm it. By this I mean that I must be able to provide usable procedures, that is, procedures which run through automatically, and other evidences, which lead me then to the object itself and through which I realize the object as being *truly there*. The same holds when my awareness of the object is a matter of experience, that is, when my awareness tells me that the object itself is already there, that the object is seen. This act of seeing, in turn, points to further seeing, that is, it points to the possibility of confirmation. Finally, it points to the fact that what has already once been realized as being can nonetheless be restored, again and again, to its previous condition of progressive confirmation.

Think about the tremendous importance of this remark, considering that we are on an egological foundation. We can see, from this ultimate point of view, that existence and essence have for us, in reality and truth, no other meaning than that of possible confirmation. Furthermore, these confirmation-procedures and their accessibility belong to me as transcendental subjectivity and make sense only as such.

True being, therefore, whether real or ideal, has significance only as a particular correlate of my own intentionality, actual or potential. Of course, this is not true of an isolated *cogito*. For example, the being of a real thing is not the mere *cogito* of an isolated perception that I now have. But the perception and its intentionally given object call to my attention, by virtue of the presumed horizon, an endless and open-system of *possible* perceptions, perceptions which are not invented but which are motivated from within my intentional existence, and which can lose their presumed validity only when conflicting experience eliminates it. These possible perceptions are necessarily presupposed as *my* possibilities, ones which I can bring about—provided I am not hindered—by approaching the object, looking around it, etc.

Needless to say, the foregoing has been stated very crudely. Extremely far-reaching and complex intentional analyses are needed in order to explain the structure of these possibilities as they relate to the specific horizons belonging to every individual class of objects, and to clarify therewith the meaning of actual being. At the outset only one fact is evident and guides me, namely, that I accept as being only that which presents itself to me as being, and that all conceivable justification of it lies within my own self and is determined in my immediate and mediate intentionality, in which any other meaning of being is also to be determined.

Jean-Paul Sartre

Born in Paris in 1905, Jean-Paul Sartre spent a number of years after graduating from the École Normale Supérieure teaching in *lycées* (roughly equivalent to high schools). His study of phenomenology in Berlin in 1933–1934 led to his early works, *Nausea*, *Transcendence of the Ego*, and his greatest work, *Being and Nothingness* (1943). His 1945 lecture, “The Humanism of Existentialism” (published in 1946), contributed to the worldwide vogue of existentialism in the fifties and sixties. Sartre also wrote novels and plays, including *No Exit*, *The Age of Reason*, *The Wall*, and *The Flies*, and for many years he edited *Les Temps Modernes*, the most influential literary journal in France. One of the greatest intellectuals in French history, he was mourned in the streets of Paris by tens of thousands of people when he died in 1980.

“The Humanism of Existentialism” was a popular lecture designed to answer critics and present a rough outline of Sartre’s views. In response to charges that existentialism paints a dreary picture of human existence, Sartre claims that this philosophy is the most humanistic of all, for it starts out from a description of how things appear to us prior to reflection and theorizing, and it rejects the idea that there is any transcendent basis for values or truth to which humans must submit themselves. This is part of what it means to say that “subjectivity” is the starting point: we have no choice but to begin with a phenomenological account of how things present themselves to us in our ordinary experience.

Sartre defines existentialism as the view that, for humans, “existence precedes essence.” This succinct formula is best understood by contrasting it with “essentialism,” the view that, for any type of thing in the world, there is an essence (e.g., a Platonic Form) that determines in advance what things of that type are and what they ought to be. Sartre diagnoses essentialism by suggesting that such a view only makes sense if people assume that there is a Creator who has created things in the world in a way similar to that in which human artisans create tools. In other words, essentialism assumes that, just as craftspersons have a concept of what a tool should be before they create it, so God also has a plan for creation and has created things with particular ideas about what things should be. It would follow, then, that whatever exists is derived from, and should strive to be like, the essences that existed in the mind of God before creation.

Existentialism, in Sartre’s definition, holds the exact opposite view. If “God is dead” (as Nietzsche claimed) and there are no transcendent Absolutes that determine what things are and ought to be, then for one type of entity at least, for humans, existence precedes essence. This means that humans first exist—they just show up one day; they are there, involved in the world and trying to accomplish something—and only afterward do they create their own identity (or essence) through what they do. If there is no essence or human nature given in advance, it follows that humans are self-creating beings: they make themselves in the course of living out their lives. In this sense, you *are* what you *do*—you fashion your own identity through the choices you make as an agent in the world. For example, if you generally run away whenever you are faced with a frightening situation, then you are making yourself into a coward. Being a coward is something you are choosing for yourself, though you are probably quite unaware that you are doing so. Since each of us creates a configuration of possibilities for ourselves in the choices we make in our lives, Sartre can say that we are nothing other than the “ensemble” of our actions over a lifetime.

If there is no pre-given human nature that determines in advance how we act, then we are free in the sense that we are the ultimate causes of our actions. To say that we are free is not to say that environmental and genetic factors have no influence on what we are and do. Sartre insists that, as living organisms in the causal order of the world, we are *en soi* or “in itself,” as much a part of the causal order as a lectern or a cauliflower. But he holds that, as self-conscious—as *pour soi* or “for itself”—we can become aware of these causal factors and reflect on them, and through this reflection we can decide what these factors mean to us and interfere with their influence if we wish. In this respect, we always “surpass” or “transcend” our causal conditioning: we can step back from the causal context in which we find ourselves and redefine it through our choices. We are therefore fully responsible for everything we do.

On what basis do we make our choices? Sartre argues that there is no basis for choice. Ethical principles are always too general and broad to provide guidance in dealing with concrete moral dilemmas. Moreover, our ethical principles are just as much a matter of free choice as the actions themselves. If we turn to an advisor, we usually know in advance what they will say, so that choosing an advisor is choosing the advice. Even our feelings can’t be a guide, because as a rule we don’t know how we really feel about things until after we have acted. In the end, making a choice comes down to just taking a leap in one direction rather than another. You

just “invent” or “create,” in the same way a painter might decide to splash a little red in the corner of a painting. There are no rules or directives that compel us to act in one way rather than another. We are alone, with neither excuses behind us nor justifications before us.

“The Humanism of Existentialism” tries to respond to charges that existentialism undermines ethics by leaving individuals with no basis for deliberation or choice in deciding how to act. Though Sartre’s reasoning is not easy to follow here, he seems to be saying that, since phenomenology shows that the individual is only an instance of the human, with no morally relevant differences from other humans, one should see that, in making choices, one is always choosing for all humans. Sartre here seems to be looking for something like Kant’s “principle of universalizability.” In choosing to act in a specific way, I commit myself to the position that all people should act, or are entitled to act, in the same way. This attempt to save ethics has been subjected to some powerful criticisms over the years, and the jury is still out on whether existentialism makes room for ethics.

• • •

A clear summary and criticism of Sartre is found in Richard Bernstein, *Praxis and Action* (Philadelphia: University of Pennsylvania Press, 1971). Good studies dealing with the topics of freedom and ethics are Thomas C. Anderson, *Sartre’s Two Ethics: From Authenticity to Integral Humanity* (La Salle, Ill.: Open Court, 1993); David Detmer, *Freedom as a Value: A Critique of the Ethical Theory of Jean-Paul Sartre* (La Salle, Ill.: Open Court, 1988); and Thomas Busch, *The Power of Consciousness and the Force of Circumstances in Sartre’s Philosophy* (Bloomington: Indiana University Press, 1990).

Charles Guignon

*The Humanism of Existentialism**

I should like on this occasion to defend existentialism against some charges which have been brought against it.

First, it has been charged with inviting people to remain in a kind of desperate quietism because, since no solutions are possible, we should have to consider action in this world as quite impossible. We should then end up in a philosophy of contemplation; and since contemplation is a luxury, we come in the end to a bourgeois philosophy. The communists in particular have made these charges.

On the other hand, we have been charged with dwelling on human degradation, with pointing up everywhere the sordid, shady, and slimy, and neglecting the gracious and beautiful, the bright side of human nature; for example, according to Mlle. Mercier, a Catholic critic, with forgetting the smile of the child. Both sides charge us with having ignored human solidarity, with considering man as an isolated being. The communists say that the main reason for this is that we take pure subjectivity, the *Cartesian I think*, as our starting point; in other words, the moment in which man becomes fully aware of what it means to him to be an isolated being; as a result, we are unable to return to a state of solidarity with the men who are not ourselves, a state which we can never reach in the *cogito*.

From the Christian standpoint, we are charged with denying the reality and seriousness of human undertakings, since, if we reject God's commandments and the eternal verities, there no longer remains anything but pure caprice, with everyone permitted to do as he pleases and incapable, from his own point of view, of condemning the points of view and acts of others.

I shall try today to answer these different charges. Many people are going to be surprised at what is said here about humanism. We shall try to see in what sense it is to be understood. In any case, what can be said from the very beginning is that by existentialism we mean a doctrine which makes human life possible and, in addition, declares that every truth and every action implies a human setting and a human subjectivity.

As is generally known, the basic charge against us is that we put the emphasis on the dark side of human life. Someone recently told me of a lady who, when she let slip a vulgar word in a moment of irritation, excused herself by saying, "I guess I'm becoming an existentialist." Consequently, existentialism is regarded as something ugly; that is why we are said to be naturalists; and if we are, it is rather surprising that in this day and age we cause so much more alarm and scandal than does naturalism, properly so called. The kind of person who can take in his stride such a novel as Zola's *The Earth*¹ is disgusted as soon as he starts reading an existentialist novel; the kind of person who is resigned to the wisdom of the ages — which is pretty sad — finds us even sadder. Yet, what can be more disillusioning than saying "true charity begins at home" or "a scoundrel will always return evil for good?"

We know the commonplace remarks made when this subject comes up, remarks which always add up to the same thing: we shouldn't struggle against the powers-that-be; we shouldn't resist authority; we shouldn't try to rise above our station; any action which doesn't conform to authority is romantic; any effort not based on past experience is doomed to failure; experience shows that man's bent is always toward trouble, that there must be a strong hand to hold him in check, if not, there will be anarchy. There are still people who go on mumbling these melancholy old saws, the people who say, "It's only human!" whenever a more or less repugnant act is pointed out to them, the people who glut themselves on *chansons réalistes*; these are the people who accuse existentialism of being too gloomy; and to such an extent that I wonder whether they are complaining about it, not for its pessimism, but much rather its optimism. Can it be that what really scares them in the doctrine I shall try to present here is that it leaves to man a possibility of choice? To answer this question, we must re-examine it on a strictly philosophical plane. What is meant by the term *existentialism*?

Most people who use the word would be rather embarrassed if they had to explain it, since, now that the word is all the rage, even the work of a musician or painter is being called existentialist. A gossip columnist in *Clartés* signs himself *The Existentialist*, so that by this time the word has been so stretched and has taken on so broad a meaning, that it no longer means anything at all. It seems that for want of an advance-guard doctrine

analogous to surrealism, the kind of people who are eager for scandal and flurry turn to this philosophy which in other respects does not at all serve their purposes in this sphere.

Actually, it is the least scandalous, the most austere of doctrines. It is intended strictly for specialists and philosophers. Yet it can be defined easily. What complicates matters is that there are two kinds of existentialist; first, those who are Christian, among whom I would include Jaspers² and Gabriel Marcel,³ both Catholic; and on the other hand the atheistic existentialists, among whom I class Heidegger,⁴ and then the French existentialists and myself. What they have in common is that they think that existence precedes essence, or, if you prefer, that subjectivity must be the starting point.

Just what does that mean? Let us consider some object that is manufactured, for example, a book or a paper-cutter: here is an object which has been made by an artisan whose inspiration came from a concept. He referred to the concept of what a paper-cutter is and likewise to a known method of production, which is part of the concept, something which is, by and large, a routine. Thus, the paper-cutter is at once an object produced in a certain way and, on the other hand, one having a specific use; and one cannot postulate a man who produces a paper-cutter but does not know what it is used for. Therefore, let us say that, for the paper-cutter, essence — that is, the ensemble of both the production routines and the properties which enable it to be both produced and defined — precedes existence. Thus, the presence of the paper-cutter or book in front of me is determined. Therefore, we have here a technical view of the world whereby it can be said that production precedes existence.

When we conceive God as the Creator, He is generally thought of as a superior sort of artisan. Whatever doctrine we may be considering, whether one like that of Descartes or that of Leibniz, we always grant that will more or less follows understanding or, at the very least, accompanies it, and that when God creates He knows exactly what He is creating. Thus, the concept of man in the mind of God is comparable to the concept of paper-cutter in the mind of the manufacturer, and, following certain techniques and a conception, God produces man, just as the artisan, following a definition and a technique, makes a paper-cutter. Thus, the individual man is the realization of a certain concept in the divine intelligence.

In the eighteenth century, the atheism of the *philosophes* discarded the idea of God, but not so much for the notion that essence precedes existence. To a certain extent, this idea is found everywhere; we find it in Diderot,⁵ in Voltaire,⁶ and even in Kant. Man has a human nature; this human nature, which is the concept of the human, is found in all men, which means that each man is a particular example of a universal concept, man. In Kant, the result of this universality is that the wild-man, the natural man, as well as the bourgeois, are circumscribed by the same definition and have the same basic qualities. Thus, here too the essence of man precedes the historical existence that we find in nature.

Atheistic existentialism, which I represent, is more coherent. It states that if God does not exist, there is at least one being in whom existence precedes essence, a being who exists before he can be defined by any concept, and that this being is man, or, as Heidegger says, human reality. What is meant here by saying that existence precedes essence? It means that, first of all, man exists, turns up, appears on the scene, and, only afterwards, defines himself. If man, as the existentialist conceives him, is indefinable, it is because at first he is nothing. Only afterward will he be something, and he himself will have made what he will be. Thus, there is no human nature, since there is no God to conceive it. Not only is man what he conceives himself to be, but he is also only what he wills himself to be after this thrust toward existence.

Man is nothing else but what he makes of himself. Such is the first principle of existentialism. It is also what is called subjectivity, the name we are labeled with when charges are brought against us. But what do we mean by this, if not that man has a greater dignity than a stone or table? For we mean that man first exists, that is, that man first of all is the being who hurls himself toward a future and who is conscious of imagining himself as being in the future. Man is at the start a plan which is aware of itself, rather than a patch of moss, a piece of garbage, or a cauliflower; nothing exists prior to this plan; there is nothing in heaven; man will be what he will have planned to be. Not what he will want to be. Because by the word “will” we generally mean a conscious decision, which is subsequent to what we have already made of ourselves. I may want to belong to a political party, write a book, get married; but all that is only a manifestation of an earlier, more spontaneous choice that is called “will.” But if existence really does precede essence, man is responsible for what he is. Thus, existentialism’s first move is to make every man aware of what he is and to make the full responsibility of his existence rest on him. And when we say that a man is responsible for himself, we do not only mean that he is responsible for his own individuality, but that he is responsible for all men.

The word subjectivism has two meanings, and our opponents play on the two. Subjectivism means, on the one hand, that an individual chooses and makes himself; and, on the other, that it is impossible for man to

transcend human subjectivity. The second of these is the essential meaning of existentialism. When we say that man chooses his own self, we mean that every one of us does likewise; but we also mean by that that in making this choice he also chooses all men. In fact, in creating the man that we want to be, there is not a single one of our acts which does not at the same time create an image of man as we think he ought to be. To choose to be this or that is to affirm at the same time the value of what we choose, because we can never choose evil. We always choose the good, and nothing can be good for us without being good for all.

If, on the other hand, existence precedes essence, and if we grant that we exist and fashion our image at one and the same time, the image is valid for everybody and for our whole age. Thus, our responsibility is much greater than we might have supposed, because it involves all mankind. If I am a workingman and choose to join a Christian trade-union rather than be a communist, and if by being a member I want to show that the best thing for man is resignation, that the kingdom of man is not of this world, I am not only involving my own case — I want to be resigned for everyone. As a result, my action has involved all humanity. To take a more individual matter, if I want to marry, to have children; even if this marriage depends solely on my own circumstances or passion or wish, I am involving all humanity in monogamy and not merely myself. Therefore, I am responsible for myself and for everyone else. I am creating a certain image of man of my own choosing. In choosing myself, I choose man.

This helps us understand what the actual content is of such rather grandiloquent words as anguish, forlornness, despair. As you will see, it's all quite simple.

First, what is meant by anguish? The existentialists say at once that man is anguish. What that means is this: the man who involves himself and who realizes that he is not only the person he chooses to be, but also a lawmaker who is, at the same time, choosing all mankind as well as himself, cannot help escape the feeling of his total and deep responsibility. Of course, there are many people who are not anxious; but we claim that they are hiding their anxiety, that they are fleeing from it. Certainly, many people believe that when they do something, they themselves are the only ones involved, and when someone says to them, "What if everyone acted that way?" they shrug their shoulders and answer, "Everyone doesn't act that way." But really, one should always ask himself, "What would happen if everybody looked at things that way?" There is no escaping this disturbing thought except by a kind of double-dealing. A man who lies and makes excuses for himself by saying "not everybody does that," is someone with an uneasy conscience, because the act of lying implies that a universal value is conferred upon the lie.

Anguish is evident even when it conceals itself. This is the anguish that Kierkegaard called the anguish of Abraham. You know the story: an angel has ordered Abraham to sacrifice his son; if it really were an angel who has come and said, "You are Abraham, you shall sacrifice your son," everything would be all right. But everyone might first wonder, "Is it really an angel, and am I really Abraham? What proof do I have?"

There was a madwoman who had hallucinations; someone used to speak to her on the telephone and give her orders. Her doctor asked her, "Who is it who talks to you?" She answered, "He says it's God." What proof did she really have that it was God? If an angel comes to me, what proof is there that it's an angel? And if I hear voices, what proof is there that they come from heaven and not from hell, or from the subconscious, or a pathological condition? What proves that they are addressed to me? What proof is there that I have been appointed to impose my choice and my conception of man on humanity? I'll never find any proof or sign to convince me of that. If a voice addresses me, it is always for me to decide that this is the angel's voice; if I consider that such an act is a good one, it is I who will choose to say that it is good rather than bad.

Now, I'm not being singled out as an Abraham, and yet at every moment I'm obliged to perform exemplary acts. For every man, everything happens as if all mankind had its eyes fixed on him and were guiding itself by what he does. And every man ought to say to himself, "Am I really the kind of man who has the right to act in such a way that humanity might guide itself by my actions?" And if he does not say that to himself, he is masking his anguish.

There is no question here of the kind of anguish which would lead to quietism, to inaction. It is a matter of a simple sort of anguish that anybody who has had responsibilities is familiar with. For example, when a military officer takes the responsibility for an attack and sends a certain number of men to death, he chooses to do so, and in the main he alone makes the choice. Doubtless, orders come from above, but they are too broad; he interprets them, and on this interpretation depend the lives of ten or fourteen or twenty men. In making a decision he cannot help having a certain anguish. All leaders know this anguish. That doesn't keep them from acting; on the contrary, it is the very condition of their action. For it implies that they envisage a number of possibilities, and when they choose one, they realize that it has value only because it is chosen. We shall see that this kind of anguish, which is the kind that existentialism describes, is explained, in addition, by a direct responsibility to the other men whom it involves. It is not a curtain separating us from action, but is

part of action itself.

When we speak of forlornness, a term Heidegger was fond of, we mean only that God does not exist and that we have to face all the consequences of this. The existentialist is strongly opposed to a certain kind of secular ethics which would like to abolish God with the least possible expense. About 1880, some French teachers tried to set up a secular ethics which went something like this: God is a useless and costly hypothesis; we are discarding it; but, meanwhile, in order for there to be an ethics, a society, a civilization, it is essential that certain values be taken seriously and that they be considered as having an *a priori* existence. It must be obligatory, *a priori*, to be honest, not to lie, not to beat your wife, to have children, etc., etc. So we're going to try a little device which will make it possible to show that values exist all the same, inscribed in a heaven of ideas, though otherwise God does not exist. In other words — and this, I believe, is the tendency of everything called reformism in France—nothing will be changed if God does not exist. We shall find ourselves with the same norms of honesty, progress, and humanism, and we shall have made of God an outdated hypothesis which will peacefully die off by itself.

The existentialist, on the contrary, thinks it very distressing that God does not exist, because all possibility of finding values in a heaven of ideas disappears along with Him; there can no longer be an *a priori* Good, since there is no infinite and perfect consciousness to think it. Nowhere is it written that the Good exists, that we must be honest, that we must not lie; because the fact is we are on a plane where there are only men. Dostoyevsky said, "If God didn't exist, everything would be possible." That is the very starting point of existentialism. Indeed, everything is permissible if God does not exist, and as a result man is forlorn, because neither within him nor without does he find anything to cling to. He can't start making excuses for himself.

If existence really does precede essence, there is no explaining things away by reference to a fixed and given human nature. In other words, there is no determinism, man is free, man is freedom. On the other hand, if God does not exist, we find no values or commands to turn to which legitimize our conduct. So, in the bright realm of values, we have no excuse behind us, nor justification before us. We are alone, with no excuses.

That is the idea I shall try to convey when I say that man is condemned to be free. Condemned, because he did not create himself, yet, in other respects is free; because, once thrown into the world, he is responsible for everything he does. The existentialist does not believe in the power of passion. He will never agree that a sweeping passion is a ravaging torrent which fatally leads a man to certain acts and is therefore an excuse. He thinks that man is responsible for his passion.

The existentialist does not think that man is going to help himself by finding in the world some omen by which to orient himself. Because he thinks that man will interpret the omen to suit himself. Therefore, he thinks that man, with no support and no aid, is condemned every moment to invent man. Ponge,⁷ in a very fine article, has said, "Man is the future of man." That's exactly it. But if it is taken to mean that this future is recorded in heaven, that God sees it, then it is false, because it would really no longer be a future. If it is taken to mean that, whatever a man may be, there is a future to be forged, a virgin future before him, then this remark is sound. But then we are forlorn.

To give you an example which will enable you to understand forlornness better, I shall cite the case of one of my students who came to see me under the following circumstances: his father was on bad terms with his mother, and, moreover, was inclined to be a collaborationist; his older brother had been killed in the German offensive of 1940, and the young man, with somewhat immature but generous feelings, wanted to avenge him. His mother lived alone with him, very much upset by the half-treason of her husband and the death of her older son; the boy was her only consolation.

The boy was faced with the choice of leaving for England and joining the Free French Forces — that is, leaving his mother behind — or remaining with his mother and helping her to carry on. He was fully aware that the woman lived only for him and that his going-off—perhaps his death—would plunge her into despair. He was also aware that every act that he did for his mother's sake was a sure thing, in the sense that it was helping her to carry on, whereas every effort he made toward going off and fighting was an uncertain move which might run aground and prove completely useless; for example, on his way to England he might, while passing through Spain, be detained indefinitely in a Spanish camp; he might reach England or Algiers and be stuck in an office at a desk job. As a result, he was faced with two very different kinds of action: one, concrete, immediate, but concerning only one individual; the other concerned an incomparably vaster group, a national collectivity, but for that very reason was dubious, and might be interrupted en route. And, at the same time, he was wavering between two kinds of ethics. On the one hand, an ethics of sympathy, of personal devotion; on the other, a broader ethics, but one whose efficacy was more dubious. He had to choose between the two.

Who could help him choose? Christian doctrine? No. Christian doctrine says, "Be charitable, love your

neighbor, take the more rugged path, etc., etc.” But which is the more rugged path? Whom should he love as a brother? The fighting man or his mother? Which does the greater good, the vague act of fighting in a group, or the concrete one of helping a particular human being to go on living? Who can decide a priori? Nobody. No book of ethics can tell him. The Kantian ethics says, “Never treat any person as a means, but as an end.” Very well, if I stay with my mother, I’ll treat her as an end and not as a means; but by virtue of this very fact, I’m running the risk of treating the people around me who are fighting, as means; and, conversely, if I go to join those who are fighting, I’ll be treating them as an end, and, by doing that, I run the risk of treating my mother as a means.

If values are vague, and if they are always too broad for the concrete and specific case that we are considering, the only thing left for us is to trust our instincts. That’s what this young man tried to do; and when I saw him, he said, “In the end, feeling is what counts. I ought to choose whichever pushes me in one direction. If I feel that I love my mother enough to sacrifice everything else for her — my desire for vengeance, for action, for adventure — then I’ll stay with her. If, on the contrary, I feel that my love for my mother isn’t enough, I’ll leave.”

But how is the value of a feeling determined? What gives his feeling for his mother value? Precisely the fact that he remained with her. I may say that I like so-and-so well enough to sacrifice a certain amount of money for him, but I may say so only if I’ve done it. I may say “I love my mother well enough to remain with her” if I have remained with her. The only way to determine the value of this affection is, precisely, to perform an act which confirms and defines it. But, since I require this affection to justify my act, I find myself caught in a vicious circle.

On the other hand, Gide⁸ has well said that a mock feeling and a true feeling are almost indistinguishable; to decide that I love my mother and will remain with her, or to remain with her by putting on an act, amount somewhat to the same thing. In other words, the feeling is formed by the acts one performs; so, I cannot refer to it in order to act upon it. Which means that I can neither seek within myself the true condition which will impel me to act, nor apply to a system of ethics for concepts which will permit me to act. You will say, “At least, he did go to a teacher for advice.” But if you seek advice from a priest, for example, you have chosen this priest; you already knew, more or less, just about what advice he was going to give you. In other words, choosing your adviser is involving yourself. The proof of this is that if you are a Christian, you will say, “Consult a priest.” But some priests are collaborating, some are just marking time, some are resisting. Which to choose? If the young man chooses a priest who is resisting or collaborating, he has already decided on the kind of advice he’s going to get. Therefore, in coming to see me he knew the answer I was going to give him, and I had only one answer to give: “You’re free, choose, that is, invent.” No general ethics can show you what is to be done; there are no omens in the world. The Catholics will reply, “But there are.” Granted—but, in any case, I myself choose the meaning they have.

When I was a prisoner, I knew a rather remarkable young man who was a Jesuit. He had entered the Jesuit order in the following way: he had had a number of very bad breaks; in childhood, his father died, leaving him in poverty, and he was a scholarship student at a religious institution where he was constantly made to feel that he was being kept out of charity; then, he failed to get any of the honors and distinctions that children like; later on, at about eighteen, he bungled a love affair; finally, at twenty-two, he failed in military training, a childish enough matter, but it was the last straw.

This young fellow might well have felt that he had botched everything. It was a sign of something, but of what? He might have taken refuge in bitterness or despair. But he very wisely looked upon all this as a sign that he was not made for secular triumphs, and that only the triumphs of religion, holiness, and faith were open to him. He saw the hand of God in all this, and so he entered the order. Who can help seeing that he alone decided what the sign meant?

Some other interpretation might have been drawn from this series of setbacks; for example, that he might have done better to turn carpenter or revolutionist. Therefore, he is fully responsible for the interpretation. Forlornness implies that we ourselves choose our being. Forlornness and anguish go together.

As for despair, the term has a very simple meaning. It means that we shall confine ourselves to reckoning only with what depends upon our will, or on the ensemble of probabilities which make our action possible. When we want something, we always have to reckon with probabilities. I may be counting on the arrival of a friend. The friend is coming by rail or streetcar; this supposes that the train will arrive on schedule, or that the street-car will not jump the track. I am left in the realm of possibility; but possibilities are to be reckoned with only to the point where my action comports with the ensemble of these possibilities, and no further. The moment the possibilities I am considering are not rigorously involved by my action, I ought to disengage

myself from them, because no God, no scheme, can adapt the world and its possibilities to my will. When Descartes said, "Conquer yourself rather than the world," he meant essentially the same thing.

The Marxists to whom I have spoken reply, "You can rely on the support of others in your action, which obviously has certain limits because you're not going to live forever. That means: rely on both what others are doing elsewhere to help you, in China, in Russia, and what they will do later on, after your death, to carry on the action and lead it to its fulfillment, which will be the revolution. You even *have* to rely upon that, otherwise you're immoral." I reply at once that I will always rely on fellow-fighters insofar as these comrades are involved with me in a common struggle, in the unity of a party or a group in which I can more or less make my weight felt; that is, one whose ranks I am in as a fighter and whose movements I am aware of at every moment. In such a situation, relying on the unity and will of the party is exactly like counting on the fact that the train will arrive on time or that the car won't jump the track. But, given that man is free and that there is no human nature for me to depend on, I cannot count on men whom I do not know by relying on human goodness or man's concern for the good of society. I don't know what will become of the Russian revolution; I may make an example of it to the extent that at the present time it is apparent that the proletariat plays a Part In Russia that it plays in no other nation. But I can't swear that this will inevitably lead to a triumph of the proletariat. I've got to limit myself to what I see.

Given that men are free and that tomorrow they will freely decide what man will be, I cannot be sure that, after my death, fellow-fighters will carry on my work to bring it to its maximum perfection. Tomorrow, after my death, some men may decide to set up Fascism, and the others may be cowardly and muddled enough to let them do it. Fascism will then be the human reality, so much the worse for us.

Actually, things will be as man will have decided they are to be. Does that mean that I should abandon myself to quietism? No. First, I should involve myself; then, act on the old saw, "Nothing ventured, nothing gained." Nor does it mean that I shouldn't belong to a party, but rather that I shall have no illusions and shall do what I can. For example, suppose I ask myself, "Will socialization, as such, ever come about?" I know nothing about it. All I know is that I'm going to do everything in my power to bring it about. Beyond that, I can't count on anything. Quietism is the attitude of people who say, "Let others do what I can't do." The doctrine I am presenting is the very opposite of quietism, since it declares, "There is no reality except in action." Moreover, it goes further, since it adds, "Man is nothing else than his plan; he exists only to the extent that he fulfills himself; he is therefore nothing else than the ensemble of his acts, nothing else than his life."

According to this, we can understand why our doctrine horrifies certain people. Because often the only way they can bear their wretchedness is to think, "Circumstances have been against me. What I've been and done doesn't show my true worth. To be sure, I've had no great love, no great friendship, but that's because I haven't met a man or woman who was worthy. The books I've written haven't been very good because I haven't had the proper leisure. I haven't had children to devote myself to because I didn't find a man with whom I could have spent my life. So there remains within me, unused and quite viable, a host of propensities, inclinations, possibilities, that one wouldn't guess from the mere series of things I've done."

Now, for the existentialist there is really no love other than one which manifests itself in a person's being in love. There is no genius other than one which is expressed in works of art; the genius of Proust⁹ is the sum of Proust's works; the genius of Racine¹⁰ is his series of tragedies. Outside of that, there is nothing. Why say that Racine could have written another tragedy, when he didn't write it? A man is involved in life, leaves his impress on it, and outside of that there is nothing. To be sure, this may seem a harsh thought to someone whose life hasn't been a success. But, on the other hand, it prompts people to understand that reality alone is what counts, that dreams, expectations, and hopes warrant no more than to define a man as a disappointed dream, as miscarried hopes, as vain expectations. In other words, to define him negatively and not positively. However, when we say, "You are nothing else than your life," that does not imply that the artist will be judged solely on the basis of his works of art; a thousand other things will contribute toward summing him up. What we mean is that a man is nothing else than a series of undertakings, that he is the sum, the organization, the ensemble of the relationships which make up these undertakings.

When all is said and done, what we are accused of, at bottom, is not our pessimism, but an optimistic toughness. If people throw up to us our works of fiction in which we write about people who are soft, weak, cowardly, and sometimes even downright bad, it's not because these people are soft, weak, cowardly, or bad; because if we were to say, as Zola did, that they are that way because of heredity, the workings of environment, society, because of biological or psychological determinism, people would be reassured. They would say, "Well, that's what we're like, no one can do anything about it." But when the existentialist writes

about a coward, he says that this coward is responsible for his cowardice. He's not like that because he has a cowardly heart or lung or brain; he's not like that on account of his physiological makeup; but he's like that because he has made himself a coward by his acts. There's no such thing as a cowardly constitution; there are nervous constitutions; there is poor blood, as the common people say, or strong constitutions. But the man whose blood is poor is not a coward on that account, for what makes cowardice is the act of renouncing or yielding. A constitution is not an act; the coward is defined on the basis of the acts he performs. People feel, in a vague sort of way, that this coward we're talking about is guilty of being a coward, and the thought frightens them. What people would like is that a coward or a hero be born that way.

One of the complaints most frequently made about *The Ways of Freedom*¹¹ can be summed up as follows: "After all, these people are so spineless, how are you going to make heroes out of them?" This objection almost makes me laugh, for it assumes that people are born heroes. That's what people really want to think. If you're born cowardly, you may set your mind perfectly at rest; there's nothing you can do about it; you'll be cowardly all your life, whatever you may do. If you're born a hero, you may set your mind just as much at rest; you'll be a hero all your life; you'll drink like a hero and eat like a hero. What the existentialist says is that the coward makes himself cowardly, that the hero makes himself heroic. There's always a possibility for the coward not to be cowardly any more and for the hero to stop being heroic. What counts is total involvement; some one particular action or set of circumstances is not total involvement.

Thus, I think we have answered a number of the charges concerning existentialism. You see that it cannot be taken for a philosophy of quietism, since it defines man in terms of action; nor for a pessimistic description of man — there is no doctrine more optimistic, since man's destiny is within himself; nor for an attempt to discourage man from acting, since it tells him that the only hope is in his acting and that action is the only thing that enables a man to live. Consequently, we are dealing here with an ethics of action and involvement.

Nevertheless, on the basis of a few notions like these, we are still charged with immuring man in his private subjectivity. There again we're very much misunderstood. Subjectivity of the individual is indeed our point of departure, and this for strictly philosophic reasons. Not because we are bourgeois, but because we want a doctrine based on truth and not a lot of fine theories, full of hope but with no real basis. There can be no other truth to take off from than this: *I think; therefore, I exist*. There we have the absolute truth of consciousness becoming aware of itself. Every theory which takes man out of the moment in which he becomes aware of himself is, at its very beginning, a theory which confounds truth, for outside the Cartesian *cogito*, all views are only probable, and a doctrine of probability which is not bound to a truth dissolves into thin air. In order to describe the probable, you must have a firm hold on the true. Therefore, before there can be any truth whatsoever, there must be an absolute truth; and this one is simple and easily arrived at; it's on everyone's doorstep; it's a matter of grasping it directly.

Secondly, this theory is the only one which gives man dignity, the only one which does not reduce him to an object. The effect of all materialism is to treat all men, including the one philosophizing, as objects, that is, as an ensemble of determined reactions in no way distinguished from the ensemble of qualities and phenomena which constitute a table or a chair or a stone. We definitely wish to establish the human realm as an ensemble of values distinct from the material realm. But the subjectivity that we have thus arrived at, and which we have claimed to be truth, is not a strictly individual subjectivity, for we have demonstrated that one discovers in the *cogito* not only himself, but others as well.

The philosophies of Descartes and Kant to the contrary, through the *I think* we reach our own self in the presence of others, and the others are just as real to us as our own self. Thus, the man who becomes aware of himself through the *cogito* also perceives all others, and he perceives them as the condition of his own existence. He realizes that he cannot be anything (in the sense that we say that someone is witty or nasty or jealous) unless others recognize it as such. In order to get any truth about myself, I must have contact with another person. The other is indispensable to my own existence, as well as my knowledge about myself. This being so, in discovering my inner being I discover the other person at the same time, like a freedom placed in front of me which thinks and wills only for or against me. Hence, let us at once announce the discovery of a world which we shall call intersubjectivity; this is the world in which man decides what he is and what others are.

Besides, if it is impossible to find in every man some universal essence which would be human nature, yet there does exist a universal human condition. It's not by chance that today's thinkers speak more readily of man's condition than of his nature. By condition they mean, more or less definitely, the a priori limits which outline man's fundamental situation in the universe. Historical situations vary; a man may be born a slave in a pagan society or a feudal lord or a proletarian. What does not vary is the necessity for him to exist in the world, to be at work there, to be there in the midst of other people, and to be mortal there. The limits are

neither subjective nor objective, or, rather, they have an objective and a subjective side. Objective because they are to be found everywhere and are recognizable everywhere; subjective because they are *lived* and are nothing if man does not live them, that is, freely determine his existence with reference to them. And though the configurations may differ, at least none of them are completely strange to me, because they all appear as attempts either to pass beyond these limits or recede from them or deny them or adapt to them. Consequently, every configuration, however individual it may be, has a universal value.

Every configuration, even the Chinese, the Indian, or the Negro, can be understood by a Westerner. "Can be understood" means that by virtue of a situation that he can imagine, a European of 1945 can, in like manner, push himself to his limits and reconstitute within himself the configuration of the Chinese, the Indian, or the African. Every configuration has universality in the sense that every configuration can be understood by every man. This does not at all mean that this configuration defines man forever, but that it can be met with again. There is always a way to understand the idiot, the child, the savage, the foreigner, provided one has the necessary information.

In this sense we may say that there is a universality of man; but it is not given, it is perpetually being made. I build the universal in choosing myself; I build it in understanding the configuration of every other man, whatever age he might have lived in. This absoluteness of choice does not do away with the relativity of each epoch. At heart, what existentialism shows is the connection between the absolute character of free involvement, by virtue of which every man realizes himself in realizing a type of mankind, an involvement always comprehensible in any age whatsoever and by any person whosoever, and the relativity of the cultural ensemble which may result from such a choice; it must be stressed that the relativity of Cartesianism and the absolute character of Cartesian involvement go together. In this sense, you may, if you like, say that each of us performs an absolute act in breathing, eating, sleeping, or behaving in any way whatever. There is no difference between being free, like a configuration, like an existence which chooses its essence, and being absolute. There is no difference between being an absolute temporarily localized, that is, localized in history, and being universally comprehensible.

This does not entirely settle the objection to subjectivism. In fact, the objection still takes several forms. First, there is the following: we are told, "So you're able to do anything, no matter what!" This is expressed in various ways. First we are accused of anarchy; then they say, "You're unable to pass judgment on others, because there's no reason to prefer one configuration to another"; finally they tell us, "Everything is arbitrary in this choosing of yours. You take something from one pocket and pretend you're putting it into the other."

These three objections aren't very serious. Take the first objection. "You're able to do anything, no matter what" is not to the point. In one sense choice is possible, but what is not possible is not to choose. I can always choose, but I ought to know that if I do not choose, I am still choosing. Though this may seem purely formal, it is highly important for keeping fantasy and caprice within bounds. If it is true that in facing a situation, for example, one in which, as a person capable of having sexual relations, of having children, I am obliged to choose an attitude, and if I in any way assume responsibility for a choice which, in involving myself, also involves all mankind, this has nothing to do with caprice, even if no a priori value determines my choice.

If anybody thinks that he recognizes here Gide's theory of the arbitrary act, he fails to see the enormous difference between this doctrine and Gide's. Gide does not know what a situation is. He acts out of pure caprice. For us, on the contrary, man is in an organized situation in which he himself is involved. Through his choice, he involves all mankind, and he cannot avoid making a choice; either he will remain chaste, or he will marry without having children, or he will marry and have children; anyhow, whatever he may do, it is impossible for him not to take full responsibility for the way he handles this problem. Doubtless, he chooses without referring to preestablished values, but it is unfair to accuse him of caprice. Instead, let us say that moral choice is to be compared to the making of a work of art. And before going any further, let it be said at once that we are not dealing here with an aesthetic ethics, because our opponents are so dishonest that they even accuse us of that. The example I've chosen is a comparison only.

Having said that, may I ask whether anyone has ever accused an artist who has painted a picture of not having drawn his inspiration from rules set up a priori? Has anyone ever asked, "What painting ought he to make?" It is clearly understood that there is no definite painting to be made, that the artist is engaged in the making of his painting, and that the painting to be made is precisely the painting he will have made. It is clearly understood that there are no a priori aesthetic values, but that there are values which appear subsequently in the coherence of the painting, in the correspondence between what the artist intended and the result. Nobody can tell what the painting of tomorrow will be like. Painting can be judged only after it has once been made. What connection does that have with ethics? We are in the same creative situation. We never say that a work of art is arbitrary. When we speak of a canvas of Picasso¹² we never say that it is

arbitrary; we understand quite well that he was making himself what he is at the very time he was painting, that the ensemble of his work is embodied in his life.

The same holds on the ethical plane. What art and ethics have in common is that we have creation and invention in both cases. We cannot decide a priori what there is to be done. I think that I pointed that out quite sufficiently when I mentioned the case of the student who came to see me, and who might have applied to all the ethical systems, Kantian or otherwise, without getting any sort of guidance. He was obliged to devise his law himself. Never let it be said by us that this man — who, taking affection, individual action, and kind-heartedness toward a specific person as his ethical first principle, chooses to remain with his mother, or who, preferring to make a sacrifice, chooses to go to England — has made an arbitrary choice. Man makes himself. He isn't ready made at the start. In choosing his ethics, he makes himself, and force of circumstances is such that he cannot abstain from choosing one. We define man only in relationship to involvement. It is therefore absurd to charge us with arbitrariness of choice.

In the second place, it is said that we are unable to pass judgment on others. In a way this is true, and in another way, false. It is true in this sense, that, whenever a man sanely and sincerely involves himself and chooses his configuration, it is impossible for him to prefer another configuration, regardless of what his own may be in other respects. It is true in this sense, that we do not believe in progress. Progress is betterment. Man is always the same. The situation confronting him varies. Choice always remains a choice in a situation. The problem has not changed since the time one could choose between those for and those against slavery, for example, at the time of the Civil War, and the present time, when one can side with the Maquis Resistance Party, or with the Communists.

But, nevertheless, one can still pass judgment, for, as I have said, one makes a choice in relationship to others. First, one can judge (and this is perhaps not a judgment of value, but a logical judgment) that certain choices are based on error and others on truth. If we have defined man's situation as a free choice, with no excuses and no recourse, every man who takes refuge behind the excuse of his passions, every man who sets up a determinism, is a dishonest man.

The objection may be raised, "But why mayn't he choose himself dishonestly?" I reply that I am not obliged to pass moral judgment on him, but that I do define his dishonesty as an error. One cannot help considering the truth of the matter. Dishonesty is obviously a falsehood because it belies the complete freedom of involvement. On the same grounds, I maintain that there is also dishonesty if I choose to state that certain values exist prior to me; it is self-contradictory for me to want them and at the same time state that they are imposed on me. Suppose someone says to me, "What if I want to be dishonest?" I'll answer, "There's no reason for you not to be, but I'm saying that that's what you are, and that the strictly coherent attitude is that of honesty."

Besides, I can bring moral judgment to bear. When I declare that freedom in every concrete circumstance can have no other aim than to want itself, if man has once become aware that in his forlornness he imposes values, he can no longer want but one thing, and that is freedom, as the basis of all values. That doesn't mean that he wants it in the abstract. It means simply that the ultimate meaning of the acts of honest men is the quest for freedom as such. A man who belongs to a communist or revolutionary union wants concrete goals; these goals imply an abstract desire for freedom; but this freedom is wanted in something concrete. We want freedom for freedom's sake and in every particular circumstance. And in wanting freedom we discover that it depends entirely on the freedom of others, and that the freedom of others depends on ours. Of course, freedom as the definition of man does not depend on others, but as soon as there is involvement, I am obliged to want others to have freedom at the same time that I want my own freedom. I can take freedom as my goal only if I take that of others as a goal as well. Consequently, when, in all honesty, I've recognized that man is a being in whom existence precedes essence, that he is a free being who, in various circumstances, can want only his freedom, I have at the same time recognized that I can want only the freedom of others.

Therefore, in the name of this will for freedom, which freedom itself implies, I may pass judgment on those who seek to hide from themselves the complete arbitrariness and the complete freedom of their existence. Those who hide their complete freedom from themselves out of a spirit of seriousness or by means of deterministic excuses, I shall call cowards; those who try to show that their existence was necessary, when it is the very contingency of man's appearance on earth, I shall call stinkers. But cowards or stinkers can be judged only from a strictly unbiased point of view.

Therefore though the content of ethics is variable, a certain form of it is universal. Kant says that freedom desires both itself and the freedom of others. Granted. But he believes that the formal and the universal are enough to constitute an ethics. We, on the other hand, think that principles which are too abstract run aground in trying to decide action. Once again, take the case of the student. In the name of what, in the name

of what great moral maxim do you think he could have decided, in perfect peace of mind, to abandon his mother or to stay with her? There is no way of judging. The content is always concrete and thereby unforeseeable; there is always the element of invention. The one thing that counts is knowing whether the inventing that has been done, has been done in the name of freedom.

For example, let us look at the following two cases. You will see to what extent they correspond, yet differ. Take *The Mill on the Floss*.¹³ We find a certain young girl, Maggie Tulliver, who is an embodiment of the value of passion and who is aware of it. She is in love with a young man, Stephen, who is engaged to an insignificant young girl. This Maggie Tulliver, instead of heedlessly preferring her own happiness, chooses, in the name of human solidarity, to sacrifice herself and give up the man she loves. On the other hand, Sanseverina, in *The Charterhouse of Parma*,¹⁴ believing that passion is man's true value, would say that a great love deserves sacrifices; that it is to be preferred to the banality of the conjugal love that would tie Stephen to the young ninny he had to marry. She would choose to sacrifice the girl and fulfill her happiness; and, as Stendahl shows, she is even ready to sacrifice herself for the sake of passion, if this life demands it. Here we are in the presence of two strictly opposed moralities. I claim that they are much the same thing; in both cases what has been set up as the goal is freedom.

You can imagine two highly similar attitudes: one girl prefers to renounce her love out of resignation; another prefers to disregard the prior attachment of the man she loves out of sexual desire. On the surface these two actions resemble those we've just described. However, they are completely different. Sanseverina's attitude is much nearer that of Maggie Tulliver, one of heedless rapacity.

Thus, you see that the second charge is true and, at the same time, false. One may choose anything if it is on the grounds of free involvement.

The third objection is the following: "You take something from one pocket and put it into the other. That is, fundamentally, values aren't serious, since you choose them." My answer to this is that I'm quite vexed that that's the way it is; but if I've discarded God the Father, there has to be someone to invent values. You've got to take things as they are. Moreover, to say that we invent values means nothing else but this: life has no meaning a priori. Before you come alive, life is nothing; it's up to you to give it a meaning, and value is nothing else but the meaning that you choose. In that way, you see, there is a possibility of creating a human community.

I've been reproached for asking whether existentialism is humanistic. It's been said, "But you said in *Nausea* that the humanists were all wrong. You made fun of a certain kind of humanist. Why come back to it now?" Actually, the word humanism has two very different meanings. By humanism one can mean a theory which takes man as an end and as a higher value. Humanism in this sense can be found in Cocteau's tale *Around the World in Eighty Hours*¹⁵ when a character, because he is flying over some mountains in an airplane, declares, "Man is simply amazing." That means that I, who did not build the airplanes, shall personally benefit from these particular inventions, and that I, as man, shall personally consider myself responsible for, and honored by, acts of a few particular men. This would imply that we ascribe a value to man on the basis of the highest deeds of certain men. This humanism is absurd, because only the dog or the horse would be able to make such an over-all judgment about man, which they are careful not to do, at least to my knowledge.

But it cannot be granted that a man may make a judgment about man. Existentialism spares him from any such judgment. The existentialist will never consider man as an end because he is always in the making. Nor should we believe that there is a mankind to which we might set up a cult in the manner of Auguste Comte.¹⁶ The cult of mankind ends in the self-enclosed humanism of Comte, and, let it be said, of fascism. This kind of humanism we can do without.

But there is another meaning of humanism. Fundamentally it is this: man is constantly outside of himself; in projecting himself, in losing himself outside of himself, he makes for man's existing; and, on the other hand, it is by pursuing transcendent goals that he is able to exist; man, being this state of passing-beyond, and seizing upon things only as they bear upon this passing-beyond, is at the heart, at the center of this passing-beyond. There is no universe other than a human universe, the universe of human subjectivity. This connection between transcendency, as a constituent element of man — not in the sense that God is transcendent, but in the sense of passing beyond—and subjectivity, in the sense that man is not closed in on himself but is always present in a human universe, is what we call existentialism humanism. Humanism, because we remind man that there is no law-maker other than himself, and that in his forlornness he will decide by himself; because we point out that man will fulfill himself as man, not in turning toward himself, but in seeking outside of himself a goal which is just this liberation, just this particular fulfillment.

From these few reflections it is evident that nothing is more unjust than the objections that have been raised against us. Existentialism is nothing else than an attempt to draw all the consequences of a coherent atheistic position. It isn't trying to plunge man into despair at all. But if one calls every attitude of unbelief despair, like the Christians, then the word is not being used in its original sense. Existentialism isn't so atheistic that it wears itself out showing that God doesn't exist. Rather, it declares that even if God did exist, that would change nothing. There you've got our point of view. Not that we believe that God exists, but we think that the problem of His existence is not the issue. In this sense existentialism is optimistic, a doctrine of action, and it is plain dishonesty for Christians to make no distinction between their own despair and ours and then to call us despairing.

Ludwig Wittgenstein

Ludwig Wittgenstein (1889–1951) was born in Vienna, where his parents were leading patrons of the arts. He showed an early talent for mechanics, which led to his studying engineering in Berlin and Manchester, England. His interests began to shift to mathematics and the foundations of mathematics, leading him to go in 1912 to Cambridge University to meet Bertrand Russell, who became his mentor. Wittgenstein's studies at Cambridge ended with the onset of World War I. He enlisted in the Austrian army and was noted for his courage in war. During his time at the front he completed his first great philosophical work, the *Tractatus Logico-Philosophicus*. In 1918 he was taken prisoner and sent to a prisoner-of-war camp in Italy, from which he managed to smuggle out to Russell a copy of the *Tractatus*.

Published in English in 1922, the *Tractatus* aims to show that language must have a certain structure if it is to represent reality. Language “pictures” reality by mimicking its structure. Like all pictures, a sentence-picture shows how things stand in the world. Sentences that do not represent possible states of affairs—including ethical statements, philosophical discourse, and religious theses—may be important to our lives but are nonetheless nonsensical.

Having completed the *Tractatus*, Wittgenstein believed that nothing more remained to be said in philosophy, and so he turned to other occupations, designing a mansion for his sister, and working as a gardener and then as a school teacher. Urged by friends, he returned to Cambridge in 1929 and submitted the *Tractatus* for his Ph.D. thesis. He was immediately made a fellow at Trinity College. Though he published nothing after the *Tractatus*, the next twenty years were a time of tremendous philosophical output in the form of lectures and manuscript writing. His lectures of 1932–1933, circulated as *The Blue and Brown Books*, contain many of the problems and ideas fully developed in the *Philosophical Investigations*. The *Blue Book* initiates a critique of the *Tractatus* theory of language, while the *Brown Book* introduces the language-game as a device to explore the limits of the imaginable. Wittgenstein's concerns with meaning, the limits of meaningfulness, nonsense, and necessity remained throughout his life at the heart of his philosophical inquiries. The *Philosophical Investigations*, published posthumously in 1953, gives his mature treatment of these issues. Wittgenstein worked virtually up until the day of his death, and his final efforts, directed toward issues of knowledge and certainty, were published as *On Certainty*.

The *Philosophical Investigations* is primarily a critical examination of theories of language and mind that have dominated Western philosophy since Descartes. Wittgenstein aims to show that viewing language as representational of reality or mind as an arena of special powers of knowing are profound mistakes resulting from conceptual confusions and fallacious arguments.

His most distinctive device is the language-game (1–18), either a primitive form of language “in which one can command a clear view of the aim and functioning of the words” (5) or “the whole, consisting of language and the actions into which it is woven” (7). Understood either way the language-game resists assimilation to the representationalist theory of language.

His criticism of that theory is first directed against the idea that what fixes the meaning of a word is the object that the word names (28–38). Wittgenstein demonstrates the diverse ways in which words are used, many of which have nothing to do with naming objects, and he constructs compelling arguments to show that naming cannot fix meanings because it always presupposes some “stage-setting” before it can be correctly interpreted. He concludes that uses of language have no single essence but display the variety of a family resemblance (65–68).

Meaning is a matter of the rule-governed character of language (139–242). Rules determine correct application of words. So the meaning of an expression is not given by naming some object but by use in accord with a rule. As Wittgenstein puts it, a rule determines what it is to go on in the same way or how one *ought* to act.

His paradigmatic case of following a rule focuses on the natural numbers—1, 2, 3, 4... . Can we explain how one ought to continue this arithmetic sequence? Wittgenstein critiques all attempted solutions to this problem: no one can show why it is correct to continue one way rather than another, for any method of projection can itself be multiply interpreted. “This was our paradox: no course of action could be determined by a rule, because every course of action can be made out to accord with the rule” (202). He concludes that rule-following requires a background of acting routinely, nonreflectively, and cooperatively.

He turns next to the Cartesian theory of mind, according to which mental episodes are marked by immediacy, transparency, and privacy. In seeking to put to rest the idea that mental acts have these extraordinary powers, he focuses on the heart of the Cartesian theory of mind, the idea that mental states are private. Wittgenstein takes pain as his paradigmatic mental state, for it is supposed to be intrinsically knowable, immediately given, and wholly private.

The foundation for Wittgenstein's critique of the Cartesian theory of mind is the so-called private language argument (243–304). It has two components. The first, which is illustrated by a private diary in which an individual marks an's every time's is sensed, shows that the distinction between one sensation and a different one cannot be maintained if sensations are private. The second component maintains that objects are irrelevant to our linguistic practice. Here Wittgenstein imagines a game in which each player has a box with a beetle inside it, but no one can look inside another's box. Wittgenstein concludes that instead of making the private object what matters most, as Cartesians do, we should recognize that living beings, not inner private states or public behaviors, are the medium of mental life. In coming to accept that we act as a matter of course (without rules) and relate to others and ourselves as living human beings, we accept the obvious and so find our way out of the "fly-bottle" (309).

A definitive biography of Wittgenstein is Ray Monk, *Ludwig Wittgenstein: The Duty of Genius* (New York: Free Press, 1990). A clear introduction to the *Tractatus* and the *Philosophical Investigations* is Anthony Kenny, *Wittgenstein* (Cambridge, Mass.: Harvard University Press, 1973). Two introductions to the *Investigations* are Marie McGinn, *Wittgenstein and the Philosophical Investigations* (London: Routledge, 1997) and Norman Malcolm, *Wittgenstein: Nothing Is Hidden* (Oxford: Basil Blackwell, 1986). More advanced treatments are Robert Fogelin, *Wittgenstein*, second edition (London, Routledge & Kegan Paul, 1987) and P. M. S. Hacker, *Insight and Illusion*, second edition (Oxford: Clarendon Press, 1986). A collection of incisive essays is Meredith Williams, ed., *Wittgenstein's Philosophical Investigations: Critical Essays* (Lanham, Md.: Rowman & Littlefield, 2007).

Meredith Williams

*Philosophical Investigations**

1. “Cum ipsi (maiores homines) appellabant rem aliquam, et cum secundum eam vocem corpus ad aliquid movenat, videbam, et tenebam hoc ab eis vocari rem illam, quod sonabant, cum eam vellent ostendere. Hoc autem eos velle ex motu corporis aperiebatur: tamquam verbis naturalibus omnium gentium, quae fiunt vultu et nutu oculorum, ceterorumque membrorum actu, et sonitu vocis indicante affectionem animi in petendis, habendis, rejiciendis, fugiendisve rebus. Ita verba in variis sententiis locis suis posita, et crebro audita, quarum rerum signa essent, paulatim colligebam, measque jam voluntates, edomito in eis signis ore, per haec enuntiabam.” (Augustine, *Confessions*, I. 8.)¹

These words, it seems to me, give us a particular picture of the essence of human language. It is this: the individual words in language name objects — sentences are combinations of such names. — In this picture of language we find the roots of the following idea: Every word has a meaning. This meaning is correlated with the word. It is the object for which the word stands.

Augustine does not speak of there being any difference between kinds of word. If you describe the learning of language in this way you are, I believe, thinking primarily of nouns like “table”, “chair”, “bread”, and of people’s names, and only secondarily of the names of certain actions and properties; and of the remaining kinds of word as something that will take care of itself.

Now think of the following use of language: I send someone shopping. I give him a slip marked “five red apples”. He takes the slip to the shopkeeper, who opens the drawer marked “apples”; then he looks up the word “red” in a table and finds a colour sample opposite it; then he says the series of cardinal numbers—I assume that he knows them by heart—up to the word “five” and for each number he takes an apple of the same colour as the sample out of the drawer.—It is in this and similar ways that one operates with words.—“But how does he know where and how he is to look up the word ‘red’ and what he is to do with the word ‘five’?” — Well, I assume that he *acts* as I have described. Explanations come to an end somewhere.—But what is the meaning of the word “five”? — No such thing was in question here, only how the word “five” is used.

2. That philosophical concept of meaning has its place in a primitive idea of the way language functions. But one can also say that it is the idea of a language more primitive than ours.

Let us imagine a language for which the description given by Augustine is right. The language is meant to serve for communication between a builder A and an assistant B. A is building with building-stones: there are blacks, pillars, slabs and beams. B has to pass the stones, and that in the order in which A needs them. For this purpose they use a language consisting of the words “block”, “pillar”, “slab”, “beam”. A calls them out;—B brings the stone which he has learnt to bring at such-and-such a call. — Conceive this as a complete primitive language.

3. Augustine, we might say, does describe a system of communication; only not everything that we call language is this system. And one has to say this in many cases where the question arises “Is this an appropriate description or not?” The answer is: “Yes, it is appropriate, but only for this narrowly circumscribed region, not for the whole of what you were claiming to describe.”

It is as if someone were to say: “A game consists in moving objects about on a surface according to certain rules ...” — and we replied: You seem to be thinking of board-games, but there are others. You can make your definition correct by expressly restricting it to those games.

4. Imagine a script in which the letters were used to stand for sounds, and also as signs of emphasis and punctuation. (A script can be conceived as a language for describing sound-patterns.) Now imagine someone interpreting that script as if there were simply a correspondence of letters to sounds and as if the letters had not also completely different functions. Augustine’s conception of language is like such an oversimple conception of the script.

5. If we look at the example in §1, we may perhaps get an inkling how much this general notion of the meaning of a word surrounds the working of language with a haze which makes clear vision impossible. It disperses the fog to study the phenomena of language in primitive kinds of application in which one can

command a clear view of the aim and functioning of the words.

A child uses such primitive forms of language when it learns to talk. Here the teaching of language is not explanation, but training.

6. We could imagine that the language of §2 was the *whole* language of A and B; even the whole language of a tribe. The children are brought up to perform *these* actions, to use *these* words as they do so, and to react in *this* way to the words of others.

An important part of the training will consist in the teacher's pointing to the objects, directing the child's attention to them, and at the same time uttering a word; for instance, the word "slab" as he points to that shape. (I do not want to call this "ostensive definition", because the child cannot as yet *ask* what the name is. I will call it "ostensive teaching of words".—I say that it will form an important part of the training, because it is so with human beings; not because it could not be imagined otherwise.) This ostensive teaching of words can be said to establish an association between the word and the thing. But what does this mean? Well, it can mean various things; but one very likely thinks first of all that a picture of the object comes before the child's mind when it hears the word. But now, if this does happen — is it the purpose of the word? — Yes, it *can* be the purpose.—I can imagine such a use of words (of series of sounds). (Uttering a word is like striking a note on the keyboard of the imagination.) But in the language of §2 it is *not* the purpose of the words to evoke images. (It may, of course, be discovered that that helps to attain the actual purpose.)

But if the ostensive teaching has this effect,—am I to say that it effects an understanding of the word? Don't you understand the call "Slab!" if you act upon it in such-and-such a way? — Doubtless the ostensive teaching helped to bring this about; but only together with a particular training. With different training the same ostensive teaching of these words would have effected a quite different understanding.

"I set the brake up by connecting up rod and lever." — Yes, given the whole of the rest of the mechanism. Only in conjunction with that is it a brake-lever, and separated from its support it is not even a lever; it may be anything, or nothing.

7. In the practice of the use of language (2) one party calls out the words, the other acts on them. In instruction in the language the following process will occur: the learner *names* the objects; that is, he utters the word when the teacher points to the stone.— And there will be this still simpler exercise: the pupil repeats the words after the teacher—both of these being processes resembling language.

We can also think of the whole process of using words in (2) as one of those games by means of which children learn their native language. I will call these games "language-games" and will sometimes speak of a primitive language as a language-game.

And the processes of naming the stones and of repeating words after someone might also be called language-games. Think of much of the use of words in games like ring-a-ring-a-roses.

I shall also call the whole, consisting of language and the actions into which it is woven, the "language-game".

8. Let us now look at an expansion of language (2). Besides the four words "block", "pillar", etc., let it contain a series of words used as the shopkeeper in (1) used the numerals (it can be the series of letters of the alphabet); further, let there be two words, which may as well be "there" and "this" (because this roughly indicates their purpose), that are used in connexion with a pointing gesture; and finally a number of colour samples. A gives an order like: "d — slab — there". At the same time he shews the assistant a colour sample, and when he says "there" he points to a place on the building site. From the stock of slabs B takes one for each letter of the alphabet up to "d", of the same colour as the sample, and brings them to the place indicated by A. — On other occasions A gives the order "this — there". At "this" he points to a building-stone. And so on.

9. When a child learns this language, it has to learn the series of 'numerals' a, b, c, ... by heart. And it has to learn their use.—Will this training include ostensive teaching of the words?—Well, people will, for example, point to slabs and count: "a, b, c slabs". — Something more like the ostensive teaching of the words "block", "pillar", etc. would be the ostensive teaching of the numerals that serve not to count but to refer to groups of objects that can be taken in at a glance. Children do learn the use of the first five or six cardinal numerals in this way.

Are "there" and "this" also taught ostensively?— Imagine how one might perhaps teach their use. One will point to places and things—but in this case the pointing occurs in the *use* of the words too and not merely in learning the use.—

10. Now what do the words of this language *signify*?— What is supposed to show what they signify, if not the kind of use they have? And we have already described that. So we are asking for the expression "This word

signifies *this*” to be made a part of the description. In other words the description ought to take the form: “The word ... signifies...”.

Of course, one can reduce the description of the use of the word “slab” to the statement that this word signifies this object. This will be done when, for example, it is merely a matter of removing the mistaken idea that the word “slab” refers to the shape of building-stone that we in fact call a “block”—but the kind of ‘referring’ this is, that is to say the use of these words for the rest, is already known.

Equally one can say that the signs “a”, “b”, etc. signify numbers; when for example this removes the mistaken idea that “a”, “b”, “c”, play the part actually played in language by “block”, “slab”, “pillar”. And one can also say that “c” means this number and not that one; when for example this serves to explain that the letters are to be used in the order a, b, c, d, etc. and not in the order a, b, d, c.

But assimilating the descriptions of the uses of words in this way cannot make the uses themselves any more like one another. For, as we see, they are absolutely unlike.

11. Think of the tools in a tool-box: there is a hammer, pliers, a saw, a screw-driver, a rule, a glue-pot, glue, nails and screws. — The functions of words are as diverse as the functions of these objects. (And in both cases there are similarities.)

Of course, what confuses us is the uniform appearance of words when we hear them spoken or meet them in script and print. For their *application* is not presented to us so clearly. Especially when we are doing philosophy!

12. It is like looking into the cabin of a locomotive. We see handles all looking more or less alike. (Naturally, since they are all supposed to be handled.) But one is the handle of a crank which can be moved continuously (it regulates the opening of a valve); another is the handle of a switch, which has only two effective positions, it is either off or on; a third is the handle of a brake-lever, the harder one pulls on it, the harder it brakes; a fourth, the handle of a pump: it has an effect only so long as it is moved to and fro.

13. When we say: “Every word in language signifies something” we have so far said *nothing whatever*; unless we have explained exactly *what* distinction we wish to make. (It might be, of course, that we wanted to distinguish the words of language (8) from words ‘without meaning’ such as occur in Lewis Carroll’s poems, or words like “Lilliburlero” in songs.)

14. Imagine someone’s saying: “All tools serve to modify something. Thus the hammer modifies the position of the nail, the saw the shape of the board, and so on.” — And what is modified by the rule, the glue-pot, the nails?—“Our knowledge of a thing’s length, the temperature of the glue, and the solidity of the box.”—Would anything be gained by this assimilation of expressions?—

15. The word “to signify” is perhaps used in the most straightforward way when the object signified is marked with the sign. Suppose that the tools A uses in building bear certain marks. When A shows his assistant such a mark, he brings the tool that has that mark on it.

It is in this and more or less similar ways that a name means and is given to a thing. — It will often prove useful in philosophy to say to ourselves: naming something is like attaching a label to a thing.

16. What about the colour samples that A shows to B: are they part of the *language*? Well, it is as you please. They do not belong among the words; yet when I say to someone: “Pronounce the word ‘the’”, you will count the second “the” as part of the sentence. Yet it has a role just like that of a colour-sample in language-game (8); that is, it is a sample of what the other is meant to say.

It is most natural, and causes least confusion, to reckon the samples among the instruments of the language ...

17. It will be possible to say: In language (8) we have different *kinds of word*. For the functions of the word “slab” and the word “block” are more alike than those of “slab” and “d”. But how we group words into kinds will depend on the aim of the classification,— and on our own inclination.

Think of the different points of view from which one can classify tools or chessmen.

18. Do not be troubled by the fact that languages (2) and (8) consist only of orders. If you want to say that this shows them to be incomplete, ask yourself whether our language is complete;—whether it was so before the symbolism of chemistry and the notation of the infinitesimal calculus were incorporated in it; for these are, so to speak, suburbs of our language. (And how many houses or streets does it take before a town begins to be a town?) Our language can be seen as an ancient city: a maze of little streets and squares, of old and new houses, and of houses with additions from various periods; and this surrounded by a multitude of new boroughs with straight regular streets and uniform houses.

28. Now one can ostensively define a proper name, the name of a colour, the name of a material, a numeral, the name of a point of the compass and so on. The definition of the number two, “That is called ‘two’” — pointing to two nuts — is perfectly exact.— But how can two be defined like that? The person one gives the definition to doesn’t know what one wants to call “two”; he will suppose that “two” is the name given to *this* group of nuts!—He *may* suppose this; but perhaps he does not. He might make the opposite mistake; when I want to assign a name to this group of nuts, he might understand it as a numeral. And he might equally well take the name of a person, of which I give an ostensive definition, as that of a colour, of a race, or even of a point of the compass. That is to say: an ostensive definition can be variously interpreted in *every* case.

29. Perhaps you say: two can only be ostensively defined in *this* way: “This *number* is called ‘two’”. For the word “number” here shows what place in language, in grammar, we assign to the word. But this means that the word “number” must be explained before the ostensive definition can be understood. — The word “number” in the definition does indeed show this place; does show the post at which we station the word. And we can prevent misunderstandings by saying: “This *colour* is called so-and-so”, “This *length* is called so-and-so”, and so on. That is to say: misunderstandings are sometimes averted in this way. But is there only *one* way of taking the word “colour” or “length”? — Well, they just need defining. — Defining, then, by means of other words! And what about the last definition in this chain? (Do not say: “There isn’t a ‘last’ definition”. That is just as if you chose to say: “There isn’t a last house in this road; one can always build an additional one”.)

Whether the word “number” is necessary in the ostensive definition depends on whether without it the other person takes the definition otherwise than I wish. And that will depend on the circumstances under which it is given, and on the person I give it to.

And how he ‘takes’ the definition is seen in the use that he makes of the word defined.

30. So one might say: the ostensive definition explains the use—the meaning—of the word when the overall role of the word in language is clear. Thus if I know that someone means to explain a colour-word to me the ostensive definition “That is called ‘sepia’” will help me to understand the word.—And you can say this, so long as you do not forget that all sorts of problems attach to the words “to know” or “to be clear”.

One has already to know (or be able to do) something in order to be capable of asking a thing’s name. But what does one have to know?²

31. When one shows someone the king in chess and says: “This is the king”, this does not tell him the use of this piece — unless he already knows the rules of the game up to this last point: the shape of the king. You could imagine his having learnt the rules of the game without ever having been shown an actual piece. The shape of the chessman corresponds here to the sound or shape of a word.

One can also imagine someone’s having learnt the game without ever learning or formulating rules. He might have learnt quite simple board-games first, by watching, and have progressed to more and more complicated ones. He too might be given the explanation “This is the king”, — if, for instance, he were being shown chessmen of a shape he was not used to. This explanation again only tells him the use of the piece because, as we might say, the place for it was already prepared. Or even: we shall only say that it tells him the use, if the place is already prepared. And in this case it is so, not because the person to whom we give the explanation already knows rules, but because in another sense he is already master of a game.

Consider this further case: I am explaining chess to someone; and I begin by pointing to a chessman and saying: “This is the king; it can move like this, ... and so on.” — In this case we shall say: the words “This is the king” (or “This is called the ‘king’”) are a definition only if the learner already ‘knows what a piece in a game is’. That is, if he has already played other games, or has watched other people playing ‘and understood’ — *and similar things*. Further, only under these conditions will he be able to ask relevantly in the course of learning the game: “What do you call this?” — that is, this piece in a game.

We may say: only someone who already knows how to do something with it can significantly ask a name.

And we can imagine the person who is asked replying: “Settle the name yourself” — and now the one who asked would have to manage everything for himself.

32. Someone coming into a strange country will sometimes learn the language of the inhabitants from ostensive definitions that they give him; and he will often have to *guess* the meaning of these definitions; and will guess sometimes right, sometimes wrong.

And now, I think, we can say: Augustine describes the learning of human language as if the child came into a strange country and did not understand the language of the country; that is, as if it already had a

language, only not this one. Or again: as if the child could already *think*, only not yet speak. And “think” would here mean something like “talk to itself”.

33. Suppose, however, someone were to object: “It is not true that you must already be master of a language in order to understand an ostensive definition: all you need — of course! — is to know or guess that the person giving the explanation is pointing to. That is, whether for example to the shape of the object, or to its colour, or to its number, and so on.” — And what does ‘pointing to the shape’, ‘pointing to the colour’ consist in? Point to a piece of paper. — And now point to its shape — now to its colour — now to its number (that sounds queer). — How did you do it? — You will say that you ‘meant’ a different thing each time you pointed. And if I ask how that is done, you will say you concentrated your attention on the colour, the shape, etc. But I ask again: how is *that* done?

Suppose someone points to a vase and says “Look at that marvellous blue — the shape isn’t the point.” — Or: “Look at the marvellous shape — the colour doesn’t matter.” Without doubt you will do something *different* when you act upon these two invitations. But do you always do the *same* thing when you direct your attention to the colour? Imagine various different cases. To indicate a few:

“Is this blue the same as the blue over there? Do you see any difference?” —

You are mixing paint and you say “It’s hard to get the blue of this sky.”

“It’s turning fine, you can already see blue sky again.”

“Look what different effects these two blues have.”

“Do you see the blue book over there? Bring it here.”

“This blue signal-light means....”

“What’s this blue called? — Is it ‘indigo’?”

You sometimes attend to the colour by putting your hand up to keep the outline from view; or by not looking at the outline of the thing; sometimes by staring at the object and trying to remember where you saw that colour before.

You attend to the shape, sometimes by tracing it, sometimes by screwing up your eyes so as not to see the colour clearly, and in many other ways. I want to say: This is the sort of thing that happens *while* one ‘directs one’s attention to this or that’. But it isn’t these things by themselves that make us say someone is attending to the shape, the colour, and so on. Just as a move in chess doesn’t consist simply in moving a piece in such-and-such a way on the board — nor yet in one’s thoughts and feelings as one makes the move: but in the circumstances that we call “playing a game of chess”, “solving a chess problem”, and so on.

34. But suppose someone said: “I always do the same thing when I attend to the shape: my eye follows the outline and I feel. And suppose this person to give someone else the ostensive definition “That is called a ‘circle’”, pointing to a circular object and having all these experiences — cannot his hearer still interpret the definition differently, even though he sees the other’s eyes following the outline, and even though he feels what the other feels? That is to say: this ‘interpretation’ may also consist in how he now makes use of the word; in what he points to, for example, when told: “Point to a circle”. — For neither the expression “to intend the definition in such-and-such a way” nor the expression “to interpret the definition in such-and-such a way” stands for a process which accompanies the giving and hearing of the definition.

35. There are, of course, what can be called “characteristic experiences” of pointing to (e.g.) the shape. For example, following the outline with one’s finger or with one’s eyes as one points. — But *this* does not happen in all cases in which I ‘mean the shape’, and no more does any other one characteristic process occur in all these cases. — Besides, even if something of the sort did recur in all cases, it would still depend on the circumstances — that is, on what happened before and after the pointing — whether we should say “He pointed to the shape and not to the colour”.

For the words “to point to the shape”, “to mean the shape”, and so on, are not used in the same way as *these*: “to point to this book (not to that one)”, “to point to the chair, not to the table”, and so on. — Only think how differently we *learn* the use of the words “to point to this thing”, “to point to that thing”, and on the other hand “to point to the colour, not the shape”, “to mean the colour”, and so on.

To repeat: in certain cases, especially when one points ‘to the shape’ or ‘to the number’ there are characteristic experiences and ways of pointing — ‘characteristic’ because they recur often (not always) when shape or number are ‘meant’. But do you also know of an experience characteristic of pointing to a piece in a game *as a piece in a game*? All the same one can say: “I meant that this *piece* is called the ‘king’, not this

particular bit of wood I am pointing to". (Recognizing, wishing, remembering, etc.)³

36. And we do here what we do in a host of similar cases: because we cannot specify any *one* bodily action which we call pointing to the shape (as opposed, for example, to the colour), we say that a *spiritual* [mental, intellectual] activity corresponds to these words.

Where our language suggests a body and there is none: there, we should like to say, is a *spirit*.

37. What is the relation between name and thing named? — Well, what *is* it? Look at language-game (2) or at another one: there you can see the sort of thing this relation consists in. This relation may also consist, among many other things, in the fact that hearing the name calls before our mind the picture of what is named; and is also consists, among other things, in the name's being written on the thing named or being pronounced when that thing is pointed at.

38. But what, for example, is the word "this" the name of in language-game (8) or the word "that" in the ostensive definition "that is called ..."? — If you do not want to produce confusion you will do best not to call these words names at all.—Yet, strange to say, the word "this" has been called the only *genuine* name; so that anything else we call a name was one only in an inexact, approximate sense.

This queer conception springs from a tendency to sublime the logic of our language — as one might put it. The proper answer to it is: we call very different things "names"; the word "name" is used to characterize many different kinds of use of a word, related to one another in many different ways; — but the kind of use that "this" has is not among them.

It is quite true that, in giving an ostensive definition for instance, we often point to the object named and say the name. And similarly, in giving an ostensive definition for instance, we say the word "this" while pointing to a thing. And also the word "this" and a name often occupy the same position in a sentence. But it is precisely characteristic of a name that it is defined by means of the demonstrative expression "That is N" (or "That is called 'N'"). But do we also give the definitions: "That is called 'this'", or "This is called 'this'"?

This is connected with the conception of naming as, so to speak, an occult process. Naming appears as a *queer* connexion of a word with an object. — And you really get such a queer connexion when the philosopher tries to bring out *the* relation between name and thing by staring at an object in front of him and repeating a name or even the word "this" innumerable times. For philosophical problems arise when language *goes on holiday*. And *here* we may indeed fancy naming to be some remarkable act of mind, as it were a baptism of an object. And we can also say the word "this" *to* the object, as it were *address* the object as "this" — a queer use of this word, which doubtless only occurs in doing philosophy.

65. Here we come up against the great question that lies behind all these considerations.—For someone might object against me: "You take the easy way out! You talk about all sorts of language-games, but have nowhere said what the essence of a language-game, and hence of language, is: what is common to all these activities, and what makes them into language or parts of language. So you let yourself off the very part of the investigation that once gave you yourself most headache, the part about the *general form of propositions* and of language."

And this is true.—Instead of producing something common to all that we call language, I am saying that these phenomena have no one thing in common which makes us use the same word for all,—but that they are *related* to one another in many different ways. And it is because of this relationship, or these relationships, that we call them all "language". I will try to explain this.

66. Consider for example the proceedings that we call "games". I mean board-games, card-games, ball-games, Olympic games, and so on. What is common to them all? — Don't say: "There *must* be something common, or they would not be called 'games'" — but *look and see* whether there is anything common to all.— For if you look at them you will not see something common to all. — For if you look at them you will not see something that is common to all, but similarities, relationships, and a whole series of them at that. To repeat: don't think, but look!— Look for example at board-games, with their multifarious relationships. Now pass to card-games; here you find many correspondences with the first group, but many common features drop out, and others appear. When we pass next to ball-games, much that is common is retained, but much is lost. — Are they all 'amusing'? Compare chess with noughts and crosses. Or is there always winning and losing, or competition between players? Think of patience. In ball games there is winning and losing; but when a child throws his ball at the wall and catches it again, this feature has disappeared. Look at the parts played by skill and luck; and at the difference between skill in chess and skill in tennis. Think now of games like ring-a-ring-a-roses; here is the element of amusement, but how many other characteristic features have disappeared! And we can go through the many, many other groups of games in the same way; can see how similarities crop up and disappear.

And the result of this examination is: we see a complicated network of similarities overlapping and criss-crossing: sometimes overall similarities, sometimes similarities of detail.

67. I can think of no better expression to characterize these similarities than “family resemblances”; for the various resemblances between members of a family: build, features, colour of eyes, gait, temperament, etc. etc. overlap and criss-cross in the same way.—And I shall say: ‘games’ form a family.

And for instance the kinds of number form a family in the same way. Why do we call something a “number”? Well, perhaps because it has a — direct — relationship with several things that have hitherto been called number; and this can be said to give it an indirect relationship to other things we call the same name. And we extend our concept of number as in spinning a thread we twist fibre on fibre. And the strength of the thread does not reside in the fact that some one fibre runs through its whole length, but in the overlapping of many fibres.

But if someone wish to say: “There is something common to all these constructions—namely the disjunction of all their common properties” — I should reply: Now you are only playing with words. One might as well say: “Something runs through the whole thread—namely the continuous overlapping of those fibres”.

68. “All right: the concept of number is defined for you as the logical sum of these individual interrelated concepts: cardinal numbers, rational numbers, real numbers, etc.; and in the same way the concept of a game as the logical sum of a corresponding set of sub-concepts.”—It need not be so. For I *can* give the concept ‘number’ rigid limits in this way, that is, use the word “number” for a rigidly limited concept, but I can also use it so that the extension of the concept is *not* closed by a frontier. And this is how we do use the word “game”. For how is the concept of a game bounded? What still counts as a game and what no longer does? Can you give the boundary? No. You can *draw* one; for none has so far been drawn. (But that never troubled you before when you used the word “game”.)

“But then the use of the word is unregulated, the ‘game’ we play with it is unregulated.”—It is not everywhere circumscribed by rules; but no more are there any rules for how high one throws the ball in tennis, or how hard; yet tennis is a game for all that and has rules too.

139. When someone says the word “cube” to me, for example, I know what it means. But can the whole *use* of the word come before my mind, when I *understand* it in this way?

Well, but on the other hand isn’t the meaning of the word also determined by this use? And can’t these ways of determining meaning conflict? Can what we grasp *in a flash* accord with a use, fit or fail to fit it? And how can what is present to us in an instant, what comes before our mind in an instant, fit a *use*?

What really comes before our mind when we *understand* a word? — Isn’t it something like a picture? Can’t it *be* a picture?

Well, suppose that a picture does come before your mind when you hear the word “cube”, say the drawing of a cube. In what sense can this picture fit or fail to fit a use of the word “cube”? — Perhaps you say: “It’s quite simple; — if that picture occurs to me and I point to a triangular prism for instance, and say it is a cube, then this use of the word doesn’t fit the picture.” — But doesn’t it fit? I have purposely so chosen the example that it is quite easy to imagine a *method of projection* according to which the picture does fit after all.⁴

The picture of the cube did indeed *suggest* a certain use to us, but it was possible for me to use it differently.

140. Then what sort of mistake did I make; was it what we should like to express by saying: I should have thought the picture forced a particular use on me? How could I think that? What *did* I think? Is there such a thing as a picture, or something like a picture, that forces a particular application on us; so that my mistake lay in confusing one picture with another?—For we might also be inclined to express ourselves like this; we are at most under a psychological, not a logical, compulsion. And now it looks quite as if we knew of two kinds of case.

What was the effect of my argument? It called our attention to (reminded us of) the fact that there are other processes, besides the one we originally thought of, which we should sometimes be prepared to call “applying the picture of a cube”. So our ‘belief that the picture forced a particular application upon us’ consisted in the fact that only the one case and no other occurred to us. “There is another solution as well” means there is something else that I am also prepared to call a “solution”; to which I am prepared to apply such-and-such a picture, such-and-such an analogy, and so on.

What is essential is to see that the same thing can come before our minds when we hear the word and the application still be different. Has it the *same* meaning both times? I think we shall say not.

141. Suppose, however, that not merely the picture of the cube, but also the method of projection comes before our mind?—How am I to imagine this? — Perhaps I see before me a schema showing the method of projection: say a picture of two cubes connected by lines of projection. — But does this really get me any further? Can't I now imagine different applications of this schema too?—Well, yes, but then can't an *application come before my mind*? — It can: only we need to get clearer about our application of *this* expression. Suppose I explain various methods of projection to someone so that he may go on to apply them; let us ask ourselves when we should say that *the* method that I intend comes before his mind.

Now clearly we accept two different kinds of criteria for this: on the one hand the picture (of whatever kind) that at some time or other comes before his mind; on the other, the application which—in the course of time—he makes of what he imagines. (And can't it be clearly seen here that it is absolutely inessential for the picture to exist in his imagination rather than as a drawing or model in front of him; or again as something that he himself constructs as a model?)

Can there be a collision between picture and application? There can, inasmuch as the picture makes us expect a different use, because people in general apply *this* picture like *this*.

I want to say: we have here a *normal* case, and abnormal cases.

142. It is only in normal cases that the use of a word is clearly prescribed; we know, are in no doubt, what to say in this or that case. The more abnormal the case, the more doubtful it becomes what we are to say. And if things were quite different from what they actually are—if there were for instance no characteristic expression of pain, of fear, of joy; if rule became exception and exception rule; or if both became phenomena of roughly equal frequency—this would make our normal language-games lose their point.—The procedure of putting a lump of cheese on a balance and fixing the price by the turn of the scale would lose its point if it frequently happened for such lumps to suddenly grow or shrink for no obvious reason. This remark will become clearer when we discuss such things as the relation of expression to feeling, and similar topics.⁵

143. Let us now examine the following kind of language-game: when A gives an order B has to write down series of signs according to a certain formation rule.

The first of these series is meant to be that of the natural numbers in decimal notation. — How does he get to understand this notation? — First of all series of numbers will be written down for him and he will be required to copy them. (Do not balk at the expression “series of numbers”; it is not being used wrongly here.) And here already there is a normal and an abnormal learner's reaction. — At first perhaps we guide his hand in writing out the series 0 to 9; but then the *possibility of getting him to understand* will depend on his going on to write it down independently. — And here we can imagine, e.g., that he does copy the figures independently, but not in the right order: he writes sometimes one sometimes another at random. And then communication stops at *that* point. — Or again, he makes ‘mistakes’ in the order. — The difference between this and the first case will of course be one of frequency. — Or he makes a *systematic* mistake; for example, he copies every other number, or he copies the series 0, 1, 2, 3, 4, 5, ... like this: 1, 0, 3, 2, 5, 4, ... Here we shall almost be tempted to say that he has understood *wrong*.

Notice, however, that there is no sharp distinction between a random mistake and a systematic one. That is, between what you are inclined to call “random” and what “systematic”.

Perhaps it is possible to wean him from the systematic mistake (as from a bad habit). Or perhaps one accepts his way of copying and tries to teach him ours as an offshoot, a variant of his.—And here too our pupil's capacity to learn may come to an end.

151. But there is also *this* use of the word “to know”; we say “Now I know!” — and similarly “Now I can do it!” and “Now I understand!”

Let us imagine the following example: A writes series of numbers down; B watches him and tries to find a law for the sequence of numbers. If he succeeds he exclaims: “Now I can go on!”—So this capacity, this understanding, is something that makes its appearance in a moment. So let us try and see what it is that makes its appearance here. — A has written down the numbers 1, 5, 11, 19, 29; at this point B says he knows how to go on. What happened here? Various things may have happened; for example, while A was slowly putting one number after another, B was occupied with trying various algebraic formulae on the numbers which had been written down. After A had written the number 19 B tried the formula $an = n^2 + n - 1$; and the next number confirmed his hypothesis.

179. Let us return to our case (151). It is clear that we should not say B had the right to say the words “Now I know how to go on”, just because he thought of the formula—unless experience showed that there was a connexion between thinking of the formula—saying it, writing it down—and actually continuing the

series. And obviously such a connexion does exist.—And now one might think that the sentence “I can go on” meant “I have experience which I know empirically to lead to the continuation of the series.” But does B mean that when he says he can go on? Does that sentence come to his mind, or is he ready to produce it in explanation of what he meant?

No. The words “Now I know how to go on” were correctly used when he thought of the formula: that is, given such circumstances as that he had learnt algebra, had used such formulae before. — But that does not mean that his statement is only short for a description of all the circumstances which constitute the scene for our language-game.—Think how we learn to use the expressions “Now I know how to go on”, “Now I can go on” and others; in what family of language-games we learn their use.

We can also imagine the case where nothing at all occurred in B’s mind except that he suddenly said, “Now I know how to go on”—perhaps with a feeling of relief; and that he did in fact go on working out the series without using the formula. And in this case too we should say—in certain circumstances—that he did know how to go on.

180. *This is how these words are used.* It would be quite misleading, in this last case, for instance, to call the words a “description of a mental state”.— One might rather call them a “signal”; and we judge whether it was rightly employed by what he goes on to do.

185. Let us return to our example (143). Now — judged by the usual criteria—the pupil has mastered the series of natural numbers. Next we teach him to write down other series of cardinal numbers and get him to the point of writing down series of the form

0, n, 2n, 3n, etc.

at an order of the form “+n”; so at the order “+1” he writes down the series of natural numbers.—Let us suppose we have done exercises and given him tests up to 1000.

Now we get the pupil to continue a series (say +2) beyond 1000 —and he writes 1000, 1004, 1008, 1012.

We say to him: “Look what you’ve done!” — He doesn’t understand. We say: “You were meant to add *two*: look how you began the series!”—He answers: “Yes, isn’t it right? I thought that was how I was *meant* to do it.”—Or suppose he pointed to the series and said: “But I went on in the same way.”—It would now be no use to say: “But can’t you see ... ?”—and repeat the old examples and explanations.—In such a case we might say, perhaps: It comes natural to this person to understand our order with our explanations as *we* should understand the order: “Add 2 up to 1000, 4 up to 2000, 6 up to 3000 and so on.”

Such a case would present similarities with one in which a person naturally reacted to the gesture of pointing with the hand by looking in the direction of the line from finger-tip to wrist, not from wrist to finger-tip.

186. “What you are saying, then, comes to this: a new insight—intuition—is needed at every step to carry out the order ‘+n’ correctly.” — To carry it out correctly! How is it decided what is the right step to take at any particular stage?—“The right step is the one that accords with the order—as it was *meant*.”— So when you gave the order +2 you meant that he was to write 1002 after 1000—and did you also mean that he should write 1868 after 1866, and 100036 after 100034, and so on — an infinite number of such propositions? —“No: what I meant was, that he should write the next but one number after *every* number that he wrote; and from this all those propositions follow in turn.”—But that is just what is in question: what, at any stage, does follow from that sentence. Or, again, what, at any stage we are to call “being in accord” with that sentence (and with the *mean*-ing you then put into the sentence — whatever that may have consisted in). It would almost be more correct to say, not that an intuition was needed at every stage, but that a new decision was needed at every stage.

191. “It is as if we could grasp the whole use of the word in a flash.” Like *what* e.g.? — Can’t the use — in a certain sense — be grasped in a flash? And in *what* sense can it not? — The point is, that it is as if we could ‘grasp it in a flash’ in yet another and much more direct sense than that. — But have you a model for this? No. It is just that this expression suggests itself to us. As the result of the crossing of different pictures.

192. You have no model of this superlative fact, but you are seduced into using a super-expression. (It might be called a philosophical superlative.)

193. The machine as symbolizing its action: the action of a machine — I might say at first — seems to be there in it from the start. What does that mean? — If we know the machine, everything else, that is its movement, seems to be already completely determined.

We talk as if these parts could only move in this way, as if they could not do anything else. How is this—do we forget the possibility of their bending, breaking off, melting, and so on? Yes; in many cases we don’t

think of that at all. We use a machine, or the drawing of a machine, to symbolize a particular action of the machine. For instance, we give someone such a drawing and assume that he will derive the movement of the parts from it. (Just as we can give someone a number by telling him that it is the twenty-fifth in the series 1, 4, 9, 16, ...)

“The machine’s action seems to be in it from the start” means: we are inclined to compare the future movements of the machine in their definiteness to objects which are already lying in a drawer and which we then take out.—But we do not say this kind of thing when we are concerned with predicting the actual behaviour of a machine. Then we do not in general forget the possibility of a distortion of the parts and so on.—We *do* talk like that, however, when we are wondering at the way we can use a machine to symbolize a given way of moving—since it can also move in quite *different* ways.

We might say that a machine, or the picture of it, is the first of a series of pictures which we have learnt to derive from this one.

But when we reflect that the machine could also have moved differently it may look as if the way it moves must be contained in the machine-as-symbol far more determinately than in the actual machine. As if it were not enough for the movements in question to be empirically determined in advance, but they had to be really — in a mysterious sense — already *present*. And it is quite true: the movement of the machine-as-symbol is predetermined in a different sense from that in which the movement of any given actual machine is predetermined.

197. “It’s as if we could grasp the whole use of a word in a flash.” — And that is just what we say we do. That is to say: we sometimes describe what we do in these words. But there is nothing astonishing, nothing queer, about what happens. It becomes queer when we are led to think that the future development must in some way already be present in the act of grasping the use and yet isn’t present.—For we say that there isn’t any doubt that we understand the word, and on the other hand its meaning lies in its use. There is no doubt that I now want to play chess, but chess is the game it is in virtue of all its rules (and so on). Don’t I know, then, which game I want to play until I *have* played it? or are all the rules contained in my act of intending? Is it experience that tells me that this sort of game is the usual consequence of such an act of intending? so is it impossible for me to be certain what I am intending to do? And if that is nonsense—what kind of super-strong connexion exists between the act of intending and the thing intended? — Where is the connexion effected between the sense of the expression “Let’s play a game of chess” and all the rules of the game? — Well, in the list of rules of the game, in the teaching of it, in the day-to-day practice of playing.

198. “But how can a rule show me what I have to do at *this* point? Whatever I do is, on some interpretation, in accord with the rule.”—That is not what we ought to say, but rather: any interpretation still hangs in the air along with what it interprets, and cannot give it any support. Interpretations by themselves do not determine meaning.

“Then can whatever I do be brought into accord with the rule?”—Let me ask this: what has the expression of a rule—say a sign-post—got to do with my actions? What sort of connexion is there here? — Well, perhaps this one: I have been trained to react to this sign in a particular way, and now I do so react to it.

But that is only to give a causal connexion; to tell how it has come about that we now go by the signpost; not what this going-by-the-sign really consists in. On the contrary; I have further indicated that a person goes by a sign-post only in so far as there exists a regular use of sign-posts, a custom.

201. This was our paradox: no course of action could be determined by a rule, because every course of action can be made out to accord with the rule. The answer was: if everything can be made out to accord with the rule, then it can also be made out to conflict with it. And so there would be neither accord nor conflict here.

It can be seen that there is a misunderstanding here from the mere fact that in the course of our argument we give one interpretation after another; as if each one contented us at least for a moment, until we thought of yet another standing behind it. What this shows is that there is a way of grasping a rule which is *not* an *interpretation*, but which is exhibited in what we call “obeying the rule” and “going against it” in actual cases.

Hence there is an inclination to say: every action according to the rule is an interpretation. But we ought to restrict the term “interpretation” to the substitution of one expression of the rule for another.

217. “How am I able to obey a rule?” — if this is not a question about causes, then it is about the justification for my following the rule in the way I do.

If I have exhausted the justifications I have reached bedrock, and my spade is turned. Then I am inclined to say: “This is simply what I do.”

(Remember that we sometimes demand definitions for the sake not of their content, but of their form. Our requirement is an architectural one; the definition a kind of ornamental coping that supports nothing.)

218. Whence comes the idea that the beginning of a series is a visible section of rails invisibly laid to infinity? Well, we might imagine rails instead of a rule. And infinitely long rails correspond to the unlimited application of a rule.

219. "All the steps are really already taken" means: I no longer have any choice. The rule, once stamped with a particular meaning, traces the lines along which it is to be followed through the whole of space.—But if something of this sort really were the case, how would it help?

No; my description only made sense if it was to be understood symbolically. — I should have said: *This is how it strikes me.*

When I obey a rule, I do not choose.

I obey the rule *blindly*.

241. "So you are saying that human agreement decides what is true and what is false?"—It is what human beings *say* that is true and false; and they agree in the *language* they use. That is not agreement in opinions but in form of life.

242. If language is to be a means of communication there must be agreement not only in definitions but also (queer as this may sound) in judgments. This seems to abolish logic, but does not do so.—It is one thing to describe methods of measurement, and another to obtain and state results of measurement. But what we call "measuring" is partly determined by a certain constancy in results of measurement.

243. A human being can encourage himself, give himself orders, obey, blame and punish himself; he can ask himself a question and answer it. We could even imagine human beings who spoke only in monologue; who accompanied their activities by talking to themselves.—An explorer who watched them and listened to their talk might succeed in translating their language into ours. (This would enable him to predict these people's actions correctly, for he also hears them making resolutions and decisions.)

But could we also imagine a language in which a person could write down or give vocal expression to his inner experiences—his feelings, moods, and the rest — for his private use?—Well, can't we do so in our ordinary language? — But that is not what I mean. The individual words of this language are to refer to what can only be known to the person speaking; to his immediate private sensations. So another person cannot understand the language.

257. "What would it be like if human beings showed no outward signs of pain (did not groan, grimace, etc.)? Then it would be impossible to teach a child the use of the word 'tooth-ache'." — Well, let's assume the child is a genius and itself invents a name for the sensation! — But then, of course, he couldn't make himself understood when he used the word.—So does he understand the name, without being able to explain its meaning to anyone?—But what does it mean to say that he has 'named his pain'? — How has he done this naming of pain?! And whatever he did, what was its purpose?—When one says "He gave a name to his sensation" one forgets that a great deal of stage-setting in the language is presupposed if the mere act of naming is to make sense. And when we speak of someone's having given a name to pain, what is presupposed is the existence of the grammar of the word "pain"; it shows the post where the new word is stationed.

258. Let us imagine the following case. I want to keep a diary about the recurrence of a certain sensation. To this end I associate it with the sign "S" and write this sign in a calendar for every day on which I have the sensation. — I will remark first of all that a definition of the sign cannot be formulated.— But still I can give myself a kind of ostensive definition. — How? Can I point to the sensation? Not in the ordinary sense. But I speak, or write the sign down, and at the same time I concentrate my attention on the sensation—and so, as it were, point to it inwardly.—But what is this ceremony for? for that is all it seems to be! A definition surely serves to establish the meaning of a sign.—Well, that is done precisely by the concentrating of my attention; for in this way I impress on myself the connexion between the sign and the sensation.—But "I impress it on myself" can only mean: this process brings it about that I remember the connexion *right* in the future. But in the present case I have no criterion of correctness. One would like to say: whatever is going to seem right to me is right. And that only means that here we can't talk about 'right'.

259. Are the rules of the private language *impressions* of rules?—The balance on which impressions are weighed is not the *impression* of a balance.

260. "Well, I *believe* that this is the sensation's again." — Perhaps you *believe* that you believe it!

Then did the man who made the entry in the calendar make a note of *nothing whatever*? — Don't consider it a matter of course that a person is making a note of something when he makes a mark—say in a calendar.

For a note has a function, and this “S” so far has none.

(One can talk to oneself. — If a person speaks when no one else is present, does that mean he is speaking to himself?)

261. What reason have we for calling “S” the sign for a *sensation*? For “sensation” is a word of our common language, not of one intelligible to me alone. So the use of this word stands in need of a justification which everybody understands.—And it would not help either to say that it need not be a *sensation*; that when he writes “S”, he has *something*—and that is all that can be said. “Has” and “something” also belong to our common language.— So in the end when one is doing philosophy one gets to the point where one would like just to emit an inarticulate sound.—But such a sound is an expression only as it occurs in a particular language-game, which should now be described.

265. Let us imagine a table (something like a dictionary) that exists only in our imagination. A dictionary can be used to justify the translation of a word X by a word Y. But are we also to call it a justification if such a table is to be looked up only in the imagination?—“Well, yes; then it is a subjective justification.”— But justification consists in appealing to something independent.—“But surely I can appeal from one memory to another. For example, I don’t know if I have remembered the time of departure of a train right and to check it I call to mind how a page of the time-table looked. Isn’t it the same here?”—No; for this process has got to produce a memory which is actually *correct*. If the mental image of the timetable could not itself be *tested* for correctness, how could it confirm the correctness of the first memory? (As if someone were to buy several copies of the morning paper to assure himself that what it said was true.)

Looking up a table in the imagination is no more looking up a table than the image of the result of an imagined experiment is the result of an experiment.

273. What am I to say about the word “red”? — that it means something ‘confronting us all’ and that everyone should really have another word, besides this one, to mean his *own* sensation of red? Or is it like this: the word “red” means something known to everyone; and in addition, for each person, it means something known only to him? (Or perhaps rather: it *refers* to something known only to him.)

274. Of course, saying that the word “red” “refers to” instead of “means” something private does not help us in the least to grasp its function; but it is the more psychologically apt expression for a particular experience in doing philosophy. It is as if when I uttered the word I cast a sidelong glance at the private sensation, as it were in order to say to myself: I know all right what I mean by it.

281. “But doesn’t what you say come to this: that there is no pain, for example, without *pain-behaviour*?” — It comes to this: only of a living human being and what resembles (behaves like) a living human being can one say: it has sensations; it sees; is blind; hears; is deaf; is conscious or unconscious.

282. “But in a fairy tale the pot too can see and hear!” (Certainly; but it *can* also talk.)

“But the fairy tale only invents what is not the case: it does not talk *nonsense*.” — It is not as simple as that. Is it false or nonsensical to say that a pot talks? Have we a clear picture of the circumstances in which we should say of a pot that it talked? (Even a nonsense-poem is not nonsense in the same way as the babbling of a child.)

We do indeed say of an inanimate thing that it is in pain: when playing with dolls for example. But this use of the concept of pain is a secondary one. Imagine a case in which people ascribed pain *only* to inanimate things; pitied *only* dolls! (When children play at trains their game is connected with their knowledge of trains. It would nevertheless be possible for the children of a tribe unacquainted with trains to learn this game from others, and to play it without knowing that it was copied from anything. One might say that the game did not make the same *sense* to them as to us.)

283. What gives us *so much as the idea* that living beings, things, can feel?

Is it that my education has led me to it by drawing my attention to feelings in myself, and now I transfer the idea to objects outside myself? That I recognize that there is something there (in me) which I can call “pain” without getting into conflict with the way other people use this word?—I do not transfer my idea to stones, plants, etc.

Couldn’t I imagine having frightful pains and turning to stone while they lasted? Well, how do I know, if I shut my eyes, whether I have not turned into a stone? And if that has happened, in what sense will *the stone* have the pains? In what sense will they be ascribable to the stone? And why need the pain have a bearer at all here?!

And can one say of the stone that it has a soul and *that* is what has the pain? What has a soul, or pain, to do with a stone?

Only of what behaves like a human being can one say that it *has* pains.

For one has to say it of a body, or, if you like of a soul which some body *has*. And how can a body *have* a soul?

284. Look at a stone and imagine it having sensations.— One says to oneself: How could one so much as get the idea of ascribing a *sensation* to a *thing*? One might as well ascribe it to a number!—And now look at a wriggling fly and at once these difficulties vanish and pain seems able to get a foothold here, where before everything was, so to speak, too smooth for it.

And so, too, a corpse seems to us quite inaccessible to pain. — Our attitude to what is alive and to what is dead, is not the same. All our reactions are different. — If anyone says: “That cannot simply come from the fact that a living thing moves about in such-and-such a way and a dead one not”, then I want to intimate to him that this is a case of the transition ‘from quantity to quality’.

293. If I say of myself that it is only from my own case that I know what the word “pain” means—must I not say the same of other people too? And how can I generalize the *one* case so irresponsibly?

Now someone tells me that *he* knows what pain is only from his own case!—Suppose everyone had a box with something in it: we call it a “beetle”. No one can look into anyone else’s box, and everyone says he knows what a beetle is only by looking at *his* beetle. — Here it would be quite possible for everyone to have something different in his box. One might even imagine such a thing constantly changing.—But suppose the word “beetle” had a use in these people’s language? — If so it would not be used as the name of a thing. The thing in the box has no place in the language-game at all; not even as a *something*: for the box might even be empty. — No, one can ‘divide through’ by the thing in the box; it cancels out, whatever it is.

That is to say: if we construe the grammar of the expression of sensation on the model of ‘object and designation’ the object drops out of consideration as irrelevant.

304. “But you will surely admit that there is a difference between pain-behaviour accompanied by pain and pain-behaviour without any pain?”—Admit it? What greater difference could there be?—“And yet you again and again reach the conclusion that the sensation itself is a *nothing*.”—Not at all. It is not a *something*, but not a *nothing* either! The conclusion was only that a nothing would serve just as well as a something about which nothing could be said. We have only rejected the grammar which tries to force itself on us here.

The paradox disappears only if we make a radical break with the idea that language always functions in one way, always serves the same purpose: to convey thoughts — which may be about houses, pains, good and evil, or anything else you please.

309. What is your aim in philosophy? —To show the fly the way out of the fly-bottle.

*Reprinted from Ludwig Wittgenstein, *Philosophical Investigations*. Translated by G.E.M. Anscombe (Oxford: Blackwell Publishing, 1953), by permission of John Wiley and Sons.

1. [“When they (my elders) named some object, and accordingly moved towards something, I saw this and I grasped that the thing was called by the sound they uttered when they meant to point it out. Their intention was shown by their bodily movements, as it were the natural language of all peoples: the expression of the face, the play of the eyes, the movement of other parts of the body, and the tone of voice which expresses our state of mind in seeking, having, rejecting, or avoiding something. Thus, as I heard words repeatedly used in their proper places in various sentences, I gradually learnt to understand what objects they signified; and after I had trained my mouth to form these signs, I used them to express my own desires.” —G.E.M.A.]

2. Could one define the word “red” by pointing to something that was *not red*? That would be as if one were supposed to explain the word “modest” to someone whose English was weak, and one pointed to an arrogant man and said “That man is *not* modest”. That it is ambiguous is no argument against such a method of definition. Any definition can be misunderstood.

But it might well be asked: are we still to call this “definition”?— For, of course, even if it has the same practical consequences, the same *effect* on the learner, it plays a different Part In the calculus from what we ordinarily call “ostensive definition” of the word “red”.

3. What is it to *mean* the words “*That is blue*” at one time as a statement about the object one is pointing to — at another as an explanation of the word “blue”? Well, in the second case one really means “That is called ‘blue’”. — Then can one at one time mean the word “is” as “is called” and the word “blue” as “blue”, and another time mean “is” really as “is”? ...

4... I see a picture; it represents an old man walking up a steep path leaning on a stick. — How? Might it not have looked just the same if he had been sliding downhill in that position? Perhaps a Martian would describe the picture so. I do not need to explain why *we* do not describe it so.

5. What we have to mention in order to explain the significance, I mean the importance, of a concept, are often extremely general facts of nature: such facts as are hardly ever mentioned because of their great generality.

J. L. Austin

John Langshaw Austin was born in 1911 and died unexpectedly in 1960, a few weeks short of his forty-ninth birthday. Although he was one of the most influential English philosophers of his generation, he did not publish a great deal during his lifetime. *Sense and Sensibilia*, the book from which selections are printed here, was put together after his death from notes for a course of lectures that he gave regularly at Oxford between 1947 and 1959.

He attended Balliol College, Oxford, emerging with a first-class degree in “Greats” (Oxford’s mixture of classics and philosophy). He was then elected, after examination, to a fellowship at All Souls College, a position he held for two years before becoming a fellow and tutor of Magdalen. In 1952, he became White’s Professor of Moral Philosophy, holding the chair until his death. Austin’s only break from academic life came during World War II, in which he served with great distinction as an intelligence officer. His contributions to the planning for the D-Day landings are said to have saved many Allied lives.

The emergence of “Oxford philosophy,” as it became known, involved a profound change in the way that philosophy was conceived. Whereas Bertrand Russell had made the revolutionary advances in mathematical logic the starting point for philosophy, the Oxford school, under the leadership of Austin, turned to ordinary language for insight into philosophical problems. Among so-called “ordinary language” philosophers, Austin stands out for his interest in the details of ordinary ways of talking. His exceptional ear for nuance and flair for vivid examples lend his philosophical writings an altogether distinctive character.

Austin’s qualities are clearly displayed in *Sense and Sensibilia*, a no-holds-barred attack on the sense-data theory of perception. This theory is a version of the view, held by the classic British empiricists (Locke, Berkeley, and Hume), and taken over by Russell, that we are never “directly” aware of objects in our surroundings but only of our “ideas,” “perceptions,” or, as Russell called them, “sense-data.” This account of perception appears to raise a serious skeptical problem, for if all we immediately know are our own perceptions, how can we determine the real nature of external objects? Indeed, how can we know that there is an external world at all? Russell thought that Berkeley’s solution—that objects are just collections of ideas—could be made precise and rigorous with the aid of modern logic. Objects, Russell said, are “logical constructions out of sense-data.” By this he meant that any statements about a material object could in principle be translated into (or perhaps, in Russell’s case, it would be better to say “replaced by”) a logically complex statement about sense-data. This epistemological/metaphysical theory, which became known as “phenomenalism,” was widely held by those philosophers who identified themselves with the empiricist tradition.

An important objection to phenomenalism is that the promised translations of talk about material objects into talk about sense-data cannot be given. But Austin levels a deeper objection. His target is the “argument from illusion,” the source of the view that we are always aware (“directly” or “immediately”) only of our own sense-data. Theories like phenomenalism seem needed only if we have already made this critical concession.

The argument from illusion begins by pointing out that some perceptual experiences are “veridical” whereas others are “delusive.” In a veridical experience, I am aware of an object that appears to me as it really is; for example, I see a round penny that looks round. In a delusive experience, the object may look other than as it really is; if the penny is tilted to my line of sight, it will appear elliptical. In extreme cases of delusive perception (the drunkard’s pink rats), there may be no object there at all. Nevertheless, in the case of the penny viewed aslant, there is something elliptical present to consciousness. (Why else would I say that the penny looks elliptical?) Even the drunkard experiences pinkness. But the pinkness that the drunkard experiences cannot belong to a material object, for no object is really there. The pinkness must therefore belong to something else: a sense-datum. However, it would be implausible to hold that we are generally aware of sense-data, except when objects happen to present their true appearances; and in any case, there is no intrinsic qualitative difference between delusive and veridical experiences. The conclusion is reached that we are always aware (directly, anyway) of our own sense-data. Knowledge of material objects depends on some kind of inference from experiential data.

According to Austin, the argument from illusion is a family of arguments, every member of which is a farrago of fallacies, largely verbal. The “arguments” are driven by bogus dichotomies involving ill-explained technical terms (sense-data versus material objects, “veridical” versus “delusive” perception); misunderstandings and oversimplifications of certain crucial words (“appears,” “real,” etc.); obsessive

concentration on hackneyed and tendentiously described examples (the straight stick that looks bent when half-immersed in water); failures to make necessary distinctions (illusions versus delusions); and implausible and ill-grounded empirical claims (dreams are qualitatively indistinguishable from waking experience). Austin exposes these fallacies by paying close attention to how we actually talk about the things we see and how we perceive (and misperceive) them. His investigation reveals that our ordinary ways of talking and thinking are powerful and nuanced, involving none of the simple dichotomies or confusions that drive the argument from illusion.

Austin does not suppose that ordinary language is sacrosanct. Rather, his view is that ordinary language is much more subtle than the “blinkering philosophical English” spoken by sense-data theorists. Since ordinary language has evolved over a long time to deal with an enormous range of practical contingencies, distinctions that have survived are likely to be worth making. In this respect, his attitude has some affinities with American Pragmatism.

A. J. Ayer responds to Austin’s attack on sense-data in “Has Austin Refuted Sense-Data?” in K. T. Fann, ed., *Symposium on J. L. Austin* (New York: Humanities Press, 1969). See also Jonathan Bennett, “Real,” in the same volume. Whether Austin’s “ordinary language” method really gets to grips with philosophical skepticism is interestingly discussed by Barry Stroud in *The Significance of Philosophical Scepticism* (Oxford: Oxford University Press, 1984). Mark Kaplan defends Austin’s method against Stroud’s criticisms in “To What Must an Epistemology Be True?” *Philosophy and Phenomenological Research* 61 (September 2000). For a comprehensive account of Austin’s philosophical work, see Geoffrey Warnock, *J. L. Austin* (London and New York: Routledge, 1991).

Michael Williams

*Sense and Sensibilia**

I

In these lectures I am going to discuss some current doctrines (perhaps, by now, not so current as they once were) about sense-perception. We shall not, I fear, get so far as to decide about the truth or falsity of these doctrines; but in fact that is a question that really *can't* be decided, since it turns out that they all bite off more than they can chew. I shall take as chief stalking-horse in the discussion Professor A. J. Ayer's *The Foundations of Empirical Knowledge*,¹ but I shall mention also Professor H. H. Price's *Perception*,² and, later on, G. J. Warnock's book on Berkeley.³ I find in these texts a good deal to criticize, but I choose them for their merits and not for their deficiencies; they seem to me to provide the best available expositions of the approved reasons for holding theories which are at least as old as Heraclitus⁴—more full, coherent, and terminologically exact than you find, for example, in Descartes or Berkeley. No doubt the authors of these books no longer hold the theories expounded in them, or at any rate wouldn't now expound them in just the same form. But at least they did hold them not very long ago; and of course very numerous great philosophers have held these theories, and have propounded other doctrines resulting from them. The authors I have chosen to discuss may differ from each other over certain refinements, which we shall eventually take note of—they appear to differ, for example, as to whether their central distinction is between two 'languages' or between two classes of entities—but I believe that they agree with each other, and with their predecessors, in all their major (and mostly unnoticed) assumptions.

Ideally, I suppose, a discussion of this sort ought to begin with the very earliest texts; but in this case that course is ruled out by their no longer being extant. The doctrines we shall be discussing—unlike, for example, doctrines about 'universals'—were already quite ancient in Plato's time.

The general doctrine, generally stated, goes like this: we never see or otherwise perceive (or 'sense'), or anyhow we never *directly* perceive or sense, material objects (or material things), but only sense-data (or our own ideas, impressions, *sensa*, sense-perceptions, percepts, &c.).

One might well want to ask how seriously this doctrine is intended, just how strictly and literally the philosophers who propound it mean their words to be taken. But I think we had better not worry about this question for the present. It is, as a matter of fact, not at all easy to answer, for, strange though the doctrine looks, we are sometimes told to take it easy—really it's just what we've all believed all along. (There's the bit where you say it and the bit where you take it back.) In any case it is clear that the doctrine is thought *worth stating*, and equally there is no doubt that people find it disturbing; so at least we can begin with the assurance that it deserves serious attention.

My general opinion about this doctrine is that it is a typically *scholastic* view, attributable, first, to an obsession with a few particular words, the uses of which are over-simplified, not really understood or carefully studied or correctly described; and second, to an obsession with a few (and nearly always the same) half-studied 'facts.' (I say 'scholastic,' but I might just as well have said 'philosophical'; oversimplification, schematization, and constant obsessive repetition of the same small range of jejune 'examples' are not only not peculiar to this case, but far too common to be dismissed as an occasional weakness of philosophers.) The fact is, as I shall try to make clear, that our ordinary words are much subtler in their uses, and mark many more distinctions, than philosophers have realized; and that the facts of perception, as discovered by, for instance, psychologists but also as noted by common mortals, are much more diverse and complicated than has been allowed for. It is essential, here as elsewhere, to abandon old habits of *Gleichschaltung*, the deeply ingrained worship of tidy-looking dichotomies.

I am not, then — and this is a point to be clear about from the beginning — going to maintain that we ought to be 'realists,' to embrace, that is, the doctrine that we *do* perceive material things (or objects). This doctrine would be no less scholastic and erroneous than its antithesis. The question, do we perceive material things or sense-data, no doubt looks very simple—*too* simple—but is entirely misleading (cp. Thales⁵

similarly vast and over-simple question, what the world is made of). One of the most important points to grasp is that these two terms, 'sense-data' and 'material things,' live by taking in each other's washing—what is spurious is not one term of the pair, but the antithesis itself.⁶ There is no *one* kind of thing that we 'perceive' but many *different* kinds, the number being reducible if at all by scientific investigation and not by philosophy: pens are in many ways though not in all ways unlike rainbows, which are in many ways though not in all ways unlike afterimages, which in turn are in many ways but not in all ways unlike pictures on the cinema-screen—and so on, without assignable limit. So we are *not* to look for an answer to the question, what kind of thing we perceive. What we have above all to do is, negatively, to rid ourselves of such illusions as 'the argument from illusion' — an 'argument' which those (e.g., Berkeley, Hume, Russell, Ayer) who have been most adept at working it, most fully masters of a certain special, happy style of blinkering philosophical English, have all themselves felt to be somehow spurious. There is no simple way of doing this—partly because, as we shall see, there is no simple 'argument.' It is a matter of unpicking, one by one, a mass of seductive (mainly verbal) fallacies, of exposing a wide variety of concealed motives—an operation which leaves us, in a sense, just where we began.

In a sense—but actually we may hope to learn something positive in the way of a technique for dissolving philosophical worries (*some* kinds of philosophical worry, not the whole of philosophy); and also something about the meanings of some English words ('reality,' 'seems,' 'looks,' &c.) which, besides being philosophically very slippery, are in their own right interesting. Besides, there is nothing so plain boring as the constant repetition of assertions that are not true, and sometimes not even faintly sensible; if we can reduce this a bit, it will be all to the good.

II

Let us have a look, then, at the very beginning of Ayer's *Foundations* — the bottom, one might perhaps call it, of the garden path. In these paragraphs⁷ we already seem to see the plain man, here under the implausible aspect of Ayer himself, dribbling briskly into position in front of his own goal, and squaring up to encompass his own destruction.

It does not normally occur to us that there is any need for us to justify our belief in the existence of material things. At the present moment, for example, I have no doubt whatsoever that I really am perceiving the familiar objects, the chairs and table, the pictures and books and flowers with which my room is furnished; and I am therefore satisfied that they exist. I recognize indeed that people are sometimes deceived by their senses, but this does not lead me to suspect that my own sense-perceptions cannot in general be trusted, or even that they may be deceiving me now. And this is not, I believe, an exceptional attitude. I believe that, in practice, most people agree with John Locke that 'the certainty of things existing *in rerum natura*, when we have the testimony of our senses for it, is not only as great as our frame can attain to, but as our condition needs.'

When, however, one turns to the writings of those philosophers who have recently concerned themselves with the subject of perception, one may begin to wonder whether this matter is quite so simple. It is true that they do, in general, allow that our belief in the existence of material things is well founded; some of them, indeed, would say that there were occasions on which we knew for certain the truth of such propositions as 'this is a cigarette' or 'this is a pen.' But even so they are not, for the most part, prepared to admit that such objects as pens or cigarettes are ever directly perceived. What, in their opinion, we directly perceive is always an object of a different kind from these; one to which it is now customary to give the name of 'sense-datum.'

Now in this passage some sort of contrast is drawn between what we (or the ordinary man) believe (or believes), and what philosophers, at least 'for the most part,' believe or are 'prepared to admit.' We must look at both sides of this contrast, and with particular care at what is assumed in, and implied by, what is actually said. The ordinary man's side, then, first.

1. It is clearly implied, first of all, that the ordinary man believes that he perceives material things. Now this, at least if it is taken to mean that he would *say* that he perceives material things, is surely wrong straight off; for 'material thing' is not an expression which the ordinary man would use — nor, probably, is 'perceive.' Presumably, though, the expression 'material thing' is here put forward, not as what the ordinary man would *say*, but as designating in a general way the *class* of things of which the ordinary man both believes and from time to time says that he perceives particular instances. But then we have to ask, of course, what this class comprises. We are given, as examples, 'familiar objects' — chairs, tables, pictures, books, flowers, pens, cigarettes; the expression 'material thing' is not here (or anywhere else in Ayer's text) further defined.⁸ But *does* the ordinary man believe that what he perceives is (always) something like furniture, or like these other 'familiar objects'— moderate-sized specimens of dry goods? We may think, for instance, of people, people's voices, rivers, mountains, flames, rainbows, shadows, pictures on the screen at the cinema, pictures in books or hung on walls, vapours, gases—all of which people say that they see or (in some cases) hear or smell, i.e., 'perceive.' Are these all 'material things'? If not, exactly which are not, and exactly why? No answer is vouchsafed. The trouble is that the expression 'material thing' is functioning *already*, from the very beginning, simply as a foil for 'sense-datum'; it is not here given, and is never given, any other role to play, and apart from this consideration it would surely never have occurred to anybody to try to represent as some single *kind of things* the things which the ordinary man says that he 'perceives.'

2. Further, it seems to be also implied (*a*) that when the ordinary man believes that he is not perceiving material things, he believes he is being deceived by his senses; and (*b*) that when he believes he is being deceived by his senses, he believes that he is not perceiving material things. But both of these are wrong. An ordinary man who saw, for example, a rainbow would not, if persuaded that a rainbow is not a material thing, at once conclude that his senses were deceiving him; nor, when for instance he knows that the ship at sea on a clear day is much farther away than it looks, does he conclude that he is not seeing a material thing (still less that he *is* seeing an immaterial ship). That is to say, there is no more a simple contrast between what the ordinary man believes when all is well (that he is 'perceiving material things') and when something is amiss (that his 'senses are deceiving him' and he is *not* 'perceiving material things') than there is between what he

believes that he perceives ('material things') and what philosophers for their part are prepared to admit, whatever that may be. The ground is already being prepared for *two* bogus dichotomies.

3. Next, is it not rather delicately hinted in this passage that the plain man is really a bit naïve?⁹ It 'does not normally occur' to him that his belief in 'the existence of material things' needs justifying— but perhaps it *ought* to occur to him. He has 'no doubt whatsoever' that he really perceives chairs and tables—but perhaps he ought to have a doubt or two and not be so easily 'satisfied.' That people are sometimes deceived by their senses 'does not lead him to suspect' that all may not be well—but perhaps a more reflective person *would* be led to suspect. Though ostensibly the plain man's position is here just being described, a little quiet undermining is already being effected by these turns of phrase.

4. But, perhaps more importantly, it is also implied, even taken for granted, that there is *room* for doubt and suspicion, whether or not the plain man feels any. The quotation from Locke, with which most people are said to agree, in fact contains a strong *suggestio falsi*.¹⁰ It suggests that when, for instance, I look at a chair a few yards in front of me in broad daylight, my view is that I have (*only*) as much certainty as I need and can get that there is a chair and that I see it. But in fact the plain man would regard doubt in such a case, not as far-fetched or over-refined or somehow unpractical, but as plain *nonsense*; he would say, quite correctly, 'Well, if that's not seeing a real chair then *I don't know what is*.' Moreover, though the plain man's alleged belief that his 'sense-perceptions' can 'in general' or 'now' be trusted is implicitly contrasted with the philosophers' view, it turns out that the philosophers' view is not just that his sense-perceptions *can't* be trusted 'now,' or 'in general,' or as often as he thinks; for apparently philosophers 'for the most part' really maintain that what the plain man believes to be the case is really *never* the case — 'what, in their opinion, we directly perceive is *always* an object of a different kind.' The philosopher is not really going to argue that things go wrong more often than the unwary plain man supposes, but that in some sense or some way he is wrong all the time. So it is misleading to hint, not only that there is always room for doubt, but that the philosophers' dissent from the plain man is just a matter of degree; it is really not *that* kind of disagreement at all.

5. Consider next what is said here about deception. We recognize, it is said, that 'people are sometimes deceived by their senses,' though we think that, in general, our 'sense-perceptions' can 'be trusted.'

Now first, though the phrase 'deceived by our senses' is a common metaphor, it *is* a metaphor; and this is worth noting, for in what follows the same metaphor is frequently taken up by the expression 'veridical' and taken very seriously. In fact, of course, our senses are dumb — though Descartes and others speak of 'the testimony of the senses,' our senses do not *tell* us anything, true or false. The case is made much worse here by the unexplained introduction of a quite new creation, our 'sense-perceptions.' These entities, which of course don't really figure at all in the plain man's language or among his beliefs, are brought in with the implication that whenever we 'perceive' there is an *intermediate* entity *always* present and *informing* us about something *else*—the question is, can we or can't we trust what it says? Is it 'veridical'? But of course to state the case in this way is simply to soften up the plain man's alleged views for the subsequent treatment; it is preparing the way for, by practically attributing to *him*, the so-called philosophers' view.

Next, it is important to remember that talk of deception only *makes sense* against a background of general non-deception. (You can't fool all of the people all of the time.) It must be possible to *recognize* a case of deception by checking the odd case against more normal ones. If I say, 'Our petrol-gauge sometimes deceives us,' I am understood: though usually what it indicates squares with what we have in the tank, sometimes it doesn't—it sometimes points to two gallons when the tank turns out to be nearly empty. But suppose I say, 'Our crystal ball sometimes deceives us': this is puzzling, because really we haven't the least idea what the 'normal' case—*not* being deceived by our crystal ball—would actually be.

The cases, again, in which a plain man might say he was 'deceived by his senses' are not at all common. In particular, he would *not* say this when confronted with ordinary cases of perspective, with ordinary mirror-images, or with dreams; in fact, when he dreams, looks down the long straight road, or at his face in the mirror, he is not, or at least is hardly ever, *deceived* at all. This is worth remembering in view of another strong *suggestio falsi*—namely, that when the philosopher cites as cases of 'illusion' all these and many other very common phenomena, he is either simply mentioning cases which the plain man already concedes as cases of 'deception by the senses,' or at any rate is only extending a bit what he would readily concede. In fact this is very far indeed from being the case.

And even so — even though the plain man certainly does not accept anything like so *many* cases as cases of being 'deceived by his senses' as philosophers seem to — it would certainly be quite wrong to suggest that he regards all the cases he *does* accept as being of just the same kind. The battle is, in fact, half lost already if this suggestion is tolerated. Sometimes the plain man would prefer to say that his senses were deceived rather than

that he was deceived by his senses—the quickness of the hand deceives the eye, &c. But there is actually a great multiplicity of cases here, at least at the edges of which it is no doubt uncertain (and it would be typically scholastic to try to decide) just which are and which are not cases where the metaphor of being ‘deceived by the senses’ would naturally be employed. But surely even the plainest of men would want to distinguish (a) cases where the *sense-organ* is deranged or abnormal or in some way or other not functioning properly; (b) cases where the *medium* — or more generally, the conditions—of perception are in some way abnormal or off-colour; and (c) cases where a wrong inference is made or a wrong construction is put on things, e.g. on some sound that he hears. (Of course these cases do not exclude each other.) And then again there are the quite common cases of misreadings, mishearings, Freudian over-sights, &c., which don’t seem to belong properly under any of these headings. That is to say, once again there is no neat and simple dichotomy between things going right and things going wrong; things may go wrong, as we really all know quite well, in lots of *different* ways — which don’t have to be, and must not be assumed to be, classifiable in any general fashion.

Finally, to repeat here a point we’ve already mentioned, of course the plain man does *not* suppose that all the cases in which he is ‘deceived by his senses’ are alike in the particular respect that, in those cases, he is not ‘perceiving material things,’ or *is* perceiving something not real or not material. Looking at the Müller-Lyer diagram (in which, of two lines of equal length, one looks longer than the other), or at a distant village on a very clear day across a valley, is a very different kettle of fish from seeing a ghost or from having D.T.s and seeing pink rats. And when the plain man sees on the stage the Headless Woman, what he sees (and this *is* what he sees, whether he knows it or not) is not something ‘unreal’ or ‘immaterial,’ but a woman against a dark background with her head in a black bag. If the trick is well done, he doesn’t (because it’s deliberately made very difficult for him) properly size up what he sees, or see *what* it is; but to say this is far from concluding that he sees something *else*.

In conclusion, then, there is less than no reason to swallow the suggestions *either* that what the plain man believes that he perceives most of the time constitutes a *kind* of things (sc. ‘material objects’), *or* that he can be said to recognize any other single *kind* of cases in which he is ‘deceived.’¹¹ Now let us consider what it is that is said about philosophers.

Philosophers, it is said, ‘are not, for the most part, prepared to admit that such objects as pens or cigarettes are ever directly perceived.’ Now of course what brings us up short here is the word ‘directly’—a great favourite among philosophers, but actually one of the less conspicuous snakes in the linguistic grass. We have here, in fact, a typical case of a word, which already has a very special use, being gradually stretched, without caution or definition or any limit, until it becomes, first perhaps obscurely metaphorical, but ultimately meaningless. One can’t abuse ordinary language without paying for it.¹²

1. First of all, it is essential to realize that here the notion of perceiving *indirectly* wears the trousers—‘directly’ takes whatever sense it has from the contrast with its opposite:¹³ while ‘indirectly’ itself (a) has a use only in special cases, and also (b) has *different* uses in different cases — though that doesn’t mean, of course, that there is not a good reason why we should use the same word. We might, for example, contrast the man who saw the procession directly with the man who saw it *through a periscope*; or we might contrast the place from which you can watch the door directly with the place from which you can see it only *in the mirror*. *Perhaps* we might contrast seeing you directly with seeing, say, your shadow on the blind; and *perhaps* we might contrast hearing the music directly with hearing it relayed outside the concert-hall. However, these last two cases suggest two further points.

2. The first of these points is that the notion of not perceiving ‘directly’ seems most at home where, as with the periscope and the mirror, it retains its link with the notion of a kink in *direction*. It seems that we must not be looking *straight at* the object in question. For this reason seeing your shadow on the blind is a doubtful case; and seeing you, for instance, through binoculars or spectacles is certainly not a case of seeing you *indirectly* at all. For such cases as these last we have quite distinct contrasts and different expressions — ‘with the naked eye’ as opposed to ‘with a telescope,’ ‘with unaided vision’ as opposed to ‘with glasses on.’ (These expressions, in fact, are much more firmly established in ordinary use than ‘directly’ is.)

3. And the other point is that, partly no doubt for the above reason, the notion of indirect perception is not naturally at home with senses other than sight. With the other senses there is nothing quite analogous with the ‘line of vision.’ The most natural sense of ‘hearing indirectly,’ of course, is that of being *told* something by an intermediary—a quite different matter. But do I hear a shout indirectly, when I hear the echo? If I touch you with a barge-pole, do I touch you indirectly? Or if you offer me a pig in a poke, might I feel the pig indirectly—*through* the poke? And what smelling indirectly might be I have simply no idea. For

this reason alone there seems to be something badly wrong with the question, 'Do we perceive things directly or not?', where perceiving is evidently intended to cover the employment of *any* of the senses.

4. But it is, of course, for other reasons too extremely doubtful how far the notion of perceiving indirectly could or should be extended. Does it, or should it, covet the telephone, for instance? Or television? Or radar? Have we moved too far in these cases from the original metaphor? They at any rate satisfy what seems to be a necessary condition—namely, concurrent existence and concomitant variation as between what is perceived in the straightforward way (the sounds in the receiver, the picture and the blips on the screen) and the candidate for what we might be prepared to describe as being perceived indirectly. And this condition fairly clearly rules out as cases of indirect perception seeing photographs (which statically record scenes from the past) and seeing films (which, though not static, are not seen contemporaneously with the events thus recorded). Certainly, there *is* a line to be drawn somewhere. It is certain, for instance, that we should not be prepared to speak of indirect perception in *every* case in which we see something from which the existence (or occurrence) of something else can be inferred; we should *not* say we see the guns indirectly, if we see in the distance only the flashes of guns.

5. Rather differently, if we are to be seriously inclined to speak of something as being perceived indirectly, it seems that it has to be the kind of thing which we (sometimes at least) just perceive, or could perceive, or which—like the backs of our own heads—others could perceive. For otherwise we don't want to say that we perceive the thing *at all*, even indirectly. No doubt there are complications here (raised, perhaps, by the electron microscope, for example, about which I know little or nothing). But it seems clear that, in general, we should want to distinguish between seeing indirectly, e.g. in a mirror, what we might have just *seen*, and seeing signs (or effects), e.g. in a Wilson cloud-chamber, of something not itself perceptible at all. It would at least not come naturally to speak of the latter as a case of perceiving something indirectly.

6. And one final point. For reasons not very obscure, we always prefer in practice what might be called the *cash-value* expression to the 'indirect' metaphor. If I were to report that I see enemy ships indirectly, I should merely provoke the question what exactly I mean. 'I mean that I can see these blips on the radar screen'—'Well, why didn't you say so then?' (Compare 'I can see an unreal duck.' — 'What on earth do you mean?' 'It's a decoy duck'—'Ah, I see, Why didn't you say so at once?') That is, there is seldom if ever any particular point in actually saying 'indirectly' (or 'unreal'); the expression can cover too many rather different cases to be *just* what is wanted in any particular case.

Thus, it is quite plain that the philosophers' use of 'directly perceive,' whatever it may be, is not the ordinary, or any familiar, use; for in *that* use it is not only false but simply absurd to say that such objects as pens or cigarettes are never perceived directly. But we are given no explanation or definition of this new use¹⁴—on the contrary, it is glibly trotted out as if we were all quite familiar with it already. It is clear, too, that the philosophers' use, whatever it may be, offends against several of the canons just mentioned above — no restrictions whatever seem to be envisaged to any special circumstances or to any of the senses in particular, and moreover it seems that what we are to be said to perceive indirectly is *never*—is not the kind of thing which ever *could* be — perceived directly.

All this lends poignancy to the question Ayer himself asks, a few lines below the passage we have been considering: 'Why may we not say that we are directly aware of material things?' The answer, he says, is provided 'by what is known as the argument from illusion'; and this is what we must next consider. Just possibly the answer may help us to understand the question.

III

The primary purpose of the argument from illusion is to induce people to accept 'sense-data' as the proper and correct answer to the question what they perceive on certain *abnormal, exceptional* occasions; but in fact it is usually followed up with another bit of argument intended to establish that they *always* perceive sense-data. Well, what is the argument?

In Ayer's statement¹⁵ it runs as follows. It is 'based on the fact that material things may present different appearances to different observers, or to the same observer in different conditions, and that the character of these appearances is to some extent causally determined by the state of the conditions and the observer.' As illustrations of this alleged fact Ayer proceeds to cite perspective ('a coin which looks circular from one point of view may look elliptical from another'); refraction ('a stick which normally appears straight looks bent when it is seen in water'); changes in colour-vision produced by drugs ('such as mescal'); mirror-images; double vision; hallucination; apparent variations in tastes; variations in felt warmth ('according as the hand that is feeling it is itself hot or cold'); variations in felt bulk ('a coin seems larger when it is placed on the tongue than when it is held in the palm of the hand'); and the oft-cited fact that 'people who have had limbs amputated may still continue to feel pain in them.'

He then selects three of these instances for detailed treatment. First, refraction — the stick which normally 'appears straight' but 'looks bent' when seen in water. He makes the 'assumptions' (a) that the stick does not *really change its shape* when it is placed in water, and (b) that it *cannot be* both crooked and straight.¹⁶ He then concludes ('it follows') that 'at least one of the *visual appearances* of the stick is *delusive*.' Nevertheless, even when 'what we see is not the *real quality* of a *material thing*, it is supposed that we are still seeing something'—and this something is to be called a 'sense-datum.' A sense-datum is to be 'the object of which we are *directly* aware, in perception, if it is not *part of any material thing*.' (The italics are mine throughout this and the next two paragraphs.)

Next, mirages. A man who sees a mirage, he says, is 'not perceiving any material thing; for the oasis which he thinks he is perceiving *does not exist*.' But 'his *experience* is not an experience of nothing'; thus 'it is said that he is experiencing sense-data, which are similar in character to what he would be experiencing if he were seeing a real oasis, but are delusive in the sense that *the material thing which they appear to present* is not *really there*.'

Lastly, reflections. When I look at myself in a mirror 'my body *appears to be* some distance behind the glass'; but it cannot actually be in two places at once; thus, my perceptions in this case 'cannot all be *veridical*.' But I do see *something*; and if 'there really is no such material thing as my body in the place where it appears to be, what is it that I am seeing?' Answer — a sense-datum. Ayer adds that 'the same conclusion may be reached by taking any other of my examples.'

Now I want to call attention, first of all, to the name of this argument — the 'argument from *illusion*,' and to the fact that it is produced as establishing the conclusion that some at least of our 'perceptions' are *delusive*. For in this there are two clear implications — (a) that all the cases cited in the argument are cases of *illusions*; and (b) that *illusion* and *delusion* are the same thing. But both of these implications, of course, are quite wrong; and it is by no means unimportant to point this out, for, as we shall see, the argument trades on confusion at just this point.

What, then, would be some genuine examples of illusion? (The fact is that hardly any of the cases cited by Ayer is, at any rate without stretching things, a case of illusion at all.) Well, first, there are some quite clear cases of *optical* illusion — for instance the case we mentioned earlier in which, of two lines of equal length, one is made to look longer than the other. Then again there are illusions produced by professional 'illusionists,' conjurors—for instance the Headless Woman on the stage, who is made to look headless, or the ventriloquist's dummy which is made to appear to be talking. Rather different — not (usually) produced on purpose—is the case where wheels rotating rapidly enough in one direction may look as if they were rotating quite slowly in the opposite direction. Delusions, on the other hand, are something altogether different from this. Typical cases would be delusions of persecution, delusions of grandeur. These are primarily a matter of grossly disordered beliefs (and so, probably, behaviour) and may well have nothing in particular to do with perception.¹⁷ But I think we might also say that the patient who sees pink rats has (suffers from) delusions—particularly, no doubt, if, as would probably be the case, he is not clearly aware that his pink rats aren't real rats.¹⁸

The most important differences here are that the term 'an illusion' (in a perceptual context) does not suggest that something totally unreal is *conjured up* — on the contrary, there just is the arrangement of lines and arrows on the page, the woman on the stage with her head in a black bag, the rotating wheels; whereas the term 'delusion' *does* suggest something totally unreal, not really there at all. (The convictions of the man who has delusions of persecution can be *completely* without foundation.) For this reason delusions are a much more serious matter—something is really wrong, and what's more, wrong *with* the person who has them. But when I see an optical illusion, however well it comes off, there is nothing wrong with me personally, the illusion is not a little (or a large) peculiarity or idiosyncrasy of my own; it is quite public, anyone can see it, and in many cases standard procedures can be laid down for producing it. Furthermore, if we are not actually to be taken in, we need to be *on our guard*; but it is no use to tell the sufferer from delusions to be on his guard. He needs to be cured.

Why is it that we tend—if we do—to confuse illusions with delusions? Well, partly, no doubt the terms are often used loosely. But there is also the point that people may have, without making this explicit, different views or theories about the facts of some cases. Take the case of seeing a ghost, for example. It is not generally known, or agreed, what seeing ghosts is. Some people think of seeing ghosts as a case of something being conjured up, perhaps by the disordered nervous system of the victim; so in their view seeing ghosts is a case of delusion. But other people have the idea that what is called seeing ghosts is a case of being taken in by shadows, perhaps, or reflections, or a trick of the light — that is, they assimilate the case in their minds to illusion. In this way, seeing ghosts, for example, may come to be labelled sometimes as 'delusion,' sometimes as 'illusion'; and it may not be noticed that it makes a difference which label we use. Rather, similarly, there seem to be different doctrines in the field as to what mirages are. Some seem to take a mirage to be a vision conjured up by the crazed brain of the thirsty and exhausted traveller (delusion), while in other accounts it is a case of atmospheric refraction, whereby something below the horizon is made to appear above it (illusion). (Ayer, you may remember, takes the delusion view, although he cites it along with the rest as a case of illusion. He says not that the oasis appears to be where it is not, but roundly that 'it does not exist.')

The way in which the 'argument from illusion' positively trades on not distinguishing illusions from delusions is, I think, this. So long as it is being suggested that the cases paraded for our attention are cases of *illusion*, there is the implication (from the ordinary use of the word) that there really is something there that we perceive. But then, when these cases begin to be quietly called delusive, there comes in the very different suggestion of something being conjured up, something unreal or at any rate 'immaterial.' These two implications taken together may then subtly insinuate that in the cases cited there really is something that we are perceiving, but that this is an immaterial something; and this insinuation even if not conclusive by itself, is certainly well calculated to edge us a little closer towards just the position where the sense-datum theorist wants to have us.

So much, then — though certainly there could be a good deal more — about the differences between illusions and delusions and the reasons for not obscuring them. Now let us look briefly at some of the other cases Ayer lists. Reflections, for instance. No doubt you *can* produce illusions with mirrors, suitably disposed. But is just *any* case of seeing something in a mirror an illusion, as he implies? Quite obviously not. For seeing things in mirrors is a perfectly *normal* occurrence, completely familiar, and there is usually no question of anyone being taken in. No doubt, if you're an infant or an aborigine and have never come across a mirror before, you may be pretty baffled, and even visibly perturbed, when you do. But is that a reason why the rest of us should speak of illusion here? And just the same goes for the phenomena of perspective—again, one *can* play tricks with perspective, but in the ordinary case there is no question of illusion. That a round coin should 'look elliptical' (in one sense) from some points of view is exactly what we expect and what we normally find; indeed, we should be badly put out if we ever found this not to be so. Refraction again—the stick that looks bent in water—is far too familiar a case to be properly called a case of illusion. We may perhaps be prepared to agree that the stick looks bent; but then we can see that it's partly submerged in water, so that is exactly how we should expect it to look.

It is important to realize here how familiarity, so to speak, takes the edge off illusion. Is the cinema a case of illusion? Well, just possibly the first man who ever saw moving pictures may have felt inclined to say that here was a case of illusion. But in fact it's pretty unlikely that even he, even momentarily, was actually taken in; and by now the whole thing is so ordinary a part of our lives that it never occurs to us even to raise the question. One might as well ask whether producing a photograph is producing an illusion—which would plainly be just silly.

Then we must not overlook, in all this talk about illusions and delusions, that there are plenty of more or less unusual cases, not yet mentioned, which certainly aren't either. Suppose that a proof-reader makes a

mistake—he fails to notice that what ought to be ‘causal’ is printed as ‘casual’; does he have a delusion? Or is there an illusion before him? Neither, of course; he simply *misreads*. Seeing after-images, too, though not a particularly frequent occurrence and not just an ordinary case of seeing, is neither seeing illusions nor having delusions. And what about dreams? Does the dreamer see illusions? Does he have delusions? Neither; dreams are *dreams*.

Let us turn for a moment to what Price has to say about illusions. He produces,¹⁹ by way of saying ‘what the term “illusion” means,’ the following ‘provisional definition’: ‘An illusory sense-datum of sight or touch is a sense-datum which is such that we tend to take it to be part of the surface of a material object, but if we take it so we are wrong.’ It is by no means clear, of course, what this dictum itself means; but still, it seems fairly clear that the definition doesn’t actually fit all the cases of illusion. Consider the two lines again. Is there anything here which we tend to take, wrongly, to be part of the surface of a material object? It doesn’t seem so. We just see the two lines, we don’t think or even tend to think that we see anything else, we aren’t even raising the question whether anything is or isn’t ‘part of the surface’ of—what, anyway? the lines? the page?—the trouble is just that one line looks longer than the other, though it isn’t. Nor surely, in the case of the Headless Woman, is it a question whether anything is or isn’t part of her surface; the trouble is just that she looks as if she had no head.

It is noteworthy, of course, that, before he even begins to consider the ‘argument from illusion,’ Price has already incorporated in this ‘definition’ the idea that in such cases there is something to be seen *in addition to* the ordinary things — which is part of what the argument is commonly used, and not uncommonly taken, to *prove*. But this idea surely has no place in an attempt to say what ‘illusion’ *means*. It comes in again, improperly I think, in his account of perspective (which incidentally he also cites as a species of illusion) — ‘a distant hillside which is full of protuberances, and slopes upwards at quite a gentle angle, will appear flat and vertical... . This means that the sense-datum, the colour-expanse which we sense, actually *is* flat and vertical.’ But why should we accept this account of the matter? Why should we say that there is *anything* we see which *is* flat and vertical, though not ‘part of the surface’ of any material object? To speak thus is to assimilate all such cases to cases of delusion, where there *is* something not ‘part of any material thing.’ But we have already discussed the undesirability of this assimilation.

Next, let us have a look at the account Ayer himself gives of some at least of the cases he cites. (In fairness we must remember here that Ayer has a number of quite substantial reservations of his own about the merits and efficacy of the argument from illusion, so that it is not easy to tell just how seriously he intends his exposition of it to be taken; but this is a point we shall come back to.)

First, then, the familiar case of the stick in water. Of this case Ayer says (*a*) that since the stick looks bent but is straight, ‘at least one of the visual appearances of the stick is *delusive*’; and (*b*) that ‘what we see [directly anyway] is not the real quality of [a few lines later, not part of] a material thing.’ Well now: does the stick ‘look bent’ to begin with? I think we can agree that it does, we have no better way of describing it. But of course it does *not* look *exactly* like a bent stick, a bent stick out of water—at most, it may be said to look rather like a bent stick partly immersed *in* water. After all, we can’t help seeing the water the stick is partly immersed in. So exactly what in this case is supposed to be *delusive*? What is wrong, what is even faintly surprising, in the idea of a stick’s being straight but looking bent sometimes? Does anyone suppose that if something is straight, then it jolly well has to *look* straight at all times and in all circumstances? Obviously no one seriously supposes this. So what mess are we supposed to get into here, what is the difficulty? For of course it has to be suggested that there *is* a difficulty — a difficulty, furthermore, which calls for a pretty radical solution, the introduction of sense-data. But what is the problem we are invited to solve in this way?

Well, we are told, in this case you are seeing *something*; and what is this something ‘if it is not part of any material thing? But this question is, really, completely mad. The straight part of the stick, the bit not under water, is presumably part of a material thing; don’t we see that? And what about the bit *under* water?—we can see that too. We can see, come to that, the water itself. In fact what we see is *a stick partly immersed in water*, and it is particularly extraordinary that this should appear to be called in question — that a question should be raised about *what* we are seeing—since this, after all, is simply the description of the situation with which we started. It was, that is to say, agreed at the start that we were looking at a stick, a ‘material thing,’ part of which was under water. If, to take a rather different case, a church were cunningly camouflaged so that it looked like a barn, how could any serious question be raised about what we see when we look at it? We see, of course, *a church that now looks like a barn*. We do *not* see an immaterial barn, an immaterial church, or an immaterial anything else. And what in this case could seriously tempt us to say that we do?

Notice, incidentally, that in Ayer’s description of the stick-in-water case, which is supposed to be prior to the drawing of any philosophical conclusions, there has already crept in the unheralded but important

expression 'visual appearances'—it is, of course, ultimately to be suggested that all we *ever* get when we see is a visual appearance (whatever that may be).

Consider next the case of my reflection in a mirror. My body, Ayer says, 'appears to be some distance behind the glass'; but as it's in front, it can't really be behind the glass. So what am I seeing? A sense-datum. What about this? Well, once again, although there is no objection to saying that my body 'appears to be some distance behind the glass', in saying this we must remember what sort of situation we are dealing with. It does not 'appear to be' there in a way which might tempt me (though it might tempt a baby or a savage) to go round the back and look for it, and be astonished when this enterprise proved a failure. (To say that A is *in* B doesn't always mean that if you open B you will find A, just as to say that A is *on* B doesn't always mean that you could pick it off— consider 'I saw my face in the mirror,' 'There's a pain in my toe,' 'I heard him on the radio,' 'I saw the image on the screen,' &c. Seeing something in a mirror is not like seeing a bun in a shop-window.) But does it follow that, since my body is not actually located behind the mirror, I am not seeing a material thing? Plainly not. For one thing, I can see the mirror (nearly always anyway). I can see my own body 'indirectly,' *sc.* in the mirror. I can also see the reflection of my own body or, as some would say, a mirror-image. And a mirror-image (if we choose this answer) is not a 'sense-datum'; it can be photographed, seen by any number of people, and so on. (Of course there is no question here of either illusion or delusion.) And if the question is pressed, what actually *is* some distance, five feet say, behind the mirror, the answer is, not a sense-datum, but some region of the adjoining room.

The mirage case—at least if we take the view, as Ayer does, that the oasis the traveler thinks he can see 'does not exist' — is significantly more amenable to the treatment it is given. For here we are supposing the man to be genuinely deluded, he is *not* 'seeing a material thing.'²⁰ We don't actually have to say, however, even here that he is 'experiencing sense-data'; for though, as Ayer says above, 'it is convenient to give a name' to what he is experiencing, the fact is that it already has a name — a *mirage*. Again, we should be wise not to accept too readily the statement that what he is experiencing is '*similar in character* to what he would be experiencing if he were seeing a real oasis.' For is it at all likely, really, to be very similar? And, looking ahead, if we were to concede this point we should find the concession being used against us at a later stage—namely, at the stage where we shall be invited to agree that we see sense-data always, in normal cases too.

V

I want now to take up again the philosophical argument as it is set out in the texts we are discussing. As I mentioned earlier, the argument from illusion is intended primarily to persuade us that, in certain exceptional, abnormal situations, what we perceive—directly anyway—is a sense-datum; but then there comes a second stage, in which we are to be brought to agree that what we (directly) perceive is *always* a sense-datum, even in the normal, unexceptional case. It is this second stage of the argument that we must now examine.

Ayer expounds the argument thus.²¹ There is, he says, ‘no intrinsic difference in kind between those of our perceptions that are veridical in their presentation of material things and those that are delusive. When I look at a straight stick, which is refracted in water and so appears crooked, my experience is qualitatively the same as if I were looking at a stick that really was crooked....’ If, however, ‘when our perceptions were delusive, we were always perceiving something of a different kind from what we perceived when they were veridical, we should expect our experience to be qualitatively different in the two cases. We should expect to be able to tell from the intrinsic character of a perception whether it was a perception of a sense-datum or of a material thing. But this is not possible...’ Price’s exposition of this point,²² to which Ayer refers us, is in fact not perfectly analogous; for Price has already somehow reached the conclusion that we are always aware of sense-data, and here is trying to establish only that we cannot distinguish *normal* sense-data, as ‘parts of the surfaces of material things,’ from *abnormal* ones, not ‘parts of the surfaces of material things.’ However, the argument used is much the same: ‘the abnormal crooked sense-datum of a straight stick standing in water is qualitatively indistinguishable from a normal sense-datum of a crooked stick’; but ‘is it not incredible that two entities so similar in all these qualities should really be so utterly different: that the one should be a real constituent of a material object, wholly independent of the observer’s mind and organism, while the other is merely the fleeting product of his cerebral process?’

It is argued further, both by Ayer and Price, that ‘even in the case of veridical perceptions we are not directly aware of material things’ [or *apud*²³ Price, that our sense-data are not parts of the surfaces of material things] for the reason that ‘veridical and delusive perceptions may form a continuous series. Thus, if I gradually approach an object from a distance I may begin by having a series of perceptions which are delusive in the sense that the object appears to be smaller than it really is. Let us assume that this series terminates in a veridical perception.²⁴ Then the difference in quality between this perception and its immediate predecessor will be of the same order as the difference between any two delusive perceptions that are next to one another in the series...’ But ‘these are differences of degree and not of kind. But this, it is argued, is not what we should expect if the veridical perception were a perception of an object of a different sort, a material thing as opposed to a sense-datum. Does not the fact that veridical and delusive perceptions shade into one another in the way that is indicated by these examples show that the objects that are perceived in either case are generically the same? And from this it would follow, if it was acknowledged that the delusive perceptions were perceptions of sense-data, that what we directly experience was always a sense-datum and never a material thing.’ As Price puts it, ‘it seems most extraordinary that there should be a total difference of nature where there is only an infinitesimal difference of quality.’²⁵

Well, what are we to make of the arguments thus set before us?

1. It is pretty obvious, for a start, that the terms in which the argument is stated by Ayer are grossly tendentious. Price, you remember, is not producing the argument as a proof that we are always aware of sense-data; in his view that question has already been settled, and he conceives himself to be faced here only with the question whether any sense-data are ‘parts of the surfaces of material objects.’ But in Ayer’s exposition the argument *is* put forward as a ground for the conclusion that what we are (directly) aware of in perception is always a sense-datum; and if so, it seems a rather serious defect that this conclusion is practically assumed from the very first sentence of the statement of the argument itself. In that sentence Ayer uses, not indeed for the first time, the term ‘perceptions’ (which incidentally has never been defined or explained), and takes it for granted, here and throughout, that there is at any rate some kind of entities of which we are aware in absolutely all cases — namely, ‘perceptions,’ delusive or veridical. But of course, if one has already been induced to swallow the idea that every case, whether ‘delusive’ or ‘veridical,’ supplies us with ‘perceptions,’ one is only too easily going to be made to feel that it would be straining at a gnat not to swallow sense-data in an equally comprehensive style. But in fact one has not even been told what ‘perceptions’ *are*; and the assumption of their ubiquity has been slipped in without any explanation or argument whatever. But if those to whom the

argument is ostensibly addressed were not thus made to concede the essential point from the beginning, would the statement of the argument be quite such plain sailing?

2. Of course we shall also want to enter a protest against the argument's bland assumption of a simple dichotomy between 'veridical and delusive experiences.' There is, as we have already seen, *no* justification at all *either* for lumping all so-called 'delusive' experiences together, *or* for lumping together all so-called 'veridical' experiences. But again, could the argument run quite so smoothly without this assumption? It would certainly—and this, incidentally, would be all to the good—take rather longer to state.

3. But now let us look at what the argument actually says. It begins, you will remember, with an alleged statement of fact—namely, that 'there is no intrinsic difference in kind between those of our perceptions that are veridical in their presentation of material things and those that are delusive' (Ayer), that 'there is no qualitative difference between normal sense-data as such and abnormal sense-data as such' (Price). Now, waiving so far as possible the numerous obscurities in and objections to this manner of speaking, let us ask whether what is being alleged here is actually true. Is it the case that 'delusive and veridical experiences' are not 'qualitatively different'? Well, at least it seems perfectly extraordinary to say so in this sweeping way. Consider a few examples. I may have the experience (dubbed 'delusive' presumably) of dreaming that I am being presented to the Pope. Could it be seriously suggested that having this dream is 'qualitatively indistinguishable' from *actually being* presented to the Pope? Quite obviously not. After all, we have the phrase 'a dream-like quality'; some waking experiences are said to have this dream-like quality, and some artists and writers occasionally try to impart it, usually with scant success, to their works. But of course, if the fact here alleged *were* a fact, the phrase would be perfectly meaningless, because applicable to everything. If dreams were not 'qualitatively' different from waking experiences, then *every* waking experience would be like a dream; the dream-like quality would be, not difficult to capture, but impossible to avoid.²⁶ It is true, to repeat, that dreams are *narrated* in the same terms as waking experiences: these terms, after all, are the best terms we have; but it would be wildly wrong to conclude from this that what is narrated in the two cases is *exactly alike*. When we are hit on the head we sometimes say that we 'see stars'; but for all that, seeing stars when you are hit on the head is *not* 'qualitatively' indistinguishable from seeing stars when you look at the sky.

Again, it is simply not true to say that seeing a bright green after-image against a white wall is exactly like seeing a bright green patch actually on the wall; or that seeing a white wall through blue spectacles is exactly like seeing a blue wall; or that seeing pink rats in D.T.s is exactly like really seeing pink rats; or (once again) that seeing a stick refracted in water is exactly like seeing a bent stick. In all these cases we may *say* the same things ('It looks blue,' 'It looks bent,' &c.), but this is no reason at all for denying the obvious fact that the 'experiences' are *different*.

4. Next, one may well wish at least to ask for the credentials of a curious general principle on which both Ayer and Price seem to rely,²⁷ to the effect that, if two things are not 'generically the same,' the same 'in nature,' then they can't be alike, or even very nearly alike. If it were true, Ayer says, that from time to time we perceived things of two different kinds, then 'we should expect' them to be qualitatively different. But why on earth should we?—particularly if, as he suggests would be the case, we never actually found such a thing to be true. It is not at all easy to discuss this point sensibly, because of the initial absurdity in the hypothesis that we perceive just *two* kinds of things. But if, for example, I had never seen a mirror, but were told (*a*) that in mirrors one sees reflections of things, and (*b*) that reflections of things are not 'generically the same' as things, is there any reason why I should forthwith *expect* there to be some whacking big 'qualitative' difference between seeing things and seeing their reflections? Plainly not; if I were prudent, I should simply wait and see what seeing reflections was like. If I am told that a lemon is generically different from a piece of soap, do I 'expect' that no piece of soap could look just like a lemon? Why should I?

(It is worth noting that Price helps the argument along at this point by a bold stroke of rhetoric: how *could* two entities be 'qualitatively indistinguishable,' he asks, if one is a 'real constituent of a material object,' the other 'a *fleeting product of his cerebral processes*'? But how in fact are we supposed to have been persuaded that sense-data are *ever* fleeting products of cerebral processes? Does this colourful description fit, for instance, the reflection of my face in a mirror?)

5. Another erroneous principle which the argument here seems to rely on is this: that it *must* be the case that 'delusive and veridical experiences' are not (as such) 'qualitatively' or 'intrinsically' distinguishable—for if they were distinguishable, we should never be 'deluded.' But of course this is not so. From the fact that I am sometimes 'deluded,' mistaken, taken in through failing to distinguish A from B, it does not follow at all that A and B must be *indistinguishable*. Perhaps I should have noticed the difference if I had been more careful or attentive; perhaps I am just bad at distinguishing things of this sort (e.g. vintages); perhaps, again, I have

never learned to discriminate between them, or haven't had much practice at it. As Ayer observes, probably truly, 'a child who had not learned that refraction was a means of distortion would naturally believe that the stick really was crooked as he saw it'; but how is the fact that an uninstructed child probably would not discriminate between *being refracted* and *being crooked* supposed to establish the allegation that there *is* no 'qualitative' difference between the two cases? What sort of reception would I be likely to get from a professional tea-taster, if I were to say to him, 'But there can't be any difference between the flavours of these two brands of tea, for I regularly fail to distinguish between them'? Again, when 'the quickness of the hand deceives the eye,' it is not that what the hand is really doing is *exactly like* what we are tricked into thinking it is doing, but simply that it is *impossible to tell* what it is really doing. In this case it may be true that we can't distinguish, and not merely that we don't; but even this doesn't mean that the two cases are exactly alike.

I do not, of course, wish to deny that there may be cases in which 'delusive and veridical experiences' really are 'qualitatively indistinguishable'; but I certainly do wish to deny (a) that such cases are anything like as *common* as both Ayer and Price seem to suppose, and (b) that there *have* to be such cases to accommodate the undoubted fact that we are sometimes 'deceived by our senses.' We are not, after all, quasi-infallible beings, who can be taken in only where the avoidance of mistake is completely impossible. But if we are prepared to admit that there may be, even that there are, *some* cases in which 'delusive and veridical perceptions' really are indistinguishable, does this admission require us to drag in, or even to let in, sense-data? No. For even if we were to make the prior admission (which we have so far found no reason to make) that in the 'abnormal' cases we perceive sense-data, we should not be obliged to extend this admission to the 'normal' cases too. For why on earth should it *not* be the case that, in some few instances, perceiving one sort of thing is exactly like perceiving another?

6. There is a further quite general difficulty in assessing the force of this argument, which we (in common with the authors of our texts) have slurred over so far. The question which Ayer invites us to consider is whether two classes of 'perceptions,' the veridical and the delusive, are or are not 'qualitatively different,' 'intrinsically different in kind'; but how are we supposed to set about even considering this question, when we are not told what 'a perception' *is*? In particular, how many of the circumstances of a situation, as these would ordinarily be stated, are supposed to be included in 'the perception'? For example, to take the stick in water again: it is a feature of this case that part of the stick is under water, and water, of course, is not invisible; is the water, then, part of 'the perception'? It is difficult to conceive of any grounds for denying that it is; but *if* it is, surely this is a perfectly obvious respect in which 'the perception' differs from, is distinguishable from, the 'perception' we have when we look at a bent stick *not* in water. There is a sense, perhaps, in which the presence or absence of water is not the *main thing* in this case — we are supposed to be addressing ourselves primarily to questions about the stick. But in fact, as a great quantity of psychological investigation has shown, discrimination between one thing and another very frequently depends on such more or less extraneous concomitants of the main thing, even when such concomitants are not consciously taken note of. As I said, we are told nothing of what 'a perception' is; but could any defensible account, if such an account were offered, completely exclude all these highly significant attendant circumstances? And if they *were* excluded—in some more or less arbitrary way—how much interest or importance would be left in the contention that 'delusive' and 'veridical' perceptions are indistinguishable? Inevitably, if you rule out the respects in which A and B differ, you may expect to be left with respects in which they are alike.

I conclude, then, that this part of the philosophical argument involves (though not in every case equally essentially) (a) acceptance of a quite bogus dichotomy of all 'perceptions' into two groups, the 'delusive' and the 'veridical'—to say nothing of the unexplained introduction of 'perceptions' themselves; (b) an implicit but grotesque exaggeration of the *frequency* of 'delusive perceptions'; (c) a further grotesque exaggeration of the *similarity* between 'delusive' perceptions and 'veridical' ones; (d) the erroneous suggestion that there *must* be such similarity, or even qualitative *identity*; (e) the acceptance of the pretty gratuitous idea that things 'generically different' could not be qualitatively alike; and (f)—which is really a corollary of (c) and (a)—the gratuitous neglect of those more or less subsidiary features which often make possible the discrimination of situations which, in other *broad* respects, may be roughly alike. These seem to be rather serious deficiencies.

4. [Regarding Heraclitus, see Aristotle, *Metaphysics*, n.8. — S.M.C.]
5. [Regarding Thales, see Aristotle, *Metaphysics*, n.3.]
6. The case of 'universal' and 'particular,' or 'individual,' is similar in some respects, though of course not in all. In philosophy it is often good policy, where one member of a putative pair falls under suspicion, to view the more innocent-seeming party suspiciously as well.
7. Ayer, op. cit., pp. 1–2.
8. Compare Price's list on p. 1 of *Perception* — 'chairs and tables, cats and rocks' — though he complicates matters by adding 'water' and 'the earth.' See also p. 280, on 'physical objects,' 'visuo-tactual solids.'
9. Price, op. cit., p. 26, says that he *is* naïve, though it is not, it seems, certain that he is actually a Naïve Realist.
10. [Misleading implication.]
11. I am not denying that cases in which things go wrong *could* be lumped together under some single name. A single name might in itself be innocent enough, provided its use was not taken to imply either (a) that the cases were all alike, or (b) that they were all in certain ways alike. What matters is that the facts should not be pre-judged and (therefore) neglected.
12. Especially if one abuses it without realizing what one is doing. Consider the trouble caused by unwitting stretching of the word 'sign,' so as to yield — apparently — the conclusion that, when the cheese is in front of our noses, we see *signs* of cheese.
13. Compare, in this respect, 'real,' 'proper,' 'free,' and plenty of others. 'It's real' — what exactly are you saying it isn't? 'I wish we had a proper stair-carpet' — what are you complaining of in the one you've got? (That it's *improper*?) 'Is he free?'—well, what have you in mind that he might be instead? In prison? Tied up in prison? Committed to a prior engagement?
14. Ayer takes note of this, rather belatedly, on pp. 60–61.
15. Ayer, op. cit., pp. 3–5.
16. It is not only strange, but also important, that Ayer calls these 'assumptions.' Later on he is going to take seriously the notion of denying at least one of them, which he could hardly do if he had recognized them here as the plain and incontestable facts that they are.
17. The latter point holds, of course, for *some* uses of 'illusion' too; there are the illusions which some people (are said to) lose as they grow older and wiser.
18. Cp. the white rabbit in the play called *Harvey*.
19. *Perception*, p. 27.
20. Not even 'indirectly,' no such thing is 'presented.' Doesn't this seem to make the case, though more amenable, a good deal less useful to the philosopher? It's hard to see how normal cases could be said to be *very like* this.
21. Ayer, op. cit., pp. 5–9.
22. *Perception*, p. 31.
23. [In the words of.]
24. But what, we may ask, does this assumption amount to? From what distance *does* an object, a cricket-ball say, 'look the size that it really is'? Six feet? Twenty feet?
25. I omit from consideration a further argument cited by both Price and Ayer, which makes play with the 'causal dependence' of our 'perceptions' upon the conditions of observation and our own 'physiological and psychological states.'
26. This is part, no doubt *only* part, of the absurdity in Descartes' toying with the notion that the whole of our experience might be a dream.
27. Ayer in fact expresses qualms later: see p. 12.

The Eighth Edition of Steven M. Cahn's *Classics of Western Philosophy* offers the same exacting standard of editing and translation that made earlier editions of this anthology the most highly valued and widely used volume of its kind. But the Eighth Edition offers exciting new content as well:

- Plato's *Laches* (complete)
- new selections from Aristotle's *Nicomachean Ethics* (on courage)
- Descartes' *Discourse on Method* (complete)
- all previously omitted sections of Berkeley's *A Treatise Concerning the Principles of Human Knowledge*
- Kant's *Prolegomena to Any Future Metaphysics* (complete)

These additions—with no offsetting deletion of content of the Seventh Edition—yield an anthology of unrivalled versatility, the only one to offer the complete texts of

- both Descartes' *Discourse on Method* and *Meditations on First Philosophy*
- both Berkeley's *A Treatise Concerning the Principles of Human Knowledge* and *Three Dialogues between Hylas and Philonous*
- Kant's *Prolegomena to Any Future Metaphysics* and selections from the *Critique of Pure Reason*

STEVEN M. CAHN is Professor of Philosophy at the Graduate Center of the City University of New York.
