three major parts, with each part divided into many questions, and each question into articles. A number of questions and articles from the first part are reprinted here. In the first question, Aquinas asks whether Christian theology is a science—a question that may seem peculiar until one finds out that by “science,” Aquinas means nothing more than any body of knowledge that has first principles. In the second question, Aquinas turns to the issue of God’s existence. Here he criticizes Anselm’s ontological argument but offers five arguments of his own to show that God exists. These “five ways” have attracted lavish philosophical attention through the centuries. The two articles from the thirteenth question address issues concerning the application to God, an infinite being, of terms like “good” and “wise” that have been learned from examples of finite beings. Finally, the excerpts from the nineteenth and the twenty-second questions attempt to resolve problems about the extent of God’s providence in the world and whether that providence can allow some events to occur contingently.

Question I

The Nature and Domain of Sacred Doctrine

(In Ten Articles)

To place our purpose within definite limits, we must first investigate the nature and domain of sacred doctrine. Concerning this there are ten points of inquiry: —

(1) Whether sacred doctrine is necessary? (2) Whether it is a science? (3) Whether it is one or many? (4) Whether it is speculative or practical? (5) How it is compared with other sciences? (6) Whether it is a wisdom? (7) Whether God is its subject-matter? (8) Whether it is argumentative? (9) Whether it rightly employs metaphors and similes? (10) Whether the Sacred Scripture of this doctrine may be expounded in different senses?

First Article

Whether, Besides the Philosophical Sciences, Any Further Doctrine Is Required?

We proceed thus to the First Article: —

Objection 1. It seems that, besides the philosophical sciences, we have no need of any further knowledge. For man should not seek to know what is above reason: *Seek not the things that are too high for thee* (Ecclus. iii. 22). But whatever is not above reason is sufficiently considered in the philosophical sciences. Therefore any other knowledge besides the philosophical sciences is superfluous.

Obj. 2. Further, knowledge can be concerned only with being, for nothing can be known, save the true, which is convertible with being. But everything that is, is considered in the philosophical sciences—even God Himself; so that there is a part of philosophy called theology, or the divine science, as is clear from Aristotle. Therefore, besides the philosophical sciences, there is no need of any further knowledge.

On the contrary, It is written (2 Tim. iii. 16): *All Scripture inspired of God is profitable to teach, to reprove, to correct, to instruct in justice.* Now Scripture, inspired by God, is not a part of the philosophical sciences discovered by human reason. Therefore it is useful that besides the philosophical sciences there should be another science— *i.e.*, inspired of God.

I answer that, It was necessary for man's salvation that there should be a knowledge revealed by God, besides the philosophical sciences investigated by human reason. First, because man is directed to God as to an end that surpasses the grasp of his reason: *The eye hath not seen, O God, besides Thee, what things Thou hast prepared for them that wait for Thee* (Isa. lxiv. 4). But the end must first be known by men who are to direct their thoughts and actions to the end. Hence it was necessary for the salvation of man that certain truths which exceed human reason should be made known to him by divine revelation. Even as regards those truths about God which human reason can investigate, it was necessary that man be taught by a divine revelation. For the truth about God, such as reason can know it, would only be known by a few, and that after a long time, and with the admixture of many errors; whereas man's whole salvation, which is in God, depends upon the knowledge of this truth. Therefore, in order that the salvation of men might be brought about more fitly and more surely, it was necessary that they be taught divine truths by divine revelation. It was therefore necessary that, besides the philosophical sciences investigated by reason, there should be a sacred science by way of revelation.

Reply Obj. 1. Although those things which are beyond man's knowledge may not be sought for by man through his reason, nevertheless, what is revealed by God must be accepted through faith. Hence the sacred text continues. *For many things are shown to thee above the understanding of man* (Ecclus. iii. 25). And in such things sacred science consists.

Reply Obj. 2. Sciences are diversified according to the diverse nature of their knowable objects. For the astronomer and the physicist both prove the same conclusion — that the earth, for instance is round: the

astronomer by means of mathematics (*i.e.*, abstracting from matter), but the physicist by means of matter itself. Hence there is no reason why those things which are treated by the philosophical sciences, so far as they can be known by the light of natural reason, may not also be treated by another science so far as they are known by the light of the divine revelation. Hence the theology included in sacred doctrine differs in genus from that theology which is part of philosophy.

Second Article

Whether Sacred Doctrine Is a Science?

We proceed thus to the Second Article: —

Objection 1. It seems that sacred doctrine is not a science. For every science proceeds from self-evident principles. But sacred doctrine proceeds from articles of faith which are not self-evident, since their truth is not admitted by all: *For all men have not faith* (2 Thess. iii. 2). Therefore sacred doctrine is not a science.

Obj. 2. Further, science is not of individuals. But sacred doctrine treats of individual facts, such as the deeds of Abraham, Isaac and Jacob, and the like. Therefore sacred doctrine is not a science.

On the contrary, Augustine says that *to this science alone belongs that whereby saving faith is begotten, nourished, protected and strengthened*. But this can be said of no science except sacred doctrine. Therefore sacred doctrine is a science.

I answer that, Sacred doctrine is a science. We must bear in mind that there are two kinds of sciences. There are some which proceed from principles known by the natural light of the intellect, such as arithmetic and geometry and the like. There are also some which proceed from principles known by the light of a higher science: thus the science of optics proceeds from principles established by geometry, and music from principles established by arithmetic. So it is that sacred doctrine is a science because it proceeds from principles made known by the light of a higher science, namely, the science of God and the blessed. Hence, just as music accepts on authority the principles taught by the arithmetician, so sacred science accepts the principles revealed by God.

Reply Obj. 1. The principles of any science are either in themselves self-evident, or reducible to the knowledge of a higher science; and such, as we have said, are the principles of sacred doctrine.

Reply Obj. 2. Individual facts are not treated in sacred doctrine because it is concerned with them principally; they are rather introduced as examples to be followed in our lives (as in the moral sciences), as well as to establish the authority of those men through whom the divine revelation, on which this sacred scripture or doctrine is based, has come down to us.

Third Article

Whether Sacred Doctrine Is One Science?

We proceed thus to the Third Article:—

Objection 1. It seems that sacred doctrine is not one science, for according to the Philosopher¹ *that science is one which treats only of one class of subjects*. But the creator and the creature, both of whom are treated in sacred doctrine, cannot be grouped together under one class of subjects. Therefore sacred doctrine is not one science.

Obj. 2. Further, in sacred doctrine we treat of angels, corporeal creatures and human morality. But these belong to separate philosophical sciences. Therefore sacred doctrine cannot be one science.

On the contrary, Holy Scripture speaks of it as one science: *Wisdom gave him the knowledge of holy things* (Wis. x. 10).

I answer that, Sacred doctrine is one science. The unity of a power or habit is to be gauged by its object, not indeed, in its material aspect, but as regards the formality under which it is an object. For example, man, ass, stone, agree in the one formality of being colored; and color is the formal object of sight. Therefore, because Sacred Scripture (as we have said) considers some things under the formality of being divinely revealed, all things which have been divinely revealed have in common the formality of the object of this science. Hence, they are included under sacred doctrine as under one science.

Reply Obj. 1. Sacred doctrine does not treat of God and creatures equally, but of God primarily, and of creatures only so far as they are referable to God as their beginning or end. Hence the unity of this science is not impaired.

Reply Obj. 2. Nothing prevents inferior powers or habits from being diversified by objects which yet agree with one another in coming together under a higher power or habit; because the higher power or habit regards its own object under a more universal formality. Thus, the object of the *common sense* is the sensible, including, therefore, whatever is visible or audible. Hence the *common sense*, although one power, extends to all the objects of the five senses. Similarly, objects which are the subject-matter of different philosophical sciences can yet be treated by this one single sacred science under one aspect, namely, in so far as they can be included in revelation. So that in this way sacred doctrine bears, as it were, the stamp of the divine science, which is one and simple, yet extends to everything.

Fourth Article

Whether Sacred Doctrine Is a Practical Science?

We proceed thus to the Fourth Article:—

Objection 1. It seems that sacred doctrine is a practical science, for a practical science is that which ends in action, according to the Philosopher. But sacred doctrine is ordained to action: *Be ye doers of the word, and not hearers only* (Jas. i. 22). Therefore sacred doctrine is a practical science.

Obj. 2. Further sacred doctrine is divided into the Old and the New Law. But law belongs to moral science, which is a practical science. Therefore sacred doctrine is a practical science.

On the contrary, Every practical science is concerned with the things man can do; as moral science is concerned with human acts, and architecture with buildings. But sacred doctrine is chiefly concerned with God, Who is rather the Maker of man. Therefore it is not a practical but a speculative science.

I answer that, Sacred doctrine, being one, extends to things which belong to the different philosophical sciences, because it considers in each the same formal aspect, namely, so far as they can be known through the divine light. Hence, although among the philosophical sciences some are speculative and others practical, nevertheless, sacred doctrine includes both; as God, by one and the same science, knows both Himself and His works.

Still, it is more speculative than practical, because it is more concerned with divine things than with human acts; though even of these acts it treats inasmuch as man is ordained by them to the perfect knowledge of God, in which consists eternal beatitude.

This is a sufficient answer to the Objections.

Fifth Article

Whether Sacred Doctrine Is Nobler Than Other Sciences?

We proceed thus to the Fifth Article:—

Objection 1. It seems that sacred doctrine is not nobler than other sciences, for the nobility of a science depends on its certitude. But other sciences, the principles of which cannot be doubted, seem to be more certain than sacred doctrine; for its principles—namely, articles of faith—can be doubted. Therefore other sciences seem to be nobler.

Obj. 2. Further, it is the part of a lower science to draw upon a higher; as music draws upon arithmetic. But sacred doctrine does draw upon the philosophical sciences; for Jerome² observes, in his Epistle to Magnus, that *the ancient doctors so enriched their books with the doctrines and thoughts of the philosophers, that thou knowest not what more to admire in them, their profane erudition or their scriptural learning*. Therefore sacred doctrine is inferior to other sciences.

On the contrary, Other sciences are called the handmaidens of this one: *Wisdom sent her maids to invite to the tower* (Prov. ix. 3).

I answer that, Since this science is partly speculative and partly practical, it transcends all other sciences, speculative and practical. Now one speculative science is said to be nobler than another either by reason of its greater certitude, or by reason of the higher dignity of its subject-matter. In both these respects this science surpasses other speculative sciences: in point of greater certitude, because other sciences derive their certitude from the natural light of human reason, which can err, whereas this derives its certitude from the light of the divine knowledge, which cannot err; in point of the higher dignity of its subject-matter, because this science treats chiefly of those things which by their sublimity transcend human reason, while other sciences consider

only those things which are within reason's grasp. Of the practical sciences, that one is nobler which is ordained to a more final end, as political science is nobler than military science; for the good of the army is directed to the good of the state. But the purpose of this science, in so far as it is practical, is eternal beatitude, to which as to an ultimate end the ends of all the practical sciences are directed. Hence it is clear that from every standpoint it is nobler than other sciences.

Reply Obj. 1. It may well happen that what is in itself the more certain may seem to us the less certain because of the weakness of our intellect, *which is dazzled by the clearest objects of nature; as the owl is dazzled by the light of the sun*. Hence the fact that some happen to doubt about the articles of faith is not due to the uncertain nature of the truths, but to the weakness of the human intellect; yet the slenderest knowledge that may be obtained of the highest things is more desirable than the most certain knowledge obtained of the lowest things, as is said in *De Animalibus* xi.³

Reply Obj. 2. This science can draw upon the philosophical sciences, not as though it stood in need of them, but only in order to make its teaching clearer. For it accepts its principles, not from the other sciences, but immediately from God, by revelation. Therefore it does not draw upon the other sciences as upon its superiors, but uses them as its inferiors and handmaidens: even so the master sciences make use of subordinate sciences, as political science of military science. That it thus uses them is not due to its own defect or insufficiency, but to the defect of our intellect, which is more easily led by what is known through natural reason (from which proceed the other sciences), to that which is above reason, such as are the teachings of this science.

Sixth Article

Whether This Doctrine Is a Wisdom?

We proceed thus to the Sixth Article: —

Objection 1. It seems that this doctrine is not a wisdom. For no doctrine which borrows its principles is worthy of the name of wisdom, seeing that the wise man directs, and is not directed. But this doctrine borrows its principles. Therefore it is not a wisdom.

Obj. 2. Further, it is a part of wisdom to prove the principles of other sciences. Hence it is called the chief of sciences, as is clear in *Ethics* vi.⁴ But this doctrine does not prove the principles of other sciences. Therefore it is not a wisdom.

Obj. 3. Further, this doctrine is acquired by study, whereas wisdom is acquired by God's inspiration, and is accordingly numbered among the gifts of the Holy Spirit (*Isa.* xi. 2). Therefore this doctrine is not a wisdom.

On the contrary, It is written (*Deut.* iv. 6): *This is your wisdom and understanding in the sight of nations.*

I answer that, This doctrine is wisdom above all human wisdoms not merely in any one order, but absolutely. For since it is the part of a wise man to order and to judge, and since lesser matters can be judged in the light of some higher cause, he is said to be wise in any genus who considers the highest cause in that genus. Thus in the realm of building, he who plans the form of the house is called wise and architect, in relation to the subordinate laborers who trim the wood and make ready the stones: thus it is said, *As a wise architect I have laid the foundation* (*1 Cor.* ii. 10). Again, in order of all human life, the prudent man is called wise, inasmuch as he directs his acts to a fitting end: thus it is said, *Wisdom is prudence to a man* (*Prov.* x. 23). Therefore, he who considers absolutely the highest cause of the whole universe, namely God, is most of all called wise. Hence wisdom is said to be the knowledge of divine things, as Augustine says. But sacred doctrine essentially treats of God viewed as the highest cause, for it treats of Him not only so far as He can be known through creatures just as philosophers knew Him — *That which is known of God is manifest in them* (*Rom.* i. 19) — but also so far as He is known to Himself alone and revealed to others. Hence sacred doctrine is especially called a wisdom.

Reply Obj. 1. Sacred doctrine derives its principles, not from any human knowledge, but from the divine knowledge, by which, as by the highest wisdom, all our knowledge is ordered.

Reply Obj. 2. The principles of the other sciences either are evident and cannot be proved, or they are proved by natural reason in some other science. But the knowledge proper to this science comes through revelation, and not through natural reason. Therefore it is not its business to prove the principles of the other sciences, but only to judge them. For whatsoever is found in the other sciences contrary to the truth of this science must be condemned as false. Hence, it is said: *Destroying counsels and every height that exalteth itself against the knowledge of God* (*2 Cor.* x. 4, 5).

Reply Obj. 3. Since judgment pertains to wisdom, in accord with a twofold manner of judging there is a twofold wisdom. A man may judge in one way by inclination, as whoever has the habit of a virtue judges rightly of what is virtuous by his very inclination towards it. Hence it is the virtuous man, as we read,⁵ who is the measure and rule of human acts. In another way, a man may judge by knowledge, just as a man learned in moral science might be able to judge rightly about virtuous acts, though he had not virtue. The first manner of judging divine things belongs to that wisdom which is numbered as a gift of the Holy Ghost: *The spiritual man judgeth all things* (1 Cor. ii. 15). And Dionysius says: *Hierotheus is taught not only as one learning, but also as experiencing divine things*. The second manner of judging belongs to this doctrine, inasmuch as it is acquired by study, though its principles are obtained by revelation.

Seventh Article

Whether God Is the Subject-Matter of This Science?

We proceed thus to the Seventh Article: —

Objection 1. It seems that God is not the subject-matter of this science. For, according to the Philosopher, in every science the essence of its subject is presupposed. But this science cannot presuppose the essence of God, for Damascene says: *It is impossible to express the essence of God*. Therefore God is not the subject-matter of this science.

Obj. 2. Further, whatever conclusions are reached in any science must be comprehended under the subject-matter of that science. But in Holy Scripture we reach conclusions not only concerning God, but concerning many other things, such as creatures and human morality. Therefore God is not the subject-matter of this science.

On the contrary, The subject-matter of a science is that of which it principally treats. But in this science the treatment is mainly about God; for it is called theology, as treating of God. Therefore God is the subject-matter of this science.

I answer that, God is the subject-matter of this science. The relation between a science and its subject-matter is the same as that between a habit or a power and its object. Now properly speaking the object of a power or habit is that under whose formality all things are referred to that power or habit, as man and stone are referred to sight in that they are colored. Hence colored things are the proper object of sight. But in sacred doctrine all things are treated under the aspect of God, either because they are God Himself, or because they refer to God as to their beginning and end. Hence it follows that God is in very truth the subject-matter of this science. This is made clear also from the principles of this science, namely, the articles of faith, for faith is about God. The subject-matter of the principles and of the whole science must be the same, since the whole science is contained virtually in its principles.

Some, however, looking to what is treated in this science, and not to the aspect under which it is treated, have asserted the subject-matter of this science to be something other than God—that is, either things and signs, or the works of salvation, or the whole Christ, that is, the head and members. Of all these things, in truth, we treat in this science, but so far as they are ordered to God.

Reply Obj. 1. Although we cannot know in what consists the essence of God, nevertheless in this doctrine we make use of His effects, either of nature or of grace, in the place of a definition, in regard to whatever is treated in this doctrine concerning God; even as in some philosophical sciences we demonstrate something about a cause from its effect, by taking the effect in the place of a definition of the cause.

Reply Obj. 2. Whatever other conclusions are reached in this sacred science are comprehended under God, not as parts or species or accidents, but as in some way ordained to Him.

Eighth Article

Whether Sacred Doctrine Is Argumentative?

We proceed thus to the Eighth Article: —

Objection 1. It seems this doctrine is not argumentative. For Ambrose⁶ says: *Put arguments aside where faith is sought*. But in this doctrine faith especially is sought: *But these things are written that you may believe* (Jo. xx. 31). Therefore sacred doctrine is not argumentative.

Obj. 2. Further, if it is argumentative, the argument is either from authority or from reason. If it is from

authority, it seems unbefitting its dignity, for the proof from authority is the weakest form of proof according to Boethius.⁷ But if from reason, this is unbefitting its end, because, according to Gregory,⁸ *faith has no merit in those things of which human reason brings its own experience*. Therefore sacred doctrine is not argumentative.

On the contrary, The Scripture says that a bishop should *embrace that faithful word which is according to doctrine, that he may be able to exhort in sound doctrine and to convince the gainsayers* (Tit. i. 9).

I answer that, As the other sciences do not argue in proof of their principles, but argue from their principles to demonstrate other truths in these sciences, so this doctrine does not argue in proof of its principles, which are the articles of faith, but from them it goes on to prove something else; as the Apostle⁹ argues from the resurrection of Christ in proof of the general resurrection (1 Cor. xv. 12). However, it is to be borne in mind, in regard to the philosophical sciences, that the inferior sciences neither prove their principles nor dispute with those who deny them, but leave this to a higher science; whereas the highest of them, viz., metaphysics, can dispute with one who denies its principles, if only the opponent will make some concession; but if he concedes nothing, it can have no dispute with him, though it can answer his arguments. Hence Sacred Scripture, since it has no science above itself, disputes argumentatively with one who denies its principles only if the opponent admits some at least of the truths obtained through divine revelation. Thus, we can argue with heretics from texts in Holy Scripture, and against those who deny one article of faith we can argue from another. If our opponent believes nothing of divine revelation, there is no longer any means of proving the articles of faith by argument, but only of answering his objections — if he has any—against faith. Since faith rests upon infallible truth, and since the contrary of a truth can never be demonstrated, it is clear that the proofs brought against faith are not demonstrations, but arguments that can be answered.

Reply Obj. 1. Although arguments from human reason cannot avail to prove what belongs to faith, nevertheless, this doctrine argues from articles of faith to other truths.

Reply Obj. 2. It is especially proper to this doctrine to argue from authority, inasmuch as its principles are obtained by revelation; and hence we must believe the authority of those to whom the revelation has been made. Nor does this take away the dignity of this doctrine, for although the argument from authority based on human reason is the weakest, yet the argument from authority based on divine revelation is the strongest. But sacred doctrine also makes use of human reason, not, indeed, to prove faith (for thereby the merit of faith would come to an end), but to make clear other things that are set forth in this doctrine. Since therefore grace does not destroy nature, but perfects it, natural reason should minister to faith as the natural inclination of the will ministers to charity. Hence the Apostle says: *Bringing into captivity every understanding unto the obedience of Christ* (2 Cor. x. 5). Hence it is that sacred doctrine makes use also of the authority of philosophers in those questions in which they were able to know the truth by natural reason, as Paul quotes a saying of Aratus:¹⁰ *As some also of your own poets said: For we are also His offspring* (Acts xvii. 28). Nevertheless, sacred doctrine makes use of these authorities as extrinsic and probable arguments, but properly uses the authority of the canonical Scriptures as a necessary demonstration, and the authority of the doctors of the Church as one that may properly be used, yet merely as probable. For our faith rests upon the revelation made to the apostles and prophets, who wrote the canonical books, and not on the revelations (if any such there are) made to other doctors. Hence Augustine says: *Only those books of Scripture which are called canonical have I learned to hold in such honor as to believe their authors have not erred in any way in writing them. But other authors I so read as not to deem anything in their works to be true, merely because of their having so thought and written, whatever may have been their holiness and learning*.

Ninth Article

Whether Holy Scripture Should Use Metaphors?

We proceed thus to the Ninth Article: —

Objection 1. It seems that Holy Scripture should not use metaphors. For that which is proper to the lowest science seems not to befit this science, which holds the highest place of all. But to proceed by the aid of various similitudes and figures is proper to poetic, the least of all the sciences. Therefore it is not fitting that this science should make use of such similitudes.

Obj. 2. Further, this doctrine seems to be intended to make truth clear. Hence a reward is held out to those who manifest it: *They that explain me shall have life everlasting* (Ecclus. xxiv. 31). But by such similitudes truth is obscured. Therefore to put forward divine truths under the likeness of corporeal things does not befit this doctrine.

Obj. 3. Further, the higher creatures are, the nearer they approach to the divine likeness. If therefore any creature be taken to represent God, this representation ought chiefly to be taken from the higher creatures, and not from the lower; yet this is often found in the Scriptures.

On the contrary, It is written (*Osee* xxiii. 10): *I have multiplied visions, and I have used similitudes by the ministry of the prophets.* But to put forward anything by means of similitudes is to use metaphors. Therefore sacred doctrine may use metaphors.

I answer that, It is befitting Holy Scripture to put forward divine and spiritual truths by means of comparisons with material things. For God provides for everything according to the capacity of its nature. Now it is natural to man to attain to intellectual truths through sensible things, because all our knowledge originates from sense. Hence in Holy Scripture spiritual truths are fittingly taught under the likeness of material things. This is what Dionysius¹¹ says: *We cannot be enlightened by the divine rays except they be hidden within the covering of many sacred veils.* It is also befitting Holy Scripture, which is proposed to all without distinction of persons — *To the wise and to the unwise I am a debtor* (*Rom.* i. 14) — that spiritual truths be expounded by means of figures taken from corporeal things, in order that thereby even the simple who are unable by themselves to grasp intellectual things may be able to understand it.

Reply Obj. 1. Poetry makes use of metaphors to produce a representation, for it is natural to man to be pleased with representations. But sacred doctrine makes use of metaphors as both necessary and useful.

Reply Obj. 2. The ray of divine revelation is not extinguished by the sensible imagery wherewith it is veiled, as Dionysius says; and its truth so far remains that it does not allow the minds of those to whom the revelation has been made, to rest in the likenesses, but raises them to the knowledge of intelligible truths; and through those to whom the revelation has been made others also may receive instruction in these matters. Hence those things that are taught metaphorically in one part of Scripture, in other parts are taught more openly. The very hiding of truth in figures is useful for the exercise of thoughtful minds, and as a defense against the ridicule of the unbelievers, according to the words, *Give not that which is holy to dogs* (*Matt.* vii. 6).

Reply Obj. 3. As Dionysius says, it is more fitting that divine truths should be expounded under the figure of less noble than of nobler bodies; and this for three reasons. First, because thereby men's minds are the better freed from error. For then it is clear that these things are not literal descriptions of divine truths, which might have been open to doubt had they been expressed under the figure of nobler bodies, especially in the case of those who could think of nothing nobler than bodies. Second, because this is more befitting the knowledge of God that we have in this life. For what He is not is clearer to us than what He is. Therefore similitudes drawn from things farthest away from God form within us a truer estimate that God is above whatsoever we may say or think of Him. Third, because thereby divine truths are the better hidden from the unworthy.

Tenth Article

Whether in Holy Scripture a Word May Have Several Senses?

We proceed thus to the Tenth Article: —

Objection 1. It seems that in Holy Scripture a word cannot have several senses, historical or literal, allegorical, tropological or moral, and anagogical. For many different senses in one text produce confusion and deception and destroy all force of argument. Hence no argument, but only fallacies, can be deduced from a multiplicity of propositions. But Holy Scripture ought to be able to state the truth without any fallacy. Therefore in it there cannot be several senses to a word.

Obj. 2. Further, Augustine says that *the Old Testament has a fourfold division: according to history, etiology, analogy, and allegory.* Now these four seem altogether different from the four divisions mentioned in the first objection. Therefore it does not seem fitting to explain the same word of Holy Scripture according to the four different senses mentioned above.

Obj. 3. Further, besides these senses, there is the parabolical, which is not one of these four.

On the contrary, Gregory says: *Holy Scripture by the manner of its speech transcends every science, because in one and the same sentence, while it describes a fact, it reveals a mystery.*

I answer that, The author of Holy Scripture is God, in Whose power it is to signify His meaning, not by words only (as man also can do), but also by things themselves. So, whereas in every other science things are signified by words, this science has the property that the things signified by the words have themselves also a signification. Therefore that first signification whereby words signify things belongs to the first sense, the

historical or literal. That signification whereby things signified by words have themselves also a signification is called the spiritual sense, which is based on the literal, and presupposes it. Now this spiritual sense has a threefold division. For as the Apostle says (*Heb. x. 1*) the Old Law is a figure of the New Law, and Dionysius says *the New Law itself is a figure of future glory*. Again, the New Law, whatever our Head has done is a type of what we ought to do. Therefore, so far as the things of the Old Law signify the things of the New Law, there is the allegorical sense; so far as the things done in Christ, or so far as the things which signify Christ, are signs of what we ought to do, there is the moral sense. But so far as they signify what relates to eternal glory, there is the anagogical sense. Since the literal sense is that which the author intends, and since the author of Holy Scripture is God, Who by one act comprehends all things by His intellect, it is not unfitting, as Augustine says, if, even according to the literal sense, one word in Holy Scripture should have several senses.

Reply Obj. 1. The multiplicity of these senses does not produce equivocation or any other kind of multiplicity, seeing that these senses are not multiplied because one word signifies several things, but because the things signified by the words can be themselves signs of other things. Thus in Holy Scripture no confusion results, for all the senses are founded on one—the literal—from which alone can any argument be drawn, and not from those intended allegorically, as Augustine says. Nevertheless, nothing of Holy Scripture perishes because of this, since nothing necessary to faith is contained under the spiritual sense which is not elsewhere put forward clearly by the Scripture in its literal sense.

Reply Obj. 2. These three—history, etiology, analogy—are grouped under the literal sense. For it is called history, as Augustine expounds, whenever anything is simply related; it is called etiology when its cause is assigned, as when Our Lord gave the reason why Moses allowed the putting away of wives — namely, because of the hardness of men’s hearts (*Matt. xix. 8*); it is called analogy whenever the truth of one text of Scripture is shown not to contradict the truth of another. Of these four, allegory alone stands for the three spiritual senses. Thus Hugh of St. Victor¹² includes the anagogical under the allegorical sense, laying down three senses only—the historical, the allegorical and the tropological.

Reply Obj. 3. The parabolical sense is contained in the literal, for by words things are signified properly and figuratively. Nor is the figure itself, but that which is figured, the literal sense. When Scripture speaks of God’s arm, the literal sense is not that God has such a member, but only what is signified by this member, namely, operative power. Hence it is plain that nothing false can ever underlie the literal sense of Holy Scripture.

Question II

The Existence of God

(*In Three Articles*)

Because the chief aim of sacred doctrine is to teach the knowledge of God not only as He is in Himself, but also as He is the beginning of things and their last end, and especially of rational creatures, as is clear from what has been already said, therefore, in our endeavor to expound this science, we shall treat: (1) of God; (2) of the rational creature's movement towards God; (3) of Christ Who as man is our way to God.

In treating of God there will be a threefold division:—

For we shall consider (1) whatever concerns the divine essence. (2) Whatever concerns the distinctions of Persons. (3) Whatever concerns the procession of creatures from Him.

Concerning the divine essence, we must consider:—

(1) Whether God exists? (2) The manner of His existence, or, rather, what is *not* the manner of His existence. (3) Whatever concerns His operations — namely, His knowledge, will, power.

Concerning the first, there are three points of inquiry: —

(1) Whether the proposition *God exists* is self-evident? (2) Whether it is demonstrable? (3) Whether God exists?

First Article

Whether the Existence of God Is Self-Evident?

We proceed thus to the First Article: —

Objection 1. It seems that the existence of God is self-evident. For those things are said to be self-evident to us the knowledge of which exists naturally in us, as we can see in regard to first principles. But as Damascene¹³ says, *the knowledge of God is naturally implanted in all*. Therefore the existence of God is self-evident.

Obj. 2. Further, those things are said to be self-evident which are known as soon as the terms are known, which the Philosopher says is true of the first principles of demonstration. Thus, when the nature of a whole and of a part is known, it is at once recognized that every whole is greater than its part. But as soon as the signification of the name *God* is understood, it is at once seen that God exists. For by this name is signified that thing than which nothing greater can be conceived. But that which exists actually and mentally is greater than that which exists only mentally. Therefore, since as soon as the name *God* is understood it exists mentally, it also follows that it exists actually. Therefore the proposition *God exists* is self-evident.

Obj. 3. Further, the existence of truth is self-evident. For whoever denies the existence of truth grants that truth does not exist: and, if truth does not exist, then the proposition *Truth does not exist* is true: and if there is anything true there must be truth. But God is truth itself: *I am the way, the truth, and the life* (Jo. xiv. 6). Therefore *God exists* is self-evident.

On the contrary, No one can mentally admit the opposite of what is self-evident, as the Philosopher states concerning the first principles of demonstration. But the opposite of the proposition *God is* can be mentally admitted: *The fool said in his heart, There is no God* (Ps. lli. 1). Therefore, that God exists is not self-evident.

I answer that, A thing can be self-evident in either of two ways: on the one hand, self-evident in itself, though not to us; on the other, self-evident in itself, and to us. A proposition is self-evident because the predicate is included in the essence of the subject: e.g., *Man is an animal*, for animal is contained in the essence of man. If, therefore, the essence of the predicate and subject be known to all, the proposition will be self-evident to all; as is clear with regard to the first principles of demonstration, the terms of which are certain common notions that no one is ignorant of, such as being and non-being, whole and part, and the like. If, however, there are some to whom the essence of the predicate and subject is unknown, the proposition will be self-evident in itself, but not to those who do not know the meaning of the predicate and subject of the proposition. Therefore, it happens, as Boethius says, that there are some notions of the mind which are common and self-evident only to the learned, as that incorporeal substances are not in space. Therefore, I say

that this proposition, *God exists*, of itself is self-evident, for the predicate is the same as the subject, because God is His own existence as will be hereafter shown. Now because we do not know the essence of God, the proposition is not self-evident to us, but needs to be demonstrated by things that are more known to us, though less known in their nature — namely, by His effects.

Reply Obj. 1. To know that God exists in a general and confused way is implanted in us by nature, inasmuch as God is man's beatitude. For man naturally desires happiness, and what is naturally desired by man is naturally known by him. This, however, is not to know absolutely that God exists; just as to know that someone is approaching is not the same as to know that Peter is approaching, even though it is Peter who is approaching; for there are many who imagine that man's perfect good, which is happiness, consists in riches, and others in pleasures, and others in something else.

Reply Obj. 2. Perhaps not everyone who hears this name *God* understands it to signify something than which nothing greater can be thought, seeing that some have believed God to be a body. Yet, granted that everyone understands that by this name *God* is signified something than which nothing greater can be thought, nevertheless, it does not therefore follow that he understands that what the name signifies exists actually, but only that it exists mentally. Nor can it be argued that it actually exists, unless it be admitted that there actually exists something than which nothing greater can be thought; and this precisely is not admitted by those who hold that God does not exist.

Reply Obj. 3. The existence of truth in general is self-evident, but the existence of a Primal Truth is not self-evident to us.

Second Article

Whether It Can Be Demonstrated That God Exists?

We proceed thus to the Second Article: —

Objection 1. It seems that the existence of God cannot be demonstrated. For it is an article of faith that God exists. But what is of faith cannot be demonstrated, because a demonstration produces scientific knowledge, whereas faith is of the unseen, as is clear from the Apostle (*Heb. xi. 1*). Therefore it cannot be demonstrated that God exists.

Obj. 2. Further, essence is the middle term of demonstration. But we cannot know in what God's essence consists, but solely in what it does not consist, as Damascene says. Therefore we cannot demonstrate that God exists.

Obj. 3. Further, if the existence of God were demonstrated, this could only be from His effects. But His effects are not proportioned to Him, since He is infinite and His effects are finite, and between the finite and infinite there is no proportion. Therefore, since a cause cannot be demonstrated by an effect not proportioned to it, it seems that the existence of God cannot be demonstrated.

On the contrary, the Apostle says: *The invisible things of Him are clearly seen, being understood by the things that are made* (*Rom. i. 20*). But this would not be unless the existence of God could be demonstrated through the things that are made; for the first thing we must know of anything is, whether it exists.

I answer that, Demonstration can be made in two ways: One is through the cause, and is called *propter quid*, and this is to argue from what is prior absolutely. The other is through the effect, and is called a demonstration *quia*; this is to argue from what is prior relatively only to us. When an effect is better known to us than its cause, from the effect we proceed to the knowledge of the cause. And from every effect the existence of its proper cause can be demonstrated, so long as its effects are better known to us; because, since every effect depends upon its cause, if the effect exists, the cause must pre-exist. Hence the existence of God, in so far as it is not self-evident to us, can be demonstrated from those of His effects which are known to us.

Reply Obj. 1. The existence of God and other like truths about God, which can be known by natural reason, are not articles of faith, but are preambles to the articles; for faith presupposes natural knowledge, even as grace presupposes nature and perfection the perfectible. Nevertheless, there is nothing to prevent a man, who cannot grasp a proof, from accepting, as a matter of faith, something which in itself is capable of being scientifically known and demonstrated.

Reply Obj. 2. When the existence of a cause is demonstrated from an effect, this effect takes the place of the definition of the cause in proving the cause's existence. This is especially the case in regard to God, because, in order to prove the existence of anything, it is necessary to accept as a middle term the meaning of the name, and not its essence, for the question of its essence follows on the question of its existence. Now the

names given to God are derived from His effects, as will be later shown. Consequently, in demonstrating the existence of God from His effects, we may take for the middle term the meaning of the name *God*.

Reply Obj. 3. From effects not proportioned to the cause no perfect knowledge of that cause can be obtained. Yet from every effect the existence of the cause can be clearly demonstrated, and so we can demonstrate the existence of God from His effects; though from them we cannot know God perfectly as He is in His essence.

Third Article

Whether God Exists?

We proceed thus to the Third Article: —

Objection 1. It seems that God does not exist; because if one of two contraries be infinite, the other would be altogether destroyed. But the name *God* means that He is infinite goodness. If, therefore, God existed, there would be no evil discoverable; but there is evil in the world. Therefore God does not exist.

Obj. 2. Further, it is superfluous to suppose that what can be accounted for by a few principles has been produced by many. But it seems that everything we see in the world can be accounted for by other principles, supposing God did not exist. For all natural things can be reduced to one principle, which is nature; and all voluntary things can be reduced to one principle, which is human reason, or will. Therefore there is no need to suppose God's existence.

On the contrary, It is said in the person of God: *I am Who am* (*Exod.* iii. 14).

I answer that, The existence of God can be proved in five ways.

The first and more manifest way is the argument from motion. It is certain, and evident to our senses, that in the world some things are in motion. Now whatever is moved is moved by another, for nothing can be moved except it is in potentiality to that towards which it is moved; whereas a thing moves inasmuch as it is in act. For motion is nothing else than the reduction of something from potentiality to actuality. But nothing can be reduced from potentiality to actuality, except by something in a state of actuality. Thus that which is actually hot, as fire, makes wood, which is potentially hot, to be actually hot, and thereby moves and changes it. Now it is not possible that the same thing should be at once in actuality and potentiality in the same respect, but only in different respects. For what is actually hot cannot simultaneously be potentially hot; but it is simultaneously potentially cold. It is therefore impossible that in the same respect and in the same way a thing should be both mover and moved, *i.e.*, that it should move itself. Therefore, whatever is moved must be moved by another. If that by which it is moved be itself moved, then this also must needs be moved by another, and that by another again. But this cannot go on to infinity, because then there would be no first mover, and, consequently, no other mover, seeing that subsequent movers move only inasmuch as they are moved by the first mover; as the staff moves only because it is moved by the hand. Therefore it is necessary to arrive at a first mover, moved by no other; and this everyone understands to be God.

The second way is from the nature of efficient cause. In the world of sensible things we find there is an order of efficient causes. There is no case known (neither is it, indeed, possible) in which a thing is found to be the efficient cause of itself; for so it would be prior to itself, which is impossible. Now in efficient causes it is not possible to go on to infinity, because in all efficient causes following in order, the first is the cause of the intermediate cause, and the intermediate is the cause of the ultimate cause, whether the intermediate cause be several, or one only. Now to take away the cause is to take away the effect. Therefore, if there be no first cause among efficient causes, there will be no ultimate, nor any intermediate, cause. But if in efficient causes it is possible to go on to infinity, there will be no first efficient cause, neither will there be an ultimate effect, nor any intermediate efficient causes; all of which is plainly false. Therefore it is necessary to admit a first efficient cause, to which everyone gives the name of God.

The third way is taken from possibility and necessity, and runs thus. We find in nature things that are possible to be and not to be, since they are found to be generated, and to be corrupted, and consequently, it is possible for them to be and not to be. But it is impossible for these always to exist, for that which can not-be at some time is not. Therefore, if everything can not-be, then at one time there was nothing in existence. Now if this were true, even now there would be nothing in existence, because that which does not exist begins to exist only through something already existing. Therefore, if at one time nothing was in existence, it would have been impossible for anything to have begun to exist; and thus even now nothing would be in existence — which is absurd. Therefore, not all beings are merely possible, but there must exist something the existence of which is necessary. But every necessary thing either has its necessity caused by another, or not. Now it is

impossible to go on to infinity in necessary things which have their necessity caused by another, as has been already proved in regard to efficient causes. Therefore we cannot but admit the existence of some being having of itself its own necessity, and not receiving it from another, but rather causing in others their necessity. This all men speak of as God.

The fourth way is taken from the gradation to be found in things. Among beings there are some more and some less good, true, noble, and the like. But *more* and *less* are predicated of different things according as they resemble in their different ways something which is the maximum, as a thing is said to be hotter according as it more nearly resembles that which is hottest; so that there is something which is truest, something best, something noblest, and consequently, something which is most being, for those things that are greatest in truth are greatest in being, as it is written in *Metaph* ii.¹⁴ Now the maximum in any genus is the cause of all in that genus, as fire, which is the maximum of heat, is the cause of all hot things, as is said in the same book. Therefore there must also be something which is to all beings the cause of their being, goodness, and every other perfection; and this we call God.

The fifth way is taken from the governance of the world. We see that things which lack knowledge, such as natural bodies, act for an end, and this is evident from their acting always, or nearly always, in the same way, so as to obtain the best result. Hence it is plain that they achieve their end, not fortuitously, but designedly. Now whatever lacks knowledge cannot move towards an end, unless it be directed by some being endowed with knowledge and intelligence; as the arrow is directed by the archer. Therefore some intelligent being exists by whom all natural things are directed to their end; and this being we call God.

Reply Obj. 1. As Augustine says: *Since God is the highest good, He would not allow any evil to exist in His works, unless His omnipotence and goodness were such as to bring good even out of evil.* This is part of the infinite goodness of God, that He should allow evil to exist, and out of it produce good.

Reply Obj. 2. Since nature works for a determinate end under the direction of a higher agent, whatever is done by nature must be traced back to God as to its first cause. So likewise whatever is done voluntarily must be traced back to some higher cause other than human reason and will, since these can change and fail; for all things that are changeable and capable of defect must be traced back to an immovable and self-necessary first principle, as has been shown.

Question XIII

The Names of God

Second Article

Whether Any Name Can Be Applied to God Substantially?

We proceed thus to the Second Article: —

Objection 1. It seems that no name can be applied to God substantially. For Damascene says: *Everything said of God must not signify His substance, but rather show forth what He is not; or express some relation, or something following from His nature or operation.*

Obj. 2. Further, Dionysius says: *You will find a chorus of holy doctors addressed to the end of distinguishing clearly and praiseworthy the divine processions in the denominations of God.* This means that the names applied by the holy doctors in praising God are distinguished according to the divine processions themselves. But what expresses the procession of anything does not signify anything pertaining to its essence. Therefore the names said of God are not said of Him substantially.

Obj. 3. Further, a thing is named by us according as we understand it. But in this life God is not understood by us in His substance. Therefore, neither is any name we can use applied substantially to God.

On the contrary, Augustine says: *For God to be is to be strong or wise, or whatever else we may say of that simplicity whereby His substance is signified.* Therefore all names of this kind signify the divine substance.

I answer that, Names which are said of God negatively or which signify His relation to creatures manifestly do not at all signify His substance, but rather express the distance of the creature from Him, or His relation to something else, or rather, the relation of creatures to Himself.

But as regards names of God said absolutely and affirmatively, as *good, wise*, and the like, various and many opinions have been held. For some have said that all such names, although they are applied to God affirmatively, nevertheless have been brought into use more to remove something from God than to posit something in Him. Hence they assert that when we say that God lives, we mean that God is not like an inanimate thing; and the same in like manner applies to other names. This was taught by Rabbi Moses.¹⁵ Others say that these names applied to God signify His relationship towards creatures: thus in the words, *God is good*, we mean, God is the cause of goodness in things; and the same interpretation applies to other names.

Both of these opinions, however, seem to be untrue for three reasons. First, because in neither of them could a reason be assigned why some names more than others should be applied to God. For He is assuredly the cause of bodies in the same way as He is the cause of good things; therefore if the words *God is good* signified no more than, *God is the cause of good things*, it might in like manner be said that God is a body, inasmuch as He is the cause of bodies. So also to say that He is a body implies that He is not a mere potentiality, as is primary matter. Secondly, because it would follow that all names applied to God would be said of Him by way of being taken in a secondary sense, as *healthy* is secondarily said of medicine, because it signifies only the cause of health in the animal which primarily is called healthy. Thirdly, because this is against the intention of those who speak of God. For in saying that God lives, they assuredly mean more than to say that He is the cause of our life, or that He differs from inanimate bodies.

Therefore we must hold a different doctrine — viz., that these names signify the divine substance, and are predicated substantially of God, although they fall short of representing Him. Which is proved thus. For these names express God, so far as our intellects know Him. Now since our intellect knows God from creatures, it knows Him as far as creatures represent Him. But it was shown above that God prepossesses in Himself all the perfections of creatures, being Himself absolutely and universally perfect. Hence every creature represents Him, and is like Him, so far as it possesses some perfection: yet not so far as to represent Him as something of the same species or genus, but as the excelling source of whose form the effects fall short, although they derive some kind of likeness thereto, even as the forms of inferior bodies represent the power of the sun. This was explained above in treating of the divine perfection. Therefore, the aforesaid names signify the divine substance, but in an imperfect manner, even as creatures represent it imperfectly. So when we say, *God is good*, the meaning is not, *God is the cause of goodness*, or, *God is not Evil*; but the meaning is, *Whatever good we attribute to creatures pre-exists in God*, and in a higher way. Hence it does not follow that God is good because He causes goodness; but rather, on the contrary, He causes goodness in things because He is good. As

Augustine says, *Because He is good, we are.*

Reply Obj. 1. Damascene says that these names do not signify what God is because by none of these names is what He is perfectly expressed; but each one signifies Him in an imperfect manner, even as creatures represent Him imperfectly.

Reply Obj. 2. In the signification of names, that from which the name is derived is different sometimes from what it is intended to signify, as for instance this name *stone* [*lapis*] is imposed from the fact that it hurts the foot [*lædit pedem*], yet it is not imposed to signify that which hurts the foot, but rather to signify a certain kind of body; otherwise everything that hurts the foot would be a stone. So we must say that such divine names are imposed from the divine processions; for as according to the diverse processions of their perfections, creatures are the representations of God, although in an imperfect manner, so likewise our intellect knows and names God according to each kind of procession. But nevertheless these names are not imposed to signify the processions themselves, as if when we say *God lives*, the sense were, *life proceeds from Him*, but to signify the principle itself of things, in so far as life pre-exists in Him, although it pre-exists in Him in a more eminent way than is understood or signified.

Reply Obj. 3. In this life, we cannot know the essence of God as it is in itself, but we know it according as it is represented in the perfections of creatures; and it is thus that the names imposed by us signify it.

Fifth Article

Whether What Is Said of God and of Creatures Is Univocally Predicated of Them?

We proceed thus to the Fifth Article: —

Objection 1. It seems that the things attributed to God and creatures are univocal. For every equivocal term is reduced to the univocal, as many are reduced to one: for if the name *dog* be said equivocally of the barking dog and of the dogfish, it must be said of some univocally — viz., of all barking dogs; otherwise we proceed to infinitude. Now there are some univocal agents which agree with their effects in name and definition, as man generates man; and there are some agents which are equivocal, as the sun which causes heat, although the sun is hot only in an equivocal sense. Therefore it seems that the first agent, to which all other agents are reduced, is a univocal agent: and thus what is said of God and creatures is predicated univocally.

Obj. 2. Further, no likeness is understood through equivocal names. Therefore, as creatures have a certain likeness to God, according to the text of *Genesis* (i. 26), *Let us make man to our image and likeness*, it seems that something can be said of God and creatures univocally.

Obj. 3. Further, measure is homogeneous with the thing measured, as is said in *Metaph.* x. But God is the first measure of all beings. Therefore God is homogeneous with creatures; and thus a name may be applied univocally to God and to creatures.

On the contrary, Whatever is predicated of various things under the same name but not in the same sense is predicated equivocally. But no name belongs to God in the same sense that it belongs to creatures; for instance, wisdom in creatures is a quality, but not in God. Now a change in genus changes an essence, since the genus is part of the definition; and the same applies to other things. Therefore whatever is said of God and of creatures is predicated equivocally.

Further, God is more distant from creatures than any creatures are from each other. But the distance of some creatures makes any univocal predication of them impossible, as in the case of those things which are not in the same genus. Therefore much less can anything be predicated univocally of God and creatures; and so only equivocal predication can be applied to them.

I answer that, Univocal predication is impossible between God and creatures. The reason of this is that every effect which is not a proportioned result of the power of the efficient cause receives the similitude of the agent not in its full degree, but in a measure that falls short; so that what is divided and multiplied in the effects resides in the agent simply, and in an unvaried manner. For example, the sun by the exercise of its one power produces manifold and various forms in these sublunary things. In the same way, as was said above, all perfections existing in creatures divided and multiplied pre-exist in God unitedly. Hence, when any name expressing perfection is applied to a creature, it signifies that perfection as distinct from the others according to the nature of its definition; as, for instance, by this term *wise* applied to a man, we signify some perfection distinct from a man's essence, and distinct from his power and his being, and from all similar things. But when we apply *wise* to God, we do not mean to signify anything distinct from His essence or power or being. And thus when this term *wise* is applied to man, in some degree it circumscribes and comprehends the thing

signified; whereas this is not the case when it is applied to God, but it leaves the thing signified as uncomprehended and as exceeding the signification of the name. Hence it is evident that this term *wise* is not applied in the same way to God and to man. The same applies to other terms. Hence, no name is predicated univocally of God and of creatures.

Neither, on the other hand, are names applied to God and creatures in a purely equivocal sense, as some have said. Because if that were so, it follows that from creatures nothing at all could be known or demonstrated about God; for the reasoning would always be exposed to the fallacy of equivocation. Such a view is against the Philosopher, who proves many things about God, and also against what the Apostle¹⁶ says: *The invisible things of God are clearly seen being understood by the things that are made* (Rom. i. 20). Therefore it must be said that these names are said of God and creatures in an *analogous* sense, that is, according to proportion.

This can happen in two ways: either according as many things are proportioned to one (thus, for example *healthy* is predicated of medicine and urine in relation and in proportion to health of body, of which the latter is the sign and the former the cause), or according as one thing is proportioned to another (thus, *healthy* is said of medicine and an animal, since medicine is the cause of health in the animal body). And in this way some things are said of God and creatures analogically, and not in a purely equivocal nor in a purely univocal sense. For we can name God only from creatures. Hence, whatever is said of God and creatures is said according as there is some relation of the creature to God as to its principle and cause, wherein all the perfections of things pre-exist excellently. Now this mode of community is a mean between pure equivocation and simple univocation. For in analogies the idea is not, as it is in univocals, one and the same; yet it is not totally diverse as in equivocals; but the name which is thus used in a multiple sense signifies various proportions to some one thing; e.g., *healthy*, applied to urine, signifies the sign of animal health; but applied to medicine, it signifies the cause of the same health.

Reply Obj. 1. Although in predications all equivocals must be reduced to univocals, still in actions the non-univocal agent must precede the univocal agent. For the non-univocal agent is the universal cause of the whole species, as the sun is the cause of the generation of all men. But the univocal agent is not the universal efficient cause of the whole species (otherwise it would be the cause of itself, since it is contained in the species), but is a particular cause of this individual which it places under the species by way of participation. Therefore the universal cause of the whole species is not a univocal agent: and the universal cause comes before the particular cause. But this universal agent, while not univocal, nevertheless is not altogether equivocal (otherwise it could not produce its own likeness); but it can be called an analogical agent, just as in predications all univocal names are reduced to one first non-univocal analogical name, which is *being*.

Reply Obj. 2. The likeness of the creature to God is imperfect, for it does not represent the same thing even generically.

Reply Obj. 3. God is not a measure proportioned to the things measured; hence it is not necessary that God and creatures should be in the same genus.

The arguments adduced in the contrary sense prove indeed that these names are not predicated univocally of God and creatures; yet they do not prove that they are predicated equivocally.

Question XIX The Will of God

Eighth Article

Whether the Will of God Imposes Necessity on the Things Willed?

We proceed thus to the Eighth Article: —

Objection 1. It seems that the will of God imposes necessity on the things willed. For Augustine says: *No one is saved, except whom God has willed to be saved. He must therefore be asked to will it; for if He wills it, it must necessarily be.*

Obj. 2. Further, every cause that cannot be hindered produces its effect necessarily, because, as the Philosopher says, *nature always works in the same way, if there is nothing to hinder it.* But the will of God cannot be hindered. For the Apostle says (*Rom. ix. 19*): *Who resisteth His will?* Therefore the will of God imposes necessity on the things willed.

Obj. 3. Further, whatever is necessary by its antecedent cause is necessary absolutely; it is thus necessary that animals should die, being compounded of contrary elements. Now things created by God are related to the divine will as to an antecedent cause, whereby they have necessity. For this conditional proposition is true: *if God wills a thing, it comes to pass*: and every true conditional proposition is necessary. It follows therefore that all that God wills is necessary absolutely.

On the contrary, All good things that exist God wills to be. If therefore His will imposes necessity on the things willed, it follows that all good happens of necessity; and thus there is an end of free choice, counsel, and all other such things.

I answer that, The divine will imposes necessity on some things willed, but not on all. The reason of this some have chosen to assign to intermediate causes, holding that what God produces by necessary causes is necessary, and what He produces by contingent causes contingent.

This does not seem to be a sufficient explanation, for two reasons. First, because the effect of a first cause is contingent because of the secondary cause, from the fact that the effect of the first cause is hindered by deficiency in the second cause, as the sun's power is hindered by a defect in the plant. But no defect of a secondary cause can hinder God's will from producing its effect. Secondly, because if the distinction between the contingent and the necessary is to be referred only to secondary causes, this must mean that the distinction itself escapes the divine intention and will; which is inadmissible.

It is better therefore to say that this happens because of the efficacy of the divine will. For when a cause is efficacious to act, the effect follows upon the cause, not only as to the thing done, but also as to its manner of being done or of being. Thus from defect of active power in the seed it may happen that a child is born unlike its father in accidental points, which belong to its manner of being. Since then the divine will is perfectly efficacious, it follows not only that things are done, which God wills to be done, but also that they are done in the way that He wills. Now God wills some things to be done necessarily, some contingently, so that there be a right order in things for the perfection of the universe. Therefore to some effects He has attached unfailing necessary causes, from which the effects follow necessarily; but to others defectible and contingent causes, from which effects arise contingently. Hence it is not because the proximate causes are contingent that the effects willed by God happen contingently; but God has prepared contingent causes for them because He has willed that they should happen contingently.

Reply Obj. 1. By the words of Augustine we must understand a necessity in things willed by God that is not absolute, but conditional. For the conditional proposition that *if God wills a thing, it must necessarily be*, is necessarily true.

Reply Obj. 2. From the very fact that nothing resists the divine will, it follows not only that those things happen that God wills to happen, but that they happen necessarily or contingently according to His will.

Reply Obj. 3. Consequents have necessity from their antecedents according to the mode of the antecedents. Hence things effected by the divine will have that kind of necessity that God wills them to have, either absolute or conditional. Not all things, therefore, are necessary absolutely.

Question XXII

The Providence of God

Second Article

Whether Everything Is Subject to the Providence of God?

We proceed thus to the Second Article: —

Objection 1. It seems that not everything is subject to divine providence. For nothing foreseen can happen by chance. If then everything has been foreseen by God, nothing will happen by chance. And thus chance and fortune disappear; which is against common opinion.

Obj. 2. Further, a wise provider excludes any defect or evil, as far as he can, from those over whom he has a care. But we see many evils existing in things. Either, then, God cannot hinder these, and thus is not omnipotent; or else He does not have care for everything.

Obj. 3. Further, whatever happens of necessity does not require providence or prudence. Hence, according to the Philosopher: *Prudence is the right reason of contingent things concerning which there is counsel and choice.* Since, then, many things happen from necessity, everything cannot be subject to providence.

Obj. 4. Further, whatsoever is left to itself cannot be subject to the providence of a governor. But men are left to themselves by God, in accordance with the words: *God made man from the beginning, and left him in the hand of his own counsel* (*Ecclus.* xv. 14). And particularly in reference to the wicked: *I let them go according to the desires of their heart* (*Ps.* lxxx. 13). Everything, therefore, cannot be subject to divine providence.

Obj. 5. Further, the Apostle says (*1 Cor.* ix. 9): *God doth not care for oxen*; and we may say the same of other irrational creatures. Thus everything cannot be under the care of divine providence.

On the contrary, It is said of divine wisdom: *She reacheth from end to end mightily, and ordereth all things sweetly* (*Wis.* viii. 1).

I answer that, Certain persons totally denied the existence of providence, as Democritus¹⁷ and the Epicureans, maintaining that the world was made by chance. Others taught that incorruptible substances only were subject to providence, while corruptible substances were not in their individual being, but only according to their species; for in this respect they are incorruptible. They are represented as saying (*Job* xxii. 14): *The clouds are His covert; and He doth not consider our things; and He walketh about the poles of heaven.* Rabbi Moses, however, excluded men from the generality of corruptible things, because of the excellence of the intellect which they possess, but in reference to all else that suffers corruption he adhered to the opinion of the others.

We must say, however, that all things are subject to divine providence, not only in general, but even in their own individual being. This is made evident thus. For since every agent acts for an end, the ordering of effects towards that end extends as far as the causality of the first agent extends. Whence it happens that in the effects of an agent something takes place which has no reference towards the end, because the effect comes from some other cause outside the intention of the agent. But the causality of God, Who is the first agent, extends to all beings not only as to the constituent principles of species, but also to the individualizing principles; not only of things incorruptible, but also of things corruptible. Hence all things that exist in whatsoever manner are necessarily directed by God towards the end; as the Apostle says: *Those things that are of God are well ordered* (*Rom.* xiii. 1). Since, therefore, the providence of God is nothing other than the notion of the order of things towards an end, as we have said, it necessarily follows that all things, inasmuch as they participate in being, must to that extent be subject to divine providence. It has also been shown that God knows all things, both universal and particular. And since His knowledge may be compared to the things themselves as the knowledge of art to the objects of art, as was said above, all things must of necessity come under His ordering; as all things wrought by an art are subject to the ordering of that art.

Reply Obj. 1. There is a difference between universal and particular causes. A thing can escape the order of a particular cause, but not the order of a universal cause. For nothing escapes the order of a particular cause, except through the intervention and hindrance of some other particular cause; as, for instance, wood may be prevented from burning by the action of water. Since, then, all particular causes are included under the universal cause, it is impossible that any effect should escape the range of the universal cause. So far then as an effect escapes the order of a particular cause, it is said to be by chance or fortuitous in respect to that cause; but

if we regard the universal cause, outside whose range no effect can happen, it is said to be foreseen. Thus, for instance, the meeting of two servants, although to them it appears a chance circumstance, has been fully foreseen by their master, who has purposely sent them to meet at the one place, in such a way that the one has no knowledge of the other.

Reply Obj. 2. It is otherwise with one who is in charge of a particular thing, and one whose providence is universal, because a particular provider excludes all defects from what is subject to his care as far as he can; whereas one who provides universally allows some little defect to remain, lest the good of the whole should be hindered. Hence, corruption and defects in natural things are said to be contrary to some particular nature, yet they are in keeping with the plan of universal nature, inasmuch as the defect in one thing yields to the good of another, or even to the universal good: for the corruption of one is the generation of another, and through this it is that a species is kept in existence. Since God, then, provides universally for all being, it belongs to His providence to permit certain defects in particular effects, that the perfect good of the universe may not be hindered; for if all evil were prevented, much good would be absent from the universe. A lion would cease to live, if there were no slaying of animals; and there would be no patience of martyrs if there were no tyrannical persecution. Thus Augustine says: *Almighty God would in no wise permit evil to exist in His works, unless He were so almighty and so good as to produce good even from evil.* It would appear that it was because of these two arguments to which we have just replied, that some were persuaded to consider corruptible things — *i.e.*, things in which chance and evil are found — as removed from the care of divine providence.

Reply Obj. 3. Man is not the author of nature; but he uses natural things for his own purposes in his works of art and virtue. Hence human providence does not reach to that which takes place in nature from necessity; but divine providence extends thus far, since God is the author of nature. Apparently it was this argument that moved those who withdrew the course of nature from the care of divine providence, attributing it rather to the necessity of matter as did Democritus, and others of the ancients.

Reply Obj. 4. When it is said that God left man to himself, this does not mean that man is exempt from divine providence, but merely that he has not a prefixed operating power determined to only the one effect; as in the case of natural things, which are only acted upon as though directed by another towards an end: for they do not act of themselves, as if they directed themselves towards an end, like rational creatures, through the possession of free choice, by which these are able to take counsel and make choices. Hence it is significantly said: *In the hand of his own counsel.* But since the very act of free choice is traced to God as to a cause, it necessarily follows that everything happening from the exercise of free choice must be subject to divine providence. For human providence is included under the providence of God as a particular cause under a universal cause. God, however, extends His providence over the just in a certain more excellent way than over the wicked, inasmuch as He prevents anything happening which would impede their final salvation. For *to them that love God, all things work together unto good* (Rom. viii. 28). But from the fact that He does not restrain the wicked from the evil of sin, He is said to abandon them. This does not mean that He altogether withdraws His providence from them; otherwise they would return to nothing, if they were not preserved in existence by His providence. This was the reason that had weight with Tully,¹⁸ who withdrew human affairs, concerning which we take counsel, from the care of divine providence.

Reply Obj. 5. Since a rational creature has, through its free choice, control over its actions, as was said above, it is subject to divine providence in an especial manner: something is imputed to it as a fault, or as a merit, and accordingly there is given to it something by way of punishment or reward. In this way the Apostle withdraws oxen from the care of God: not, however, that individual irrational creatures escape the care of divine providence, as was the opinion of the Rabbi Moses.

Third Article

Whether God Has Immediate Providence over Everything?

We proceed thus to the Third Article: —

Objection 1. It seems that God has not immediate providence over all things. For whatever pertains to dignity must be attributed to God. But it belongs to the dignity of a king that he should have ministers, through whose mediation he provides for his subjects. Therefore much less has God Himself immediate providence over all things.

Obj. 2. Further, it belongs to providence to order all things to an end. Now the end of everything is its perfection and its good. But it pertains to every cause to bring its effect to good; and therefore every agent cause is a cause of the effect over which it has providence. If therefore God were to have immediate

providence over all things, all secondary causes would be withdrawn.

Obj. 3. Further, Augustine says that, *It is better to be ignorant of some things than to know them, for example, ignoble things*; and the Philosopher says the same. But whatever is better must be attributed to God. Therefore He has not immediate providence over ignoble and wicked things.

On the contrary, It is said (*Job xxxiv. 13*): *What other hath He appointed over the earth? or whom hath He set over the world which He made?* On which passage Gregory says: *Himself He ruleth the world which He Himself hath made.*

I answer that, Two things belong to providence— namely, the exemplar of the order of things foreordained towards an end, and the execution of this order, which is called government. As regards the first of these, God has immediate providence over everything, because he has in His intellect the exemplars of everything, even the smallest; and whatsoever causes He assigns to certain effects, He gives them the power to produce those effects. Whence it must be that He has pre-comprehended the order of those effects in His mind. As to the second, there are certain intermediaries of God's providence, for He governs things inferior by superior, not because of any defect in His power, but by reason of the abundance of His goodness; so that the dignity of causality is imparted even to creatures. Thus Plato's opinion, as narrated by Gregory of Nyssa, is removed. He taught a threefold providence. First, one which belongs to the supreme Deity, Who first and foremost has provision over spiritual things, and thus over the whole world as regards genus, species, and universal causes. The second providence, which is over the individuals of all that can be generated and corrupted, he attributed to the divinities who circulate in the heavens; that is, certain separate substances, which move corporeal things in a circular motion. The third providence, which is over human affairs, he assigned to demons, whom the Platonic philosophers placed between us and the gods, as Augustine tells us.

Reply Obj. 1. It pertains to a king's dignity to have ministers who execute his providence. But the fact that he does not know the plans of what is done by them arises from a deficiency in himself. For every operative science is the more perfect, the more it considers the particular things where action takes place.

Reply Obj. 2. God's immediate provision over everything does not exclude the action of secondary causes, which are the executors of His order, as was said above.

Reply Obj. 3. It is better for us not to know evil and ignoble things, insofar as by them we are impeded in our knowledge of what is better and higher (for we cannot understand many things simultaneously), and insofar as the thought of evil sometimes perverts the will towards evil. This does not hold true of God, Who sees everything simultaneously at one glance, and Whose will cannot turn in the direction of evil.

Fourth Article

Whether Providence Imposes Any Necessity on What Is Foreseen?

We proceed thus to the Fourth Article: —

Objection 1. It seems that divine providence imposes necessity upon what it foresees. For every effect that has an essential cause (present or past) which it necessarily follows, comes to be of necessity; as the Philosopher proves. But the providence of God, since it is eternal, precedes its effect, and the effect flows from it of necessity; for divine providence cannot be frustrated. Therefore divine providence imposes a necessity upon what it foresees.

Obj. 2. Further, every provider makes his work as stable as he can, lest it should fail. But God is most powerful. Therefore He assigns the stability of necessity to things whose providence He is.

Obj. 3. Further, Boethius says: *Fate from the immutable source of providence binds together human acts and fortunes by the indissoluble connexion of causes.* It seems therefore that providence imposes necessity upon what it foresees.

On the contrary, Dionysius says that *to corrupt nature is not the work of providence.* But it is in the nature of some things to be contingent. Divine providence does not therefore impose any necessity upon things so as to destroy their contingency.

I answer that, Divine providence imposes necessity upon some things; not upon all, as some believed. For to providence it belongs to order things towards an end. Now after the divine goodness, which is an extrinsic end to all things, the principal good in things themselves is the perfection of the universe; which would not be, were not all grades of being found in things. Whence it pertains to divine providence to produce every grade of being. And thus for some things it has prepared necessary causes, so that they happen of necessity; for others contingent causes, that they may happen by contingency, according to the disposition of their

proximate causes.

Reply Obj. 1. The effect of divine providence is not only that things should happen *somehow*; but that they should happen either by necessity or by contingency. Therefore whatsoever divine providence ordains to happen infallibly and of necessity, happens infallibly and of necessity; and what the divine providence plans to happen contingently, happens contingently.

Reply Obj. 2. The order of divine providence is unchangeable and certain, so far as all things foreseen happen as they have been foreseen, whether from necessity or from contingency.

Reply Obj. 3. The indissolubility and unchangeableness, of which Boethius speaks, pertain to the certainty of providence, which does not fail to produce its effect, and that in the way foreseen; but they do not pertain to the necessity of the effects. We must remember that, properly speaking, *necessary* and *contingent* are consequent upon being as such. Hence the mode both of necessity and of contingency falls under the foresight of God, Who provides universally for all being; not under the foresight of causes that provide only for some particular order of things.

Levi Gersonides

Rabbi Levi ben Gershom, known by his Latinized name Gersonides and his Hebrew acronym RaLBaG, was born in 1288 in the southern French city of Provence, where he lived until his death in 1344. His father was a rabbinic scholar, but little is known about Gersonides' personal life. After the Almohade conquest of Spain in the late 1140s, many Jews migrated to Christian communities in northern Spain and southern France, transporting with them the rich philosophical heritage of Muslim Spain. The resultant philosophical culture of Provençal Jewry met with staunch opposition from the more traditionalist northern French rabbinic authorities, igniting the bans and counterbans of the fierce dispute known as the Maimonidean controversy. Gersonides stands as the preeminent Provençal representative of Jewish rationalism, that is, the view that religious beliefs must be formulated, and the Torah interpreted, in the light of scientific and philosophical knowledge.

Versatility and rigor are Gersonides' hallmarks: He was renowned especially as an astronomer, mathematician, philosopher, and biblical commentator. *The Wars of the Lord* spans the topics of immortality, prophecy, divine knowledge, providence, creation, cosmology, and miracles. His biblical commentaries, which cover almost all the works of the Bible, constitute the most comprehensive and detailed medieval Jewish attempt to interpret Scripture by the light of philosophical reason. In these works and in his supercommentaries on the Muslim philosopherjurist Averroes' commentaries on Aristotle, Gersonides evinces a thorough command of the issues and approaches that earlier had occupied Islamic and Jewish philosophers in Muslim Spain.

Gersonides' ideas long have been the target of suspicion and criticism from Jewish thinkers due to their rigorously Aristotelian and radical strain. Like Maimonides, Gersonides believed that the Torah and reason can never conflict; when they appear to, Scripture must be interpreted to fit reason. However, his conceptions of what reason and Scripture jointly teach sometimes put him sharply at odds with traditional Jewish thinking. For example, although he rejects Aristotle's view that the world is eternal, neither does he accept the traditional Jewish belief in creation *ex nihilo*, creation from nothing, which, according to Maimonides, Scripture teaches. Instead Gersonides submits that both reason and the narrative of Genesis support Plato's position that the world was created by an artisan out of eternal, preexisting matter. By constructing proofs for creation out of eternal matter and against both creation *ex nihilo* and Aristotle's view of an eternal universe, Gersonides was rejecting Maimonides' claims that reason is unable to demonstrate a conclusion about the world's origins and that the choice must be made by appeal to Scripture.

A second controversial view of Gersonides, represented in the selection that follows, is that God does not know which free choices human beings will make in the future. This position emerges as a response to a well-known conundrum: If God knows the future, how can human beings act freely? After all, at the time a person acts, God already has knowledge about what the person will do, and a person clearly lacks the power to make God's knowledge false. Gersonides' bold reply is that God does not know the truth of statements describing "future contingents"—future events whose occurrence or nonoccurrence depends on free human choices. That is because such statements are neither true nor false—no choice has yet been made. But God's lack of *foreknowledge* of free human choices does not spell a lack of *omniscience*. To be omniscient is to know everything that is knowable, and failing to know propositions that are unknowable (because they are neither true nor false) does not detract from omniscience. Gersonides went further, arguing, with Aristotle and against Maimonides, that God does not know "particulars" (truths about particular beings) but only general laws ("general natures") that order and govern the world, including laws expressing tendencies of human nature that free choices can overcome.

In this context Gersonides expressly dismisses Maimonides' solution that "know" is equivocal; that is, that the word does not mean the same thing when applied to God as when applied to humans. This dismissal is but a special case of Gersonides' larger rejection of Maimonides' "negative theology" and its claims that statements about God are completely equivocal, that affirmative attributes cannot be applied to God, and that God is beyond all conceptualizations in categories that apply to humans. Gersonides argued that among other unpalatable features of Maimonides' view is that it precludes our drawing any inferences about God, for such inferences depend on our knowing the meanings of terms we are using in our premises and conclusions. Furthermore, if Maimonides were right that the true meaning of statements about God is that none of our concepts apply to God, one term would be just as good (or bad) as any other in describing God. Instead of

insisting that God is not a body, as Maimonides does, why cannot we just as well say that God is a body and that “body” is completely equivocal in this context? Gersonides’ own view is that terms are ascribed to God in the “prior” sense (“primarily”) and to created things in the “posterior” sense (“secondarily”). What this means is that, for example, divine knowledge is the cause of wisdom in humans, and that God possesses knowledge to a higher degree than humans do.

• • •

The Wars of the Lord has been translated by Seymour Feldman in a three-volume work (Philadelphia: Jewish Publication Society, 1984–1999) that includes excellent introductions, synopses, notes, and appendices. Two important works that serve both neophytes and scholars are Seymour Feldman, *Gersonides Judaism Within the Limits of Reason* (The Littman Library of Jewish Civilization, 2010) and Menachem Kellner, *Torah in the Observatory: Gersonides, Maimonides, Song of Songs* (Boston: Academic Studies Press, 2010). Robert Eisen’s penetrating study, *Gersonides on Providence, Covenant, and the Chosen People* (Albany: State University of New York Press, 1995), illustrates the philosophical richness of Gersonides’ biblical commentary. An important counterbalance to the standard portrait of Gersonides as a radical theologian is Charles Manekin’s “Conservative Tendencies in Gersonides’ Religious Philosophy,” in *The Cambridge Companion to Medieval Jewish Philosophy*, eds., Daniel H. Frank and Oliver Leaman (Cambridge: Cambridge University Press, 2003), 304–42. A useful anthology is Gad Freudenthal, ed., *Studies on Gersonides: A Fourteenth-Century Jewish Philosopher-Scientist* (Leiden: E. J. Brill, 1992), which includes a detailed bibliography by Menachem Kellner.

Gersonides’ views on free will and divine foreknowledge have attracted considerable attention. On this topic, see Tamar Rudavsky, “Divine Omniscience and Future Contingents in Gersonides,” *Journal of the History of Philosophy* 21 (1983): 513–36; Norbert M. Samuelson, “Gersonides’ Account of God’s Knowledge of Particulars,” *Journal of the History of Philosophy* 10 (1972): 399–416; and Charles H. Manekin, “Freedom Within Reason? Gersonides on Human Choice,” in C. H. Manekin and Manachem M. Kellner, eds., *Freedom and Moral Responsibility: General and Jewish Perspectives* (Bethesda: University Press of Maryland, 1997). A contemporary defense of Gersonides’ solution to the problem of foreknowledge and free will is Steven M. Cahn, “Does God Know the Future?” in Steven M. Cahn and David Shatz, eds., *Questions About God: Today’s Philosophers Ponder the Divine*, (New York: Oxford University Press, 2002).

David Shatz

*The Wars of the Lord**

INTRODUCTORY REMARKS

... I have decided to mention all the possible opinions on a given issue of the various problems I shall discuss and the arguments for and against them. For in this way many principles involved in these questions will be established for us, and it will be easier to determine the true from the false so that the truth in these matters will be achieved in an indubitable manner. Doubt arises on a given matter when we have contrary views concerning it; but when the inquiry will be completed and the true will be sifted out from the false, the doubts in this matter will vanish. Since there have been many false opinions among our predecessors on these matters, and we have [therefore, in our] investigation contended with them in order to refute these views in every possible way, and yet everything that we have been able to demonstrate is the view of our Torah,¹ we have accordingly entitled our book "The Wars of the Lord." For we have fought the battles of the Lord in so far as we have refuted the false views of our predecessors.

The reader should not think it is the Torah that has stimulated us to verify what shall be verified in this book, [whereas in reality] the truth itself is something different. It is evident, as Maimonides (may his name be blessed) has said, that we must believe what reason has determined to be true. If the literal sense of the Torah differs from reason, it is necessary to interpret those passages in accordance with the demands of reason. Accordingly, Maimonides (may his name be blessed) explains the words of the Torah that suggest that God (may He be blessed) is corporeal in such a way that reason is not violated. He, therefore, maintains that if the eternity of the universe is demonstrated, it would be necessary to believe in it and to interpret the passages of the Torah that seem to be incompatible with it in such a way that they agree with reason. It is, therefore, evident that if reason causes us to affirm doctrines that are incompatible with the literal sense of Scripture, we are not prohibited by the Torah to pronounce the truth of these matters, for reason is not incompatible with the true understanding of the Torah. The Torah is not a law that forces us to believe false ideas; rather it leads us to the truth to the extent that is possible, as we have explained in the beginning of our commentary on the Torah. Accordingly, it is our practice in these discussions to begin with an exhaustive philosophical inquiry into the question at hand, and then to show that what we have philosophically discovered concerning the question is compatible with the Torah. With respect to some of these problems the Torah itself has, in its marvelous way, directed us toward the truth. Indeed, this should be the case, since the Torah is intended to guide its adherents to human perfection as far as it is attainable... .

BOOK THREE

Chapter 1

THE VIEWS OF OUR PREDECESSORS CONCERNING THIS QUESTION

It is appropriate to examine whether or not God knows particular, contingent things in the sublunar world, and if He does know them [there is still the question], how He knows them. Since the philosophers and the sages of our Torah have differed with respect to this problem, it is proper that we first examine their views. Whatever truth we find in them we shall accept, and in whatever falsity we find we shall indicate the truth that is to be found in refuting it.

There are two main views on this topic among the ancients that are worthy of discussion: (1) the views of Aristotle and his followers, and (2) the views of the great sages of the Torah. Aristotle maintained that God (may He be blessed) does not know particular things in the sublunar world. Those who followed him are divided into two camps on this question, the first group maintaining that Aristotle believed that God (may He be blessed) has no knowledge of these things in the sublunar world, either universals or particulars, for if He were to know either universals or particulars, there would be multiplicity in His knowledge and hence in His essence. In short, His essence would be divided into a more perfect part and a less perfect part ... The second camp holds that Aristotle's view is that God (may He be blessed) knows the things in the sublunar world with respect to their general natures, i.e., their essences, but not insofar as they are particulars, i.e., contingents. Nor is there any multiplicity in His essence on this view, since He knows only Himself and in this knowledge He knows all things with respect to their general natures. For He is the principle of law, order, and regularity in the universe. But God [according to this view] does not know particulars; hence there is no order to them by virtue of [His not knowing them as particulars], although they do exhibit some order and regularity insofar as God knows them [i.e., their general natures]. It shall be demonstrated (with God's help) in Book Five of this treatise that this is the authentic view of Aristotle.

However, the great sages of our Torah, such as the outstanding philosopher Maimonides (may he be blessed) and others of our Torah who have followed him, maintain that God (may He be blessed) does know all particular and contingent things insofar as they are particular. Indeed, they believe that in one piece of knowledge He knows all these things, which in fact are infinite. This is indeed the view of Maimonides (may his memory be blessed), who in Chapter 20 of Part III of his great book *The Guide of the Perplexed* says the following: "Similarly we say that the various things that occur are known to Him before they take place and that He doesn't cease knowing them. Hence, no new knowledge accrues to Him at all. For example, He knows that a particular person is now nonexistent but will exist at some later date, and will continue to exist for some time and then will be nonexistent. Now when this person actually does exist according to [God's prior] knowledge of him, there is no addition to His knowledge and no new piece of information has arisen which was not already known to Him. But something has in fact taken place that previously was known would take place and exactly in the same way [as He knew it would]. This belief implies that [God's] knowledge refers to the nonexistent and encompasses the infinite. We accept this belief. And we say that the nonexistent things, the bringing forth of which pre-exists in His knowledge and falls within His power to bring about, can be objects of God's knowledge." It is clear from this that Maimonides maintains that God (may He be blessed) knows particular, contingent things insofar as they are particular.

Chapter 11

THE ARGUMENTS IN FAVOR OF THESE VIEWS, AS WE HAVE FOUND THEM EXPLICITLY OR IMPLICITLY IN THE STATEMENTS OF THEIR PROPONENTS

After having mentioned these opinions on this question, let us now examine them to see which is the true one. It will be necessary to examine the arguments in behalf of these views as well as those that purport to refute them.

Aristotle's thesis that God (may He be blessed) does not know particulars has been thought to be quite plausible. First, a particular is not apprehended except by means of a corporeal faculty, for example, the senses or the imagination. But it is obvious that God (may He be blessed) has no corporeal powers. Hence, God does not know these particulars. The following syllogism can be constructed: God has no corporeal powers; anything that apprehends a particular possesses a corporeal power; hence, God cannot apprehend particulars.

Second, a particular is a temporal phenomenon, i.e., its existence is in some portion of time. But someone who cannot be described as in motion or at rest cannot apprehend temporal phenomena. Now God cannot be described as in motion or at rest; hence He cannot apprehend particulars. The following syllogism can be constructed: God cannot be described as in motion or at rest; anyone who cannot be described as in motion or at rest cannot apprehend temporal phenomena; hence God cannot apprehend temporal phenomena. To this conclusion we add a self-evident premise, namely, that particulars are temporal phenomena. From this it follows that God cannot apprehend particulars... .

Sixth, if it were alleged that God (may He be blessed) knows things that are generated, the following dilemma ensues: either He knows them *before* they occur, or He knows them only *simultaneously* with their occurrence, not beforehand. Now, if we assume that He knows them before their occurrence, His knowledge would refer to nonbeing. But this is absurd, for knowledge is necessarily [the cognition] of an existent, apprehended thing. Moreover, this divine foreknowledge of generated things implies the following dilemma. If He knows generated things as genuine contingents, then His knowledge that one of these contingencies is to occur is compatible with the occurrence of the alternative. If, on the other hand, He knows precisely *which* of the two alternative states of affairs will occur, its alternative will not be genuinely possible. Now, if we assume that God has knowledge of these events as genuine contingencies [the first horn of this dilemma], His foreknowledge of them would change when they actually occurred, for prior to their occurrence they could or could not have happened, but after their occurrence this possibility is removed. And since the intellect is constituted by what it knows, God would be continually changing — but this is utterly absurd. If, on the other hand, God knows *precisely* which of these contingencies will occur [the second horn of this dilemma], it follows that there is no genuine contingency at all; hence everything would be necessary. But this, too, is absurd and repugnant. It is clear, then, that it is false to say that God has knowledge of these generated events before they occur. But if we say that He has knowledge of them simultaneously with their occurrence [the second horn of the original dilemma], new knowledge would continually arise in Him. And since the intellect is constituted by what it knows, the divine essence would be continually changing, which is utterly impossible... . [In sum,] these are the arguments that we have been able to extract from the words of the philosophers, explicitly or implicitly, in support of the thesis that God does not know particulars... .

Nevertheless, the view of our sages of the Torah (of blessed memory) that God (may He be blessed) does know particulars also has arguments in its favor. First, since it is admitted by all who philosophize that God is the most perfect being, it is improper to attribute to Him the defect of ignorance, i.e., that He does not know *some* thing; for ignorance is one of the greatest defects. Someone who chooses to attribute to Him ignorance of particulars rather than to ascribe to Him the inability to arrange these particulars in an orderly manner escapes from one evil and falls into something worse. For it could be the case that the recipient cannot receive more perfection than it actually does, and this is not a defect with respect to God (may He be blessed).

Second, it is not proper to ascribe to the agent who produces something ignorance of his product. Rather, his knowledge of the product is more perfect than that possessed by someone else. For he knows through one cognition everything that will derive from the produced thing by virtue of the disposition [i.e., structure] according to which he made it. Someone else, however, acquires his knowledge of it from the product, and when he observes that the object exhibits some new property resulting from the nature with which it has been endowed, he acquires new knowledge of that new property. And so new properties of a thing give rise to successive cognitions in the observer, and it is possible that the observer will never obtain complete knowledge

of the properties that accrue to this object, [especially] if the properties are quite numerous. Thus, since God (may He be blessed) is the creator of the whole world, He has a complete knowledge of what shall happen to that which He has made, a knowledge that cannot be compared to our knowledge. For He knows in one cognition everything that will happen with respect to the world according to the nature with which He has endowed it, whereas we know these things only as they occur. Hence, it is not proper to compare our knowledge and His knowledge, saying that if God (may He be blessed) were to have this knowledge. He would have many cognitions, and hence His essence would be subject to plurality. What we know by many cognitions is known to God (may He be blessed) in one cognition, as we have seen. Indeed, God knows through one cognition [many things of] these particulars, of which we can have knowledge [only] by means of a plurality of cognitions. For our knowledge does not encompass the many things that are generated in the world according to the nature with which God (may He be blessed) has endowed the world.

These two arguments are given by Maimonides (of blessed memory) in Part III of his celebrated book *The Guide of the Perplexed* in behalf of the claim that God (may He be blessed) knows all these particulars. It is clear that the second argument, in addition to proving that God knows all the things that happen, refutes some of the arguments of the philosophers against the view that God knows particulars. On the other hand, some of the philosophers have countered the first argument in behalf of divine knowledge of all particulars by saying that the denial of this claim does not entail any defect in God. For not every privation is a defect; it is a defect only when the thing is able to have the characteristic in question, not when it cannot. For example, motion is a perfection of animate creatures; when we deny motion of God, however, it is not a defect in Him but a perfection. Similarly, they say that in claiming that God does not know particulars, no imperfection in Him results, only perfection; for His knowledge concerns superior things, not these trivial matters. And so Aristotle says in Book XII of the *Metaphysics* that it is better not to see some things than to see them.

Maimonides (of blessed memory) countered all those difficulties that have been believed to entail the rejection of divine knowledge of particulars by means of his dictum that it is not appropriate to compare divine cognition with human cognition. For to the extent that His being is greater than ours, so, too, is His knowledge greater than ours. And this is a necessary truth, since His knowledge is identical with Himself, as the philosophers have explained. Accordingly, Maimonides frequently rebukes the philosophers for comparing divine knowledge with human knowledge and inferring therefrom that God does not know particulars. They themselves have shown us in some sense that when applied to both God and men, the term “knowledge” is equivocal. And it is obvious that with respect to things having equivocal predicates, inferences from one to the other cannot be made. By means of this argument, Maimonides claimed that it is not impossible, despite the arguments of the philosophers, for God to know all particulars. And when it has been shown that there is no impossibility in this supposition, it is clearly proper then to ascribe this power to Him in order to remove the defect of ignorance from Him... .

According to Maimonides, there are five factors by virtue of which God’s knowledge differs from our knowledge, i.e., each one of these factors that is present in divine cognition cannot obtain in human cognition... .

The fourth differentiating factor is that the divine knowledge of future events does not entail that the predicted event will occur; rather, its opposite is still possible. Maimonides was led to this belief because he could not deny the existence of contingency, for both philosophy and the Torah assert the existence of contingent events. Hence, it would follow that when it is claimed that God has foreknowledge of future events, the opposite of the event predicted by God could occur and the predicted event could [then] not occur. For if [it were maintained] that the predicted event will undoubtedly occur, its opposite could not occur at all, and contingency would thereby be eliminated. And this is what Maimonides wanted to avoid. Now this feature cannot be attributed to human cognition. For if Maimonides meant that God (may He be blessed) knows with respect to two opposite possibilities which one will occur but also that it may not occur (i.e., its opposite is possible) — and this seems to be how his position should be construed — this [kind of cognition] would obviously not be considered by us to be *knowledge* but *opinion*. For when we say that we *know* that one particular possibility of two contradictory possibilities will occur, we thereby imply that it is impossible that it not occur, whereas if we *think* that it cannot occur, we call this “opinion,” not “knowledge.” That is, we would then say “we *think* that this possibility will happen” and not “we *know* that it will occur.” And if what we thought would occur turns out not to occur, our opinion would be considered by us to have been erroneous; this is obviously not knowledge.

[On the other hand,] if Maimonides meant that God knows determinately which possibility will occur but does not know that it may not occur, and it is the case that the latter is really possible (i.e., the opposite of this event is possible), we would not consider this to be knowledge but error. That is, if the opposite of what we

judged would occur happens instead, [we would] obviously [consider our judgment to be mistaken]. Hence, it is evident that according to this principle, what is knowledge with respect to God (may He be blessed) with respect to us is the opposite of knowledge; for error is the contrary of knowledge, and opinion, too, is in some sense the opposite of knowledge. For this reason, then, Maimonides claimed that divine knowledge differs from human knowledge. This difference in these two cognitions is consistent with Maimonides' thesis that the term "knowledge" is absolutely equivocal when applied to God (may He be blessed) and to us... .

Chapter III

A CRITICAL EXAMINATION OF THE ADEQUACY OF THE ARGUMENTS ADVANCED BY THE “MASTER OF THE *GUIDE*” [I.E., MAIMONIDES] ON THIS TOPIC

It is proper that we determine whether Maimonides’ efforts to counter all the possible arguments of the philosophers who differ from him are successful before we examine whether or not these arguments are correct and, if they are correct, whether [or not] they entail what the philosophers concluded from them. For if Maimonides’ replies to these arguments are adequate, there will be no need for us to examine them by means of another method.

We claim that the first thing to do is to examine whether the term “knowledge” is equivocal with respect to divine and human knowledge, such that the difference between them is as Maimonides thought — i.e., that divine knowledge is the opposite of our knowledge, so that what we consider to be opinion, error, or confusion is knowledge with respect to God—or whether the equivocation involved here is such that this difference cannot be such [as Maimonides claimed]. It seems to us that Maimonides’ position on this question of divine cognition is not implied by any philosophical principles; indeed, reason denies this view, as I will show. It seems rather that theological considerations have forced him to this view. The question of whether the Torah requires this doctrine will be considered after our philosophical analysis of this problem.

That philosophical argument rules out Maimonides’ position on this topic will be demonstrated as follows. It would seem that God’s knowledge is equivocal with respect to our knowledge in the sense of prior and posterior predication, that is, the term “knowledge” is predicated of God (may He be blessed) *primarily* and of others *secondarily*. For in God knowledge is identical with His essence, whereas in anyone else knowledge is the effect of God’s knowledge. In such a case the term is applied to God in a prior sense and to other things in a posterior sense. The same is true with respect to such terms as “exists,” “one,” “essence,” and the like, i.e., they are predicated of God primarily and of other things secondarily. For His existence, unity, and essence belong to Him essentially, whereas the existence, unity, and essence of every [other] existent thing emanate from Him. Now when something is of this kind, the predicate applies to it in a prior sense, whereas the predicate applies in a posterior sense to the other things that are called by it insofar as they are given this property directly by the substance that has the property in the prior sense... . Hence, it seems that the difference between divine and human cognition is a difference in terms of greater perfection, for this is what is implied by prior and posterior predication. Now if what we have said is true, and since it is obvious that the most perfect knowledge is more true with respect to specificity and determinateness, it would follow that God’s knowledge is more true with respect to specificity and determinateness. Hence, it cannot be that what is considered knowledge with respect to God can be called “belief,” “error,” or “confusion” with respect to man.

We can show in another way that the difference between divine and human cognition is not as Maimonides thought. It is evident that we proceed to affirm attributes of God from that with which we are familiar. That is, we say that God knows because of the knowledge found in us. For example, since we apprehend that the knowledge belonging to our intellect is a perfection of our intellect—without which it could not be an intellect in act [i.e., perfect]—we predicate of God that He knows by virtue of the fact, which we have demonstrated concerning Him, that God (may He be blessed) is indubitably an intellect in act. It is self-evident that when a predicate is affirmed of some object because it is true of some other thing, it is not predicated of both things in an absolutely equivocal sense, for between things that are absolutely equivocal there is no analogy... . Hence, it is clear that the term “knowledge” is not completely equivocal when applied to God (may He be blessed) and man. Since this term cannot be applied univocally with respect to God and man, it must be predicated in the sense of priority and posteriority. The same holds for other attributes that are predicated of both God (may He be blessed) and man. Thus, the difference between divine and human knowledge is one of greater perfection, albeit exceedingly so, and this type of knowledge is more precise and clear... .

The inadequacy of Maimonides’ contention about the [absolute] difference between our knowledge and God’s knowledge can be shown in another way. With respect to those attributes concerning which we want to know whether or not they can be predicated of God, it is evident that such predicates have one meaning regardless whether we affirm or deny them. For example, if we want to know whether God is corporeal or incorporeal, the term “corporeal” has the same meaning in some sense in either case. For if the term “body” has a completely different connotation in the negation from the meaning it has in the affirmation, these

statements would not be considered genuine contradictions, as is obvious... . Hence, since it is clear when we deny attributes of God that are found in us that such attributes are not completely equivocal with respect to God (may He be blessed) and us, the same is true when we affirm of God predicates that are true of us. For example, we say that God is immovable, since if He were movable He would be a body, for all movable objects [are bodies]. Now it is evident that in this proposition the term “movable” is not completely equivocal with respect to the term “movable” when it is applied to nondivine things. For if it were, there would be no proof that God is not movable, since the movable object that must be a body is that which is movable in the domain of human phenomena, whereas the term “movable” (in the completely equivocal sense) would not imply that it is a body. Hence, since it is evident that the predicates we deny of God are not absolutely equivocal, neither are the terms that we affirm of Him. For at first we were uncertain whether to affirm or deny such predicates of God (may He be blessed). Then when the inquiry was completed, we were able to affirm or deny such predicates of Him. In general, if the terms used in affirming predicates of Him were absolutely equivocal, there would be no term applicable to things in our world that would be more appropriate to deny than to affirm of God or [more appropriate] to affirm than to deny of Him. For example, someone could say “God is a body” but not mean by the term “body,” “a magnitude”; rather he would mean something that is completely equivocal with the term “body” as we usually use it. Similarly, someone could say “God does not have knowledge,” since the term “knowledge” would not [on this view] have the same meaning for him in this statement as it does for us. It will not do to object that we indeed deny corporeality of God because it is an imperfection for us, whereas we affirm knowledge of Him because it is a perfection for us. For the *term* “corporeality” is not [itself] an imperfection, and it is the term that we deny of Him, but the content of the term is the imperfection. Similarly, the *term* “knowledge” is not [itself] a perfection; its content is. The proof of this is as follows. If by the term “corporeality” we were to connote what the term “knowledge” connotes, and conversely, corporeality would be a perfection for us and knowledge an imperfection. Moreover, we do not affirm or deny anything of God except by determining at the outset whether it is proper or improper for *Him*; we do not ask whether or not it is a perfection for *us*. Thus, it is clear that reason shows that the term “knowledge” is not completely equivocal with respect to God (may He be blessed) and man... .

On the basis of this entire discussion, it is now evident that reason shows that the term “knowledge” is predicated of God (may He be blessed) primarily and of creatures secondarily, not absolutely equivocally, and that the principles [of religious language] adopted by Maimonides in order to remove the objections of the philosophers concerning the problem of divine knowledge are not acceptable.

Chapter IV

THE COMPLETION OF OUR THEORY OF DIVINE KNOWLEDGE, PHILOSOPHICALLY DEMONSTRATED; REFUTATION OF THE OPPOSING ARGUMENTS

... Now, when we consider these arguments that have been brought forth in favor of divine knowledge of particulars and the arguments adduced by the philosophers against this thesis, there is no alternative but to say that God knows particulars in one respect but does not know them in another respect. But what these respects are, would that I knew!

It has been previously shown that these particulars are ordered and determined in one sense, yet contingent in another sense. Accordingly, it is evident that the sense in which God knows these particulars is the sense in which they are ordered and determined... . For from this aspect it is possible to have knowledge of them. On the other hand, the sense in which God does not know particulars is the sense in which they are not ordered, i.e., the sense in which they are contingent. For in the latter sense knowledge of them is not possible. However, God does know from this aspect that these events may not occur because of the choice, which He has given man... . But He does not know which of the contradictory outcomes will be realized insofar as they are [genuinely] contingent affairs; for if He did, there would not be any contingency at all. [Nevertheless,] the fact that God does not have the knowledge of which possible outcomes will be realized does not imply any defect in God (may He be blessed). For perfect knowledge of something is the knowledge of what that thing is in reality; when the thing is not apprehended as it is, this is error, not knowledge. Hence, God knows these things in the best manner possible, for He knows them insofar as they are ordered in a determinate and certain way, and He knows in addition that these events are contingent, insofar as they fall within the domain of human choice, [and as such knows them] truly as contingent. Thus, God (may He be blessed), by means of the Prophets, commands men who are about to suffer evil fortune that they mend their ways so that they will avert this punishment, as in the case of King Zedekiah who was commanded to make peace with the King of Babylonia.² Now this indicates that what God knows of future events is known by Him as not necessarily occurring; however, He knows these events in the sense that they are part of the general order and also as possibly not occurring insofar as they are contingent... .

Having established this point, we shall now show that none of the aforementioned arguments of the philosophers against divine knowledge of particulars is valid against our own theory.

The first of these arguments of the philosophers — since God has no corporeal powers, He has no knowledge of particulars—does not prove that God has no knowledge of the intelligible order inherent in them and in terms of which they are ordered and determinate. This argument implies only that He does not know them as particulars in their very individuality. This is evident. Similarly, the second argument — God has no knowledge of particulars because they are temporal phenomena—does not refute our theory. For we have not claimed that His knowledge encompasses their temporal aspects; rather we have claimed that it is concerned with the intelligible order in terms of which these particulars are ordered, and from this aspect they are not temporally specified... .

The sixth argument maintains that God cannot know generated events [i.e., particular events], for if He did, He would know them either *before* their occurrence or only simultaneously with their occurrence. If He knows them before their occurrence, His knowledge would refer to nonexistents. Moreover, if this is indeed the case, either He knows them as they really are, i.e., as contingents, and then it is still possible that the opposite of what He predicted will occur; or He knows definitely which alternative of two contradictory states of affairs will occur, such that the other alternative is not possible. If we say that He knows them as genuine contingents, His foreknowledge of these events would be subject to change when the event in question has occurred; for prior to its occurrence the event could or could not have occurred, whereas after its occurrence this possibility has disappeared. And since the intellect is constituted by its knowledge, God's essence would be continually subject to change, which is absurd. On the other hand, if we say that He knows definitely which of two contradictory events will occur, no contingency would exist. Finally, if we say that God knows particulars only as they occur, His knowledge would always be generated and His essence subject to change. Since all of these suppositions are absurd, it follows that God does not know particulars at all.

Nevertheless, this argument does not invalidate our version of the thesis that God knows particulars. In saying that God knows particulars insofar as they are ordered and that He knows them as contingent insofar as human choice is involved, we are not subject to any of the above-mentioned absurdities. [In the first place],

His knowledge does not refer to nonexistents, since we maintain that His knowledge of particulars is grounded in the intelligible order pertaining to them as it is present in His mind, but not in these particulars themselves. [In the second place], it does not follow that His knowledge is subject to change when any of these events has occurred, for we have not claimed that His knowledge is based upon any of these events; rather, it is grounded in their intelligible order in His mind. And this order is eternally in His mind and never changes. [In the third place], it does not follow from our hypothesis that there is no contingency [merely because] we maintain that God has foreknowledge of which of two contradictory events will occur. According to our theory God knows that a particular event *should* occur given the ordering of phenomena [in the intelligible order of things], but not that it *must absolutely* occur; for God recognizes that by virtue of human choice this event might not occur, and this is the sense in which these things are contingent... .

Chapter V

THE ADVANTAGES OF OUR THEORY

One of the evident advantages of our theory of divine knowledge of particulars is that none of the absurdities that ensue from Maimonides' account of divine knowledge is applicable to it, i.e., the difficulties deriving from the five features that allegedly differentiate divine knowledge from human knowledge... .

The fourth feature — God's knowledge of future events does not imply that the event foreknown will necessarily occur; rather its opposite is still possible— is also a characteristic of our knowledge insofar as we have knowledge of these events through dreams, divination, or prophecy. For we do possess such knowledge insofar as such events are ordered. Yet they remain contingent by virtue of the factor of choice. This is the reason why this knowledge has been given to us, that we can recognize the evil that has been prepared for us and take measures to avoid it... . This can be understood if we examine the practice of the Prophets (may they rest in peace), who warn us of some [imminent] evil. For it is the case that they give advice on how to prevent this evil from coming. Similarly, Joseph warns Pharaoh, by interpreting his dream, about the famine and suggests a relief measure so that the famine will not be as calamitous as it was originally predicted in the dream.³ Daniel, for example, tells Nebuchadnezzar, by interpreting his dream, that he will lose his reason and be like an animal for seven years, but he also suggests a way in which this evil can be averted.⁴ Since we have claimed that God has knowledge of these events insofar as they are ordered, it is not strange that they are still contingent with respect to human choice. In this way, the difficulty that has continually plagued men—i.e., how can God know future events without these events being necessary—disappears; for these events exhibit two aspects [i.e., an ordered, or regular, pattern and a free, or voluntary, dimension], and not just one aspect.

Chapter VI

THE IDENTITY OF OUR VIEW WITH THE DOCTRINE OF THE TORAH

It is now incumbent upon us to show that the theory we have established by philosophical argument is identical with the view of our Torah. It is a fundamental and pivotal belief of the Torah that there are contingent events in the world. Accordingly, the Torah commands us to perform certain things and prohibits other things. It is [also] a fundamental principle implicit in all the Prophets (may they rest in peace) that God informs them of these contingent events before they actually occur, as it is said, “God does nothing without having revealed His purpose to His servants the prophets.”⁵ Yet it is not necessary that any evil predicted by them must occur, as it is said, “God is gracious ... [abounding in kindness] and renouncing punishment.”⁶ These principles are reconcilable only on the hypothesis that [first] these contingent events are in some sense ordered, and it is in this respect that knowledge of them is possible, but in another sense not ordered, and it is in the latter sense that they are contingent; and [second] that God (may He be blessed) knows all future contingent events insofar as they are ordered and [in addition] knows that they are contingent. It is, therefore, clear that the view of our Torah is identical with the theory that philosophical argument has proved with respect to divine knowledge. Moreover, it can be shown that the view of the Torah is that God knows these things in a general manner, not as particulars, for it is said “He who fashions the hearts of them *all*, who discerns *all* their doings.”⁷ That is, God created the hearts and thoughts of men *at the same time* insofar as He endowed the heavenly bodies with those patterns from which [these thoughts] are in their entirety derived. In this way God considers *all* their deeds, i.e., simultaneously, not in the sense that His knowledge refers to the particular as particular. This shows that [according to the Torah] God understands all human affairs in a general way.

Moreover, the Torah maintains that the will of God does not change, as it said, “I am the Lord — I have not changed.”⁸ And Balaam, when he was a prophet, said: “God is not man to be capricious, or mortal to change His mind.”⁹ [Yet] in some of the Prophets [it is related that] God does repent of His acts, as it is said, “The Lord renounced the punishment He had planned to bring upon His people”;¹⁰ “For God is gracious ... renouncing punishment.”¹¹ Since this difficulty cannot be removed when it is assumed that God (may He be blessed) knows particulars as particulars but can be easily removed when it is assumed that He knows them as we have argued [i.e., generally], it is proper, according to the Torah, that we should interpret the doctrine of divine knowledge according to our philosophical theory.

That our theory of divine cognition can easily solve this problem can be shown as follows. God’s knowledge does not imply that a particular event will occur to a particular man, but that it may occur to *any* man who falls under this [general] ordering of events, insofar as these events are ordered; in addition, God knows that this event may *not* occur because of human choice. But if we were to claim that God knows this affair with respect to this particular man as a definite individual, it would follow that His will would be subject to change.

In short, there is nothing in the words of the Prophets (may they rest in peace) that implies anything incompatible with the theory we have developed by means of philosophy. Hence, it is incumbent upon us to follow philosophy in this matter. For, when the Torah, interpreted literally, seems to conflict with doctrines that have been proved by reason, it is proper to interpret these passages according to philosophical understanding, so long as none of the fundamental principles of the Torah are destroyed.

William of Ockham

In 1277, the Bishop of Paris condemned 219 propositions expressing various positions in philosophy and theology. Several of the condemned propositions bore the influence of Aristotle's natural philosophy. It is hard not to see some of the Aristotelian doctrines of Thomas Aquinas, who had died shortly before the promulgation of the condemnation, as its targets. Because of Aquinas' philosophical prominence among the Dominicans, to place elements of his teachings under a cloud of suspicion was to compromise the educational project of the Dominican order. Whether the condemnation was symptom or cause, the first half of the fourteenth century was witness to a different, more critical philosophical atmosphere, created principally by two great Franciscan masters, John Duns Scotus (c. 1266–1308) and William of Ockham (1285–1348). Renaissance humanists, impatient with and perhaps incapable of comprehending the intricate argumentative style of Scotus, derisively referred to him and his followers as "Dunsmen," giving rise to the word "dunce." Until recently, Ockham's reputation has not fared much better. Unlike Scotus, however, whose life was comparatively uneventful, Ockham's disfavor can be attributed both to his maverick philosophical opinions and his controversial political career.

Coming from the village of Ockham, in Surrey, Ockham joined the Franciscans at an early age. He was educated at Oxford and lectured there from about 1315 to 1319. He had hoped to be appointed to a chair at Oxford. The hope never materialized because there were other Franciscans ahead of him and because there was opposition to his appointment, apparently on grounds having to do with Ockham's philosophical writings. Ockham is thus sometimes referred to as "Venerable Inceptor," that is, someone on the verge of incepting or formally assuming a title at a university.

By 1324, Ockham had written several of his major logical and philosophical works. They had attracted the attention of the former chancellor at Oxford, now in residence at the papal court in Avignon, who regarded some of Ockham's philosophical views as heretical. Ockham was summoned to Avignon in 1324 to be examined on these views. He would remain in Avignon for four years. A papal commission charged with the inquiry into Ockham's views took two years in its deliberations, finally declaring several of Ockham's opinions vulnerable to censure. The opinions were never formally condemned. In 1327, Michael of Cesena, minister general of the Franciscan order, who was also in residence at Avignon, set Ockham the task of investigating the issue of apostolic poverty. The Franciscans had contended that Jesus and the apostles had not owned property and thus that the mendicant Franciscans were following in the apostles' footsteps. The contention and the ideal that it fostered provoked Pope John XXII (1316–1334), who believed that the Church could succeed in maintaining its independence from secular rulers only if it were as wealthy as they. Ockham came to believe that John's pronouncements contradicted Scripture and views held by earlier popes. In Ockham's eyes, then, John was a heretic and could not be a true pope. In May 1328, Michael of Cesena and Ockham fled Avignon for Munich, placing themselves under the protection of Louis (or Ludwig) of Bavaria, the Holy Roman Emperor. They were excommunicated by John. Ockham continued to write political treatises aimed at what he took to be the deviations from the Christian mission of John and John's successor, Pope Benedict XII. When Louis died in 1347, Ockham made an attempt to reconcile himself with the Church but died shortly thereafter, probably a victim of the Black Death.

Two salient themes in Ockham's philosophical methodology are his appeals to God's absolute power and his appeals to what is now known as "Ockham's Razor." God's absolute power is God's power to do anything that does not involve a contradiction. Ockham appeals to that power in dealing with issues in metaphysics, ethics, and theology. One might have thought, for example, that spatial extension is an essential property of matter. According to Ockham, however, God can diminish the size of the material universe to an extensionless point without thereby destroying any of the universe's parts. Thus extension cannot be an absolutely essential property of matter. Again, one might have thought that God's commandment to love Him is a necessary consequence of God's perfect goodness. But, Ockham argues, God could have commanded us to hate Him; had He done so, it would have been obligatory for us to hate God. Or one might have thought that faith was necessary for salvation. But God can, if He chooses, save someone who lacks faith. One consequence of the appeal to God's absolute power is Ockham's voluntarism in ethics—his belief that right and wrong are determined entirely by God's will.

Ockham's Razor is commonly expressed as the injunction "Do not multiply entities beyond necessity." Ockham never enunciates the principle in quite these words, but he is clearly committed to its spirit. The

reading included here, from Ockham's major work on logic, provides an important example of the Razor's influence. For Ockham, the study of logic begins with the study of terms and their properties. In the sentences "This rose is red" and "That rose is red," it is plausible to say that the subject-terms, "This rose" and "That rose," refer to individual, identifiable roses. But to what does the predicate-term, "red," refer? One view, called realism, maintains that "red" refers to a universal, redness, that is common to both this rose and that rose. Realism thus maintains that in addition to the individual roses, there is another kind of entity, redness, that has the property of being able to exist in more than one place at the same time.

Ockham rejects this kind of realism on grounds that it multiplies entities beyond necessity. The redness of this rose and the redness of that rose are just two individual things, not unlike the roses themselves. More generally, Ockham undertakes the project of arguing for nominalism, the position that the only things that exist are individuals.

• • •

Some of Ockham's individual works have received excellent translations, a few with very helpful introductory essays. Michael J. Loux's *Ockham's Theory of Terms* (South Bend, Ind.: St. Augustine's Press, 1998), from which the following text is taken, is a translation of Part I of Ockham's *Summa Logicae*. Alfred J. Freddoso and Henry Schuurman's *Ockham's Theory of Propositions* (Notre Dame, Ind.: University of Notre Dame Press, 1980) is a translation of Part II. Marilyn McCord Adams and Norman Kretzmann have translated Ockham's *Predestination, God's Foreknowledge, and Future Contingents* (Indianapolis: Hackett Publishing Company, 1983). Alfred J. Freddoso has produced a two-volume translation of Ockham's *Cuodlibetal Questions* (New Haven: Yale University Press, 1991). Marilyn McCord Adams' two-volume *William Ockham* (Notre Dame, Ind.: University of Notre Dame Press, 1987) is a magisterial treatment of Ockham's philosophy. For a collection of important essays on various aspects of Ockham's philosophy, see Paul Vincent Spade, ed., *The Cambridge Companion to Ockham* (Cambridge: Cambridge University Press, 1999).

William E. Mann

*Summa Logicae**

PART I

On Terms

14: ON THE UNIVERSAL

It is not enough for the logician to have a merely general knowledge of terms; he needs a deep understanding of the concept of a term. Therefore, after discussing some general divisions among terms we should examine in detail the various headings under these divisions.

First, we should deal with terms of second intention and afterwards with terms of first intention. I have said that 'universal,' 'genus,' and 'species' are examples of terms of second intention. We must discuss those terms of second intention which are called the five universals, but first we should consider the common term 'universal.' It is predicated of every universal and is opposed to the notion of a particular.

First, it should be noted that the term 'particular' has two senses. In the first sense a particular is that which is one and not many. Those who hold that a universal is a certain quality residing in the mind which is predicable of many (not suppositing for itself, of course, but for the many of which it is predicated) must grant that, in this sense of the word, every universal is a particular. Just as a word, even if convention makes it common, is a particular, the intention of the soul signifying many is numerically one thing a particular; for although it signifies many things it is nonetheless one thing and not many.

In another sense of the word we use 'particular' to mean that which is one and not many and which cannot function as a sign of many. Taking 'particular' in this sense no universal is a particular, since every universal is capable of signifying many and of being predicated of many. Thus, if we take the term 'universal' to mean that which is not one in number, as many do, then, I want to say that nothing is a universal. One could, of course, abuse the expression and say that a population constitutes a single universal because it is not one but many. But that would be puerile.

Therefore, it ought to be said that every universal is one particular thing and that it is not a universal except in its signification, in its signifying many things. This is what Avicenna¹ means to say in his commentary on the fifth book of the *Metaphysics*. He says, "One form in the intellect is related to many things, and in this respect it is a universal; for it is an intention of the intellect which has an invariant relationship to anything you choose." He then continues, "Although this form is a universal in its relationship to individuals, it is a particular in its relationship to the particular soul in which it resides; for it is just one form among many in the intellect." He means to say that a universal is an intention of a particular soul. Insofar as it can be predicated of many things not for itself but for these many, it is said to be a universal; but insofar as it is a particular form actually existing in the intellect, it is said to be a particular. Thus 'particular' is predicated of a universal in the first sense but not in the second. In the same way we say that the sun is a universal cause and, nevertheless, that it is really and truly a particular or individual cause. For the sun is said to be a universal cause because it is the cause of many things (i.e., every object that is generable and corruptible), but it is said to be a particular cause because it is one cause and not many. In the same way the intention of the soul is said to be a universal because it is a sign predicable of many things, but it is said to be a particular because it is one thing and not many.

But it should be noted that there are two kinds of universals. Some things are universal by nature; that is, by nature they are signs predicable of many in the same way that the smoke is by nature a sign of fire; weeping, a sign of grief; and laughter, a sign of internal joy. The intention of the soul, of course, is a universal by nature. Thus, no substance outside the soul, nor any accident outside the soul is a universal of this sort. It is of this kind of universal that I shall speak in the following chapters.

Other things are universals by convention. Thus, a spoken word, which is numerically one quality, is a universal; it is a sign conventionally appointed for the signification of many things. Thus, since the word is said to be common, it can be called a universal. But notice it is not by nature, but only by convention, that this label applies.

15: THAT THE UNIVERSAL IS NOT A THING OUTSIDE THE MIND

But it is not enough just to state one's position; one must defend it by philosophical arguments. Therefore, I shall set forth some arguments for my view, and then corroborate it by an appeal to the authorities.

That no universal is a substance existing outside the mind can be proved in a number of ways:

No universal is a particular substance, numerically one; for if this were the case, then it would follow that Socrates is a universal; for there is no good reason why one substance should be a universal rather than another. Therefore no particular substance is a universal; every substance is numerically one and a particular. For every substance is either one thing and not many or it is many things. Now, if a substance is one thing and not many, then it is numerically one; for that is what we mean by 'numerically one.' But if, on the other hand, some substance is several things, it is either several particular things or several universal things. If the first alternative is chosen, then it follows that some substance would be several particular substances; and consequently that some substance would be several men. But although the universal would be distinguished from a single particular, it would not be distinguished from several particulars. If, however, some substance were to be several universal entities, I take one of those universal entities and ask, "Is it many things or is it one and not many?" If the second is the case then it follows that the thing is particular. If the first is the case then I ask, "Is it several particular things or several universal things?" Thus, either an infinite regress will follow or it will be granted that no substance is a universal in a way that would be incompatible with its also being a particular. From this it follows that no substance is a universal.

Again, if some universal were to be one substance existing in particular substances, yet distinct from them, it would follow that it could exist without them; for everything that is naturally prior to something else can, by God's power, exist without that thing; but the consequence is absurd.

Again, if the view in question were true, no individual would be able to be created. Something of the individual would pre-exist it, for the whole individual would not take its existence from nothing if the universal which is in it were already in something else. For the same reason it would follow that God could not annihilate an individual substance without destroying the other individuals of the same kind. If He were to annihilate some individual, he would destroy the whole which is essentially that individual and, consequently, He would destroy the universal which is in that thing and in others of the same essence. Consequently, other things of the same essence would not remain, for they could not continue to exist without the universal which constitutes a part of them.

Again, such a universal could not be construed as something completely extrinsic to the essence of an individual; therefore, it would belong to the essence of the individual; and, consequently, an individual would be composed of universals, so that the individual would not be any more a particular than a universal.

Again, it follows that something of the essence of Christ would be miserable and damned, since that common nature really existing in Christ would be damned in the damned individual; for surely that essence is also in Judas. But this is absurd.

Many other arguments could be brought forth, but in the interests of brevity, I shall dispense with them. Instead, I shall corroborate my account by an appeal to authorities.

First, in the seventh book of the *Metaphysics*, Aristotle is treating the question of whether a universal is a substance. He shows that no universal is a substance. Thus, he says, "it is impossible that substance be something that can be predicated universally."

Again, in the tenth book of the *Metaphysics*, he says, "Thus, if, as we argued in the discussions on substance and being, no universal can be a substance, it is not possible that a universal be a substance in the sense of a one over and against the many."

From these remarks it is clear that, in Aristotle's view, although universals can supposit for substances, no universal is a substance.

Again, the Commentator in his forty-fourth comment on the seventh book of the *Metaphysics* says, "In the individual, the only substance is the particular form and matter out of which the individual is composed."

Again, in the forty-fifth comment, he says, "Let us say, therefore, that it is impossible that one of those things we call universals be the substance of anything, although they do express the substances of things."

And, again, in the forty-seventh comment, "It is impossible that they (universals) be parts of substances existing of and by themselves."

Again, in the second comment on the eighth book of the *Metaphysics*, he says, "No universal is either a substance or a genius."

Again, in the sixth comment on the tenth book, he says, "Since universals are not substances, it is clear that the common notion of being is not a substance existing outside the mind."

Using these and many other authorities, the general point emerges: no universal is a substance regardless of

the viewpoint from which we consider the matter. Thus, the viewpoint from which we consider the matter is irrelevant to the question of whether something is a substance. Nevertheless, the meaning of a term is relevant to the question of whether the expression 'substance' can be predicated of the term. Thus, if the term 'dog' in the proposition 'The dog is an animal' is used to stand for the barking animal, the proposition is true; but if it is used for the celestial body which goes by that name, the proposition is false. But it is impossible that one and the same thing should be a substance from one viewpoint and not a substance from another.

Therefore, it ought to be granted that no universal is a substance regardless of how it is considered. On the contrary, every universal is an intention of the mind which, on the most probable account, is identical with the act of understanding. Thus, it is said that the act of understanding by which I grasp men is a natural sign of men in the same way that weeping is a natural sign of grief. It is a natural sign such that it can stand for men in mental propositions in the same way that a spoken word can stand for things in spoken propositions.

That the universal is an intention of the soul is clearly expressed by Avicenna in the fifth book of the *Metaphysics*, in which he comments, "I say, therefore, that there are three senses of 'universal.' For we say that something is a universal if (like 'man') it is actually predicated of many things; and we also call an intention a universal if it could be predicated of many." Then follows the remark, "An intention is also called a universal if there is nothing inconceivable in its being predicated of many."

From these remarks it is clear that the universal is an intention of the soul capable of being predicated of many. The claim can be corroborated by argument. For everyone agrees that a universal is something predicable of many, but only an intention of the soul or a conventional sign is predicated. No substance is ever predicated of anything. Therefore, only an intention of the soul or a conventional sign is a universal; but I am not here using the term 'universal' for conventional signs, but only for signs that are universals by nature. That substance is not capable of functioning as predicate is clear; for if it were, it would follow that a proposition would be composed of particular substances; and, consequently, the subject would be in Rome and the predicate in England which is absurd.

Furthermore, propositions occur only in the mind, in speech, or in writing; therefore, their parts can exist only in the mind, in speech, and in writing. Particular substances, however, cannot themselves exist in the mind, in speech, or in writing. Thus, no proposition can be composed of particular substances. Propositions are, however, composed of universals; therefore, universals cannot conceivably be substances.

16: AGAINST SCOTUS² ACCOUNT OF THE UNIVERSAL

It may be clear to many that a universal is not a substance outside the mind which exists in, but is distinct from, particulars. Nevertheless, some want to claim that the universal is, in some way, outside the soul and in particulars; and while they do not want to say that a universal is really distinct from particulars, they say that it is formally distinct from particulars. Thus, they say that in Socrates there is human nature which is contracted to Socrates by an individual difference which is not really, but only formally, distinct from that nature. Thus, while there are not two things, one is not formally the other.

I do not find this view tenable:

First, in creatures there can never be any distinction outside the mind unless there are distinct things; if, therefore, there is any distinction between the nature and the difference, it is necessary that they really be distinct things. I prove my premise by the following syllogism: the nature is not formally distinct from itself; this individual difference is formally distinct from this nature; therefore, this individual difference is not this nature.

Again, the same entity is not both common and proper, but in their view the individual difference is proper and the universal is common; therefore, no universal is identical with an individual difference.

Again, opposites cannot be attributed to one and the same created thing, but *common* and *proper* are opposites; therefore, the same thing is not both common and proper. Nevertheless, that conclusion would follow if an individual difference and a common nature were the same thing.

Again, if a common nature were the same thing as an individual difference, there would be as many common natures as there are individual differences; and, consequently, none of those natures would be common, but each would be peculiar to the difference with which it is identical.

Again, whenever one thing is distinct from another it is distinguished from that thing either of and by itself or by something intrinsic to itself. Now, the humanity of Socrates is something different from the humanity of Plato; therefore, they are distinguished of and by themselves and not by differences that are added to them.

Again, according to Aristotle things differing in species also differ in number, but the nature of a man and the nature of a donkey differ in species of and by themselves; therefore, they are numerically distinguished of and by themselves; therefore, each of them is numerically one of and by itself.

Again, that which cannot belong to many cannot be predicated of many; but such a nature, if it really is the same thing as the individual difference, cannot belong to many since it cannot belong to any other particular. Thus, it cannot be predicable of many; but, then, it cannot be a universal.

Again, take an individual difference and the nature which it contracts. Either the difference between these two things is greater or less than the difference between two particulars. It is not greater because they do not differ really; particulars, however, do differ really. But neither is it less because then they would admit of one and the same definition, since two particulars can admit of the same definition. Consequently, if one of them is, by itself, one in number, the other will also be.

Again, either the nature is the individual difference or it is not. If it is the difference I argue as follows: this individual difference is proper and not common; this individual difference is this nature; therefore this nature is proper and not common, but that is what I set out to prove. Likewise, I argue as follows: the individual difference is not formally distinct from the individual difference; the individual difference is the nature; therefore, the nature is not formally distinct from the individual difference. But if it be said that the individual difference is not the nature, my point has been proved; for it follows that if the individual difference is not the nature, the individual difference is not really the nature; for from the opposite of the consequent follows the opposite of the antecedent. Thus, if it is true that the individual difference really is the nature, then the individual difference is the nature. The inference is valid, for from a determinable taken with its determination (where the determination does not detract from or diminish the determinable) one can infer the determinable taken by itself; but 'really' does not express a determination that detracts or diminishes. Therefore, it follows that if the individual difference is really the nature, the individual difference is the nature.

Therefore, one should grant that in created things there is no such thing as a formal distinction. All things which are distinct in creatures are really distinct and, therefore, different things. In regard to creatures modes of argument like the following ought never be denied: this is *A*; this is *B*; therefore, *B* is *A*; and this is not *A*; this is *B*; therefore, *B* is not *A*. Likewise, one ought never deny that, as regards creatures, there are distinct things where contradictory notions hold. The only exception would be the case where contradictory notions hold true because of some syncategorematic element or similar determination, but in the same present case this is not so.

Therefore, we ought to say with the philosophers that in a particular substance there is nothing substantial except the particular form, the particular matter, or the composite of the two. And, therefore, no one ought to think that in Socrates there is a humanity or a human nature which is distinct from Socrates and to which there is added an individual difference which contracts that nature. The only thing in Socrates which can be construed as substantial is this particular matter, this particular form, or the composite of the two. And, therefore, every essence and quiddity and whatever belongs to substance, if it is really outside the soul, is just matter, form, or the composite of these or, following the doctrine of the Peripatetics, a separated and immaterial substance.

17: RESPONSES TO OBJECTIONS

The ability of a doctrine to handle objections is a sign of its truth. Consequently, I shall outline some objections against the foregoing and show how they can be met. Many men of no small authority hold that the universal is, in some sense, an entity outside the soul and belonging to the essence of particular substances. They bring forth arguments and authorities to show this:

(1) It is claimed that when things both really agree and really differ, there is something by which they agree and something else by which they differ. But Socrates and Plato really agree and really differ; therefore, they must agree and differ with respect to different things. They agree with respect to humanity, matter, and form; therefore, they each include an entity over and above these things, an entity in terms of which they are distinguished. These additional entities are called individual differences.

(2) Again, Socrates and Plato agree more than Socrates and a donkey; therefore, there is something in which Plato and Socrates agree but something in which Socrates and the donkey do not agree. However, Socrates and Plato do not agree in anything that is numerically one. Therefore, that in which they agree is not a particular; it must be something common.

(3) Again, in the tenth book of the *Metaphysics*, Aristotle says that in every genus there is some one thing that is first and the measure of all other things in that genus. But no particular can be the measure of all other

particulars in the same genus, for no particular can be the measure of all individuals of the same species; therefore, there is something over and above particulars.

(4) Again, every common notion belongs to the essence of what is subsumed under it; therefore, a universal belongs to the essence of substance. But non-substantiality is not a part of the essence of any substance; therefore, some universal must be a substance.

(5) Again, if no universal were a substance, then all universals would be accidents and, consequently, all the categories would be accidents. Thus, the category of substance would itself be an accident. Consequently, some accident would be more general than substance. Indeed, it would follow that one and the same thing would be more general than itself; for if universals are accidents, they must be placed in the genus of quality; and, consequently, the category of quality would be common to all the universals. Thus, it would be common to the universal which is itself the category of quality.

Other arguments and innumerable authorities are adduced in behalf of this view, but in the interests of brevity I shall not consider them now. I shall, however, refer to them in a number of places later in the book. To the objections raised I respond as follows:

Response to (1) To the first objection I grant that Socrates and Plato both really agree and really differ; they agree specifically and differ numerically. But I want to claim that it is in terms of the same thing that they agree specifically and differ numerically; and here I do not differ from those who distinguish between the common nature and the individual difference, for they are forced to say that it is in terms of the same thing that the individual difference is both really the same as and formally different from the nature. One might object here that the same thing cannot be the cause both of agreement and of the difference which is its opposite. While the claim is true, it is beside the point; for specific identity and numerical difference are not intrinsically opposed. It ought to be granted, therefore, that Socrates agrees specifically with Plato and differs numerically from him by one and the same thing.

Response to (2) In the same way the second argument fails. For it does not follow that if Socrates and Plato agree more than Socrates and the donkey, there is some one thing with respect to which they agree more. But it is sufficient they agree more of and by themselves. Thus, I say that Socrates agrees more with Plato in virtue of his intellectual soul; and, similarly, that he agrees with Plato more than with the donkey with respect to his whole being. Thus, if we are to be accurate we should not say that Socrates and Plato agree in some one thing which is their essence; we should say rather that they agree in several things, for they agree in their forms and in themselves taken as wholes.

Of course, if by contradiction there was one nature in both of them, they would agree in that too; but one might as well say that if by contradiction God were frivolous, He would rule the world badly.

Response to (3) With regard to the third point one should say that although an individual may not be the measure of all the individuals of the same genus or the same lowest level species, nonetheless, one and the same individual can be the measure of individuals from another genus or of many individuals from the same species. This is all that is needed to preserve Aristotle's view.

Response to (4) The response to the fourth objection is that, properly speaking, no universal belongs to the essence of any substance, for every universal is an intention of the soul or a conventional sign and nothing of either sort can belong to the essence of substance. Consequently, no genus nor any species nor any other universal belongs to the essence of any substance. But, strictly speaking, it should be said that a universal expresses or indicates the nature of a substance; that is, it expresses the nature which is a substance. The Commentator makes this point in the seventh book of the *Metaphysics*, when he notes that although it is impossible that any universal belong to the essence of anything, universals do express the essence of things. Thus, all authorities who say that universals belong to the essence of substance or are in substance or are parts of substances should be interpreted as saying only that universals indicate, express, designate, and signify the essences of things.

But one might object along the following lines: common names like 'man' and 'animal' signify substantial entities but not particular entities. The items they signify are substantial; but if they were particular substances, the term 'man,' for example, would signify all men and clearly it does not.

In response to this objection I want to claim that common names signify only particulars. Thus, the name 'man' does not signify anything other than the thing which is a particular man. Consequently, the only substantial entity for which it can supposit is a particular man. Indeed, it ought to be granted that the name 'man' signifies indifferently all particular men, but it does not follow that the term 'man' is equivocal. The reason is that although it signifies several individuals equally, it signifies them all by one convention; and in signifying them it is subordinated to only one concept and not several. Thus, it can be predicated of them

univocally.

Response to (5) With respect to the last objection it should be noted that those who hold that intentions of the soul are qualities of the mind have to claim that all universals are accidents; nevertheless, not all universals are signs of accidents. On the contrary some are signs of substances only; they constitute the category of substance. Other universals constitute the other categories. Therefore, it should be granted that the category of substance is an accident, although it signifies substances and not accidents; and, consequently, it should be granted that some accident (i.e., the accident which is a sign only of substances) is, of itself, more general than substance. But this is not more perplexing than the claim that some word is a name of many substances.

But does not this imply that one and the same thing is more general than itself?

I think not, for in order that one thing be more general than another a distinction between them is required. Thus, although all universals are qualities, one can deny that all universals are per se less general than the common term 'quality.' The general term 'quality' is a quality; but this is not a case where one term is more or less general than another, for we are dealing here with just one term.

One might also object that since no one term is predicable of different categories, 'quality' cannot be common to different categories. But here we must ask whether the categories are being taken significantly or not. When the categories are not taken significantly, one and the same thing can be predicated of different categories. Thus, the proposition "'Substance' is a quality" is true if the subject supposits materially or simply for an intention. In the same way "'Quantity' is a quality" is true if 'quantity' does not stand significantly. It is in this way that the same thing is predicated of different categories. In the same way the proposition "'Substance' is a word" and "'Quality' is a word" are both true provided the subjects are suppositing materially and not significantly.

Likewise, one might object that the notion of *spiritual quality* is more general than any category, for it is predicated of several different categories and no one category is predicated of all the categories. The correct response here is that the notion *spiritual quality* is not predicated of all the categories when these are taken significantly, but only when they are taken as signs. Thus, it does not follow that the notion of *spiritual quality* is more general than any category; for one term is more general than another if, when both are taken significantly, the first is predicated of more items than the second.

A similar difficulty arises with the name 'expression,' for this name is one subsumed under the notion 'name.' 'Expression' is a name and not every name is the name 'expression.' Nonetheless, the name 'expression' is somehow more general than all names, more general even than the term 'name'; for every name is an expression, but not every expression is a name. Thus, it seems that the same thing is both more general and less general than some other thing. The difficulty is removed when we note that the argument just presented is conclusive only if the relevant common terms are suppositing uniformly in all the propositions in which they appear. Careful consideration shows that they are not.

Nevertheless, one could use the term 'less general' in a different way. He could argue that one term is less general than another if the second is predicated of the first (along with others) when the first is suppositing in some way or other. Thus, it might be that the more general term cannot be predicated of its inferior when the inferior is suppositing in a different way, so that it would not be predicated of that inferior when it supposits in all ways. In this new sense one could hold that the same thing is both more and less general than some other thing, but in the revised usage 'less general' and 'more general' cease to function as opposites. They are simply different notions.

René Descartes

René Descartes lived in an era of geniuses. In the year of his birth, 1596, Shakespeare was writing *Richard II* and *The Merchant of Venice*. When Descartes died in 1650, Newton was seven. Hobbes and Galileo were near-contemporaries.

Descartes was born in La Haye, now La Haye-Descartes, a small town in Touraine, France, and lived much of his life in virtual seclusion in Holland. His interests were extremely wide-ranging. He made major contributions to anatomy and physiology, optics, mathematics, and, of course, philosophy. The *Discourse on the Method of Rightly Conducting Reasoning* gives some sense of his range. Part Five describes his researches into the properties of light, the constitutions of men and animals, including an explanation of why 'lower' animals cannot think, and an account of the circulation of the blood that he takes to be more satisfactory than Harvey's.

At the center of Descartes' thought lies the view that each science is a branch of one unified science of the world, a science based on mathematics. Thus, Descartes was an early champion of Galileo's doctrine that "the book of nature is written in the language of mathematics." In addition to unifying other sciences through mathematics, Descartes effected a major unification within mathematics when he displayed the relation between the geometry of the ancients and the algebra he helped develop through the use of his Cartesian coordinate system.

The value of mathematics in studying natural science seems obvious to us today. How can mathematics advance the study of philosophy? Like Plato before him, Descartes believes that through training in mathematics the mind becomes capable of engaging in philosophical thought. In mathematics, we encounter absolute certainty, according to Descartes. We recognize that our conclusion cannot be mistaken, because our starting assumptions are obviously true and each step in the chain of reasoning is correct. Further, mathematics introduces us to knowledge gained through the understanding, or through reasoning, rather than through the senses. While children may originally come to accept that $1 + 1 = 2$ by counting cookies, the mature person's belief that $1 + 1 = 2$, always and with no exceptions, seems to have a different basis. Descartes believes that it rests on intellectual understanding: We grasp what a unit is and how the addition operation combines units. It is not mathematical results, but these two striking characteristics of mathematical knowledge, its certainty and its dependence on understanding rather than sensation, that provide illumination for philosophy. Descartes argues that, as with mathematics, certainty must be the touchstone of philosophical truth and the way to that truth must be through the understanding.

The *Meditations on First Philosophy*, reprinted here, is Descartes' most important philosophical treatise. It is an unusual work: Rather than lecturing his readers on the virtues of his conclusions, Descartes invites us to come along with him on the journey of discovering those conclusions. What is required of readers is that we too reflect on the issues that intrigue Descartes, that we ask ourselves such questions as, "If I am thinking, is it possible for me to doubt that I exist?"

Recalling that Descartes wished to bring to philosophy the certainty he discerned in mathematics, it is hardly surprising that the First Meditation begins by attempting to doubt all claims. The doubting has two purposes. Descartes wants to show that beliefs based on sensory data are not certain, thereby establishing the superiority of the understanding in acquiring knowledge. He also wants to discover whether any of our beliefs is in fact immune to doubt. In the Second Meditation, Descartes and his readers come to understand through reasoning that there is a claim that cannot be doubted: When one contemplates one's existence, it is not possible to have the slightest doubt that one does in fact exist. This conclusion is neatly captured in the well-known phrase, *cogito, ergo sum*, or "I think, therefore I am" (although these words do not appear in the *Meditations*). It is crucially important to note that, for Descartes, the "I" in this claim does not refer to a physical person, but to an immaterial mind. "Cartesian dualism" is the view that the world consists of two fundamental types of entities: physical bodies and immaterial minds. Since only minds can think, the *cogito* can only be used to show that a mind exists.

Later in the *Meditations*, Descartes attempts to restore the beliefs that his method of doubt had cast aside, arguing that it is also certain that physical bodies exist. In the Third Meditation, he completes the *cogito* argument and lays the basis for the later arguments concerning the existence of the physical world, contending that any claim that cannot be doubted must actually be true because God exists and would not permit us to be deceived about anything that was completely obvious to us.

Vere Chappell has collected the best recent work on this topic in Descartes' *Meditations* (Lanham, Md.: Rowman & Littlefield, 1997). Anthony Kenny, *Descartes: A Study of His Philosophy* (New York: Random House, 1968) is designed as an introduction for students but also treats those aspects of Descartes' thought that are the most interesting to contemporary philosophers. Another helpful work on the introductory level is John Cottingham, *Descartes* (Oxford: Basil Blackwell, 1986). John Cottingham, ed., *The Cambridge Companion to Descartes* (Cambridge: Cambridge University Press, 1992) offers introductory essays on a variety of important topics. Harry Frankfurt, *Demons, Dreamers, and Madmen: The Defense of Reason in Descartes' Meditations* (Indianapolis: Bobbs-Merrill, 1970) offers an excellent discussion of the first two meditations as does E. M. Curley, *Descartes Against the Skeptics* (Cambridge, Mass.: Harvard University Press, 1978). Peter J. Markie, *Descartes's Gambit* (Ithaca, N.Y.: Cornell University Press, 1986) presents an incisive study of the strategy of Descartes' argumentation. When Descartes first published the *Meditations*, he included a series of objections by contemporaries and his replies to them, which is still a wonderful companion to the *Meditations*. These are available along with other major works of Descartes, including the *Discourse on Method*, the *Principles of Philosophy*, and *The Passions of the Soul*, in *The Philosophical Writings of Descartes*, 2 vols., translated by J. Cottingham, R. Stoothoff, and D. Murdoch (Cambridge: Cambridge University Press, 1985). An influential contemporary critique of Descartes' position is Gilbert Ryle, *The Concept of Mind* (New York: Barnes and Noble, 1949).

DISCOURSE ON THE METHOD FOR CONDUCTING ONE'S REASON WELL AND FOR SEEKING THE TRUTH IN THE SCIENCES

[1] *If this discourse seems too long to be read at one time, it may be divided into six parts. In the first part, you will find various considerations concerning the sciences; in the second part, the chief rules of the method which the author has sought; in the third part, some of the rules of morality which he has derived from this method; in the fourth part, the arguments by which he proves the existence of God and of the human soul, which are the foundations of his metaphysics; in the fifth part, the order of the questions in physics that he has investigated, and particularly the explanation of the movement of the heart and of other difficulties that pertain to medicine, as well as the difference between our soul and that of beasts; and in the final part, what things the author believes are required in order to advance further in the investigation of nature than the author has done, and what reasons have made him write.*

PART ONE

Good sense is the best distributed thing in the world, for everyone thinks himself to be so well endowed [2] with it that even those who are the most difficult to please in everything else are not at all wont to desire more of it than they have. It is not likely that everyone is mistaken in this. Rather, it provides evidence that the power of judging well and of distinguishing the true from the false (which is, properly speaking, what people call “good sense” or “reason”) is naturally equal in all men, and that the diversity of our opinions does not arise from the fact that some people are more reasonable than others, but solely from the fact that we lead our thoughts along different paths and do not take the same things into consideration. For it is not enough to have a good mind; the main thing is to apply it well. The greatest souls are capable of the greatest vices as well as of the greatest virtues. And those who proceed only very slowly can make much greater progress, provided they always follow the right path, than do those who hurry and stray from it.

For myself, I have never presumed that my mind was in any respect more perfect than that of ordinary men. In fact, I have often desired to have as quick a wit, or as keen and distinct an imagination, or as full and responsive a memory as some other people. And other than these I know of no qualities that serve in the perfecting of the mind, for as to reason or sense, inasmuch as it alone makes us men and distinguishes us from the beasts, I prefer to believe that it exists whole and entire in each of us, and in this to follow the opinion commonly held by the philosophers, who [3] say that there are differences of degree only between accidents, but not at all between forms or natures of individuals of the same species.

But I shall have no fear of saying that I think I have been rather fortunate to have, since my youth, found myself on certain paths that have led me to considerations and maxims from which I have formed a method by which, it seems to me, I have the means to increase my knowledge by degrees and to raise it little by little to the highest point which the mediocrity of my mind and the short duration of my life will be able to allow it to attain. For I have already reaped from it such a harvest that, although I try, in judgments I make of myself, always to lean more on the side of diffidence than of presumption, and although, looking with a philosopher's eye at the various actions and enterprises of all men, there is hardly one of them that does not seem to me vain and useless, I cannot but take immense satisfaction in the progress that I think I have already made in the search for truth, and I cannot but envisage such hopes for the future that if, among the occupations of men purely as men, there is one that is solidly good and important, I dare to believe that it is the one I have chosen.

All the same, it could be that I am mistaken, and what I take for gold and diamonds is perhaps nothing but a bit of copper and glass. I know how much we are prone to err in what affects us, and also how much the judgments made by our friends should be [4] distrusted when these judgments are in our favor. But I will be very happy to show in this discourse what paths I have followed and to represent my life in it as if in a picture, so that everyone may judge it for himself; and thus, that, learning from the common response the opinions one will have of it, this may be a new means of teaching myself, which I shall add to those that I am accustomed to using.

Thus my purpose here is not to teach the method that everyone ought to follow in order to conduct his reason well, but merely to show how I have tried to conduct my own. Those who take it upon themselves to give precepts must regard themselves as more competent than those to whom they give them; and if they are found wanting in the least detail, they are to blame. But putting forward this essay merely as a story or, if you prefer, as a fable in which, among some examples one can imitate, one will perhaps also find many others which one will have reason not to follow, I hope that it will be useful to some without being harmful to anyone, and that everyone will be grateful to me for my frankness.

I have been nourished on letters since my childhood, and because I was convinced that by means of them one could acquire a clear and assured knowledge of everything that is useful in life, I had a tremendous desire to master them. But as soon as I had completed this entire course of study, at the end of which one is ordinarily received into the ranks of the learned, I completely changed my mind. For I found myself confounded by so many doubts and errors that it seemed to me that I had not gained any profit from my attempt to teach myself, except that more and more I had discovered my ignorance. And yet I was at one of the most renowned schools of [5] Europe, where I thought there must be learned men, if in fact any such men existed anywhere on earth. There I had learned everything the others were learning; and, not content with the disciplines we were taught there, I had gone through all the books I could lay my hands on that treated those disciplines considered the most curious and most unusual. Moreover, I knew what judgments the others were making about me; and I did not at all see that I was rated inferior to my fellow students, even though there already were some among them who were destined to take the place of our teachers. And finally our age

seemed to me to be just as flourishing and as fertile in good minds as any of the preceding ones. This made me feel free to judge all others by myself, and to think that there was no doctrine in the world that was of the sort that I had previously been led to hope for.

I did not, however, cease to hold in high regard the academic exercises with which we occupy ourselves in the schools. I knew that the languages learned there are necessary for the understanding of classical texts; that the charm of fables awakens the mind; that the memorable deeds recounted in histories uplift it, and, if read with discretion, aid in forming one's judgment; that the reading of all good books is like a conversation with the most honorable people of past ages, who were their authors, indeed, even like a set conversation in which they reveal to us only the best of their thoughts; that oratory has incomparable power and beauty; that poetry has quite ravishing delicacy and sweetness; that mathematics has some very [6] subtle stratagems that can serve as much to satisfy the curious as to facilitate all the arts and to lessen men's labor; that writings dealing with morals contain many lessons and many exhortations to virtue that are very useful; that theology teaches one how to reach heaven; that philosophy provides the means of speaking plausibly about all things and of making oneself admired by the less learned; that jurisprudence, medicine, and the other sciences bring honors and riches to those who cultivate them; and, finally, that it is good to have examined all these disciplines, even the most superstition-ridden and the most false of them, in order to know their true worth and to guard against being deceived by them.

But I believed I had already given enough time to languages, and also to the reading of classical texts, both to their histories and to their fables. For conversing with those of other ages is about the same thing as traveling. It is good to know something of the customs of various peoples, so as to judge our own more soundly and so as not to think that everything that is contrary to our ways is ridiculous and against reason, as those who have seen nothing have a habit of doing. But when one takes too much time traveling, one eventually becomes a stranger in one's own country; and when one is too curious about what commonly took place in past ages, one usually remains quite [7] ignorant of what is taking place in one's own country. Moreover, fables make one imagine many events to be possible which are not so at all. And even the most accurate histories, if they neither alter nor exaggerate the significance of things in order to render them more worthy of being read, almost always at least omit the baser and less noteworthy details. Consequently the rest do not appear as they really are, and those who govern their own conduct by means of examples drawn from these texts are liable to fall into the extravagances of the knights of our romances and to conceive plans that are beyond their powers.

I held oratory in high regard and was enamored of poetry, but I thought both were gifts of the mind, rather than fruits of study. Those who possess the strongest reasoning and who best order their thoughts in order to make them clear and intelligible can always best persuade others of what they are proposing, even if they were to speak only Low Breton¹ and had never learned rhetoric. And those who have the most pleasing rhetorical devices and who know how to express themselves with the most embellishment and sweetness would not fail to be the greatest poets, even if the art of poetry were unknown to them.

I delighted most of all in mathematics because of the certainty and the evidence of its reasonings. But I did not yet notice its true use, and, thinking that it was of service merely to the mechanical arts, I was astonished by the fact that no one had built anything more noble upon its foundations, given that they were so solid and firm. On the other hand, I compared the writings of the ancient pagans that deal with morals to very proud and very magnificent palaces that were built on nothing but sand and mud. They place [8] virtues on a high plateau and make them appear to be valued more than anything else in the world, but they do not sufficiently instruct us about how to recognize them; and often what they call by so fine-sounding a name is nothing more than a kind of insensibility, pride, desperation, or parricide.

I revered our theology, and I desired as much as anyone else to reach heaven; but having learned as something very certain that the road to heaven is open no less to the most ignorant than to the most learned, and that the revealed truths guiding us there are beyond our understanding, I would not have dared to submit them to the frailty of my reasonings. And I thought that, in order to undertake an examination of these truths and to succeed in doing so, it would be necessary to have some extraordinary assistance from heaven and to be more than a man.

Concerning philosophy I shall say only that, seeing that it has been cultivated for many centuries by the most excellent minds that have ever lived and that, nevertheless, there still is nothing in it about which there is not some dispute, and consequently nothing that is not doubtful, I was not at all so presumptuous as to hope to fare any better there than the others; and that, considering how many opinions there can be about the very same matter that are held by learned people without there ever being the possibility of more than one opinion being true, I deemed everything that was merely probable to be well-nigh false.

Then, as for the other sciences, I judged that, insofar as they borrow their principles from philosophy, one could not have built anything solid upon such [9] unstable foundations. And neither the honor nor the monetary gain they promised was sufficient to induce me to master them, for I did not perceive myself, thank God, to be in a condition that obliged me to make a career out of science in order to enhance my fortune. And although I did not make a point of rejecting glory after the manner of a Cynic, nevertheless I placed very little value on the glory that I could not hope to acquire except through false pretenses. And finally, as to the false doctrines, I thought I already knew well enough what they were worth, so as not to be liable to be deceived either by the promises of an alchemist, the predictions of an astrologer, the tricks of a magician, or the ruses or boasts of any of those who profess to know more than they do.

That is why, as soon as age permitted me to emerge from the supervision of my teachers, I completely abandoned the study of letters. And resolving to search for no knowledge other than what could be found within myself, or else in the great book of the world, I spent the rest of my youth traveling, seeing courts and armies, mingling with people of diverse temperaments and circumstances, gathering various experiences, testing myself in the encounters that fortune offered me, and everywhere engaging in such reflection upon the things that presented themselves that I was able to derive some profit from them. For it seemed to me that I could find much more truth in the reasonings that each person makes concerning [10] matters that are important to him, and whose outcome ought to cost him dearly later on if he has judged badly, than in those reasonings engaged in by a man of letters in his study, which touch on speculations that produce no effect and are of no other consequence to him except perhaps that, the more they are removed from common sense, the more pride he will take in them, for he will have to employ that much more wit and ingenuity in attempting to render them plausible. And I have always had an especially great desire to learn to distinguish the true from the false, in order to see my way clearly in my actions, and to go forward with confidence in this life.

It is true that, so long as I merely considered the customs of other men, I found hardly anything there about which to be confident, and that I noticed there was about as much diversity as I had previously found among the opinions of philosophers. Thus the greatest profit I derived from this was that, on seeing many things that, although they seem to us very extravagant and ridiculous, do not cease to be commonly accepted and approved among other great peoples, I learned not to believe anything too firmly of which I had been persuaded only by example and custom; and thus I little by little freed myself from many errors that can darken our natural light and render us less able to listen to reason. But after I had spent some years thus studying in the book of the world and in trying to gain some experience, I resolved one day to study within myself too and to spend all the powers of [11] my mind in choosing the paths that I should follow. In this I had much more success, it seems to me, than had I never left either my country or my books.

PART TWO

I was then in Germany, where the occasion of the wars which are not yet over there² had called me; and as I was returning to the army from the coronation of the emperor, the onset of winter detained me in quarters where, finding no conversation to divert me and fortunately having no worries or passions to trouble me, I remained for an entire day shut up by myself in a stove-heated room,³ where I was completely free to converse with myself about my thoughts. Among them, one of the first was that it occurred to me to consider that there is often not so much perfection in works composed of many pieces and made by the hands of various master craftsmen as there is in those works on which but a single individual has worked. Thus one sees that buildings undertaken and completed by a single architect are usually more attractive and better ordered than those which many architects have tried to patch up by using old walls that had been built for other purposes. Thus those ancient cities that were once mere villages and in the course of time have become large towns are usually so poorly laid out, compared to those well-ordered places that an engineer traces out on a vacant plain as it suits his fancy, that even though, upon considering each building one by one in the former sort, one often finds as much, if not more, art than one finds in those of the latter sort, still, upon seeing how the buildings are arranged — here a large one, there a small one — and how they make the streets crooked and uneven, one would say that it is chance rather [12] than the will of some men using reason that has arranged them thus. And if one considers that there have nevertheless always been officials responsible for seeing that private buildings contribute to the attractiveness of public areas, one will well understand that it is difficult to make things that are very finely crafted by laboring only on the works of others. Thus I imagined that peoples who, having once been half savages and having been civilized only little by little, have made their laws only to the extent that the inconvenience due to crimes and quarrels have forced them to do so, could not be as well ordered as those who, from the very beginning of their coming together, have followed the fundamental precepts of some prudent legislator. Likewise, it is quite certain that the state of the true religion, whose ordinances were made by God alone, must be incomparably better ordered than all the others. And, speaking of things human, I believe that if Sparta was at one time very flourishing, this was not because of the goodness of each one of its laws taken by itself, seeing that many of them were very strange and even contrary to good morals, but because, having been devised by a single individual, they all tended toward the same end. And thus I thought that book learning, at least the kind whose reasonings are merely probable and that do not have any demonstrations, having been composed and enlarged little by little from the opinions of many different persons, does not draw nearly so close to the [13] truth as the simple reasonings that a man of good sense can naturally make about the things he encounters. And thus, too, I thought that, because we were all children before being men and because for a long time it was necessary for us to be governed by our appetites and our teachers (which were frequently in conflict with one another, and of which perhaps neither always gave us the best advice), it is nearly impossible for our judgments to be as pure or as solid as they would have been if we had had the full use of our reason from the moment of our birth and if we had always been guided by it alone.

It is true that we never see anyone pulling down all the houses in a city for the sole purpose of rebuilding them in a different style and of making the streets more attractive; but one does see very well that many people tear down their own houses in order to rebuild them, and that in some cases they are even forced to do so when their houses are in danger of collapsing and when the foundations are not very secure. This example persuaded me that it would not really be at all reasonable for a single individual to plan to reform a state by changing everything in it from the foundations up and by toppling it in order to set it up again, nor even also to reform the body of the sciences or the order established in the schools for teaching them; but that, as regards all the opinions to which I had until now given credence, I could not do better than to try to get rid of them once and for all, in order to replace [14] them later on, either with other ones that are better, or even with the same ones once I had reconciled them to the norms of reason. And I firmly believed that by this means I would succeed in conducting my life much better than if I were to build only upon old foundations and if I were to rely only on the principles of which I had allowed myself to be persuaded in my youth without ever having examined whether they were true. For although I noticed various difficulties in this undertaking, still they were not irremediable, nor were they comparable to those difficulties occurring in the reform of the least things that affect the public. These great bodies are too difficult to raise up once they have been knocked down, or even to hold up once they have been shaken; and their fall can only be very violent. Moreover, as to their imperfections, if they have any (and the mere fact of the diversity that exists among them suffices to assure one that many do have imperfections), custom has doubtless greatly mitigated them and has even prevented or imperceptibly corrected many of them, against which prudence could not provide so well. And finally, these imperfections are almost always more tolerable than changing them would be; similarly, the great

roads that wind through mountains little by little become so smooth and so convenient by dint of being frequently used, that it is much better to follow them than to try to take a more direct route by climbing over rocks and descending to the bottom of precipices.

That is why I could in no way approve of those troublemaking and restless personalities who, called neither by their birth nor by their fortune to manage public affairs, are forever coming up with an idea for some new reform in this matter. And if I thought there were in this writing the slightest thing by means [15] of which one might suspect me of such folly, I would be very sorry to permit its publication. My plan has never gone beyond trying to reform my own thoughts and building upon a foundation which is completely my own. And if, my work having pleased me sufficiently, I here show you a model of it, it is not for the reason that I would wish to advise anyone to imitate it. Perhaps those with whom God has better shared his graces will have more lofty plans; but I fear that even this one here may already be too daring for many. The single resolution to rid oneself of all the opinions to which one has heretofore given credence is not an example that everyone ought to follow; and the world consists almost exclusively of two kinds of minds for whom it is not at all suitable. First, there are those who, believing themselves more capable than they are, are unable to avoid being hasty in their judgments or to have enough patience to conduct all their thoughts in an orderly manner; as a result, if they have once taken the liberty of doubting the principles they had accepted and of straying from the common path, they could never keep to the path one must take in order to go in a more straightforward direction, and they would remain lost all their lives. Second, there are those who have enough reason or modesty to judge that they are less capable of distinguishing the true from the false than certain others by whom they can be instructed; they should content themselves more with following the opinions of these others than with looking for better ones themselves.

And as for myself, I would unquestionably have [16] been counted among these latter persons if I had always had only one master or if I had not known at all the differences that have always existed among the opinions of the most learned. But I had learned in my college days that one cannot imagine anything so strange or so little believable that it had not been said by one of the philosophers, and since then, I had recognized in my travels that all those who have sentiments quite contrary to our own are not for that reason barbarians or savages, but that many of them use their reason as much as or more than we do. And I considered how one and the same man with the very same mind, were he brought up from infancy among the French or the Germans, would become different from what he would be had he always lived among the Chinese or the cannibals, and how, even down to the styles of our clothing, the same thing that pleased us ten years ago, and that perhaps will again please us ten years hence, now seems to us extravagant and ridiculous. Thus it is more custom and example that persuades us than any certain knowledge; and yet the majority opinion is worthless as a proof of truths that are at all difficult to discover, since it is much more likely that one man would have found them than a whole multitude of people. Hence I could not choose anyone whose opinions seemed to me should be preferred over those of the others, and I found myself, as it were, constrained to try to guide myself on my own.

But, like a man who walks alone and in the [17] dark, I resolved to go so slowly and to use so much circumspection in all things that, if I advanced only very slightly, at least I would effectively keep myself from falling. Nor did I want to begin to reject totally any of the opinions that had once been able to slip into my head without having been introduced there by reason, until I had first spent sufficient time planning the work I was undertaking and seeking the true method for arriving at the knowledge of everything of which my mind would be capable.

When I was younger, I had studied, among the parts of philosophy, a little logic, and among those of mathematics, a bit of geometrical analysis and algebra—three arts or sciences that, it seemed, ought to contribute something to my plan. But in examining them, I noticed that, in the case of logic, its syllogisms and the greater part of its other lessons served more to explain to someone else the things one knows, or even, like the art of Lully,⁴ to speak without judgment concerning matters about which one is ignorant, than to learn them. And although, in effect, it might well contain many very true and very good precepts, nevertheless there are so many others mixed up with them that are either harmful or superfluous, that it is almost as difficult to separate the latter precepts from the former as it is to draw a Diana or a Minerva from a block of marble that has not yet been hewn. Then, as to the analysis of the ancients and the algebra of the moderns, apart from the fact that they apply only to very abstract matters and seem to be of no use, the former is always so closely tied to the consideration of figures that it cannot exercise the understanding without greatly fatiguing the imagination; and in the [18] case of the latter, one is so subjected to certain rules and to certain symbols, that out of it there results a confused and obscure art that encumbers the mind, rather than a science that cultivates it. That is why I thought it necessary to search for some other method embracing the

advantages of these three yet free from their defects. And since the multiplicity of laws often provides excuses for vices, so that a state is much better ruled when it has but very few laws and when these are very strictly observed; likewise, in place of the large number of precepts of which logic is composed, I believed that the following four rules would be sufficient for me, provided I made a firm and constant resolution not even once to fail to observe them:

The first was never to accept anything as true that I did not plainly know to be such; that is to say, carefully to avoid hasty judgment and prejudice; and to include nothing more in my judgments than what presented itself to my mind so clearly and so distinctly that I had no occasion to call it in doubt.

The second, to divide each of the difficulties I would examine into as many parts as possible and as was required in order better to resolve them.

The third, to conduct my thoughts in an orderly fashion, by commencing with those objects that are simplest and easiest to know, in order to ascend little by little, as by degrees, to the knowledge of the most composite things, and by supposing an order even [19] among those things that do not naturally precede one another.

And the last, everywhere to make enumerations so complete and reviews so general that I was assured of having omitted nothing.

Those long chains of utterly simple and easy reasonings that geometers commonly use to arrive at their most difficult demonstrations had given me occasion to imagine that all the things that can fall within human knowledge follow from one another in the same way, and that, provided only that one abstain from accepting any of them as true that is not true, and that one always adheres to the order one must follow in deducing the ones from the others, there cannot be any that are so remote that they are not eventually reached nor so hidden that they are not discovered. And I was not very worried about trying to find out which of them it would be necessary to begin with; for I already knew that it was with the simplest and easiest to know. And considering that, of all those who have hitherto searched for the truth in the sciences, only mathematicians have been able to find any demonstrations, that is to say, certain and evident reasonings, I did not at all doubt that it was with these same things that they had examined [that I should begin]; although I expected from them no other utility but that they would accustom my mind to nourish itself on truths and not to be content with false reasonings. But it was not my plan on that account to try to learn all those particular sciences commonly called “mathematical”; and seeing that, even though their objects differed, these sciences [20] did not cease to be all in accord with one another in considering nothing but the various relations or proportions which are found in their objects, I thought it would be more worthwhile for me to examine only these proportions in general, and to suppose them to be only in subjects that would help me make the knowledge of them easier, and without at the same time in any way restricting them to those subjects, so that later I could apply them all the better to everything else to which they might pertain. Then, having noted that, in order to know these proportions, I would sometimes need to consider each of them individually, and sometimes only to keep them in mind, or to grasp many of them together, I thought that, in order better to consider them in particular, I ought to suppose them to be relations between lines, since I found nothing more simple, or nothing that I could represent more distinctly to my imagination and to my senses; but that, in order to keep them in mind or to grasp many of them together, I would have to explicate them by means of certain symbols, the briefest ones possible; and that by this means I would be borrowing all that is best in geometrical analysis and algebra, and correcting all the defects of the one by means of the other.

In fact, I dare say the strict adherence to these few precepts I had chosen gave me such facility for disentangling all the questions to which these two sciences extend, that, in the two or three months I spent examining them, having begun with the simplest and most general, and each truth that I found being a rule that [21] later helped me to find others, not only did I arrive at a solution of many problems that I had previously judged very difficult, but also it seemed to me toward the end that, even in those instances where I was ignorant, I could determine by what means and how far it was possible to resolve them. In this perhaps I shall not seem to you to be too vain, if you will consider that, there being but one truth with respect to each thing, whoever finds this truth knows as much about a thing as can be known; and that, for example, if a child who has been instructed in arithmetic has made an addition following its rules, he can be assured of having found everything regarding the sum he was examining that the human mind would know how to find. For ultimately, the method that teaches one to follow the true order and to enumerate exactly all the circumstances of what one is seeking contains everything that gives certainty to the rules of arithmetic.

But what pleased me most about this method was that by means of it I was assured of using my reason in everything, if not perfectly, at least as well as was in my power; and in addition that I felt that in practicing this method my mind was little by little getting into the habit of conceiving its objects more rigorously and

more distinctly and that, not having restricted the method to any particular subject matter, I promised myself to apply it as usefully to the problems of the other sciences as I had to those of algebra. Not that, on this account, I would have dared at the outset to undertake an examination of all the problems that presented themselves, for that would itself have been contrary to the order prescribed by the method. But having noted that the principles of these sciences must all be derived from philosophy, in which I did [22] not yet find any that were certain, I thought that it was necessary for me first of all to try to establish some there and that, this being the most important thing in the world, and the thing in which hasty judgment and prejudice were most to be feared, I should not try to accomplish that objective until I had reached a much more mature age than that of merely twenty-three, which I was then, and until I had first spent a great deal of time preparing myself for it, as much in rooting out from my mind all the wrong opinions that I had accepted before that time as in accumulating many experiences, in order for them later to be the subject matter of my reasonings, and in always practicing the method I had prescribed for myself so as to strengthen myself more and more in its use.

PART THREE

And finally, just as it is not enough, before beginning to rebuild the house where one is living, simply to pull it down, and to make provision for materials and architects or to train oneself in architecture, and also to have carefully drawn up the building plans for it; but it is also necessary to be provided with someplace else where one can live comfortably while working on it; so, too, in order not to remain irresolute in my actions while reason required me to be so in my judgments, and in order not to cease to live as happily as possible during this time, I formulated a provisional code of morals, which consisted of but three or four maxims, which I very much want to share with you.

The first was to obey the laws and the customs of my country, constantly holding on to the religion in [23] which, by God's grace, I had been instructed from my childhood, and governing myself in everything else according to the most moderate opinions and those furthest from excess—opinions that were commonly accepted in practice by the most judicious of those with whom I would have to live. For, beginning from then on to count my own opinions as nothing because I wished to submit them all to examination, I was assured that I could not do better than to follow those of the most judicious. And although there may perhaps be people among the Persians or the Chinese just as judicious as there are among ourselves, it seemed to me that the most useful thing was to rule myself in accordance with those with whom I had to live, and that, in order to know what their opinions truly were, I ought to pay attention to what they did rather than to what they said, not only because in the corruption of our morals there are few people who are willing to say everything they believe, but also because many do not know what they believe, for, given that the action of thought by which one believes something is different from that by which one knows that one believes it, the one often occurs without the other. And among many opinions that are equally accepted, I would choose only the most moderate, not only because they are always the most suitable for practical affairs and probably the best (every excess usually being bad), but also so as to stray less from the true path, in case I should be mistaken, than if I had chosen one of the two extremes when it was the other one I should have followed. And in [24] particular I counted among the excesses all the promises by which one curtails something of one's freedom. Not that I disapproved of laws that, to remedy the inconstancy of weak minds, permit someone, when he has a good plan or even, for the security of commerce, some plan that is merely indifferent, to make vows or contracts that oblige him to persevere in it, but because I saw nothing in the world that always remained in the same state, and because, for my part, I promised myself to improve my judgments more and more, and never to make them worse, I would have thought I committed a grave indiscretion against good sense if, having once approved of something, I had obliged myself to take it as good again later, when perhaps it might have stopped being so or when I might have stopped considering it as such.

My second maxim was to be as firm and resolute in my actions as I could, and to follow the most doubtful opinions, once I had decided on them, with no less constancy than if they had been very well assured. In this I would be imitating travelers who, finding themselves lost in some forest, should not wander about turning this way and that, nor, worse still, stop in one place, but should always walk in as straight a line as they can in one direction and never change it for feeble reasons, even if at the outset it had perhaps been only chance that made them choose it, for by this means, even if they are not going exactly where they wish, at least they will eventually arrive somewhere where they will probably be better off than in the middle of a forest. And thus the actions of life often tolerating no delay, it is a very certain truth that, [25] when it is not in our power to discern the truest opinions, we must follow the most probable, and even if we notice no more probability in some than in others, nevertheless we must settle on some, and afterwards no longer regard them as doubtful, insofar as they relate to practical matters, but as very true and very certain, because the reason that made us decide on them appears so. And from then on this was able to free me from all the regret and remorse that usually agitate the consciences of those frail and irresolute minds that allow themselves inconstantly to go about treating as if good things they later judge to be bad.

My third maxim was always to try to conquer myself rather than fortune, and to change my desires rather than the order of the world, and generally to accustom myself to believing that there is nothing that is completely within our power except our thoughts, so that, after we have done our best regarding things external to us, everything that is lacking for us to succeed is, from our point of view, absolutely impossible. And this alone seemed to me sufficient to prevent me in the future from desiring anything but what I was to acquire, and thus to make me contented. For, our will tending by nature to desire only what our [26] understanding represents to it as somehow possible, it is certain that, if we consider all the goods that are outside us as equally beyond our power, we will have no more regrets about lacking those that seem owed to us as our birthright when we are deprived of them through no fault of our own, than we have in not

possessing the kingdoms of China or Mexico, and that, making a virtue of necessity, as they say, we shall no more desire to be healthy if we are sick, or to be free if we are in prison, than we now do to have a body made of a material as incorruptible as diamonds, or wings to fly like birds. But I admit that long exercise is needed as well as frequently repeated meditation, in order to become accustomed to looking at everything from this point of view; and I believe that it is principally in this that the secret of those philosophers consists, who in earlier times were able to free themselves from fortune's domination and who, despite sorrows and poverty, could rival their gods in happiness. For occupying themselves ceaselessly with considering the limits prescribed to them by nature, they so perfectly persuaded themselves that nothing was in their power but their thoughts, that this alone was sufficient to prevent them from having any affection for other things, and they controlled their thoughts so absolutely that in this they had some reason for reckoning themselves richer, more powerful, freer, and happier than any other men who, not having this philosophy, never thus controlled everything they wished to control, however favored by [27] nature and fortune they might be.

Finally, to conclude this code of morals, I took it upon myself to review the various occupations that men have in this life, in order to try to choose the best one, and, not wanting to say anything about the occupations of others, I thought I could not do better than to continue in that very one in which I found myself, that is to say, spending my whole life cultivating my reason and advancing, as far as I could, in the knowledge of the truth, following the method I had prescribed to myself. I had met with such extreme contentment since the time I had begun to make use of this method, that I did not believe one could obtain any sweeter or more innocent contentment in this life, and, discovering every day by its means some truths that to me seemed quite important and commonly ignored by other men, the satisfaction I had from them so filled my mind that nothing else was of any consequence to me. In addition, the three preceding maxims were founded solely on the plan I had of continuing to instruct myself, for since God has given each of us some light to distinguish the true from the false, I would not have believed I ought to rest content for a single moment with the opinions of others, had I not proposed to use my own judgment to examine them when there would be time; and I would not have been able to free myself of scruples in following these opinions, had I not hoped that [28] I would not, on that account, lose any opportunity of finding better ones, in case there were any. And finally, I could not have limited my desires or have been content, had I not followed a path by which, thinking I was assured of acquiring all the knowledge of which I was capable, I thought I was assured by the same means of the knowledge of all the true goods that would ever be in my power. For, given that our will tends not to pursue or flee anything unless our understanding represents it to the will as either good or bad, it suffices to judge well in order to do well, and to judge as best one can, in order also to do one's very best, that is to say, to acquire all the virtues and in general all the other goods that one could acquire, and, when one is certain that this is the case, one could not fail to be contented.

When I had thus assured myself of these maxims and put them to one side along with the truths of the faith, which have always held first place among my beliefs, I judged that, as for the rest of my opinions, I could freely undertake to rid myself of them. And inasmuch as I hoped to be able to reach my goal better by conversing with men than by staying shut up any longer in the stove-heated room⁵ where I had had all these thoughts, the winter was not yet over when I set out again on my travels. And in all the nine years that followed I did nothing but wander here and there in the world, trying to be more a spectator than an actor in all the comedies that are played out there; and reflecting particularly in each matter on what might render it suspect and give us occasion for erring, I meanwhile rooted out from my mind all the [29] errors that had previously been able to slip into it. Not that, in order to do this, I was imitating the skeptics who doubt merely for the sake of doubting and put on the affectation of being perpetually undecided, for, on the contrary, my entire plan tended simply to give me assurance and to cast aside the shifting earth and sand in order to find rock or clay. In this I was quite successful, it seems to me, inasmuch as, trying to discover the falsity or the uncertainty of the propositions I was examining, not by feeble conjectures but by clear and certain reasonings, I never found any that was so doubtful that I could not draw from it some quite certain conclusion, even if it had been merely that it contained nothing certain. And just as in tearing down an old house, one usually saves the wreckage for use in building a new one, similarly, in destroying all those opinions of mine that I judged to be poorly founded, I made various observations and acquired many experiences that have since served me in establishing more certain opinions. Moreover, I continued to practice the method I had prescribed for myself, for, besides taking care generally to conduct all my thoughts according to its rules, from time to time I set aside some hours that I spent particularly in applying it to mathematical problems, or even also to some other problems that I could make as it were similar to those of mathematics, by detaching them from all the principles of the other sciences, which I did not find to be sufficiently firm, as you will see I have done in many problems that are explained in this volume.⁶ And thus, without living any differently in outward

appearance than do those who, having no task but to live a sweet and innocent life, make a [30] point of separating pleasures from vices, and who, in order to enjoy their leisure without becoming bored, involve themselves in all sorts of honest diversions, I did not cease to carry out my plan and to progress in the knowledge of the truth, perhaps more than if I had done nothing but read books or keep company with men of letters.

Nevertheless, those nine years slipped by before I had as yet taken any stand regarding the difficulties commonly debated among learned men, or had begun to seek the foundations of any philosophy that was more certain than the commonly accepted one. And the example of many excellent minds, who had previously had this plan and had not, it seemed to me, succeeded in it, made me imagine so much difficulty in it that perhaps I would not have dared to undertake it so soon again, if I had not seen that some had already spread the rumor that I had achieved my goal. I cannot say on what they based this opinion, and if I have contributed something to it by my conversation, this must have been because I confessed that of which I was ignorant more ingenuously than those who have studied only a little are in the habit of doing, and perhaps also because I showed the reasons I had for doubting many things that other people regard as certain, rather than because I was boasting of any learning. But having a good enough heart not to want someone to take me for something other than I was, I thought it necessary to try by every means to render myself worthy of the reputation that was bestowed on [31] me. And it is exactly eight years ago that this desire made me resolve to take my leave of all those places where I might have acquaintances, and to retire here, to a country where the long duration of the war has led to the establishment of such well-ordered discipline that the armies quartered here seem to serve only to make one enjoy the fruits of peace with even greater security, and where, in the midst of the crowd of a great and very busy people who are more concerned with their own affairs than they are curious about those of others, I have been able, without lacking any of the amenities to be found in the most bustling cities, to live as solitary and as withdrawn a life as I could in the remotest deserts.

PART FOUR

I do not know whether I ought to tell you about the first meditations I engaged in there, for they are so metaphysical and so out of the ordinary that perhaps they will not be to everyone's liking. And yet, in order that it should be possible to judge whether the foundations I have laid are sufficiently firm, I find myself in some sense forced to talk about them. For a long time I had noticed that in matters of morality one must sometimes follow opinions that one knows to be quite uncertain, just as if they were indubitable, as has been said above, but because I then desired to devote myself exclusively to the search for the truth, I thought it necessary that I do exactly the opposite, and that I reject as absolutely false everything in which I could imagine the least doubt, in order to see whether, after this process, something in my [32] beliefs remained that was entirely indubitable. Thus, because our senses sometimes deceive us, I wanted to suppose that nothing was exactly as they led us to imagine. And because there are men who make mistakes in reasoning, even in the simplest matters in geometry, and who commit paralogisms, judging that I was just as prone to err as any other, I rejected as false all the reasonings that I had previously taken for demonstrations. And finally, considering the fact that all the same thoughts we have when we are awake can also come to us when we are asleep, without any of them being true, I resolved to pretend that all the things that had ever entered my mind were no more true than the illusions of my dreams. But immediately afterward I noticed that, while I wanted thus to think that everything was false, it necessarily had to be the case that I, who was thinking this, was something. And noticing that this truth — *I think, therefore I am* — was so firm and so assured that all the most extravagant suppositions of the skeptics were incapable of shaking it, I judged that I could accept it without scruple as the first principle of the philosophy I was seeking.

Then, examining with attention what I was, and seeing that I could pretend that I had no body and that there was no world nor any place where I was, I could not pretend, on that account, that I did not exist at all, and that, on the contrary, from the very fact that I thought of doubting the truth of other things, it followed very evidently and very certainly that I [33] existed; whereas, on the other hand, had I simply stopped thinking, even if all the rest of what I had ever imagined had been true, I would have had no reason to believe that I had existed. From this I knew that I was a substance the whole essence or nature of which is simply to think, and which, in order to exist, has no need of any place nor depends on any material thing. Thus this "I," that is to say, the soul through which I am what I am, is entirely distinct from the body and is even easier to know than the body, and even if there were no body at all, it would not cease to be all that it is.

After this, I considered in general what is needed for a proposition to be true and certain, for since I had just found one of them that I knew to be such, I thought I ought also to know in what this certitude consists. And having noticed that there is nothing at all in this *I think, therefore I am* that assures me that I am speaking the truth, except that I see very clearly that, in order to think, it is necessary to exist, I judged that I could take as a general rule that the things we conceive very clearly and very distinctly are all true, but that there is merely some difficulty in properly discerning which are those that we distinctly conceive.

Following this, reflecting upon the fact that I doubted and that, as a consequence, my being was not utterly perfect (for I saw clearly that it is a greater perfection to know than to doubt), I decided to search for the source from which I had learned to think of something more perfect than I was, and I plainly [34] knew that this had to be from some nature that was in fact more perfect. As to those thoughts I had of many other things outside me, such as the heavens, the earth, light, heat, and a thousand others, I had no trouble at all knowing where they came from, because, noticing nothing in them that seemed to me to make them superior to me, I could believe that, if they were true, they were dependencies of my nature, insofar as it had some perfection, and that, if they were not true, I obtained them from nothing, that is to say, they were in me because I had some defect. But the same could not hold for the idea of a being more perfect than my own, for it is a manifest contradiction to receive this idea from nothing, and because it is no less a contradiction that something more perfect should follow from and depend upon something less perfect than that something should come from nothing, I could not obtain it from myself. It thus remained that this idea had been placed in me by a nature truly more perfect than I was and that it even had within itself all the perfections of which I could have any idea, that is to say, to explain myself in a single word, that it was God. To this I added that, since I knew of some perfections that I did not at all possess, I was not the only being that existed (here, if you please, I shall freely use the terminology of the School), but that of necessity there must be something else more perfect, upon which I depended, and from which I had acquired all that I had. For, had I been alone and independent of [35] everything else, so that I had had from myself all that small amount of perfection in which I participated in the perfect being, I would have been able, for the same reason, to have from myself everything else I knew I lacked, and thus to be myself infinite, eternal, unchanging, all-knowing, all-powerful;

in short, to have all the perfections I could observe to be in God. For, following the reasonings I have just gone through, in order to know the nature of God, so far as my own nature was capable of doing so, I had only to consider, regarding all the things of which I found in myself some idea, whether or not it was a perfection to possess them, and I was assured that none of those that indicated any imperfection were in God, but that all others were in him. Thus I saw that doubt, inconstancy, sadness, and the like could not be in God, since I myself would have been happy to be exempt from them. Then, besides this, I had ideas of a number of sensible and corporeal things, for even if I were to suppose that I was dreaming and that everything I saw or imagined was false, I still could not deny that the ideas of these things were truly in my thought. But since I had already recognized very clearly in myself that intelligent nature is distinct from corporeal nature, taking into consideration that all composition attests to dependence and that dependence is manifestly a defect, I judged from this that being composed of these two natures could not be a perfection in God and that, as a consequence, God was not thus composed, but that, if there are bodies in the world, or even intelligences, or other natures [36] that were not at all entirely perfect, their being had to depend on God's power in such wise that they could not subsist without God for a single moment.

After this, I wanted to search for other truths, and, having set before myself the object dealt with by geometers, which I conceived of as a continuous body or a space indefinitely extended in length, breadth, and height or depth, divisible into various parts which could have various shapes and sizes and which may be moved or transposed in all sorts of ways—for the geometers assume all this in their object—I went through some of their simplest demonstrations. And, having noted that the great certitude that everyone attributes to these demonstrations is founded exclusively on the fact that they are plainly conceived, following the rule that I mentioned earlier, I also noted that there was nothing at all in them that assured me of the existence of their object. For I saw very well that if one supposed, for example, a triangle, it was necessary for its three angles to be equal to two right angles, but I did not see anything in all this to assure me that there was any triangle existing in the world. On the other hand, returning to examine the idea I had of a perfect being, I found that existence was contained in it in the same way in which the equality of its three angles to two right angles is contained in the idea of a triangle, or that the equidistance of all its parts from its center is contained in the idea of a sphere, or even more plainly still, and that, consequently, it is, at the very least, just as certain that God, who is this perfect being, is or exists, as any demonstration in geometry could be.

But what brings it about that there are many people [37] who are persuaded that it is difficult to know this and also even to know what their soul is is that they never lift their minds above sensible things and that they are so accustomed to consider nothing except by imagining it (which is a way of thinking appropriate for material things), that everything unimaginable seems to them unintelligible. This is obvious enough from the fact that even philosophers take it as a maxim in the schools that there is nothing in the understanding that has not first been in the senses, where it is nevertheless certain that the ideas of God and the soul have never been. And it seems to me that those who want to use their imagination in order to grasp these ideas are doing the very same thing as if, in order to hear sounds or to smell odors, they wanted to use their eyes. There is just this difference: the sense of sight assures us no less of the truth of its objects than do the senses of smell or hearing, whereas neither our imagination nor our senses could ever assure us of anything if our understanding did not intervene.

Finally, if there still are men who have not been sufficiently persuaded of the existence of God and of their soul by means of the reasons I have brought forward, I very much want them to know that all the other things of which they think themselves perhaps more assured, such as having a body, that there are stars and an earth, and the like, are less certain. For although one might have a moral assurance about these things, which is such that it seems one cannot [38] doubt them without being extravagant, still when it is a question of metaphysical certitude, it seems unreasonable for anyone to deny that there is not a sufficient basis for one's being completely assured about them, when one observes that while asleep one can, in the same fashion, imagine that one has a different body and that one sees different stars and a different earth, without any of these things being the case. For how does one know that the thoughts that come to us in dreams are any more false than the others, given that they are often no less vivid and explicit? And even if the best minds study this as much as they please, I do not believe they can give any reason sufficient to remove this doubt, unless they presuppose the existence of God. For first of all, even what I have already taken for a rule, namely that the things we very clearly and very distinctly conceive are all true, is assured only for the reason that God is or exists, and that he is a perfect being, and that all that is in us comes from him. It follows from this that our ideas or notions, being real things and coming from God, cannot, in all that is clear and distinct in them, be anything but true. Thus, if we quite often have ideas that contain some falsity, this can only be the case with respect to things that have something confused or obscure about them, because in this respect they participate in nothing; that is, they are thus confused in us only because we are not perfect. And it is evident that it is no

less a contradiction that falsity or imperfection as [39] such proceeds from God, than that truth or perfection proceeds from nothing. But if we did not know that all that is real and true in us comes from a perfect and infinite being, however clear and distinct our ideas were, we would have no reason that assured us that they had the perfection of being true.

But once the knowledge of God and the soul has thus made us certain of this rule, it is very easy to know that the dreams we imagine while asleep ought in no way to make us doubt the truth of the thoughts we have while awake. For if it did happen, even while asleep, that one had a very distinct idea (as, for example, if a geometer found some new demonstration), one's being asleep would not prevent its being true. And as to the most common error of our dreams, which consists in the fact that they represent to us various objects in the same way as our external senses do, it does not matter that it gives us occasion to question the truth of such ideas, since they can also deceive us quite often without our being asleep, such as when those with jaundice see everything as yellow, or when the stars or other very distant bodies appear to us much smaller than they are. For finally, whether awake or asleep, we should never allow ourselves to be persuaded except by the evidence of our reason. And it is to be observed that I say "of our reason," and not "of our imagination" or "of our senses." Even [40] though we see the sun very clearly, we should not on that account judge that it is only as large as we see it, and we can well imagine distinctly the head of a lion grafted onto the body of a goat, without having to conclude for that reason that there is a chimera in the world, for reason does not at all dictate to us that what we thus see or imagine is true. But it does dictate to us that all our ideas or notions must have some foundation of truth, for it would not be possible that God, who is all-perfect and all-truthful, would have put them in us without that. And because our reasonings are never so evident nor so complete while we are asleep as they are while we are awake, even though our imaginings while we are asleep are sometimes just as vivid and explicit as those we have while we are awake, or even more so, reason also dictates to us that our thoughts cannot all be true, since we are not all-perfect; what truth there is in them must infallibly be encountered in those we have when we are awake rather than in those we have in our dreams.

PART FIVE

I would be quite happy to continue and to show here the whole chain of other truths that I have deduced from these first ones. But because, in order to do this, it would now be necessary for me to speak about many questions that are a matter of controversy among the learned, with whom I have no desire to get into any quarrel, I believe it will be better for me to abstain from this and to state only in a general way what these questions are, in order to let those who are wiser judge whether it would be useful for the public to be more particularly informed about them. I have always remained firm in the resolution I had made not to [41] suppose any principle but the one I have just used to demonstrate the existence of God and of the soul, and not to accept anything as true that did not seem to me clearer and more certain than the demonstrations of the geometers had hitherto seemed. And, nevertheless, I dare say not only that have I found a means of satisfying myself within a short time regarding all the principal difficulties commonly treated in philosophy, but also that I have noted certain laws that God has so established in nature, and of which he has impressed in our souls such notions, that, after having reflected sufficiently on these matters, we cannot doubt that they are strictly adhered to in everything that exists or occurs in the world. Moreover, in considering the consequences of these laws, it seems to me that I have discovered many truths more useful and more important than all that I had previously learned or even hoped to learn.

But because I have tried to explain the principal ones among these truths in a treatise that certain considerations prevented me from publishing,⁷ I could not make them better known than by stating here in summary form what the treatise contains. I had intended to include in it everything that I thought I knew, before writing it down, concerning the nature of material things. But just as painters, who are unable to represent equally well on a flat surface all the various sides of a solid body, choose one of the principal sides which they place alone facing the light of day, and, by darkening the rest with shadows, make them appear only as they can be seen by someone [42] who is looking at the principal side, just so, fearing I could not put into my discourse everything I had in mind about it, I undertook in it merely to speak at length about what I conceived with respect to light; then, at the proper time, to add something about the sun and the fixed stars, because light proceeds almost entirely from them; something about the heavens, because they transmit light; about planets, comets, and the earth, because they reflect light; and, in particular, about all terrestrial bodies, because they are either colored, or transparent, or luminous; and finally, about man, because he is the observer of these things. All the same, to cast all these things a little in shadow and to be able to say more freely what I judged about them without being obliged either to follow or to refute the opinions that are accepted among the learned, I resolved to leave this entire world here to their disputes, and to speak only of what would happen in a new world, were God now to create enough matter to compose it, somewhere in imaginary spaces, and were he to agitate in various ways and without order the different parts of this matter, so that he composed from it a chaos as confused as any the poets could concoct and that later he did no more than apply his ordinary concurrence to nature, and let nature act in accordance with the laws he had established. Thus, first, I described this matter and tried to represent it in such a way that there is nothing in the world, it seems to me, clearer and more intelligible, [43] with the exception of what has already been said about God and the soul, for I even explicitly supposed that in this matter there were none of those forms or qualities about which disputes occur in the schools, nor generally anything the knowledge of which was not so natural to our souls that one could not even pretend to be ignorant of it. Moreover, I showed what the laws of nature were, and, without supporting my reasons on any other principle but the infinite perfections of God, I tried to demonstrate all those laws about which one might have been able to have any doubt and to show that they are such that, even if God had created many worlds, there could not be any of them in which these laws failed to be observed. After that, I showed how, as a consequence of these laws, the greater part of the matter of this chaos had to be disposed and arranged in a certain way, which made it similar to our heavens; how, at the same time, some of its parts had to compose an earth; others, planets and comets; and still others, a sun and fixed stars. And here, dwelling on the subject of light, I explained at some length what this light was that had to be found in the sun and the stars, and how from thence it travelled in an instant across the immense spaces of the heavens, and how it was reflected from the planets and comets to the earth. To this I added also a number of things touching on the substance, position, motions, and all the various qualities of these heavens and these stars; and as a result, I thought I said enough on these matters to show that there is nothing to be observed in the things of this world which should not, or at least could not, have [44] appeared entirely similar in those of the world I was describing. From there, I went on to speak in particular about the earth: how, although I had expressly supposed that God had not put any weight⁸ in the matter out of which the earth was composed, none of its parts ceased to tend precisely toward its center; how, there being water and air on its

surface, the disposition of the heavens and of the stars, principally of the moon, had to cause there an ebb and flow similar in all respects to what we observe in our seas, and, in addition, a certain coursing, as much of the water as of the air, from east to west, such as is also observed between the tropics; how mountains, seas, springs, and rivers could naturally be formed there, and how metals could make their way into mines there; how plants could grow naturally in the fields there, and generally how all the bodies called “mixed” or “composed” could be engendered there. And, among other things, because apart from the stars I know of nothing else in the world that would produce light except fire, I tried to make very clearly understood all that belonged to its nature: how it is made, how it is nourished, how sometimes it has only heat but no light, and sometimes only light but no heat; how it can introduce various colors and various other qualities into various bodies; how it melts some bodies and hardens others; how it can consume nearly all of them or turn them into ashes and smoke; and finally, how from these ashes, merely by the force of its action, it produces glass, for since this transmutation of ashes into glass seemed to me to be as awesome as any other that occurs in nature, I took [45] particular pleasure in describing it.

Yet I did not want to infer from all these things that this world has been created in the manner I was proposing, for it is much more likely that, from the beginning, God made it such as it had to be. But it is certain (and this is an opinion commonly accepted among theologians) that the action by which God preserves the world is precisely the same as that by which he created it; so that, even if, in the beginning, he had never given it any other form at all but that of a chaos, provided he established the laws of nature and bestowed his concurrence in order for nature to function just as it does ordinarily, one can believe, without doing injustice to the miracle of creation, that by this means alone all the things that are purely material could over time have been rendered such as we now see them. And their nature is much easier to conceive, when one sees them coming to be little by little in this manner, than when one considers them only in their completed state.

From the description of inanimate bodies and plants I passed to that of animals and in particular to that of human beings. But because I did not yet have sufficient knowledge of them to speak of them in the same manner as I did of the rest, that is to say, by demonstrating effects from causes and by showing from what seeds and in what manner nature must produce them, I contented myself with supposing [46] that God formed the body of a man exactly like one of ours, as much in the outward shape of its members as in the internal arrangement of its organs, without composing it out of any material but the type I had described, and without putting into it, at the start, any rational soul, or anything else to serve there as a vegetative or sensitive soul, but merely kindled in the man’s heart one of those fires without light which I had already explained and which I did not at all conceive to be of a nature other than what heats hay when it has been stored before it is dry, or which makes new wines boil when they are left to ferment after crushing. For on examining the functions that could, as a consequence, be in this body, I found there precisely all those things that can be in us without our thinking about them, and hence, without our soul’s contributing to them, that is to say, that part distinct from the body of which it has been said previously that its nature is only to think. And these are all the same features in which one can say that animals lacking reason resemble us. But I could not on that account find there any of those functions, which, being dependent on thought, are the only ones that belong to us as men, although I did find them all later on, once I had supposed that God created a rational soul and joined it to this body in a particular manner that I described.

But in order that one might be able to see how I treated this matter there, I want to place here the explanation of the movement of the heart and of the arteries, because, this being the first and most general movement that one observes in animals, on the basis [47] of it one will easily judge what one ought to think about all the others. And, in order that there might be less difficulty in understanding what I shall say on the matter, I would like those who are not at all versed in anatomy to take the trouble, before reading this, to have the heart of some large animal that has lungs dissected in their presence (for such a heart is in all respects sufficiently similar to that of a man), and to be shown the two chambers or cavities that are in it. First, there is the one on the right side of the heart, into which two very large tubes lead, namely the *vena cava*, which is the principal receptacle of the blood, and which is like the trunk of a tree of which the other veins of the body are the branches, and the arterial vein (which has thus been rather ill-named, because it is, in effect, an artery), which, taking its origin from the heart, divides up after leaving the heart into many branches that go on to be spread throughout the lungs. Then there is the chamber or cavity on the left side, into which two tubes lead in the same fashion, which are as large as or larger than the preceding ones: namely, the venous artery (which has also been ill-named, since it is nothing but a vein), which comes from the lungs, where it is divided into many branches interlaced with those of the arterial vein and with those in the passageway called the windpipe, through which the air one breathes enters, and the great artery, which, on leaving the heart, sends its branches throughout the body. I would also like those who are not versed in anatomy to be carefully shown the eleven

little membranes that, like so many little doors, open and shut the four openings in the two cavities: namely, three at the entrance to the *vena* [48] *cava*, where they are so disposed that they cannot in any way prevent the blood it contains from flowing into the right cavity of the heart, and yet completely prevent it from being able to leave it: three at the entrance to the arterial vein, which, being arranged totally in the other direction, readily permit the blood in this cavity to pass into the lungs, but do not permit any blood in the lungs to return there; likewise, two others at the entrance to the venous artery, which let blood flow from the lungs into the left cavity of the heart but block its return; and three at the entrance to the great artery, which permit blood to leave the heart but prevent it from returning there. And there is no need at all to search for any other reason for the number of membranes except that the opening of the venous artery, being oval-shaped because of its location, can conveniently be closed with two, while the other openings, being round, can better be closed with three. Further, I would like to make them consider that the great artery and the arterial vein are of a much harder and firmer constitution than the venous artery and the *vena cava*, and that these latter two become enlarged before entering the heart and there form, as it were, sacks, called the “auricles” of the heart, which are made of flesh similar to that of the heart; and that there is always more heat in the heart than anywhere else in the body, and, finally, that this heat is able to bring it about that, if a drop of blood enters its cavities, it promptly expands and is dilated, [49] just as all liquids generally do when one lets them fall drop by drop into some vessel that is very hot.

For, after that, I have no need to say anything else in order to explain the movement of the heart, except that, when its cavities are not full of blood, blood necessarily flows from the *vena cava* into the right cavity and from the venous artery into the left cavity, given that these two vessels are always full of blood, and their openings, which face the heart, cannot then be closed. But as soon as two drops of blood have thus entered the heart, one into each of its cavities, these drops, which can only be very large because the openings through which they enter are very wide and the vessels from whence they come are quite full of blood, are rarified and dilated because of the heat they find there, by means of which, making the whole heart inflate, they push and close the five little doors that are at the entrances to the two vessels from whence they come, thus preventing any more blood from descending into the heart, and, continuing to become more and more rarified, they push and open the six other little doors which are at the entrances to the other two vessels by which they leave. By this means they inflate all the branches of the arterial vein and the great artery, almost at the same instant as the heart; immediately afterward the heart contracts, as do these arteries as well, because the blood that has entered them gets cooled and their six little doors close again, and the five doors of the *vena cava* and [50] the venous artery reopen and grant passage to two other drops of blood, which immediately make the heart and the arteries inflate exactly as before. And, because the blood that thus enters the heart passes through the two sacks called its auricles, it follows from this that their movement is contrary to that of the heart, and that they are deflated while the heart is inflated. As for the rest (in order that those who do not know the force of mathematical demonstrations and are not accustomed to distinguishing true reasons from probable ones should not venture to deny this without examining it), I want to put them on notice that this movement which I have just been explaining follows just as necessarily from the mere disposition of the organs that can be seen in the heart by the naked eye, and from the heat that can be felt with the fingers, and from the nature of blood, which can be known through observation, as does the movement of a clock from the force, placement, and shape of its counterweights and wheels.

But if one asks how it is that the blood in the veins is not at all dissipated in flowing thus continually into the heart, and how the arteries are never overly full of blood, since all the blood that flows through the heart is going to flow into them, to this I need give no other answer than what has already been written by an English physician,⁹ to whom homage must be paid for having broken the ice in this area, and for being the first to have taught that there are many small passages at the extremities of the arteries through which the blood they receive enters into the small branches of the veins, from which it flows immediately to the heart, so that its course is merely [51] a perpetual circulation. He proves this very effectively from the common experience of surgeons, who, on binding an arm moderately tightly above the spot where they open the vein, cause the blood to flow out in even greater abundance than if they had not bound the arm at all. And just the opposite would happen if they bound the arm below, between the hand and the opening, or even if they bind it very tightly above the opening, for it is obvious that a moderately tight tourniquet, being able to prevent the blood that is already in the arm from returning to the heart through the veins, does not on that account prevent new blood from coming in through the arteries, because they are located below the veins, and their membranes, being harder, are less easy to press, and also because the blood coming from the heart tends to pass through the arteries toward the hand with greater force than it does in returning from these to the heart through the veins. And since this blood leaves the arm through the opening in one of the veins, there must necessarily be some passages below the tourniquet, that is to say, toward the extremities of the arm, through which it could

come from the arteries. He also proves quite effectively what he says regarding the circulation of blood by referring to certain small membranes that are so disposed in various places along the length of the veins that they do not at all permit blood to pass from the middle of the body toward the extremities, but only to return from the extremities toward the heart; and further, by means of the experiment that shows that all the blood that is in the body can flow out of it in a very short time through just one artery when it is cut open, even if the artery is very tightly bound quite close to the heart, and cut open between the heart and the tourniquet, so that one would have [52] no basis for imagining that the blood that flowed out came from somewhere else.

But there are many other things that attest to the fact that the true cause of this movement of blood is as I have said. First, the difference that one notices between the blood leaving the veins and the blood leaving the arteries can result only from the fact that the blood is rarified and, as it were, distilled, in passing through the heart; it is thinner, livelier, and warmer just after having left the heart, that is to say, while it is in the arteries, than it is shortly before it enters the heart, that is to say, while it is in the veins. And if one takes note of it, one will find that this difference is more readily apparent near the heart and not at all so much in those places furthest removed from the heart. Then the hardness of the membranes of which the arterial vein and the great artery are composed shows well enough that the blood beats against them with more force than it does against the veins. And why would the left cavity of the heart and the great artery be larger and wider than the right cavity and the arterial vein, unless it is because the blood in the venous artery, having been only in the lungs after having passed through the heart, is thinner and is more forcefully and more easily rarified than what comes immediately from the *vena cava*? And what can physicians divine from taking the pulse, if they do not know that, as the blood changes its nature, it can be rarified by the heat of the heart more or less strongly, and more or less quickly than before? And [53] if one examines how this heat is communicated to the other members, must one not admit that it is by means of the blood, which, on passing through the heart, is reheated there and from there is spread throughout the whole body? It follows from this that if one removes the blood from some part of the body, one thereupon also removes the heat; and even if the heart were as hot as a piece of glowing iron, it would not be enough to reheat the feet and hands as much as it does, if it did not continuously send new blood to them. Then, too, it is also evident from this that the true function of respiration is to bring enough fresh air into the lungs to cause the blood which comes there from the right cavity of the heart, where it has been rarified and, as it were, changed into vapors, immediately to be condensed and to be converted once again into blood before returning to the left cavity; without this process the blood could not properly aid in feeding the fire that is in the heart. This is confirmed because one sees that animals without lungs have but one single cavity in their hearts, and that children, who cannot use their lungs while enclosed within their mother's womb, have an opening through which blood flows from the *vena cava* into the left cavity of the heart, as well as a tube through which blood goes from the arterial vein to the great artery without passing through the lungs. Next, how would digestion take place in the stomach if the heart did not send heat there through the arteries, and with it some of the most fluid parts of the blood, which help dissolve the food that has gone there? And is it not easy to understand the action that changes the juice of this food into blood, if one considers that, in passing and repassing through the heart, it is distilled perhaps more than one or two hundred times a day? And is anything else needed to explain nutrition and the [54] production of the various humors that are in the body, except to say that the force with which the blood, in being rarified, passes from the heart toward the extremities of the arteries, makes some of its parts stop in those parts of the members where they are found and there take the place of others that they expel from there; and that, according to the situation or the shape or the smallness of the pores they encounter, some of the parts of the blood tend to go certain places rather than others, in just the same way that anyone can have seen various sieves of different fineness serve to separate out different grains from one another? And finally what is most remarkable in all this is the generation of the animal spirits, which are like a very subtle wind, or rather, like a very pure and lively flame that rises continuously in great abundance from the heart to the brain, and from there goes through the nerves into the muscles, and gives movement to all the members. The parts of the blood that are the most agitated and penetrating, and are thus the best suited to compose these spirits, are going to move toward the brain rather than elsewhere; and there is no need to imagine any reason for this other than that the arteries that carry these parts of the blood there are those that come from the heart in the straightest line of all, and that, according to the laws of mechanics (which are the same as those of nature), when a number of things tend to move together in the same direction, where there is not enough room for all of them, as when the parts of the blood leaving the left cavity of the heart tend toward the brain, the weakest and least [55] agitated must be pushed aside by the strongest which by this means arrive there alone.

I had provided a sufficiently detailed explanation for all these things in the treatise that I had previously intended to publish. And then I had shown what the constitution of the nerves and muscles of the human body must be in order to make the animal spirits within them have the force to move its members, as when

one observes that heads, shortly after being severed, still move about and bite the earth, even though they are no longer alive. I had also shown what changes must take place in the brain in order to cause wakefulness, sleep, and dreams; how light, sounds, odors, tastes, heat, and all the other qualities of external objects can imprint various ideas there through the mediation of the senses; how hunger, thirst, and the other internal passions can also send their ideas there; what part of them needs to be taken there for the common sense, where these ideas are received, for the memory, which preserves them, and for the imagination, which can change them in various ways and compose new ones out of them, and, by the same means, distributing the animal spirits into the muscles, make the members of this body move in as many different ways (and in a manner appropriate to the objects that present themselves to the senses and to the internal passions that are in the body), as our own bodies can, without their being guided by the will. This will in no way seem strange to those who are cognizant of how many different automata or moving machines the [56] ingenuity of men can make, without, in doing so, using more than a very small number of parts, in comparison with the great multitude of bones, muscles, nerves, arteries, veins, and all the other parts which are in the body of each animal. For they will regard this body as a machine which, having been made by the hands of God, is incomparably better ordered and has within itself movements far more wondrous than any of those that can be invented by men.

And I paused here in particular in order to show that, if there were such machines having the organs and the shape of a monkey or of some other animal that lacked reason, we would have no way of recognizing that they were not entirely of the same nature as these animals; whereas, if there were any such machines that bore a resemblance to our bodies and imitated our actions as far as this is practically feasible, we would always have two very certain means of recognizing that they were not at all, for that reason, true men. The first is that they could never use words or other signs, or put them together as we do in order to declare our thoughts to others. For one can well conceive of a machine being so made that it utters words, and even that it utters words appropriate to the bodily actions that will cause some change in its organs (such as, if one touches it in a certain place, it asks what one wants to say to it, or, if in another place, it cries out that one is hurting it, and the like). But it could not arrange its words differently so as to respond to the sense of all that will be said in its presence, as [57] even the dumbest men can do. The second means is that, although they might perform many tasks very well or perhaps better than any of us, such machines would inevitably fail in other tasks; by this means one would discover that they were acting not through knowledge but only through the disposition of their organs. For while reason is a universal instrument that can be of help in all sorts of circumstances, these organs require some particular disposition for each particular action; consequently, it is for all practical purposes impossible for there to be enough different organs in a machine to make it act in all the contingencies of life in the same way as our reason makes us act.

Now by these two means one can also know the difference between men and beasts. For it is rather remarkable that there are no men so dull and so stupid (excluding not even the insane), that they are incapable of arranging various words together and of composing from them a discourse by means of which they might make their thoughts understood, and that, on the other hand, there is no other animal at all, however perfect and pedigreed it may be, that does the like. This does not happen because they lack the organs, for one sees that magpies and parrots can utter words just as we can, and yet they cannot speak as we do, that is to say, by testifying to the fact that they are thinking about what they are saying; on the other hand, men born deaf and dumb, who are deprived [58] of the organs that aid others in speaking just as much as, or more than beasts, are wont to invent for themselves various signs by means of which they make themselves understood to those who, being with them on a regular basis, have the time to learn their language. And this attests not merely to the fact that beasts have less reason than men but that they have none at all. For it is obvious it does not need much to know how to speak; and since we notice as much inequality among animals of the same species as among men, and that some are easier to train than others, it is unbelievable that a monkey or a parrot that is the most perfect of its species would not equal in this respect one of the most stupid children or at least a child with a disordered brain, if their soul were not of a nature entirely different from our own. And we should not confuse words with the natural movements that attest to the passions and can be imitated by machines as well as by animals. Nor should we think, as did some of the ancients, that beasts speak, although we do not understand their language, for if that were true, since they have many organs corresponding to our own, they could make themselves as well understood by us as they are by their fellow creatures. It is also a very remarkable phenomenon that, although there are many animals that show more skill than we do in some of their actions, we nevertheless see that they show none at all in many other actions. Consequently, the fact that they do something better than we do does not prove that they have any intelligence, for, were that the case, they would have more [59] of it than any of us and would excel us in everything. But rather it proves that they have no intelligence at all, and that it is nature that acts in them, according to the disposition of their organs

— just as we see that a clock composed exclusively of wheels and springs can count the hours and measure time more accurately than we can with all our carefulness.

After that, I described the rational soul and showed that it can in no way be derived from the potentiality of matter, as can the other things I have spoken of, but rather that it must be expressly created; and how it is not enough for it to be lodged in the human body like a pilot in his ship, unless perhaps in order to move its members, but rather that it must be more closely joined and united to the body in order to have, in addition to this, feelings and appetites similar to our own, and thus to constitute a true man. As to the rest, I elaborated here a little on the subject of the soul because it is of the greatest importance; for, after the error of those who deny the existence of God (which I think I have sufficiently refuted), there is none at all that puts weak minds at a greater distance from the straight path of virtue than to imagine that the soul of beasts is of the same nature as ours, and that, as a consequence, we have nothing to fear or to hope for after this life any more than do flies and ants. On the other hand, when one knows how different they are, one understands much better the arguments which prove that our soul is of a nature entirely independent of the body, and consequently that it is not subject to die with it. Then, since we do not see any other causes at all for its destruction, we are naturally led to [60] judge from this that it is immortal.

PART SIX

But it is now three years since I arrived at the end of the treatise that contains all these things and began to review it in order to put it into the hands of a printer, when I learned that some people to whom I defer and whose authority over my actions can hardly be less than that of my reason over my thoughts, had disapproved of an opinion in physics, published a short time earlier by someone else,¹⁰ concerning which I do not want to say that I was in agreement, but rather that I had not noticed anything in it, before their censuring of it, that I could imagine to be prejudicial either to religion or to the state, nor, as a consequence, had I found anything that would have prevented me from writing it, had reason persuaded me of it, and this made me fear that there might likewise be found among my opinions one in which I had been mistaken, notwithstanding the great care that I have always taken never to accept into my beliefs any new opinions for which I did not have very certain demonstrations and never to write anything that could turn to anyone's disadvantage. This was sufficient to make me change the resolution I had had to publish my opinions. For although the reasons for which I had earlier made the resolution were very strong, my inclination, which has always made me hate the business of writing books, immediately made me find enough other reasons to excuse me from it. And these reasons, both for and [61] against, are such that not only do I have some interest in stating them here, but perhaps also the public has some interest in knowing them.

I had never made much of the things that came from my mind, and so long as I had reaped no other fruits from the method I am using except my own satisfaction regarding certain problems that pertain to the speculative sciences or else my attempt at governing my moral conduct by means of the reasons which the method taught me, I believed I was under no obligation whatever to write anything about it. For as to moral conduct, everyone is so very full of his own viewpoint, that it would be possible to find as many reformers as heads, if anyone other than those God has established as rulers over his peoples or even those to whom he has given sufficient grace and zeal to be prophets were permitted to try to change anything here. And although my speculations pleased me very much, I believed that others also had their own which perhaps pleased them more. But as soon as I had acquired some general notions regarding physics, and, beginning to test them in various particular difficulties, I had noticed where they could lead and how much they differ from the principles that have been in use up to the present, I believed I could not keep them hidden away without sinning grievously against the law that obliges us to procure, as much as is in our power, the common good of all men. For these notions made me see that it is possible to arrive at knowledge that would be very useful in life and that, in place of that speculative philosophy [62] taught in the schools, it is possible to find a practical philosophy, by means of which, knowing the force and the actions of fire, water, air, the stars, the heavens, and all the other bodies that surround us, just as distinctly as we know the various skills of our craftsmen, we might be able, in the same way, to use them for all the purposes for which they are appropriate, and thus render ourselves, as it were, masters and possessors of nature. This is desirable not only for the invention of an infinity of devices that would enable one to enjoy trouble-free the fruits of the earth and all the goods found there, but also principally for the maintenance of health, which unquestionably is the first good and the foundation of all the other goods of this life, for even the mind depends so greatly on the temperament and on the disposition of the organs of the body that, if it is possible to find some means to render men generally more wise and more adroit than they have been up until now, I believe that one should look for it in medicine. It is true that the medicine currently practiced contains few things whose usefulness is so noteworthy, but without intending to ridicule it, I am sure there is no one, not even among those who make a profession of it, who would not admit that everything known in medicine is practically nothing in comparison with what remains to be known, and that one could rid oneself of an infinity of maladies, as much of the body as of the mind, and even perhaps also the frailty of old age, if one had a sufficient knowledge of their causes and of all the remedies that nature has provided us. For, having the intention of spending my entire life in the search for so indispensable a science, and having found a path that [63] seems to me such that, by following it, one ought infallibly to find this science, unless one is prevented from doing so either by the brevity of life or by a lack of experiments,¹¹ I judged there to be no better remedy against these two obstacles than to communicate faithfully to the public the entirety of what little I had found and to urge good minds to try to advance beyond this by contributing, each according to his inclination and ability, to the experiments that must be performed and also by communicating to the public everything they might learn, in order that, with subsequent inquirers beginning where their predecessors had left off, and thus, joining together the lives and labors of many, we might all advance together much further than a single individual could do on his own.

Moreover, I noticed, in regard to experiments, that they are the more necessary as one is more advanced in knowledge. For in the beginning it is better to make use only of those observations which present themselves

of their own accord to our senses and which we could not ignore, provided we reflect, however so little, on them, rather than to search for unusual and contrived experiments. The reason for this is that these more unusual experiments often deceive one when one does not know yet the causes of the more common ones, and that the circumstances on which the unusual ones depend are almost always so special and so minute that it is very difficult to notice them. But the order I have held to has been the following. [64] First, I have tried to find in general the principles or first causes of all that is or can be in the world, without considering anything but God alone, who created the world, and without deriving these principles from any other source but from certain seeds of truths that are naturally in our souls. After that I examined what were the first and most ordinary effects that could be deduced from these causes; and it seems to me that by this means I had found the heavens, stars, an earth, and even, on the earth, water, air, fire, minerals, and other such things that are the most common of all and the simplest, and, as a consequence, the easiest to know. Then, when I wanted to descend to those things which were more particular, so many different ones were presented to me that I did not believe it possible for the human mind to distinguish the forms or species of bodies that are on the earth from an infinity of others that could have been there had it been the will of God to have put them there, nor, as a consequence, to make them serviceable to us, unless we advance to the causes through the effects and make use of many particular observations. After this, passing my mind again over all the objects that have ever presented themselves to my senses, I daresay I did not notice anything in them that I could not explain easily enough by means of the principles I had found. But I must also admit that the power of nature is so ample and so vast, and these principles are so simple and so [65] general, that I notice hardly any particular effect without at once knowing that it can be deduced in many different ways from them, and that ordinarily my greatest difficulty is to find in which of these ways it depends on them. For, to this end, I know of no other expedient at all except to search once more for some experiments which are such that their outcomes are not the same, if it is in one of these ways rather than in another that one ought to explain the outcome. As to the rest, I am now at the point where, it seems to me, I see quite well what approach one must take in order to make most of the experiments that can serve this purpose; but I also see that they are of such a kind and of so great a number that neither my adroitness nor my financial resources (even if I had a thousand times more than I have) would suffice for all of them, so that, according as I henceforth have the opportunity to perform more or fewer experiments, I shall also advance more or less in the knowledge of nature. That is what I meant to make known through the treatise I had written, and to show there so clearly the utility that the public could gain from such knowledge that I would oblige all those who desire the general well-being of men (that is to say, all those who really are virtuous, not just appearing to be so through false pretenses or merely by reputation), both to communicate those experiments they have already performed and to assist me in the search for those that remain to be performed.

But since then other reasons have made me change my mind and to think that I really ought to continue to write about all the things I judged to be of some importance, to the extent that I discovered the truth with respect to them, and to take the same care in regard to them as I would take if I wanted to have them published. I did this as much to have all [66] the more of an occasion to examine them well (since without doubt one always looks more carefully at what one believes must be seen by many than at what one does only for oneself, and often the things that have seemed to me to be true when I began to conceive them have appeared false to me when I wanted to put them on paper), as in order not to lose any occasion to benefit the public, if I am able, and in order that, if my writings are worth anything, those who will have them after my death can thus use them as will be most fitting. But I must not in any way consent to their being published during my lifetime, so that neither the hostilities and the controversies to which they might be subject, nor even such reputation as they could gain for me, would give me any occasion for losing the time I have intended to use in instructing myself. For although it may be true that each man is obliged to secure as best he can the good of others, and that to be useful to no one is, strictly speaking, to be worthless, still it is also true that our concerns ought to extend further than to the present time, and that it is well to omit things that perhaps would yield some profit to those who are alive, when it is with the intention of doing other things that would yield even more profit to our posterity. In any event, I very much want people to understand that what little I have learned up until now is almost nothing in comparison to what I do not know and to what I do not despair of being able to learn, for it is almost the same with those who little by little discover the truth in the sciences as it is [67] with those who, upon beginning to acquire wealth, have less trouble making large acquisitions than they had had before, when they were poorer, in making very small ones. Or indeed, one can compare them to army commanders whose forces typically grow in proportion to their victories and who need more skill to maintain themselves after losing a battle than they do to take cities or provinces when they have won one. For it is truly to engage in battle when one tries to overcome all the difficulties and errors that prevent us from arriving at the knowledge of the truth, and it is truly to lose a battle when one accepts a false

opinion touching on a matter that is at all general and important. And afterward it requires much more skill to recover one's former position than to make great progress when one already has principles that are assured. For myself, if I have already found some truths in the sciences (and I hope the things contained in this volume will make people judge that I have found some of them), I can say that these are only things that result from and depend on five or six principal difficulties that I have surmounted and that I count as so many battles in which I have had fortune on my side. I will not even fear to say that I think I need to win only two or three more battles like them in order to succeed entirely in my plans, and that my age is not at all so advanced that, in the ordinary [68] course of nature, I might not still have enough time to bring this about. But I believe I am all the more obliged to manage well the time remaining to me, the more hope I have of being able to use it well, and doubtless I would have many opportunities to lose time, had I published the foundations of my physics. For although they are nearly all so evident that it is necessary only to understand them in order to believe them, and although there has not been a single one for which I did not believe I could give demonstrations, nevertheless, because it is impossible for them to be in agreement with all the diverse opinions of other men, I foresee that I would often be distracted by the disputes they would engender.

One could say that these disputes might be useful, as much in order that I be made aware of my faults, as in order that, if I had anything worthwhile to say, others would by this means have greater understanding of it, and that, since many can see more than one man alone, these others, by beginning right now to use it, might also help me with their discoveries. But, although I recognize that I am extremely prone to err and that I almost never rely on the first thoughts that come to me, still the experience I have of the objections that can be made against me prevents me from expecting any profit from them. For I have already often put to the test the judgments of those I took to be my friends, as well as of some others whom I took to be indifferent, and even of those too whose maliciousness and envy I knew would try hard enough to discover what affection would hide from my friends. But it has rarely happened that an objection has been [69] raised against me that I had not at all foreseen, unless it was very far removed from my subject; thus I have almost never found any critic of my opinions who did not seem to me to be either less rigorous or less unbiased than myself. Nor have I ever observed that, through the method of disputations practiced in the schools, any truth has been discovered that had until then been unknown. For, so long as each person in the dispute aims at winning, he is more concerned with making much out of probability than with weighing the arguments on each side; and those who have long been good advocates are not, on that account, afterward better judges.

As to the utility that others might gain from the communication of my thoughts, it could not be so very great, given that I have not yet at all taken them so far that there is no need to add many things to them before applying them to actual practice. And I think I can say without vanity that, if there is anyone who is capable of doing this, it must be myself rather than someone else: not that there could not be in the world many minds incomparably greater than mine, but because one cannot conceive a thing so well and make it one's own when one learns it from someone else as one can when one discovers it for oneself. This is so true in this matter that, although I have often explained some of my opinions to people with good minds, who, while I spoke to them, seemed to understand them quite distinctly, nevertheless, when they repeated them, I noticed that they had almost always changed them in such a way that I could no longer acknowledge them as mine. In this connection, I [70] am very happy here to ask our descendants never to believe the things people tell them came from me, unless I myself have divulged them. And I am in no way surprised by the extravagances attributed to all those ancient philosophers whose writings we do not have, nor do I judge, for that reason, that their thoughts have been so very unreasonable, given that they were the greatest minds of their time, but only that their thoughts have been poorly reported to us. For one also sees that it has almost never happened that any of their followers had ever surpassed them, and I am sure that the most impassioned of those who now follow Aristotle would believe themselves fortunate, if they had as much knowledge of nature as he had, even if it were on the condition that they would never have any more. They are like ivy, which never stretches any higher than the trees supporting it, and which often even descends again after it has reached their tops, for it seems to me that they too are redescending, that is, they are making themselves somehow less knowledgeable than if they abstained from studying; not content with knowing all that is intelligibly explained in their author, they want in addition to find the solutions there to many difficulties about which he says nothing and about which he has perhaps never thought. Still, their manner of philosophizing is very convenient for those who have only very mediocre minds, for the obscurity of the distinctions and the principles they make use of is the reason why they can speak about all things as boldly as if they [71] knew them, and why they can uphold everything they say against the most subtle and the most adroit, without anyone's having the means of convincing them that they are mistaken. In this they seem to me like a blind man who, in order to fight without a disadvantage against someone who is sighted, had made his opponent go into the depths of some very dark cellar. And I may say that these people have an interest in my

refraining from publishing the principles of the philosophy I use, for my principles being as very simple and very evident as they are, I would, by publishing them, be doing almost the same as if I were to open some windows and make some daylight enter that cellar they had gone into in order to fight. But even the best minds have no reason for wanting to know these principles, for if they want to know how to speak about all things and to acquire the reputation for being learned, they will achieve their objective more easily by contenting themselves with probability, which can be found without great difficulty in all sorts of matters, than by seeking the truth, which can only be discovered little by little in some and which, when it is a question of speaking about other matters, obliges one to confess frankly that one is ignorant of them. But if they prefer the knowledge of some few truths to the vanity of appearing to be ignorant of nothing, as no doubt it is really preferable to do, and if they want to follow a plan similar to mine, they do not, on that score, need me to say anything more except what I have already said in this discourse. For, if they are capable of advancing further than I have, then *a fortiori* they are also capable of finding for themselves all that I think I have found. Inasmuch as I have never examined anything except in an orderly manner, it is certain that what still remains for me to discover is of itself more difficult and more hidden than what [72] I have heretofore been able to discover, and they would take much less pleasure in learning it from me than from themselves. Moreover, the habit they will acquire of seeking first the easy things and then of passing little by little by degrees to other more difficult ones will serve them better than all my instructions could do. As for myself, I am convinced that, if I had been taught from my youth all the truths for which I have since then sought demonstrations, and if I had not had any difficulty in learning them, I might perhaps have never known any other truths, and at least I would never have acquired the habit and facility I think I have for always finding new truths, to the extent that I apply myself in searching for them. And, in a word, if there is any task in the world that could not be accomplished so well by anyone else but the same person who began it, it is the one on which I am working.

It is true that, with respect to experiments that can help here, one man alone cannot suffice to perform them all, but neither can he usefully employ hands other than his own, except those of craftsmen, or such people as he could pay and whom the hope of gain, which is a very effective means, would cause to do precisely what he ordered them to do. For, as to volunteers, who, out of curiosity or a desire to learn, might offer themselves in order perhaps to help him (aside from the fact that they usually make more promises than they produce achievements, and merely make fine proposals, none of which will come to anything), they would inevitably want to be paid [73] by the explanation of various difficulties, or at least by compliments and useless conversations, which could not cost him so little time that he would not lose by it. And as to the experiments that others have already performed, even if these people did want to communicate them to him (something those who call them “secrets” would never do), they are for the most part composed of so many details and superfluous ingredients that it would be very hard for him to discern the truth in them; besides, he would find almost all of them to be so badly explained or even so false, because those who have done them strove to make them appear to be in conformity with their principles, that, if there were among them some experiments that might serve him, they could not be worth the time he would need to spend in selecting them. In this way, if there were someone in the world whom one assuredly knows to be capable of finding the greatest things and the things as beneficial to the public as possible and whom, for this cause, other men were to exert themselves to help in every way to succeed in his plans, I do not see that they could do a thing for him except to make a donation toward the expenses of the experiments he would need and, for the rest, to prevent his leisure from being wasted by the importunity of anyone. But, although I do not presume so much of myself as to want to promise anything out of the ordinary, or feast on such vain thoughts as to imagine that the public ought to be especially interested in my plans, I do not have so base a soul that I would [74] want to accept from anyone any favor that one might believe I had not deserved.

All these considerations taken together were the reason why, three years ago, I did not at all want to divulge the treatise I had on hand, and why I had even made a resolution not to make public during my lifetime any other treatise which was so general or on the basis of which one could understand the foundations of my physics. But since then there have been yet again two other reasons that have obliged me to place here certain particular essays and to render to the public some account of my actions and my plans. The first is that, if I failed to do so, many who knew of the intention I once had to have certain writings published could imagine that the reasons for which I am abstaining from doing so were more to my disadvantage than they are. For although I do not love glory excessively—indeed, if I dare say so, I hate it, inasmuch as I judge it to be contrary to the tranquility I esteem above all things—still, I have also never tried to hide my actions as if they were crimes, nor have I taken many precautions so as not to be known. This is the case as much because I would have believed I would be doing myself an injustice, as because it would have given me a certain kind of disquiet, which again would have been contrary to the perfect peace of mind I am seeking. And because,

having always been thus indifferent about the concern over being known or not known, I could not prevent my acquiring some type of reputation, I thought I ought to do my best at least to spare myself from having a bad one. The other reason that has obliged me to write this is as [75] follows: I saw more and more every day the delay that the plan I have of self-instruction is suffering because of an infinity of experiments of which I have need and which it is impossible for me to perform without the help of others. And although I do not flatter myself so much as to hope that the public will become greatly taken with my interests, still I also do not want to fail myself so much as to give those who will survive me cause to reproach me one day on the grounds that I could have left them many far better things than I had done, if I had not so badly neglected making them understand how they could contribute to my plans.

And I thought that it was easy to choose certain matters that, without being subjected to much controversy or obliging me to declare more of my principles than I desire, would nevertheless allow me to show quite clearly what I can or cannot do in the sciences. I cannot say whether I have been successful in this, and I do not at all want to prejudice the judgments of anyone in speaking for myself about my writings; but I shall be very happy if they are examined, and, in order to have more of an opportunity to do this, I am imploring all who have any objections to make against them to take the trouble to send them to my publisher and, on being advised about them by him, I shall try at the same time to append my reply to the objections, and by this means, seeing both of them together, readers will judge the truth all the more easily. For I promise never to make long replies to them, but only to admit [76] my errors very candidly, if I recognize them, or, even if I cannot perceive any, to say simply what I believe to be required for the defense of what I have written, without adding to it an explanation of any new material, in order not to become endlessly involved in one issue after another.

And, if any of those things about which I have spoken at the beginning of the *Dioptrics* and the *Meteors* are shocking at first glance because I call them suppositions and seem to lack the inclination to prove them, I entreat the reader to have the patience to read the whole thing with attention, and I hope he will find himself satisfied with it. For it seems to me that the reasonings follow each other there in such a way that, just as the last are demonstrated by means of the first, which are their causes, so these first are reciprocally demonstrated by means of the last, which are their effects. And one must not imagine that I am here committing the fallacy that logicians call a circle, for, experience rendering the majority of these effects very certain, the causes from which I deduce these effects serve not so much to prove them as to explain them; on the contrary, it is rather the case that the causes are what are proved by the effects. And I have called them suppositions only to make it understood that I think I can deduce them from these first truths that I have explained above. But I wanted expressly not to do so, in order to prevent certain minds, who imagine that they know in one day all that someone else has thought about for twenty years as soon as he has said but two or three words to them about it, and who are the more subject to error and the less capable of truth, the more penetrating and [77] lively they are, from being able to take this occasion to build some extravagant philosophy on what they believe are my principles, and in order to prevent me from being blamed for it. For as to the opinions that are entirely mine, I do not apologize for their being new, since, if one considers well the arguments for them, I am sure that one will find them so simple and so in conformity with common sense that they will seem less extraordinary and less strange than any others one could have on the same subjects. Nor do I pride myself at all on being the first discoverer of any of them; rather, I pride myself on never having accepted them because they have or have not been said by others, but only because reason has persuaded me of them.

If craftsmen cannot immediately carry out the invention explained in the *Dioptrics*, I do not believe one could say, on that account, that it is bad, for, inasmuch as skill and practice are needed to make and adjust the machines I have described, without any detail being overlooked there, I would be no less astonished if they were to succeed on the first try than if someone were able to learn in one day to play the lute with distinction simply because he had been given a good score. And if I write in French, the language of my country, rather than in Latin, the language of my teachers, it is because I am hoping that those who use only their natural reason in all its purity will judge my opinions better than those who believe only in old books. And as to those who combine good sense with study, whom alone I wish to have as my judges, they will not at all, I am sure, be so [78] partial to Latin that they refuse to listen to my reasons because I explain them in the vernacular.

As to the rest, I do not at all want to speak here in detail about the future progress I hope to make in the sciences, or to involve myself vis-à-vis the public in any promise that I am not assured of keeping; rather I shall say simply that I have resolved to spend the rest of my life on nothing but trying to acquire some knowledge of nature which is such that one could draw from it rules for medicine that are more reliable than those we have had to the present, and that my inclination puts me at such a great distance from all other sorts of plans, and chiefly from those that can be useful to some only by being harmful to others, that if

circumstances were to force me to busy myself with them, I do not at all believe I could succeed. About this I am here making a declaration which I know very well cannot serve to make me eminent in the world, but I also have no desire to be so; and I shall always hold myself obliged more to those by whose favor I enjoy my leisure without hindrance than to those who might offer me the most honorable positions on earth.

*Meditations on First Philosophy**

To those Most Wise and Distinguished Men, the Dean and Doctors of the Faculty of Sacred Theology of Paris

René Descartes Sends Greetings

So right is the cause that impels me to offer this work to you, that I am confident you too will find it equally right and thus take up its defense, once you have understood the plan of my undertaking; so much is this the case that I have no better means of commending it here than to state briefly what I have sought to achieve in this work.

I have always thought that two issues — namely, God and the soul — are chief among those that ought to be demonstrated with the aid of philosophy rather than theology. For although it suffices for us believers to believe by faith that the human soul does not die with the body, and that God exists, certainly no unbelievers seem capable of being persuaded of any religion or even of almost any moral virtue, until these two are first proven to them by natural reason. And since in this life greater rewards are often granted to vices than to virtues, few would prefer what is right to what is useful, if they neither feared God nor anticipated an afterlife. Granted, it is altogether true that we must believe in God's existence because it is taught in the Holy Scriptures, and, conversely, that we must believe the Holy Scriptures because they have come from God. This is because, of course, since faith is a gift from God, the very same one who gives the grace that is necessary for believing the rest can also give the grace to believe that he exists. Nonetheless, this reasoning cannot be proposed to unbelievers because they would judge it to be circular. In fact, I have observed that not only do you and all other theologians affirm that one can prove the existence of God by natural reason, but also that one may infer from Sacred Scripture that the knowledge of him is easier to achieve than the many things we know about creatures, and is so utterly easy that those without this knowledge are blameworthy. For this is clear from *Wisdom*, Chapter 13, where it is said: "They are not to be excused, for if their capacity for knowing were so great that they could think well of this world, how is it that they did not find the Lord of it even more easily?" And in *Romans*, Chapter 1, it is said that they are "without excuse." And again in the same passage it appears we are being warned with the words: "What is known of God is manifest in them," that everything that can be known about God can be shown by reasons drawn exclusively from our own mind. For this reason, I did not think it unbecoming for me to inquire how this may be the case, and by what path God may be known more easily and with greater certainty than the things of this world.

And as to the soul, there are many who have regarded its nature as something into which one cannot easily inquire, and some have even gone so far as to say that human reasoning convinces them that the soul dies with the body, while it is by faith alone that they hold the contrary position. Nevertheless, because the Lateran Council¹ held under Leo X, in Session 8, condemned such people and expressly enjoined Christian philosophers to refute their arguments and to use all their powers to demonstrate the truth, I have not hesitated to undertake this task as well.

Moreover, I know that there are many irreligious people who refuse to believe that God exists and that the human mind is distinct from the body—for no other reason than their claim that up until now no one has been able to demonstrate these two things. By no means am I in agreement with these people; on the contrary, I believe that nearly all the arguments which have been brought to bear on these questions by great men have the force of a demonstration, when they are adequately understood, and I am convinced that hardly any arguments can be given that have not already been discovered by others. Nevertheless, I judge that there is no greater task to perform in philosophy than assiduously to seek out, once and for all, the best of all these arguments and to lay them out so precisely and plainly that henceforth all will take them to be true demonstrations. And finally, I was strongly urged to do this by some people who knew that I had developed a method for solving all sorts of problems in the sciences — not a new one, mind you, since nothing is more ancient than the truth, but one they had seen me use with some success in other areas. Accordingly, I took it to be my task to attempt something on this subject.

This treatise contains all that I have been able to accomplish. Not that I have attempted to gather together

in it all the various arguments that could be brought forward as proof of the very same conclusions, for this does not seem worthwhile, except where no one proof is sufficiently certain. Rather, I have sought out the primary and chief arguments, so that I now make bold to propose these as most certain and evident demonstrations. Moreover, I will say in addition that these arguments are such that I believe there is no way open to the human mind whereby better ones could ever be found. For the urgency of the cause, as well as the glory of God, to which this entire enterprise is referred, compels me here to speak somewhat more freely on my own behalf than is my custom. But although I believe these arguments to be certain and evident, still I am not thereby convinced that they are suited to everyone's grasp. In geometry there are many arguments developed by Archimedes,² Apollonius,³ Pappus,⁴ and others, which are taken by everyone to be evident and certain because they contain absolutely nothing which, considered by itself, is not quite easily known, and in which what follows does not square exactly with what has come before. Nevertheless they are rather lengthy and require a particularly attentive reader; thus only a small handful of people understand them. Likewise, although the arguments I use here do, in my opinion, equal or even surpass those of geometry in certitude and obviousness, nevertheless I am fearful that many people will not be capable of adequately perceiving them, both because they too are a bit lengthy, with some of them depending on still others, and also because, first and foremost, they demand a mind that is quite free from prejudices and that can easily withdraw itself from association with the senses. Certainly there are not to be found in the world more people with an aptitude for metaphysical studies than those with an aptitude for geometry. Moreover, there is the difference that in geometry everyone is of a mind that usually nothing is put down in writing without there being a sound demonstration for it; thus the inexperienced more frequently err on the side of assenting to what is false, wanting as they do to give the appearance of understanding it, than on the side of denying what is true. But it is the reverse in philosophy: since it is believed that there is no issue that cannot be defended from either side, few look for the truth, and many more prowl about for a reputation for profundity by arrogantly challenging whichever arguments are the best.

And therefore, regardless of the force of my arguments, because they are of a philosophical nature I do not anticipate that what I will have accomplished through them will be very worthwhile unless you assist me with your patronage. Your faculty is held in such high esteem in the minds of all, and the name of the Sorbonne has such authority, that not only in matters of faith has no association, with the exception of the councils of the Church, been held in such high regard as yours, but even in human philosophy nowhere is there thought to be greater insightfulness and solidity, or greater integrity and wisdom in rendering judgments. Should you deign to show any interest in this work, I do not doubt that, first of all, its errors would be corrected by you (for I am mindful not only of my humanity but also, and most especially, of my ignorance, and thus do not claim that there are no errors in it); second, what is lacking would be added, or what is not sufficiently complete would be perfected, or what is in need of further discussion would be expanded upon more fully, either by yourselves or at least by me, after you have given me your guidance; and finally, after the arguments contained in this work proving that God exists and that the mind is distinct from the body have been brought (as I am confident they can be) to such a level of lucidity that these arguments ought to be regarded as the most precise of demonstrations, you may be of a mind to make such a declaration and publicly attest to it. Indeed, should this come to pass, I have no doubt that all the errors that have ever been entertained regarding these issues would shortly be erased from the minds of men. For the truth itself will easily cause other men of intelligence and learning to subscribe to your judgment. Your authority will cause the atheists, who more often than not are dilettantes rather than men of intelligence and learning, to put aside their spirit of contrariness, and perhaps even to defend the arguments which they will come to know are regarded as demonstrations by all who are discerning, lest they appear not to understand them. And finally, everyone else will readily give credence to so many indications of support, and there will no longer be anyone in the world who would dare call into doubt either the existence of God or the real distinction between the soul and the body. Just how great the usefulness of this thing might be, you yourselves, in virtue of your singular wisdom, are in the best position of anyone to judge; nor would it behoove me to commend the cause of God and religion at any greater length to you, who have always been the greatest pillar of the Catholic Church.

Preface to the Reader

I have already touched briefly on the issues of God and the human mind in my *Discourse on the Method of Rightly Conducting One's Reason and Searching for Truth in the Sciences*, published in French in 1637. The intent there was not to provide a precise treatment of them, but only to offer a sample and to learn from the opinions of readers how these issues should be treated in the future. For they seemed to me to be so important that I judged they ought to be dealt with more than once. And the path I follow in order to explain them is so little trodden and so far removed from the one commonly taken that I did not think it useful to hold forth at greater length in a work written in French and designed to be read indiscriminately by everyone, lest weaker minds be in a position to think that they too ought to set out on this path.

In the *Discourse* I asked everyone who might find something in my writings worthy of refutation to do me the favor of making me aware of it. As for what I touched on regarding these issues, only two objections were worth noting, and I will respond briefly to them here before undertaking a more precise explanation of them.

The first is that, from the fact that the human mind, when turned in on itself, does not perceive itself to be anything other than a thinking thing, it does not follow that its nature or *essence* consists only in its being a thinking thing, such that the word *only* excludes everything else that also could perhaps be said to belong to the nature of the soul. To this objection I answer that in that passage I did not intend my exclusion of those things to reflect the order of the truth of the matter (I was not dealing with it then), but merely the order of my perception. Thus what I had in mind was that I was aware of absolutely nothing that I knew belonged to my essence, save that I was a thinking thing, that is, a thing having within itself the faculty of thinking. Later on, however, I will show how it follows, from the fact that I know of nothing else belonging to my essence, that nothing else really does belong to it.

The second objection is that it does not follow from the fact that I have within me an idea of a thing more perfect than me, that this idea is itself more perfect than me, and still less that what is represented by this idea exists. But I answer that there is an equivocation here in the word "idea." For "idea" can be taken either materially, for an operation of the intellect (in which case it cannot be said to be more perfect than me), or objectively, for the thing represented by means of that operation. This thing, even if it is not presumed to exist outside the intellect, can nevertheless be more perfect than me by reason of its essence. I will explain in detail in the ensuing remarks how, from the mere fact that there is within me an idea of something more perfect than me, it follows that this thing really exists.

In addition, I have seen two rather lengthy treatises, but these works, utilizing as they do arguments drawn from atheist commonplaces, focused their attack not so much on my arguments regarding these issues, as on my conclusions. Moreover, arguments of this type exercise no influence over those who understand my arguments, and the judgments of many people are so preposterous and feeble that they are more likely to be persuaded by the first opinions to come along, however false and contrary to reason they may be, than by a true and firm refutation of them which they hear subsequently. Accordingly, I have no desire to respond here to these objections, lest I first have to state what they are. I will only say in general that all the objections typically bandied about by the atheists to assail the existence of God always depend either on ascribing human emotions to God, or on arrogantly claiming for our minds such power and wisdom that we attempt to determine and grasp fully what God can and ought to do. Hence these objections will cause us no difficulty, provided we but remember that our minds are to be regarded as finite, while God is to be regarded as incomprehensible and infinite.

But now, after having, to some degree, conducted an initial review of the judgments of men, here I begin once more to treat the same questions about God and the human mind, together with the starting points of the whole of first philosophy, but not in a way that causes me to have any expectation of widespread approval or a large readership. On the contrary, I do not advise anyone to read these things except those who have both the ability and the desire to meditate seriously with me, and to withdraw their minds from the senses as well as from all prejudices. I know all too well that such people are few and far between. As to those who do not take the time to grasp the order and linkage of my arguments, but will be eager to fuss over statements taken out of context (as is the custom for many), they will derive little benefit from reading this work. Although perhaps they might find an occasion for quibbling in several places, still they will not find it easy to raise an objection that is either compelling or worthy of response.

But because I do not promise to satisfy even the others on all counts the first time around, and because I do not arrogantly claim for myself so much that I believe myself capable of anticipating all the difficulties that

will occur to someone, I will first of all narrate in the *Meditations* the very thoughts by means of which I seem to have arrived at a certain and evident knowledge of the truth, so that I may determine whether the same arguments that persuaded me can be useful in persuading others. Next, I will reply to the objections of a number of very gifted and learned gentlemen, to whom these *Meditations* were forwarded for their examination prior to their being sent to press. For their objections were so many and varied that I have dared to hope that nothing will readily occur to anyone, at least nothing of importance, which has not already been touched upon by these gentlemen. And thus I earnestly entreat the readers not to form a judgment regarding the *Meditations* until they have deigned to read all these objections and the replies I have made to them.

Synopsis of the Following Six Meditations

In the First Meditation the reasons are given why we can doubt all things, especially material things, so long, that is, as, of course, we have no other foundations for the sciences than the ones which we have had up until now. Although the utility of so extensive a doubt is not readily apparent, nevertheless its greatest utility lies in freeing us of all prejudices, in preparing the easiest way for us to withdraw the mind from the senses, and finally, in making it impossible for us to doubt any further those things that we later discover to be true.

In the Second Meditation the mind, through the exercise of its own freedom, supposes the nonexistence of all those things about whose existence it can have even the least doubt. In so doing the mind realizes that it is impossible for it not to exist during this time. This too is of the greatest utility, since by means of it the mind easily distinguishes what things belong to it, that is, to an intellectual nature, from what things belong to the body. But because some people will perhaps expect to see proofs for the immortality of the soul in this Meditation, I think they should be put on notice here that I have attempted to write only what I have carefully demonstrated. Therefore the only order I could follow was the one typically used by geometers, which is to lay out everything on which a given proposition depends, before concluding anything about it. But the first and principal prerequisite for knowing that the soul is immortal is that we form a concept of the soul that is as lucid as possible and utterly distinct from every concept of a body. This is what has been done here. Moreover, there is the additional requirement that we know that everything that we clearly and distinctly understand is true, in exactly the manner in which we understand it; however, this could not have been proven prior to the Fourth Meditation. Moreover, we must have a distinct concept of corporeal nature, and this is formulated partly in the Second Meditation itself, and partly in the Fifth and Sixth Meditations. From all this one ought to conclude that all the things we clearly and distinctly conceive as different substances truly are substances that are really distinct from one another. (This, for example, is how mind and body are conceived.) This conclusion is arrived at in the Sixth Meditation. This same conclusion is also confirmed in this Meditation in virtue of the fact that we cannot understand a body to be anything but divisible, whereas we cannot understand the mind to be anything but indivisible. For we cannot conceive of half of a mind, as we can half of any body whatever, no matter how small. From this we are prompted to acknowledge that the natures of mind and body not only are different from one another, but even, in a manner of speaking, are contraries of one another. However, I have not written any further on the matter in this work, both because these considerations suffice for showing that the annihilation of the mind does not follow from the decaying of the body (and thus these considerations suffice for giving mortals hope in an afterlife), and also because the premises from which the immortality of the mind can be inferred depend upon an account of the whole of physics. First, we need to know that absolutely all substances, that is, things that must be created by God in order to exist, are by their very nature incorruptible, and can never cease to exist, unless, by the same God's denying his concurrence to them, they be reduced to nothingness. Second, we need to realize that body, taken in a general sense, is a substance and hence it too can never perish. But the human body, insofar as it differs from other bodies, is composed of merely a certain configuration of members, together with other accidents of the same sort. But the human mind is not likewise composed of any accidents, but is a pure substance. For even if all its accidents were changed, so that it understands different things, wills different things, senses different things, and so on, the mind itself does not on that score become something different. On the other hand, the human body does become something different, merely as a result of the fact that a change in the shape of some of its parts has taken place. It follows from these considerations that a body can very easily perish, whereas the mind by its nature is immortal.

In the Third Meditation I have explained at sufficient length, it seems to me, my principal argument for proving the existence of God. Nevertheless, since my intent was to draw the minds of readers as far as possible from the senses, I had no desire to draw upon comparisons based upon corporeal things. Thus many obscurities may perhaps have remained; but these, I trust, will later be entirely removed in my Replies to the Objections. One such point of contention, among others, is the following: how can the idea that is in us of a supremely perfect being have so much objective reality that it can only come from a supremely perfect cause? This is illustrated in the Replies by a comparison with a very perfect machine, the idea of which is in the mind of some craftsman. For, just as the objective ingeniousness of this idea ought to have some cause (say, the knowledge possessed by the craftsman or by someone else from whom he received this knowledge), so too, the idea of God which is in us must have God himself as its cause.

In the Fourth Meditation it is proved that all that we clearly and distinctly perceive is true, and it is also explained what constitutes the nature of falsity. These things necessarily need to be known both to confirm

what has preceded as well as to help readers understand what remains. (But here one should meanwhile bear in mind that in that Meditation there is no discussion whatsoever of sin, that is, the error committed in the pursuit of good and evil, but only the error that occurs in discriminating between what is true and what is false. Nor is there an examination of those matters pertaining to the faith or to the conduct of life, but merely of speculative truths known exclusively by means of the light of nature.)

In the Fifth Meditation, in addition to an explanation of corporeal nature in general, the existence of God is also demonstrated by means of a new proof. But again several difficulties may arise here; however, these are resolved later in my Replies to the Objections. Finally, it is shown how it is true that the certainty of even geometrical demonstrations depends upon the knowledge of God.

Finally, in the Sixth Meditation the understanding is distinguished from the imagination and the marks of this distinction are described. The mind is proved to be really distinct from the body, even though the mind is shown to be so closely joined to the body that it forms a single unit with it. All the errors commonly arising from the senses are reviewed; an account of the ways in which these errors can be avoided is provided. Finally, all the arguments on the basis of which we may infer the existence of material things are presented — not because I believe them to be very useful for proving what they prove, namely, that there really is a world, that men have bodies, and the like (things which no one of sound mind has ever seriously doubted), but rather because, through a consideration of these arguments, one realizes that they are neither so firm nor so evident as the arguments leading us to the knowledge of our mind and of God, so that, of all the things that can be known by the human mind, these latter are the most certain and the most evident. Proving this one thing was for me the goal of these Meditations. For this reason I will not review here the various issues that are also to be treated in these Meditations as the situation arises.

*Meditations on First Philosophy in Which the Existence of God and the Distinction
between the Soul and the Body Are Demonstrated*

Meditation One: Concerning Those Things That Can Be Called into Doubt

Several years have now passed since I first realized how numerous were the false opinions that in my youth I had taken to be true, and thus how doubtful were all those that I had subsequently built upon them. And thus I realized that once in my life I had to raze everything to the ground and begin again from the original foundations, if I wanted to establish anything firm and lasting in the sciences. But the task seemed enormous, and I was waiting until I reached a point in my life that was so timely that no more suitable time for undertaking these plans of action would come to pass. For this reason, I procrastinated for so long that I would henceforth be at fault, were I to waste the time that remains for carrying out the project by brooding over it. Accordingly, I have today suitably freed my mind of all cares, secured for myself a period of leisurely tranquillity, and am withdrawing into solitude. At last I will apply myself earnestly and unreservedly to this general demolition of my opinions.

Yet to bring this about I will not need to show that all my opinions are false, which is perhaps something I could never accomplish. But reason now persuades me that I should withhold my assent no less carefully from opinions that are not completely certain and indubitable than I would from those that are patently false. For this reason, it will suffice for the rejection of all of these opinions, if I find in each of them some reason for doubt. Nor therefore need I survey each opinion individually, a task that would be endless. Rather, because undermining the foundations will cause whatever has been built upon them to crumble of its own accord, I will attack straightaway those principles which supported everything I once believed.

Surely whatever I had admitted until now as most true I received either from the senses or through the senses. However, I have noticed that the senses are sometimes deceptive; and it is a mark of prudence never to place our complete trust in those who have deceived us even once.

But perhaps, even though the senses do sometimes deceive us when it is a question of very small and distant things, still there are many other matters concerning which one simply cannot doubt, even though they are derived from the very same senses: for example, that I am sitting here next to the fire, wearing my winter dressing gown, that I am holding this sheet of paper in my hands, and the like. But on what grounds could one deny that these hands and this entire body are mine? Unless perhaps I were to liken myself to the insane, whose brains are impaired by such an unrelenting vapor of black bile that they steadfastly insist that they are kings when they are utter paupers, or that they are arrayed in purple robes when they are naked, or that they have heads made of clay, or that they are gourds, or that they are made of glass. But such people are mad, and I would appear no less mad, were I to take their behavior as an example for myself.

This would all be well and good, were I not a man who is accustomed to sleeping at night, and to experiencing in my dreams the very same things, or now and then even less plausible ones, as these insane people do when they are awake. How often does my evening slumber persuade me of such ordinary things as these: that I am here, clothed in my dressing gown, seated next to the fireplace — when in fact I am lying undressed in bed! But right now my eyes are certainly wide awake when I gaze upon this sheet of paper. This head which I am shaking is not heavy with sleep. I extend this hand consciously and deliberately, and I feel it. Such things would not be so distinct for someone who is asleep. As if I did not recall having been deceived on other occasions even by similar thoughts in my dreams! As I consider these matters more carefully, I see so plainly that there are no definitive signs by which to distinguish being awake from being asleep. As a result, I am becoming quite dizzy, and this dizziness nearly convinces me that I am asleep.

Let us assume then, for the sake of argument, that we are dreaming and that such particulars as these are not true: that we are opening our eyes, moving our head, and extending our hands. Perhaps we do not even have such hands, or any such body at all. Nevertheless, it surely must be admitted that the things seen during slumber are, as it were, like painted images, which could only have been produced in the likeness of true things, and that therefore at least these general things — eyes, head, hands, and the whole body — are not imaginary things, but are true and exist. For indeed when painters themselves wish to represent sirens and satyrs by means of especially bizarre forms, they surely cannot assign to them utterly new natures. Rather, they simply fuse together the members of various animals. Or if perhaps they concoct something so utterly novel that nothing like it has ever been seen before (and thus is something utterly fictitious and false), yet certainly

at the very least the colors from which they fashion it ought to be true. And by the same token, although even these general things—eyes, head, hands and the like—could be imaginary, still one has to admit that at least certain other things that are even more simple and universal are true. It is from these components, as if from true colors, that all those images of things that are in our thought are fashioned, be they true or false.

This class of things appears to include corporeal nature in general, together with its extension; the shape of extended things; their quantity, that is, their size and number; as well as the place where they exist; the time through which they endure, and the like.

Thus it is not improper to conclude from this that physics, astronomy, medicine, and all the other disciplines that are dependent upon the consideration of composite things are doubtful, and that, on the other hand, arithmetic, geometry, and other such disciplines, which treat of nothing but the simplest and most general things and which are indifferent as to whether these things do or do not in fact exist, contain something certain and indubitable. For whether I am awake or asleep, two plus three make five, and a square does not have more than four sides. It does not seem possible that such obvious truths should be subject to the suspicion of being false.

Be that as it may, there is fixed in my mind a certain opinion of long standing, namely that there exists a God who is able to do anything and by whom I, such as I am, have been created. How do I know that he did not bring it about that there is no earth at all, no heavens, no extended thing, no shape, no size, no place, and yet bringing it about that all these things appear to me to exist precisely as they do now? Moreover, since I judge that others sometimes make mistakes in matters that they believe they know most perfectly, may I not, in like fashion, be deceived every time I add two and three or count the sides of a square, or perform an even simpler operation, if that can be imagined? But perhaps God has not willed that I be deceived in this way, for he is said to be supremely good. Nonetheless, if it were repugnant to his goodness to have created me such that I be deceived all the time, it would also seem foreign to that same goodness to permit me to be deceived even occasionally. But we cannot make this last assertion.

Perhaps there are some who would rather deny so powerful a God than believe that everything else is uncertain. Let us not oppose them; rather, let us grant that everything said here about God is fictitious. Now they suppose that I came to be what I am either by fate, or by chance, or by a connected chain of events, or by some other way. But because being deceived and being mistaken appear to be a certain imperfection, the less powerful they take the author of my origin to be, the more probable it will be that I am so imperfect that I am always deceived. I have nothing to say in response to these arguments. But eventually I am forced to admit that there is nothing among the things I once believed to be true which it is not permissible to doubt — and not out of frivolity or lack of forethought, but for valid and considered reasons. Thus I must be no less careful to withhold assent henceforth even from these beliefs than I would from those that are patently false, if I wish to find anything certain.

But it is not enough simply to have realized these things; I must take steps to keep myself mindful of them. For long-standing opinions keep returning, and, almost against my will, they take advantage of my credulity, as if it were bound over to them by long use and the claims of intimacy. Nor will I ever get out of the habit of assenting to them and believing in them, so long as I take them to be exactly what they are, namely, in some respects doubtful, as has just now been shown, but nevertheless highly probable, so that it is much more consonant with reason to believe them than to deny them. Hence, it seems to me I would do well to deceive myself by turning my will in completely the opposite direction and pretend for a time that these opinions are wholly false and imaginary, until finally, as if with prejudices weighing down each side equally, no bad habit should turn my judgment any further from the correct perception of things. For indeed I know that meanwhile there is no danger or error in following this procedure, and that it is impossible for me to indulge in too much distrust, since I am now concentrating only on knowledge, not on action.

Accordingly, I will suppose not a supremely good God, the source of truth, but rather an evil genius, supremely powerful and clever, who has directed his entire effort at deceiving me. I will regard the heavens, the air, the earth, colors, shapes, sounds, and all external things as nothing but the bedeviling hoaxes of my dreams, with which he lays snares for my credulity. I will regard myself as not having hands, or eyes, or flesh, or blood, or any senses, but as nevertheless falsely believing that I possess all these things. I will remain resolute and steadfast in this meditation, and even if it is not within my power to know anything true, it certainly is within my power to take care resolutely to withhold my assent to what is false, lest this deceiver, however powerful, however clever he may be, have any effect on me. But this undertaking is arduous, and a certain laziness brings me back to my customary way of living. I am not unlike a prisoner who enjoyed an imaginary freedom during his sleep, but, when he later begins to suspect that he is dreaming, fears being awakened and nonchalantly conspires with these pleasant illusions. In just the same way, I fall back of my own

accord into my old opinions, and dread being awakened, lest the toilsome wakefulness which follows upon a peaceful rest must be spent thenceforward not in the light but among the inextricable shadows of the difficulties now brought forward.

Meditation Two: Concerning the Nature of the Human Mind: That It Is Better Known Than the Body

Yesterday's meditation has thrown me into such doubts that I can no longer ignore them, yet I fail to see how they are to be resolved. It is as if I had suddenly fallen into a deep whirlpool; I am so tossed about that I can neither touch bottom with my foot, nor swim up to the top. Nevertheless I will work my way up and will once again attempt the same path I entered upon yesterday. I will accomplish this by putting aside everything that admits of the least doubt, as if I had discovered it to be completely false. I will stay on this course until I know something certain, or, if nothing else, until I at least know for certain that nothing is certain. Archimedes sought but one firm and immovable point in order to move the entire earth from one place to another. Just so, great things are also to be hoped for if I succeed in finding just one thing, however slight, that is certain and unshaken.

Therefore I suppose that everything I see is false. I believe that none of what my deceitful memory represents ever existed. I have no senses whatever. Body, shape, extension, movement, and place are all chimeras. What then will be true? Perhaps just the single fact that nothing is certain.

But how do I know there is not something else, over and above all those things that I have just reviewed, concerning which there is not even the slightest occasion for doubt? Is there not some God, or by whatever name I might call him, who instills these very thoughts in me? But why would I think that, since I myself could perhaps be the author of these thoughts? Am I not then at least something? But I have already denied that I have any senses and any body. Still I hesitate; for what follows from this? Am I so tied to a body and to the senses that I cannot exist without them? But I have persuaded myself that there is absolutely nothing in the world: no sky, no earth, no minds, no bodies. Is it then the case that I too do not exist? But doubtless I did exist, if I persuaded myself of something. But there is some deceiver or other who is supremely powerful and supremely sly and who is always deliberately deceiving me. Then too there is no doubt that I exist, if he is deceiving me. And let him do his best at deception, he will never bring it about that I am nothing so long as I shall think that I am something. Thus, after everything has been most carefully weighed, it must finally be established that this pronouncement "I am, I exist" is necessarily true every time I utter it or conceive it in my mind.

But I do not yet understand sufficiently what I am — I, who now necessarily exist. And so from this point on, I must be careful lest I unwittingly mistake something else for myself, and thus err in that very item of knowledge that I claim to be the most certain and evident of all. Thus, I will meditate once more on what I once believed myself to be, prior to embarking upon these thoughts. For this reason, then, I will set aside whatever can be weakened even to the slightest degree by the arguments brought forward, so that eventually all that remains is precisely nothing but what is certain and unshaken.

What then did I use to think I was? A man, of course. But what is a man? Might I not say a "rational animal"? No, because then I would have to inquire what "animal" and "rational" mean. And thus from one question I would slide into many more difficult ones. Nor do I now have enough free time that I want to waste it on subtleties of this sort. Instead, permit me to focus here on what came spontaneously and naturally into my thinking whenever I pondered what I was. Now it occurred to me first that I had a face, hands, arms, and this entire mechanism of bodily members: the very same as are discerned in a corpse, and which I referred to by the name "body." It next occurred to me that I took in food, that I walked about, and that I sensed and thought various things; these actions I used to attribute to the soul. But as to what this soul might be, I either did not think about it or else I imagined it a rarified I-know-not-what, like a wind, or a fire, or ether, which had been infused into my coarser parts. But as to the body I was not in any doubt. On the contrary, I was under the impression that I knew its nature distinctly. Were I perhaps tempted to describe this nature such as I conceived it in my mind, I would have described it thus: by "body," I understand all that is capable of being bounded by some shape, of being enclosed in a place, and of filling up a space in such a way as to exclude any other body from it; of being perceived by touch, sight, hearing, taste, or smell; of being moved in several ways, not, of course, by itself, but by whatever else impinges upon it. For it was my view that the power of self-motion, and likewise of sensing or of thinking, in no way belonged to the nature of the body. Indeed I used rather to marvel that such faculties were to be found in certain bodies.

But now what am I, when I suppose that there is some supremely powerful and, if I may be permitted to say so, malicious deceiver who deliberately tries to fool me in any way he can? Can I not affirm that I possess at least a small measure of all those things which I have already said belong to the nature of the body? I focus

my attention on them, I think about them, I review them again, but nothing comes to mind. I am tired of repeating this to no purpose. But what about those things I ascribed to the soul? What about being nourished or moving about? Since I now do not have a body, these are surely nothing but fictions. What about sensing? Surely this too does not take place without a body; and I seemed to have sensed in my dreams many things that I later realized I did not sense. What about thinking? Here I make my discovery: thought exists; it alone cannot be separated from me. I am; I exist—this is certain. But for how long? For as long as I am thinking; for perhaps it could also come to pass that if I were to cease all thinking I would then utterly cease to exist. At this time I admit nothing that is not necessarily true. I am therefore precisely nothing but a thinking thing; that is, a mind, or intellect, or understanding, or reason — words of whose meanings I was previously ignorant. Yet I am a true thing and am truly existing; but what kind of thing? I have said it already: a thinking thing.

What else am I? I will set my imagination in motion. I am not that concatenation of members we call the human body. Neither am I even some subtle air infused into these members, nor a wind, nor a fire, nor a vapor, nor a breath, nor anything I devise for myself. For I have supposed these things to be nothing. The assumption still stands; yet nevertheless I am something. But is it perhaps the case that these very things which I take to be nothing, because they are unknown to me, nevertheless are in fact no different from that “me” that I know? This I do not know, and I will not quarrel about it now. I can make a judgment only about things that are known to me. I know that I exist; I ask now who is this “I” whom I know? Most certainly, in the strict sense the knowledge of this “I” does not depend upon things of whose existence I do not yet have knowledge. Therefore it is not dependent upon any of those things that I simulate in my imagination. But this word “simulate”⁵ warns me of my error. For I would indeed be simulating were I to “imagine” that I was something, because imagining is merely the contemplating of the shape or image of a corporeal thing. But I now know with certainty that I am and also that all these images — and, generally, everything belonging to the nature of the body—could turn out to be nothing but dreams. Once I have realized this, I would seem to be speaking no less foolishly were I to say: “I will use my imagination in order to recognize more distinctly who I am,” than were I to say: “Now I surely am awake, and I see something true; but since I do not yet see it clearly enough, I will deliberately fall asleep so that my dreams might represent it to me more truly and more clearly.” Thus I realize that none of what I can grasp by means of the imagination pertains to this knowledge that I have of myself. Moreover, I realize that I must be most diligent about withdrawing my mind from these things so that it can perceive its nature as distinctly as possible.

But what then am I? A thing that thinks. What is that? A thing that doubts, understands, affirms, denies, wills, refuses, and that also imagines and senses.

Indeed it is no small matter if all of these things belong to me. But why should they not belong to me? Is it not the very same “I” who now doubts almost everything, who nevertheless understands something, who affirms that this one thing is true, who denies other things, who desires to know more, who wishes not to be deceived, who imagines many things even against my will, who also notices many things which appear to come from the senses? What is there in all of this that is not every bit as true as the fact that I exist — even if I am always asleep or even if my creator makes every effort to mislead me? Which of these things is distinct from my thought? Which of them can be said to be separate from myself? For it is so obvious that it is I who doubt, I who understand, and I who will, that there is nothing by which it could be explained more clearly. But indeed it is also the same “I” who imagines; for although perhaps, as I supposed before, absolutely nothing that I imagined is true, still the very power of imagining really does exist, and constitutes a part of my thought. Finally, it is this same “I” who senses or who is cognizant of bodily things as if through the senses. For example, I now see a light, I hear a noise, I feel heat. These things are false, since I am asleep. Yet I certainly do seem to see, hear, and feel warmth. This cannot be false. Properly speaking, this is what in me is called “sensing.” But this, precisely so taken, is nothing other than thinking.

From these considerations I am beginning to know a little better what I am. But it still seems (and I cannot resist believing) that corporeal things — whose images are formed by thought, and which the senses themselves examine—are much more distinctly known than this mysterious “I” which does not fall within the imagination. And yet it would be strange indeed were I to grasp the very things I consider to be doubtful, unknown, and foreign to me more distinctly than what is true, what is known—than, in short, myself. But I see what is happening: my mind loves to wander and does not yet permit itself to be restricted within the confines of truth. So be it then; let us just this once allow it completely free rein, so that, a little while later, when the time has come to pull in the reins, the mind may more readily permit itself to be controlled.

Let us consider those things which are commonly believed to be the most distinctly grasped of all: namely the bodies we touch and see. Not bodies in general, mind you, for these general perceptions are apt to be somewhat more confused, but one body in particular. Let us take, for instance, this piece of wax. It has been

taken quite recently from the honeycomb; it has not yet lost all the honey flavor. It retains some of the scent of the flowers from which it was collected. Its color, shape, and size are manifest. It is hard and cold; it is easy to touch. If you rap on it with your knuckle it will emit a sound. In short, everything is present in it that appears needed to enable a body to be known as distinctly as possible. But notice that, as I am speaking, I am bringing it close to the fire. The remaining traces of the honey flavor are disappearing; the scent is vanishing; the color is changing; the original shape is disappearing. Its size is increasing; it is becoming liquid and hot; you can hardly touch it. And now, when you rap on it, it no longer emits any sound. Does the same wax still remain? I must confess that it does; no one denies it; no one thinks otherwise. So what was there in the wax that was so distinctly grasped? Certainly none of the aspects that I reached by means of the senses. For whatever came under the senses of taste, smell, sight, touch or hearing has now changed; and yet the wax remains.

Perhaps the wax was what I now think it is: namely that the wax itself never really was the sweetness of the honey, nor the fragrance of the flowers, nor the whiteness, nor the shape, nor the sound, but instead was a body that a short time ago manifested itself to me in these ways, and now does so in other ways. But just what precisely is this thing that I thus imagine? Let us focus our attention on this and see what remains after we have removed everything that does not belong to the wax: only that it is something extended, flexible, and mutable. But what is it to be flexible and mutable? Is it what my imagination shows it to be: namely, that this piece of wax can change from a round to a square shape, or from the latter to a triangular shape? Not at all; for I grasp that the wax is capable of innumerable changes of this sort, even though I am incapable of running through these innumerable changes by using my imagination. Therefore this insight is not achieved by the faculty of imagination. What is it to be extended? Is this thing's extension also unknown? For it becomes greater in wax that is beginning to melt, greater in boiling wax, and greater still as the heat is increased. And I would not judge correctly what the wax is if I did not believe that it takes on an even greater variety of dimensions than I could ever grasp with the imagination. It remains then for me to concede that I do not grasp what this wax is through the imagination; rather, I perceive it through the mind alone. The point I am making refers to this particular piece of wax, for the case of wax in general is clearer still. But what is this piece of wax which is perceived only by the mind? Surely it is the same piece of wax that I see, touch, and imagine; in short it is the same piece of wax I took it to be from the very beginning. But I need to realize that the perception of the wax is neither a seeing, nor a touching, nor an imagining. Nor has it ever been, even though it previously seemed so; rather it is an inspection on the part of the mind alone. This inspection can be imperfect and confused, as it was before, or clear and distinct, as it is now, depending on how closely I pay attention to the things in which the piece of wax consists.

But meanwhile I marvel at how prone my mind is to error. For although I am considering these things within myself silently and without words, nevertheless I seize upon words themselves and I am nearly deceived by the ways in which people commonly speak. For we say that we see the wax itself, if it is present, and not that we judge it to be present from its color or shape. Whence I might conclude straightaway that I know the wax through the vision had by the eye, and not through an inspection on the part of the mind alone. But then were I perchance to look out my window and observe men crossing the square, I would ordinarily say I see the men themselves just as I say I see the wax. But what do I see aside from hats and clothes, which could conceal automata? Yet I judge them to be men. Thus what I thought I had seen with my eyes, I actually grasped solely with the faculty of judgment, which is in my mind.

But a person who seeks to know more than the common crowd ought to be ashamed of himself for looking for doubt in common ways of speaking. Let us then go forward and inquire when it was that I perceived more perfectly and evidently what the piece of wax was. Was it when I first saw it and believed I knew it by the external sense, or at least by the so-called common sense, that is, the power of imagination? Or do I have more perfect knowledge now, when I have diligently examined both what the wax is and how it is known? Surely it is absurd to be in doubt about this matter. For what was there in my initial perception that was distinct? What was there that any animal seemed incapable of possessing? But indeed when I distinguish the wax from its external forms, as if stripping it of its clothing, and look at the wax in its nakedness, then, even though there can be still an error in my judgment, nevertheless I cannot perceive it thus without a human mind.

But what am I to say about this mind, that is, about myself? For as yet I admit nothing else to be in me over and above the mind. What, I ask, am I who seem to perceive this wax so distinctly? Do I not know myself not only much more truly and with greater certainty, but also much more distinctly and evidently? For if I judge that the wax exists from the fact that I see it, certainly from this same fact that I see the wax it follows much more evidently that I myself exist. For it could happen that what I see is not truly wax. It could happen that I have no eyes with which to see anything. But it is utterly impossible that, while I see or think I

see (I do not now distinguish these two), I who think am not something. Likewise, if I judge that the wax exists from the fact that I touch it, the same outcome will again obtain, namely that I exist. If I judge that the wax exists from the fact that I imagine it, or for any other reason, plainly the same thing follows. But what I note regarding the wax applies to everything else that is external to me. Furthermore, if my perception of the wax seemed more distinct after it became known to me not only on account of sight or touch, but on account of many reasons, one has to admit how much more distinctly I am now known to myself. For there is not a single consideration that can aid in my perception of the wax or of any other body that fails to make even more manifest the nature of my mind. But there are still so many other things in the mind itself on the basis of which my knowledge of it can be rendered more distinct that it hardly seems worth enumerating those things which emanate to it from the body.

But lo and behold, I have returned on my own to where I wanted to be. For since I now know that even bodies are not, properly speaking, perceived by the senses or by the faculty of imagination, but by the intellect alone, and that they are not perceived through their being touched or seen, but only through their being understood, I manifestly know that nothing can be perceived more easily and more evidently than my own mind. But since the tendency to hang on to long-held beliefs cannot be put aside so quickly, I want to stop here, so that by the length of my meditation this new knowledge may be more deeply impressed upon my memory.

Meditation Three: Concerning God, That He Exists

I will now shut my eyes, stop up my ears, and withdraw all my senses. I will also blot out from my thoughts all images of corporeal things, or rather, since the latter is hardly possible, I will regard these images as empty, false and worthless. And as I converse with myself alone and look more deeply into myself, I will attempt to render myself gradually better known and more familiar to myself. I am a thing that thinks, that is to say, a thing that doubts, affirms, denies, understands a few things, is ignorant of many things, wills, refrains from willing, and also imagines and senses. For as I observed earlier, even though these things that I sense or imagine may perhaps be nothing at all outside me, nevertheless I am certain that these modes of thinking, which are cases of what I call sensing and imagining, insofar as they are merely modes of thinking, do exist within me.

In these few words, I have reviewed everything I truly know, or at least what so far I have noticed that I know. Now I will ponder more carefully to see whether perhaps there may be other things belonging to me that up until now I have failed to notice. I am certain that I am a thinking thing. But do I not therefore also know what is required for me to be certain of anything? Surely in this first instance of knowledge, there is nothing but a certain clear and distinct perception of what I affirm. Yet this would hardly be enough to render me certain of the truth of a thing, if it could ever happen that something that I perceived so clearly and distinctly were false. And thus I now seem able to posit as a general rule that everything I very clearly and distinctly perceive is true.

Be that as it may, I have previously admitted many things as wholly certain and evident that nevertheless I later discovered to be doubtful. What sort of things were these? Why, the earth, the sky, the stars, and all the other things I perceived by means of the senses. But what was it about these things that I clearly perceived? Surely the fact that the ideas or thoughts of these things were hovering before my mind. But even now I do not deny that these ideas are in me. Yet there was something else I used to affirm, which, owing to my habitual tendency to believe it, I used to think was something I clearly perceived, even though I actually did not perceive it at all: namely, that certain things existed outside me, things from which those ideas proceeded and which those ideas completely resembled. But on this point I was mistaken; or rather, if my judgment was a true one, it was not the result of the force of my perception.

But what about when I considered something very simple and easy in the areas of arithmetic or geometry, for example that two plus three make five, and the like? Did I not intuit them at least clearly enough so as to affirm them as true? To be sure, I did decide later on that I must doubt these things, but that was only because it occurred to me that some God could perhaps have given me a nature such that I might be deceived even about matters that seemed most evident. But whenever this preconceived opinion about the supreme power of God occurs to me, I cannot help admitting that, were he to wish it, it would be easy for him to cause me to err even in those matters that I think I intuit as clearly as possible with the eyes of the mind. On the other hand, whenever I turn my attention to those very things that I think I perceive with such great clarity, I am so completely persuaded by them that I spontaneously blurt out these words: "let anyone who can do so deceive me; so long as I think that I am something, he will never bring it about that I am nothing. Nor will he one day make it true that I never existed, for it is true now that I do exist. Nor will he even bring it about that perhaps two plus three might equal more or less than five, or similar items in which I recognize an obvious contradiction." And certainly, because I have no reason for thinking that there is a God who is a deceiver (and of course I do not yet sufficiently know whether there even is a God), the basis for doubting, depending as it does merely on the above hypothesis, is very tenuous and, so to speak, metaphysical. But in order to remove even this basis for doubt, I should at the first opportunity inquire whether there is a God, and, if there is, whether or not he can be a deceiver. For if I am ignorant of this, it appears I am never capable of being completely certain about anything else.

However, at this stage good order seems to demand that I first group all my thoughts into certain classes, and ask in which of them truth or falsity properly resides. Some of these thoughts are like images of things; to these alone does the word "idea" properly apply, as when I think of a man, or a chimera, or the sky, or an angel, or God. Again there are other thoughts that take different forms: for example, when I will, or fear, or affirm, or deny, there is always some thing that I grasp as the subject of my thought, yet I embrace in my thought something more than the likeness of that thing. Some of these thoughts are called volitions or affects, while others are called judgments.

Now as far as ideas are concerned, if they are considered alone and in their own right, without being

referred to something else, they cannot, properly speaking, be false. For whether it is a she-goat or a chimera that I am imagining, it is no less true that I imagine the one than the other. Moreover, we need not fear that there is falsity in the will itself or in the affects, for although I can choose evil things or even things that are utterly non-existent, I cannot conclude from this that it is untrue that I do choose these things. Thus there remain only judgments in which I must take care not to be mistaken. Now the principal and most frequent error to be found in judgments consists in the fact that I judge that the ideas which are in me are similar to or in conformity with certain things outside me. Obviously, if I were to consider these ideas merely as certain modes of my thought, and were not to refer them to anything else, they could hardly give me any subject matter for error.

Among these ideas, some appear to me to be innate, some adventitious, and some produced by me. For I understand what a thing is, what truth is, what thought is, and I appear to have derived this exclusively from my very own nature. But say I am now hearing a noise, or looking at the sun, or feeling the fire; up until now I judged that these things proceeded from certain things outside me, and finally, that sirens, hippogriffs, and the like are made by me. Or perhaps I can even think of all these ideas as being adventitious, or as being innate, or as fabrications, for I have not yet clearly ascertained their true origin.

But here I must inquire particularly into those ideas that I believe to be derived from things existing outside me. Just what reason do I have for believing that these ideas resemble those things? Well, I do seem to have been so taught by nature. Moreover, I do know from experience that these ideas do not depend upon my will, nor consequently upon myself, for I often notice them even against my will. Now, for example, whether or not I will it, I feel heat. It is for this reason that I believe this feeling or idea of heat comes to me from something other than myself, namely from the heat of the fire by which I am sitting. Nothing is more obvious than the judgment that this thing is sending its likeness rather than something else into me.

I will now see whether these reasons are powerful enough. When I say here "I have been so taught by nature," all I have in mind is that I am driven by a spontaneous impulse to believe this, and not that some light of nature is showing me that it is true. These are two very different things. For whatever is shown me by this light of nature, for example, that from the fact that I doubt, it follows that I am, and the like, cannot in any way be doubtful. This is owing to the fact that there can be no other faculty that I can trust as much as this light and which could teach that these things are not true. But as far as natural impulses are concerned, in the past I have often judged myself to have been driven by them to make the poorer choice when it was a question of choosing a good; and I fail to see why I should place any greater faith in them than in other matters.

Again, although these ideas do not depend upon my will, it does not follow that they necessarily proceed from things existing outside me. For just as these impulses about which I spoke just now seem to be different from my will, even though they are in me, so too perhaps there is also in me some other faculty, one not yet sufficiently known to me, which produces these ideas, just as it has always seemed up to now that ideas are formed in me without any help from external things when I am asleep.

And finally, even if these ideas did proceed from things other than myself, it does not therefore follow that they must resemble those things. Indeed it seems I have frequently noticed a vast difference in many respects. For example, I find within myself two distinct ideas of the sun. One idea is drawn, as it were, from the senses. Now it is this idea which, of all those that I take to be derived from outside me, is most in need of examination. By means of this idea the sun appears to me to be quite small. But there is another idea, one derived from astronomical reasoning, that is, it is elicited from certain notions that are innate in me, or else is fashioned by me in some other way. Through this idea the sun is shown to be several times larger than the earth. Both ideas surely cannot resemble the same sun existing outside me; and reason convinces me that the idea that seems to have emanated from the sun itself from so close is the very one that least resembles the sun.

All these points demonstrate sufficiently that up to this point it was not a well-founded judgment but only a blind impulse that formed the basis of my belief that things existing outside me send ideas or images of themselves to me through the sense organs or by some other means.

But still another way occurs to me for inquiring whether some of the things of which there are ideas in me do exist outside me: insofar as these ideas are merely modes of thought, I see no inequality among them; they all seem to proceed from me in the same manner. But insofar as one idea represents one thing and another idea another thing, it is obvious that they do differ very greatly from one another. Unquestionably, those ideas that display substances to me are something more and, if I may say so, contain within themselves more objective reality than those which represent only modes or accidents. Again, the idea that enables me to understand a supreme deity, eternal, infinite, omniscient, omnipotent, and creator of all things other than himself, clearly has more objective reality within it than do those ideas through which finite substances are

displayed.

Now it is indeed evident by the light of nature that there must be at least as much [reality] in the efficient and total cause as there is in the effect of that same cause. For whence, I ask, could an effect get its reality, if not from its cause? And how could the cause give that reality to the effect, unless it also possessed that reality? Hence it follows that something cannot come into being out of nothing, and also that what is more perfect (that is, what contains in itself more reality) cannot come into being from what is less perfect. But this is manifestly true not merely for those effects whose reality is actual or formal, but also for ideas in which only objective reality is considered. For example, not only can a stone which did not exist previously not now begin to exist unless it is produced by something in which there is, either formally or eminently,⁶ everything that is in the stone; nor heat be introduced into a subject which was not already hot unless it is done by something that is of at least as perfect an order as heat — and the same for the rest — but it is also true that there can be in me no idea of heat, or of a stone, unless it is placed in me by some cause that has at least as much reality as I conceive to be in the heat or in the stone. For although this cause conveys none of its actual or formal reality to my idea, it should not be thought for that reason that it must be less real. Rather, the very nature of an idea is such that of itself it needs no formal reality other than what it borrows from my thought, of which it is a mode. But that a particular idea contains this as opposed to that objective reality is surely owing to some cause in which there is at least as much formal reality as there is objective reality contained in the idea. For if we assume that something is found in the idea that was not in its cause, then the idea gets that something from nothing. Yet as imperfect a mode of being as this is by which a thing exists in the intellect objectively through an idea, nevertheless it is plainly not nothing; hence it cannot get its being from nothing.

Moreover, even though the reality that I am considering in my ideas is merely objective reality, I ought not on that account to suspect that there is no need for the same reality to be formally in the causes of these ideas, but that it suffices for it to be in them objectively. For just as the objective mode of being belongs to ideas by their very nature, so the formal mode of being belongs to the causes of ideas, at least to the first and preeminent ones, by their very nature. And although one idea can perhaps issue from another, nevertheless no infinite regress is permitted here; eventually some first idea must be reached whose cause is a sort of archetype that contains formally all the reality that is in the idea merely objectively. Thus it is clear to me by the light of nature that the ideas that are in me are like images that can easily fail to match the perfection of the things from which they have been drawn, but which can contain nothing greater or more perfect.

And the longer and more attentively I examine all these points, the more clearly and distinctly I know they are true. But what am I ultimately to conclude? If the objective reality of any of my ideas is found to be so great that I am certain that the same reality was not in me, either formally or eminently, and that therefore I myself cannot be the cause of the idea, then it necessarily follows that I am not alone in the world, but that something else, which is the cause of this idea, also exists. But if no such idea is found in me, I will have no argument whatsoever to make me certain of the existence of anything other than myself, for I have conscientiously reviewed all these arguments, and so far I have been unable to find any other.

Among my ideas, in addition to the one that displays me to myself (about which there can be no difficulty at this point), are others that represent God, corporeal and inanimate things, angels, animals, and finally other men like myself.

As to the ideas that display other men, or animals, or angels, I easily understand that they could be fashioned from the ideas that I have of myself, of corporeal things, and of God — even if no men (except myself), no animals, and no angels existed in the world.

As to the ideas of corporeal things, there is nothing in them that is so great that it seems incapable of having originated from me. For if I investigate them thoroughly and examine each one individually in the way I examined the idea of wax yesterday, I notice that there are only a very few things in them that I perceive clearly and distinctly: namely, size, or extension in length, breadth, and depth; shape, which arises from the limits of this extension; position, which various things possessing shape have in relation to one another; and motion, or alteration in position. To these can be added substance, duration, and number. But as for the remaining items, such as light and colors, sounds, odors, tastes, heat and cold and other tactile qualities, I think of these only in a very confused and obscure manner, to the extent that I do not even know whether they are true or false, that is, whether the ideas I have of them are ideas of things or ideas of non-things. For although a short time ago I noted that falsity properly so called (or “formal” falsity) is to be found only in judgments, nevertheless there is another kind of falsity (called “material” falsity) which is found in ideas whenever they represent a non-thing as if it were a thing. For example, the ideas I have of heat and cold fall so far short of being clear and distinct that I cannot tell from them whether cold is merely the privation of heat or whether heat is the privation of cold, or whether both are real qualities, or whether neither is. And because

ideas can only be, as it were, of things, if it is true that cold is merely the absence of heat, then an idea that represents cold to me as something real and positive will not inappropriately be called false. The same holds for other similar ideas.

Assuredly I need not assign to these ideas an author distinct from myself. For if they were false, that is, if they were to represent non-things, I know by the light of nature that they proceed from nothing; that is, they are in me for no other reason than that something is lacking in my nature, and that my nature is not entirely perfect. If, on the other hand, these ideas are true, then because they exhibit so little reality to me that I cannot distinguish it from a non-thing, I see no reason why they cannot get their being from me.

As for what is clear and distinct in the ideas of corporeal things, it appears I could have borrowed some of these from the idea of myself: namely, substance, duration, number, and whatever else there may be of this type. For instance, I think that a stone is a substance, that is to say, a thing that is suitable for existing in itself; and likewise I think that I too am a substance. Despite the fact that I conceive myself to be a thinking thing and not an extended thing, whereas I conceive of a stone as an extended thing and not a thinking thing, and hence there is the greatest diversity between these two concepts, nevertheless they seem to agree with one another when considered under the rubric of substance. Furthermore, I perceive that I now exist and recall that I have previously existed for some time. And I have various thoughts and know how many of them there are. It is in doing these things that I acquire the ideas of duration and number, which I can then apply to other things. However, none of the other components out of which the ideas of corporeal things are fashioned (namely extension, shape, position, and motion) are contained in me formally, since I am merely a thinking thing. But since these are only certain modes of a substance, whereas I am a substance, it seems possible that they are contained in me eminently.

Thus there remains only the idea of God. I must consider whether there is anything in this idea that could not have originated from me. I understand by the name "God" a certain substance that is infinite, independent, supremely intelligent and supremely powerful, and that created me along with everything else that exists — if anything else exists. Indeed all these are such that, the more carefully I focus my attention on them, the less possible it seems they could have arisen from myself alone. Thus, from what has been said, I must conclude that God necessarily exists.

For although the idea of substance is in me by virtue of the fact that I am a substance, that fact is not sufficient to explain my having the idea of an infinite substance, since I am finite, unless this idea proceeded from some substance which really was infinite.

Nor should I think that I do not perceive the infinite by means of a true idea, but only through a negation of the finite, just as I perceive rest and darkness by means of a negation of motion and light. On the contrary, I clearly understand that there is more reality in an infinite substance than there is in a finite one. Thus the perception of the infinite is somehow prior in me to the perception of the finite, that is, my perception of God is prior to my perception of myself. For how would I understand that I doubt and that I desire, that is, that I lack something and that I am not wholly perfect, unless there were some idea in me of a more perfect being, by comparison with which I might recognize my defects?

Nor can it be said that this idea of God is perhaps materially false and thus can originate from nothing, as I remarked just now about the ideas of heat and cold, and the like. On the contrary, because it is the most clear and distinct and because it contains more objective reality than any other idea, no idea is in and of itself truer and has less of a basis for being suspected of falsehood. I maintain that this idea of a being that is supremely perfect and infinite is true in the highest degree. For although I could perhaps pretend that such a being does not exist, nevertheless I could not pretend that the idea of such a being discloses to me nothing real, as was the case with the idea of cold which I referred to earlier. It is indeed an idea that is utterly clear and distinct; for whatever I clearly and distinctly perceive to be real and true and to involve some perfection is wholly contained in that idea. It is no objection that I do not comprehend the infinite or that there are countless other things in God that I can in no way either comprehend or perhaps even touch with my thought. For the nature of the infinite is such that it is not comprehended by a being such as I, who am finite. And it is sufficient that I understand this very point and judge that all those things that I clearly perceive and that I know to contain some perfection—and perhaps even countless other things of which I am ignorant—are in God either formally or eminently. The result is that, of all the ideas that are in me, the idea that I have of God is the most true, the most clear and distinct.

But perhaps I am something greater than I myself understand. Perhaps all these perfections that I am attributing to God are somehow in me potentially, although they do not yet assert themselves and are not yet actualized. For I now observe that my knowledge is gradually being increased, and I see nothing standing in the way of its being increased more and more to infinity. Moreover, I see no reason why, with my knowledge

thus increased, I could not acquire all the remaining perfections of God. And, finally, if the potential for these perfections is in me already, I see no reason why this potential would not suffice to produce the idea of these perfections.

Yet none of these things can be the case. First, while it is true that my knowledge is gradually being increased and that there are many things in me potentially that are not yet actual, nevertheless, none of these pertains to the idea of God, in which there is nothing whatever that is potential. Indeed this gradual increase is itself a most certain proof of imperfection. Moreover, although my knowledge may always increase more and more, nevertheless I understand that this knowledge will never by this means be actually infinite, because it will never reach a point where it is incapable of greater increase. On the contrary, I judge God to be actually infinite, so that nothing can be added to his perfection. Finally, I perceive that the objective being of an idea cannot be produced by a merely potential being (which, strictly speaking, is nothing), but only by an actual or formal being.

Indeed there is nothing in all these things that is not manifest by the light of nature to one who is conscientious and attentive. But when I am less attentive, and the images of sensible things blind the mind's eye, I do not so easily recall why the idea of a being more perfect than me necessarily proceeds from a being that really is more perfect. This being the case, it is appropriate to ask further whether I myself who have this idea could exist, if such a being did not exist.

From what source, then, do I derive my existence? Why, from myself, or from my parents, or from whatever other things there are that are less perfect than God. For nothing more perfect than God, or even as perfect as God, can be thought or imagined.

But if I got my being from myself, I would not doubt, nor would I desire, nor would I lack anything at all. For I would have given myself all the perfections of which I have some idea; in so doing, I myself would be God! I must not think that the things I lack could perhaps be more difficult to acquire than the ones I have now. On the contrary, it is obvious that it would have been much more difficult for me (that is, a thing or substance that thinks) to emerge out of nothing than it would be to acquire the knowledge of many things about which I am ignorant (these items of knowledge being merely accidents of that substance). Certainly, if I got this greater thing for myself, I would not have denied myself at least those things that can be had more easily. Nor would I have denied myself any of those other things that I perceive to be contained in the idea of God, for surely none of them seem to me more difficult to bring about. But if any of them were more difficult to bring about, they would certainly also seem more difficult to me, even if the remaining ones that I possess I got from myself, since it would be on account of them that I would experience that my power is limited.

Nor am I avoiding the force of these arguments, if I suppose that perhaps I have always existed as I do now, as if it then followed that no author of my existence need be sought. For because the entire span of one's life can be divided into countless parts, each one wholly independent of the rest, it does not follow from the fact that I existed a short time ago that I must exist now, unless some cause, as it were, creates me all over again at this moment, that is to say, which preserves me. For it is obvious to one who pays close attention to the nature of time that plainly the same force and action are needed to preserve anything at each individual moment that it lasts as would be required to create the same thing anew, were it not yet in existence. Thus conservation differs from creation solely by virtue of a distinction of reason; this too is one of those things that are manifest by the light of nature.

Therefore I must now ask myself whether I possess some power by which I can bring it about that I myself, who now exist, will also exist a little later on. For since I am nothing but a thinking thing — or at least since I am now dealing simply and precisely with that part of me which is a thinking thing—if such a power were in me, then I would certainly be aware of it. But I observe that there is no such power; and from this very fact I know most clearly that I depend upon some being other than myself.

But perhaps this being is not God, and I have been produced either by my parents or by some other causes less perfect than God. On the contrary, as I said before, it is obvious that there must be at least as much in the cause as there is in the effect. Thus, regardless of what it is that eventually is assigned as my cause, because I am a thinking thing and have within me a certain idea of God, it must be granted that what caused me is also a thinking thing and it too has an idea of all the perfections which I attribute to God. And I can again inquire of this cause whether it got its existence from itself or from another cause. For if it got its existence from itself, it is evident from what has been said that it is itself God, because, having the power of existing in and of itself, it unquestionably also has the power of actually possessing all the perfections of which it has in itself an idea — that is, all the perfections that I conceive to be in God. However, if it got its existence from another cause, I will once again inquire in similar fashion about this other cause: whether it got its existence from itself or from another cause, until finally I arrive at the ultimate cause, which will be God. For it is apparent enough

that there can be no infinite regress here, especially since I am not dealing here merely with the cause that once produced me, but also and most especially with the cause that preserves me at the present time.

Nor can one fancy that perhaps several partial causes have concurred in bringing me into being, and that I have taken the ideas of the various perfections I attribute to God from a variety of causes, so that all of these perfections are found somewhere in the universe, but not all joined together in a single being— God. On the contrary, the unity, the simplicity, that is, the inseparability of all those features that are in God is one of the chief perfections that I understand to be in him. Certainly the idea of the unity of all his perfections could not have been placed in me by any cause from which I did not also get the ideas of the other perfections; for neither could some cause have made me understand them joined together and inseparable from one another, unless it also caused me to recognize what they were.

Finally, as to my parents, even if everything that I ever believed about them were true, still it is certainly not they who preserve me; nor is it they who in any way brought me into being, insofar as I am a thinking thing. Rather, they merely placed certain dispositions in the matter which I judged to contain me, that is, a mind, which now is the only thing I take myself to be. And thus there can be no difficulty here concerning my parents. Indeed I have no choice but to conclude that the mere fact of my existing and of there being in me an idea of a most perfect being, that is, God, demonstrates most evidently that God too exists.

All that remains for me is to ask how I received this idea of God. For I did not draw it from the senses; it never came upon me unexpectedly, as is usually the case with the ideas of sensible things when these things present themselves (or seem to present themselves) to the external sense organs. Nor was it made by me, for I plainly can neither subtract anything from it nor add anything to it. Thus the only option remaining is that this idea is innate in me, just as the idea of myself is innate in me.

To be sure, it is not astonishing that in creating me, God should have endowed me with this idea, so that it would be like the mark of the craftsman impressed upon his work, although this mark need not be something distinct from the work itself. But the mere fact that God created me makes it highly plausible that I have somehow been made in his image and likeness, and that I perceive this likeness, in which the idea of God is contained, by means of the same faculty by which I perceive myself. That is, when I turn the mind's eye toward myself, I understand not only that I am something incomplete and dependent upon another, something aspiring indefinitely for greater and greater or better things, but also that the being on whom I depend has in himself all those greater things — not merely indefinitely and potentially, but infinitely and actually, and thus that he is God. The whole force of the argument rests on the fact that I recognize that it would be impossible for me to exist, being of such a nature as I am (namely, having in me the idea of God), unless God did in fact exist. God, I say, that same being the idea of whom is in me: a being having all those perfections that I cannot comprehend, but can somehow touch with my thought, and a being subject to no defects whatever. From these considerations it is quite obvious that he cannot be a deceiver, for it is manifest by the light of nature that all fraud and deception depend on some defect.

But before examining this idea more closely and at the same time inquiring into other truths that can be gathered from it, at this point I want to spend some time contemplating this God, to ponder his attributes and, so far as the eye of my darkened mind can take me, to gaze upon, to admire, and to adore the beauty of this immense light. For just as we believe by faith that the greatest felicity of the next life consists solely in this contemplation of the divine majesty, so too we now experience that from the same contemplation, although it is much less perfect, the greatest pleasure of which we are capable in this life can be perceived.

Meditation Four: Concerning the True and the False

Lately I have become accustomed to withdrawing my mind from the senses, and I have carefully taken note of the fact that very few things are truly perceived regarding corporeal things, although a great many more things are known regarding the human mind, and still many more things regarding God. The upshot is that I now have no difficulty directing my thought away from things that can be imagined to things that can be grasped only by the understanding and are wholly separate from matter. In fact the idea I clearly have of the human mind — insofar as it is a thinking thing, not extended in length, breadth or depth, and having nothing else from the body—is far more distinct than the idea of any corporeal thing. And when I take note of the fact that I doubt, or that I am a thing that is incomplete and dependent, there comes to mind a clear and distinct idea of a being that is independent and complete, that is, an idea of God. And from the mere fact that such an idea is in me, or that I who have this idea exist, I draw the obvious conclusion that God also exists, and that my existence depends entirely upon him at each and every moment. This conclusion is so obvious that I am confident that the human mind can know nothing more evident or more certain. And now I seem to see a way by which I might progress from this contemplation of the true God, in whom, namely, are hidden all the treasures of the sciences and wisdom, to the knowledge of other things.

To begin with, I acknowledge that it is impossible for God ever to deceive me, for trickery or deception is always indicative of some imperfection. And although the ability to deceive seems to be an indication of cleverness or power, the will to deceive undoubtedly attests to maliciousness or weakness. Accordingly, deception is incompatible with God.

Next I experience that there is in me a certain faculty of judgment, which, like everything else that is in me, I undoubtedly received from God. And since he does not wish to deceive me, he assuredly has not given me the sort of faculty with which I could ever make a mistake, when I use it properly.

No doubt regarding this matter would remain, but for the fact that it seems to follow from this that I am never capable of making a mistake. For if everything that is in me I got from God, and he gave me no faculty for making mistakes, it seems I am incapable of ever erring. And thus, so long as I think exclusively about God and focus my attention exclusively on him, I discern no cause of error or falsity. But once I turn my attention back on myself, I nevertheless experience that I am subject to countless errors. As I seek a cause of these errors, I notice that passing before me is not only a real and positive idea of God (that is, of a supremely perfect being), but also, as it were, a certain negative idea of nothingness (that is, of what is at the greatest possible distance from any perfection), and that I have been so constituted as a kind of middle ground between God and nothingness, or between the supreme being and non-being. Thus insofar as I have been created by the supreme being, there is nothing in me by means of which I might be deceived or be led into error; but insofar as I participate in nothingness or non-being, that is, insofar as I am not the supreme being and lack a great many things, it is not surprising that I make mistakes. Thus I certainly understand that error as such is not something real that depends upon God, but rather is merely a defect. And thus there is no need to account for my errors by positing a faculty given to me by God for this purpose. Rather, it just so happens that I make mistakes because the faculty of judging the truth, which I got from God, is not, in my case, infinite.

Still this is not yet altogether satisfactory; for error is not a pure negation, but rather a privation or a lack of some knowledge that somehow ought to be in me. And when I attend to the nature of God, it seems impossible that he would have placed in me a faculty that is not perfect in its kind or that is lacking some perfection it ought to have. For if it is true that the more expert the craftsman, the more perfect the works he produces, what can that supreme creator of all things make that is not perfect in all respects? No doubt God could have created me such that I never erred. No doubt, again, God always wills what is best. Is it then better that I should be in error rather than not?

As I mull these things over more carefully, it occurs to me first that there is no reason to marvel at the fact that God should bring about certain things the reasons for which I do not understand. Nor is his existence therefore to be doubted because I happen to experience other things of which I fail to grasp why and how he made them. For since I know now that my nature is very weak and limited, whereas the nature of God is immense, incomprehensible, and infinite, this is sufficient for me also to know that he can make innumerable things whose causes escape me. For this reason alone the entire class of causes which people customarily derive from a thing's "end," I judge to be utterly useless in physics. It is not without rashness that I think myself capable of inquiring into the ends of God.

It also occurs to me that whenever we ask whether the works of God are perfect, we should keep in view not simply some one creature in isolation from the rest, but the universe as a whole. For perhaps something might rightfully appear very imperfect if it were all by itself, and yet be most perfect, to the extent that it has the status of a part in the universe. And although subsequent to having decided to doubt everything, I have come to know with certainty only that I and God exist, nevertheless, after having taken note of the immense power of God, I cannot deny that many other things have been made by him, or at least could have been made by him. Thus I may have the status of a part in the universal scheme of things.

Next, as I focus more closely on myself and inquire into the nature of my errors (the only things that are indicative of some imperfection in me), I note that these errors depend on the simultaneous concurrence of two causes: the faculty of knowing that is in me and the faculty of choosing, that is, the free choice of the will, in other words, simultaneously on the intellect and will. Through the intellect alone I merely perceive ideas, about which I can render a judgment. Strictly speaking, no error is to be found in the intellect when properly viewed in this manner. For although perhaps there may exist countless things about which I have no idea, nevertheless it must not be said that, strictly speaking, I am deprived of these ideas but only that I lack them in a negative sense. This is because I cannot adduce an argument to prove that God ought to have given me a greater faculty of knowing than he did. No matter how expert a craftsman I understand him to be, still I do not for that reason believe he ought to have bestowed on each one of his works all the perfections that he can put into some. Nor, on the other hand, can I complain that the will or free choice I have received from God is insufficiently ample or perfect, since I experience that it is limited by no boundaries whatever. In fact, it seems to be especially worth noting that no other things in me are so perfect or so great but that I understand that they can be still more perfect or greater. If, for example, I consider the faculty of understanding, I immediately recognize that in my case it is very small and quite limited, and at the very same time I form an idea of another much greater faculty of understanding — in fact, an understanding which is consummately great and infinite; and from the fact that I can form an idea of this faculty, I perceive that it pertains to the nature of God. Similarly, were I to examine the faculty of memory or imagination, or any of the other faculties, I would understand that in my case each of these is without exception feeble and limited, whereas in the case of God I understand each faculty to be boundless. It is only the will or free choice that I experience to be so great in me that I cannot grasp the idea of any greater faculty. This is so much the case that the will is the chief basis for my understanding that I bear a certain image and likeness of God. For although the faculty of willing is incomparably greater in God than it is in me, both by virtue of the knowledge and power that are joined to it and that render it more resolute and efficacious and by virtue of its object inasmuch as the divine will stretches over a greater number of things, nevertheless, when viewed in itself formally and precisely, God's faculty of willing does not appear to be any greater. This is owing to the fact that willing is merely a matter of being able to do or not do the same thing, that is, of being able to affirm or deny, to pursue or to shun; or better still, the will consists solely in the fact that when something is proposed to us by our intellect either to affirm or deny, to pursue or to shun, we are moved in such a way that we sense that we are determined to it by no external force. In order to be free I need not be capable of being moved in each direction; on the contrary, the more I am inclined toward one direction — either because I clearly understand that there is in it an aspect of the good and the true, or because God has thus disposed the inner recesses of my thought—the more freely do I choose that direction. Nor indeed does divine grace or natural knowledge ever diminish one's freedom; rather, they increase and strengthen it. However, the indifference that I experience when there is no reason moving me more in one direction than in another is the lowest grade of freedom; it is indicative not of any perfection in freedom, but rather of a defect, that is, a certain negation in knowledge. Were I always to see clearly what is true and good, I would never deliberate about what is to be judged or chosen. In that event, although I would be entirely free, I could never be indifferent.

But from these considerations I perceive that the power of willing, which I got from God, is not, taken by itself, the cause of my errors, for it is most ample as well as perfect in its kind. Nor is my power of understanding the cause of my errors. For since I got my power of understanding from God, whatever I understand I doubtless understand rightly, and it is impossible for me to be deceived in this. What then is the source of my errors? They are owing simply to the fact that, since the will extends further than the intellect, I do not contain the will within the same boundaries; rather, I also extend it to things I do not understand. Because the will is indifferent in regard to such matters, it easily turns away from the true and the good; and in this way I am deceived and I sin.

For example, during these last few days I was examining whether anything in the world exists, and I noticed that, from the very fact that I was making this examination, it obviously followed that I exist. Nevertheless, I could not help judging that what I understood so clearly was true; not that I was coerced into making this judgment because of some external force, but because a great light gave way to a great inclination

in my will, and the less indifferent I was, the more spontaneously and freely did I believe it. But now, in addition to my knowing that I exist, insofar as I am a certain thinking thing, I also observe a certain idea of corporeal nature. It happens that I am in doubt as to whether the thinking nature which is in me, or rather which I am, is something different from this corporeal nature, or whether both natures are one and the same thing. And I assume that as yet no consideration has occurred to my intellect to convince me of the one alternative rather than the other. Certainly in virtue of this very fact I am indifferent about whether to affirm or to deny either alternative, or even whether to make no judgment at all in the matter.

Moreover, this indifference extends not merely to things about which the intellect knows absolutely nothing, but extends generally to everything of which the intellect does not have a clear enough knowledge at the very time when the will is deliberating on them. For although probable guesses may pull me in one direction, the mere knowledge that they are only guesses and not certain and indubitable proofs is all it takes to push my assent in the opposite direction. These last few days have provided me with ample experience on this point. For all the beliefs that I had once held to be most true I have supposed to be utterly false, and for the sole reason that I determined that I could somehow raise doubts about them.

But if I hold off from making a judgment when I do not perceive what is true with sufficient clarity and distinctness, it is clear that I am acting properly and am not committing an error. But if instead I were to make an assertion or a denial, then I am not using my freedom properly. Were I to select the alternative that is false, then obviously I will be in error. But were I to embrace the other alternative, it will be by sheer luck that I happen upon the truth; but I will still not be without fault, for it is manifest by the light of nature that a perception on the part of the intellect must always precede a determination on the part of the will. Inherent in this incorrect use of free will is the privation that constitutes the very essence of error: the privation, I say, present in this operation insofar as the operation proceeds for me, but not in the faculty given to me by God, nor even in its operation insofar as it depends upon him.

Indeed I have no cause for complaint on the grounds that God has not given me a greater power of understanding or a greater light of nature than he has, for it is of the essence of a finite intellect not to understand many things, and it is of the essence of a created intellect to be finite. Actually, instead of thinking that he has withheld from me or deprived me of those things that he has not given me, I ought to thank God, who never owed me anything, for what he has bestowed upon me.

Again, I have no cause for complaint on the grounds that God has given me a will that has a wider scope than my intellect. For since the will consists of merely one thing, something indivisible, as it were, it does not seem that its nature could withstand anything being removed from it. Indeed, the more ample the will is, the more I ought to thank the one who gave it to me.

Finally, I should not complain because God concurs with me in eliciting those acts of the will, that is those judgments, in which I am mistaken. For insofar as those acts depend on God, they are absolutely true and good; and in a certain sense, there is greater perfection in me in being able to elicit those acts than in not being able to do so. But privation, in which alone the defining characteristic of falsehood and wrong-doing is to be found, has no need whatever for God's concurrence, since a privation is not a thing, nor, when it is related to God as its cause, is it to be called a privation, but simply a negation. For it is surely no imperfection in God that he has given me the freedom to give or withhold my assent in those instances where he has not placed a clear and distinct perception in my intellect. But surely it is an imperfection in me that I do not use my freedom well and that I make judgments about things I do not properly understand. Nevertheless, I see that God could easily have brought it about that, while still being free and having finite knowledge, I should nonetheless never make a mistake. This result could have been achieved either by his endowing my intellect with a clear and distinct perception of everything about which I would ever deliberate, or by simply impressing the following rule so firmly upon my memory that I could never forget it: I should never judge anything that I do not clearly and distinctly understand. I readily understand that, considered as a totality, I would have been more perfect than I am now, had God made me that way. But I cannot therefore deny that it may somehow be a greater perfection in the universe as a whole that some of its parts are not immune to error, while others are, than if all of them were exactly alike. And I have no right to complain that the part God has wished me to play is not the principal and most perfect one of all.

Furthermore, even if I cannot abstain from errors in the first way mentioned above, which depends upon a clear perception of everything about which I must deliberate, nevertheless I can avoid error in the other way, which depends solely on my remembering to abstain from making judgments whenever the truth of a given matter is not apparent. For although I experience a certain infirmity in myself, namely that I am unable to keep my attention constantly focused on one and the same item of knowledge, nevertheless, by attentive and often repeated meditation, I can bring it about that I call this rule to mind whenever the situation calls for it,

and thus I would acquire a certain habit of not erring.

Since herein lies the greatest and chief perfection of man, I think today's meditation, in which I investigated the cause of error and falsity, was quite profitable. Nor can this cause be anything other than the one I have described; for as often as I restrain my will when I make judgments, so that it extends only to those matters that the intellect clearly and distinctly discloses to it, it plainly cannot happen that I err. For every clear and distinct perception is surely something, and hence it cannot come from nothing. On the contrary, it must necessarily have God for its author: God, I say, that supremely perfect being to whom it is repugnant to be a deceiver. Therefore the perception is most assuredly true. Today I have learned not merely what I must avoid so as never to make a mistake, but at the same time what I must do to attain truth. For I will indeed attain it if only I pay enough attention to all the things that I perfectly understand, and separate them off from the rest, which I apprehend more confusedly and more obscurely. I will be conscientious about this in the future.

Meditation Five: Concerning the Essence of Material Things, and Again Concerning God, That He Exists

Several matters remain for me to examine concerning the attributes of God and myself, that is, concerning the nature of my mind. But perhaps I will take these up at some other time. For now, since I have noted what to avoid and what to do in order to attain the truth, nothing seems more pressing than that I try to free myself from the doubts into which I fell a few days ago, and that I see whether anything certain is to be had concerning material things.

Yet, before inquiring whether any such things exist outside me, I surely ought to consider the ideas of these things, insofar as they exist in my thought, and see which ones are distinct and which ones are confused.

I do indeed distinctly imagine the quantity that philosophers commonly call “continuous,” that is, the extension of this quantity, or rather of the thing quantified in length, breadth and depth. I enumerate the various parts in it. I ascribe to these parts any sizes, shapes, positions, and local movements whatever; to these movements I ascribe any durations whatever.

Not only are these things manifestly known and transparent to me, viewed thus in a general way, but also, when I focus my attention on them, I perceive countless particulars concerning shapes, number, movement, and the like. Their truth is so open and so much in accord with my nature that, when I first discover them, it seems I am not so much learning something new as recalling something I knew beforehand. In other words, it seems as though I am noticing things for the first time that were in fact in me for a long while, although I had not previously directed a mental gaze upon them.

What I believe must be considered above all here is the fact that I find within me countless ideas of certain things, that, even if perhaps they do not exist anywhere outside me, still cannot be said to be nothing. And although, in a sense, I think them at will, nevertheless they are not something I have fabricated; rather they have their own true and immutable natures. For example, when I imagine a triangle, even if perhaps no such figure exists outside my thought anywhere in the world and never has, the triangle still has a certain determinate nature, essence, or form which is unchangeable and eternal, which I did not fabricate, and which does not depend on my mind. This is evident from the fact that various properties can be demonstrated regarding this triangle: namely, that its three angles are equal to two right angles, that its longest side is opposite its largest angle, and so on. These are properties I now clearly acknowledge, whether I want to or not, even if I previously had given them no thought whatever when I imagined the triangle. For this reason, then, they were not fabricated by me.

It is irrelevant for me to say that perhaps the idea of a triangle came to me from external things through the sense organs because of course I have on occasion seen triangle-shaped bodies. For I can think of countless other figures, concerning which there can be no suspicion of their ever having entered me through the senses, and yet I can demonstrate various properties of these figures, no less than I can those of the triangle. All these properties are patently true because I know them clearly, and thus they are something and not merely nothing. For it is obvious that whatever is true is something, and I have already demonstrated at some length that all that I know clearly is true. And even if I had not demonstrated this, certainly the nature of my mind is such that nevertheless I cannot refrain from assenting to these things, at least while I perceive them clearly. And I recall that even before now, when I used to keep my attention glued to the objects of the senses, I always took the truths I clearly recognized regarding figures, numbers, or other things pertaining to arithmetic, geometry or, in general, to pure and abstract mathematics to be the most certain of all.

But if, from the mere fact that I can bring forth from my thought the idea of something, it follows that all that I clearly and distinctly perceive to belong to that thing really does belong to it, then cannot this too be a basis for an argument proving the existence of God? Clearly the idea of God, that is, the idea of a supremely perfect being, is one I discover to be no less within me than the idea of any figure or number. And that it belongs to God’s nature that he always exists is something I understand no less clearly and distinctly than is the case when I demonstrate in regard to some figure or number that something also belongs to the nature of that figure or number. Thus, even if not everything that I have meditated upon during these last few days were true, still the existence of God ought to have for me at least the same degree of certainty that truths of mathematics had until now.

However, this point is not wholly obvious at first glance, but has a certain look of a sophism about it. Since in all other matters I have become accustomed to distinguishing existence from essence, I easily convince myself that it can even be separated from God’s essence, and hence that God can be thought of as not

existing. But nevertheless, it is obvious to anyone who pays close attention that existence can no more be separated from God's essence than its having three angles equal to two right angles can be separated from the essence of a triangle, or that the idea of a valley can be separated from the idea of a mountain. Thus it is no less contradictory to think of God (that is, a supremely perfect being) lacking existence (that is, lacking some perfection) than it is to think of a mountain without a valley.

But granted I can no more think of God as not existing than I can think of a mountain without a valley, nevertheless it surely does not follow from the fact that I think of a mountain with a valley that a mountain exists in the world. Likewise, from the fact that I think of God as existing, it does not seem to follow that God exists, for my thought imposes no necessity on things. And just as one may imagine a winged horse, without there being a horse that has wings, in the same way perhaps I can attach existence to God, even though no God exists.

But there is a sophism lurking here. From the fact that I am unable to think of a mountain without a valley, it does not follow that a mountain or a valley exists anywhere, but only that, whether they exist or not, a mountain and a valley are inseparable from one another. But from the fact that I cannot think of God except as existing, it follows that existence is inseparable from God, and that for this reason he really exists. Not that my thought brings this about or imposes any necessity on anything; but rather the necessity of the thing itself, namely of the existence of God, forces me to think this. For I am not free to think of God without existence, that is, a supremely perfect being without a supreme perfection, as I am to imagine a horse with or without wings.

Further, it should not be said here that even though I surely need to assent to the existence of God once I have asserted that God has all perfections and that existence is one of these perfections, nevertheless that earlier assertion need not have been made. Likewise, I need not believe that all four-sided figures can be inscribed in a circle; but given that I posit this, it would then be necessary for me to admit that a rhombus can be inscribed in a circle. Yet this is obviously false. For although it is not necessary that I should ever happen upon any thought of God, nevertheless whenever I am of a mind to think of a being that is first and supreme, and bring forth the idea of God as it were from the storehouse of my mind, I must of necessity ascribe all perfections to him, even if I do not at that time enumerate them all or take notice of each one individually. This necessity plainly suffices so that afterwards, when I realize that existence is a perfection, I rightly conclude that a first and supreme being exists. In the same way, there is no necessity for me ever to imagine a triangle, but whenever I do wish to consider a rectilinear figure having but three angles, I must ascribe to it those properties on the basis of which one rightly infers that the three angles of this figure are no greater than two right angles, even though I do not take note of this at the time. But when I inquire as to the figures that may be inscribed in a circle, there is absolutely no need whatever for my thinking that all four-sided figures are of this sort; for that matter, I cannot even fabricate such a thing, so long as I am of a mind to admit only what I clearly and distinctly understand. Consequently, there is a great difference between false assumptions of this sort and the true ideas that are inborn in me, the first and chief of which is the idea of God. For there are a great many ways in which I understand that this idea is not an invention that is dependent upon my thought, but is an image of a true and immutable nature. First, I cannot think of anything aside from God alone to whose essence existence belongs. Next, I cannot understand how there could be two or more Gods of this kind. Again, once I have asserted that one God now exists, I plainly see that it is necessary that he has existed from eternity and will endure for eternity. Finally, I perceive many other features in God, none of which I can remove or change.

But, whatever type of argument I use, it always comes down to the fact that the only things that fully convince me are those that I clearly and distinctly perceive. And although some of these things I thus perceive are obvious to everyone, while others are discovered only by those who look more closely and inquire carefully, nevertheless, once they have been discovered, they are considered no less certain than the others. For example, in the case of a right triangle, although it is not so readily apparent that the square of the hypotenuse is equal to the sum of the squares of the other two sides as it is that the hypotenuse is opposite the largest angle, nevertheless, once the former has been ascertained, it is no less believed. However, as far as God is concerned, if I were not overwhelmed by prejudices and if the images of sensible things were not besieging my thought from all directions, I would certainly acknowledge nothing sooner or more easily than him. For what, in and of itself, is more manifest than that a supreme being exists, that is, that God, to whose essence alone existence belongs, exists?

And although I needed to pay close attention in order to perceive this, nevertheless I now am just as certain about this as I am about everything else that seems most certain. Moreover, I observe also that certitude about other things is so dependent on this, that without it nothing can ever be perfectly known.

For I am indeed of such a nature that, while I perceive something very clearly and distinctly, I cannot help believing it to be true. Nevertheless, my nature is also such that I cannot focus my mental gaze always on the same thing, so as to perceive it clearly. Often the memory of a previously made judgment may return when I am no longer attending to the arguments on account of which I made such a judgment. Thus, other arguments can be brought forward that would easily make me change my opinion, were I ignorant of God. And thus I would never have true and certain knowledge about anything, but merely fickle and changeable opinions. Thus, for example, when I consider the nature of a triangle, it appears most evident to me, steeped as I am in the principles of geometry, that its three angles are equal to two right angles. And so long as I attend to its demonstration I cannot help believing this to be true. But no sooner do I turn the mind's eye away from the demonstration, than, however much I still recall that I had observed it most clearly, nevertheless, it can easily happen that I entertain doubts about whether it is true, were I ignorant of God. For I can convince myself that I have been so constituted by nature that I might occasionally be mistaken about those things I believe I perceive most evidently, especially when I recall that I have often taken many things to be true and certain, which other arguments have subsequently led me to judge to be false.

But once I perceived that there is a God, and also understood at the same time that everything else depends on him, and that he is not a deceiver, I then concluded that everything that I clearly and distinctly perceive is necessarily true. Hence even if I no longer attend to the reasons leading me to judge this to be true, so long as I merely recall that I did clearly and distinctly observe it, no counter-argument can be brought forward that might force me to doubt it. On the contrary, I have a true and certain knowledge of it. And not just of this one fact, but of everything else that I recall once having demonstrated, as in geometry, and so on. For what objections can now be raised against me? That I have been made such that I am often mistaken? But I now know that I cannot be mistaken in matters I plainly understand. That I have taken many things to be true and certain which subsequently I recognized to be false? But none of these were things I clearly and distinctly perceived. But I was ignorant of this rule for determining the truth, and I believed these things perhaps for other reasons which I later discovered were less firm. What then remains to be said? That perhaps I am dreaming, as I recently objected against myself, in other words, that everything I am now thinking of is no truer than what occurs to someone who is asleep? Be that as it may, this changes nothing; for certainly, even if I were dreaming, if anything is evident to my intellect, then it is entirely true.

And thus I see plainly that the certainty and truth of every science depends exclusively upon the knowledge of the true God, to the extent that, prior to my becoming aware of him, I was incapable of achieving perfect knowledge about anything else. But now it is possible for me to achieve full and certain knowledge about countless things, both about God and other intellectual matters, as well as about the entirety of that corporeal nature which is the object of pure mathematics.

Meditation Six: Concerning the Existence of Material Things, and the Real Distinction between Mind and Body

It remains for me to examine whether material things exist. Indeed I now know that they can exist, at least insofar as they are the object of pure mathematics, since I clearly and distinctly perceive them. For no doubt God is capable of bringing about everything that I am capable of perceiving in this way. And I have never judged that God was incapable of something, except when it was incompatible with my perceiving it distinctly. Moreover, from the faculty of imagination, which I notice I use while dealing with material things, it seems to follow that they exist. For to anyone paying very close attention to what imagination is, it appears to be simply a certain application of the knowing faculty to a body intimately present to it, and which therefore exists.

To make this clear, I first examine the difference between imagination and pure intellection. So, for example, when I imagine a triangle, I not only understand that it is a figure bounded by three lines, but at the same time I also envisage with the mind's eye those lines as if they were present; and this is what I call "imagining." On the other hand, if I want to think about a chiliagon, I certainly understand that it is a figure consisting of a thousand sides, just as well as I understand that a triangle is a figure consisting of three sides, yet I do not imagine those thousand sides in the same way, or envisage them as if they were present. And although in that case — because of force of habit I always imagine something whenever I think about a corporeal thing—I may perchance represent to myself some figure in a confused fashion, nevertheless this figure is obviously not a chiliagon. For this figure is really no different from the figure I would represent to myself, were I thinking of a myriagon or any other figure with a large number of sides. Nor is this figure of any help in knowing the properties that differentiate a chiliagon from other polygons. But if the figure in question is a pentagon, I surely can understand its figure, just as was the case with the chiliagon, without the help of my imagination. But I can also imagine a pentagon by turning the mind's eye both to its five sides and at the same time to the area bounded by those sides. At this point I am manifestly aware that I am in need of a peculiar sort of effort on the part of the mind in order to imagine, one that I do not employ in order to understand. This new effort on the part of the mind clearly shows the difference between imagination and pure intellection.

Moreover, I consider that this power of imagining that is in me, insofar as it differs from the power of understanding, is not required for my own essence, that is, the essence of my mind. For were I to be lacking this power, I would nevertheless undoubtedly remain the same entity I am now. Thus it seems to follow that the power of imagining depends upon something distinct from me. And I readily understand that, were a body to exist to which a mind is so joined that it may apply itself in order, as it were, to look at it any time it wishes, it could happen that it is by means of this very body that I imagine corporeal things. As a result, this mode of thinking may differ from pure intellection only in the sense that the mind, when it understands, in a sense turns toward itself and looks at one of the ideas that are in it; whereas when it imagines, it turns toward the body, and intuits in the body something that conforms to an idea either understood by the mind or perceived by sense. To be sure, I easily understand that the imagination can be actualized in this way, provided a body does exist. And since I can think of no other way of explaining imagination that is equally appropriate, I make a probable conjecture from this that a body exists. But this is only a probability. And even though I may examine everything carefully, nevertheless I do not yet see how the distinct idea of corporeal nature that I find in my imagination can enable me to develop an argument which necessarily concludes that some body exists.

But I am in the habit of imagining many other things, over and above that corporeal nature which is the object of pure mathematics, such as colors, sounds, tastes, pain, and the like, though not so distinctly. And I perceive these things better by means of the senses, from which, with the aid of the memory, they seem to have arrived at the imagination. Thus I should pay the same degree of attention to the senses, so that I might deal with them more appropriately. I must see whether I can obtain any reliable argument for the existence of corporeal things from those things that are perceived by the mode of thinking that I call "sense."

First of all, to be sure, I will review here all the things I previously believed to be true because I had perceived them by means of the senses and the causes I had for thinking this. Next I will assess the causes why I later called them into doubt. Finally, I will consider what I must now believe about these things.

So first, I sensed that I had a head, hands, feet, and other members that comprised this body which I viewed as part of me, or perhaps even as the whole of me. I sensed that this body was found among many

other bodies, by which my body can be affected in various beneficial or harmful ways. I gauged what was opportune by means of a certain sensation of pleasure, and what was inopportune by a sensation of pain. In addition to pain and pleasure, I also sensed within me hunger, thirst, and other such appetites, as well as certain bodily tendencies toward mirth, sadness, anger, and other such affects. And externally, besides the extension, shapes, and motions of bodies, I also sensed their hardness, heat, and other tactile qualities. I also sensed light, colors, odors, tastes, and sounds, on the basis of whose variety I distinguished the sky, the earth, the seas, and the other bodies, one from the other. Now given the ideas of all these qualities that presented themselves to my thought, and which were all that I properly and immediately sensed, still it was surely not without reason that I thought I sensed things that were manifestly different from my thought, namely, the bodies from which these ideas proceeded. For I knew by experience that these ideas came upon me utterly without my consent, to the extent that, wish as I may, I could not sense any object unless it was present to a sense organ. Nor could I fail to sense it when it was present. And since the ideas perceived by sense were much more vivid and explicit and even, in their own way, more distinct than any of those that I deliberately and knowingly formed through meditation or that I found impressed on my memory, it seemed impossible that they came from myself. Thus the remaining alternative was that they came from other things. Since I had no knowledge of such things except from those same ideas themselves, I could not help entertaining the thought that they were similar to those ideas. Moreover, I also recalled that the use of the senses antedated the use of reason. And since I saw that the ideas that I myself fashioned were not as explicit as those that I perceived through the faculty of sense, and were for the most part composed of parts of the latter, I easily convinced myself that I had absolutely no idea in the intellect that I did not have beforehand in the sense faculty. Not without reason did I judge that this body, which by a certain special right I called "mine," belongs more to me than did any other. For I could never be separated from it in the same way I could be from other bodies. I sensed all appetites and feelings in and on behalf of it. Finally, I noticed pain and pleasurable excitement in its parts, but not in other bodies external to it. But why should a certain sadness of spirit arise from some sensation or other of pain, and why should a certain elation arise from a sensation of excitement, or why should that peculiar twitching in the stomach, which I call hunger, warn me to have something to eat, or why should dryness in the throat warn me to take something to drink, and so on? I plainly had no explanation other than that I had been taught this way by nature. For there is no affinity whatsoever, at least none I am aware of, between this twitching in the stomach and the will to have something to eat, or between the sensation of something causing pain and the thought of sadness arising from this sensation. But nature also seems to have taught me everything else as well that I judged concerning the objects of the senses, for I had already convinced myself that this was how things were, prior to my assessing any of the arguments that might prove it.

Afterwards, however, many experiences gradually weakened any faith that I had in the senses. Towers that had seemed round from afar occasionally appeared square at close quarters. Very large statues mounted on their pedestals did not seem large to someone looking at them from ground level. And in countless other such instances I determined that judgments in matters of the external senses were in error. And not just the external senses, but the internal senses as well. For what can be more intimate than pain? But I had sometimes heard it said by people whose leg or arm had been amputated that it seemed to them that they still occasionally sensed pain in the very limb they had lost. Thus, even in my own case it did not seem to be entirely certain that some bodily member was causing me pain, even though I did sense pain in it. To these causes for doubt I recently added two quite general ones. The first was that everything I ever thought I sensed while awake I could believe I also sometimes sensed while asleep, and since I do not believe that what I seem to sense in my dreams comes to me from things external to me, I saw no reason why I should hold this belief about those things I seem to be sensing while awake. The second was that, since I was still ignorant of the author of my origin (or at least pretended to be ignorant of it), I saw nothing to prevent my having been so constituted by nature that I should be mistaken even about what seemed to me most true. As to the arguments that used to convince me of the truth of sensible things, I found no difficulty responding to them. For since I seemed driven by nature toward many things about which reason tried to dissuade me, I did not think that what I was taught by nature deserved much credence. And even though the perceptions of the senses did not depend on my will, I did not think that we must therefore conclude that they came from things distinct from me, since perhaps there is some faculty in me, as yet unknown to me, that produces these perceptions.

But now, having begun to have a better knowledge of myself and the author of my origin, I am of the opinion that I must not rashly admit everything that I seem to derive from the senses; but neither, for that matter, should I call everything into doubt.

First, I know that all the things that I clearly and distinctly understand can be made by God such as I understand them. For this reason, my ability clearly and distinctly to understand one thing without another

suffices to make me certain that the one thing is different from the other, since they can be separated from each other, at least by God. The question as to the sort of power that might effect such a separation is not relevant to their being thought to be different. For this reason, from the fact that I know that I exist, and that at the same time I judge that obviously nothing else belongs to my nature or essence except that I am a thinking thing, I rightly conclude that my essence consists entirely in my being a thinking thing. And although perhaps (or rather, as I shall soon say, assuredly) I have a body that is very closely joined to me, nevertheless, because on the one hand I have a clear and distinct idea of myself, insofar as I am merely a thinking thing and not an extended thing, and because on the other hand I have a distinct idea of a body, insofar as it is merely an extended thing and not a thinking thing, it is certain that I am really distinct from my body, and can exist without it.

Moreover, I find in myself faculties for certain special modes of thinking, namely the faculties of imagining and sensing. I can clearly and distinctly understand myself in my entirety without these faculties, but not vice versa: I cannot understand them clearly and distinctly without me, that is, without a substance endowed with understanding in which they inhere, for they include an act of understanding in their formal concept. Thus I perceive them to be distinguished from me as modes from a thing. I also acknowledge that there are certain other faculties, such as those of moving from one place to another, of taking on various shapes, and so on, that, like sensing or imagining, cannot be understood apart from some substance in which they inhere, and hence without which they cannot exist. But it is clear that these faculties, if in fact they exist, must be in a corporeal or extended substance, not in a substance endowed with understanding. For some extension is contained in a clear and distinct concept of them, though certainly not any understanding. Now there clearly is in me a passive faculty of sensing, that is, a faculty for receiving and knowing the ideas of sensible things; but I could not use it unless there also existed, either in me or in something else, a certain active faculty of producing or bringing about these ideas. But this faculty surely cannot be in me, since it clearly presupposes no act of understanding, and these ideas are produced without my cooperation and often even against my will. Therefore the only alternative is that it is in some substance different from me, containing either formally or eminently all the reality that exists objectively in the ideas produced by that faculty, as I have just noted above. Hence this substance is either a body, that is, a corporeal nature, which contains formally all that is contained objectively in the ideas, or else it is God, or some other creature more noble than a body, which contains eminently all that is contained objectively in the ideas. But since God is not a deceiver, it is patently obvious that he does not send me these ideas either immediately by himself, or even through the mediation of some creature that contains the objective reality of these ideas not formally but only eminently. For since God has given me no faculty whatsoever for making this determination, but instead has given me a great inclination to believe that these ideas issue from corporeal things, I fail to see how God could be understood not to be a deceiver, if these ideas were to issue from a source other than corporeal things. And consequently corporeal things exist. Nevertheless, perhaps not all bodies exist exactly as I grasp them by sense, since this sensory grasp is in many cases very obscure and confused. But at least they do contain everything I clearly and distinctly understand — that is, everything, considered in a general sense, that is encompassed in the object of pure mathematics.

As far as the remaining matters are concerned, which are either merely particular (for example, that the sun is of such and such a size or shape, and so on) or less clearly understood (for example, light, sound, pain, and the like), even though these matters are very doubtful and uncertain, nevertheless the fact that God is no deceiver (and thus no falsity can be found in my opinions, unless there is also in me a faculty given me by God for the purpose of rectifying this falsity) offers me a definite hope of reaching the truth even in these matters. And surely there is no doubt that all that I am taught by nature has some truth to it; for by “nature,” taken generally, I understand nothing other than God himself or the ordered network of created things which was instituted by God. By my own particular nature I understand nothing other than the combination of all the things bestowed upon me by God.

There is nothing that this nature teaches me more explicitly than that I have a body that is ill-disposed when I feel pain, that needs food and drink when I suffer hunger or thirst, and the like. Therefore, I should not doubt that there is some truth in this.

By means of these sensations of pain, hunger, thirst and so on, nature also teaches that I am present not merely to my body in the way a sailor is present in a ship, but that I am most tightly joined and, so to speak, commingled with it, so much so that I and the body constitute one single thing. For if this were not the case, then I, who am only a thinking thing, would not sense pain when the body is injured; rather, I would perceive the wound by means of the pure intellect, just as a sailor perceives by sight whether anything in his ship is broken. And when the body is in need of food or drink, I should understand this explicitly, instead of having

confused sensations of hunger and thirst. For clearly these sensations of thirst, hunger, pain, and so on are nothing but certain confused modes of thinking arising from the union and, as it were, the commingling of the mind with the body.

Moreover, I am also taught by nature that various other bodies exist around my body, some of which are to be pursued, while others are to be avoided. And to be sure, from the fact that I sense a wide variety of colors, sounds, odors, tastes, levels of heat, and grades of roughness, and the like, I rightly conclude that in the bodies from which these different perceptions of the senses proceed there are differences corresponding to the different perceptions — though perhaps the latter do not resemble the former. And from the fact that some of these perceptions are pleasant while others are unpleasant, it is plainly certain that my body, or rather my whole self, insofar as I am comprised of a body and a mind, can be affected by various beneficial and harmful bodies in the vicinity.

Granted, there are many other things that I seem to have been taught by nature; nevertheless it was not really nature that taught them to me but a certain habit of making reckless judgments. And thus it could easily happen that these judgments are false: for example, that any space where there is absolutely nothing happening to move my senses is empty; or that there is something in a hot body that bears an exact likeness to the idea of heat that is in me; or that in a white or green body there is the same whiteness or greenness that I sense; or that in a bitter or sweet body there is the same taste, and so on; or that stars and towers and any other distant bodies have the same size and shape that they present to my sense, and other things of this sort. But to ensure that my perceptions in this matter are sufficiently distinct, I ought to define more precisely what exactly I mean when I say that I am “taught something by nature.” For I am taking “nature” here more narrowly than the combination of everything bestowed on me by God. For this combination embraces many things that belong exclusively to my mind, such as my perceiving that what has been done cannot be undone, and everything else that is known by the light of nature. That is not what I am talking about here. There are also many things that belong exclusively to the body, such as that it tends to move downward, and so on. I am not dealing with these either, but only with what God has bestowed on me insofar as I am comprised of mind and body. Accordingly, it is this nature that teaches me to avoid things that produce a sensation of pain and to pursue things that produce a sensation of pleasure, and the like. But it does not appear that nature teaches us to conclude anything, besides these things, from these sense perceptions unless the intellect has first conducted its own inquiry regarding things external to us. For it seems to belong exclusively to the mind, and not to the composite of mind and body, to know the truth in these matters. Thus, although a star affects my eye no more than does the flame from a small torch, still there is no real or positive tendency in my eye toward believing that the star is no larger than the flame. Yet, ever since my youth, I have made this judgment without any reason for doing so. And although I feel heat as I draw closer to the fire, and I also feel pain upon drawing too close to it, there is not a single argument that persuades me that there is something in the fire similar to that heat, any more than to that pain. On the contrary, I am convinced only that there is something in the fire that, regardless of what it finally turns out to be, causes in us those sensations of heat or pain. And although there may be nothing in a given space that moves the senses, it does not therefore follow that there is no body in it. But I see that in these and many other instances I have been in the habit of subverting the order of nature. For admittedly I use the perceptions of the senses (which are properly given by nature only for signifying to the mind what things are useful or harmful to the composite of which it is a part, and to that extent they are clear and distinct enough) as reliable rules for immediately discerning what is the essence of bodies located outside us. Yet they signify nothing about that except quite obscurely and confusedly.

I have already examined in sufficient detail how it could happen that my judgments are false, despite the goodness of God. But a new difficulty now arises regarding those very things that nature shows me are either to be sought out or avoided, as well as the internal sensations where I seem to have detected errors, as for example, when someone is deluded by a food’s pleasant taste to eat the poison hidden inside it. In this case, however, he is driven by nature only toward desiring the thing in which the pleasurable taste is found, but not toward the poison, of which he obviously is unaware. I can only conclude that this nature is not omniscient. This is not remarkable, since man is a limited thing, and thus only what is of limited perfection befits him.

But we not infrequently err even in those things to which nature impels us. Take, for example, the case of those who are ill and who desire food or drink that will soon afterwards be injurious to them. Perhaps it could be said here that they erred because their nature was corrupt. However, this does not remove our difficulty, for a sick man is no less a creature of God than a healthy one, and thus it seems no less inconsistent that the sick man got a deception-prone nature from God. And a clock made of wheels and counter-weights follows all the laws of nature no less closely when it has been badly constructed and does not tell time accurately than it does when it completely satisfies the wish of its maker. Likewise, I might regard a man’s body as a kind of

mechanism that is outfitted with and composed of bones, nerves, muscles, veins, blood and skin in such a way that, even if no mind existed in it, the man's body would still exhibit all the same motions that are in it now except for those motions that proceed either from a command of the will or, consequently, from the mind. I easily recognize that it would be natural for this body, were it, say, suffering from dropsy and experiencing dryness in the throat (which typically produces a thirst sensation in the mind), and also so disposed by its nerves and other parts to take something to drink, the result of which would be to exacerbate the illness. This is as natural as for a body without any such illness to be moved by the same dryness in the throat to take something to drink that is useful to it. And given the intended purpose of the clock, I could say that it deviates from its nature when it fails to tell the right time. And similarly, considering the mechanism of the human body in terms of its being equipped for the motions that typically occur in it, I may think that it too is deviating from its nature, if its throat were dry when having something to drink is not beneficial to its conservation. Nevertheless, I am well aware that this last use of "nature" differs greatly from the other. For this latter "nature" is merely a designation dependent on my thought, since it compares a man in poor health and a poorly constructed clock with the ideas of a healthy man and of a well-made clock, a designation extrinsic to the things to which it is applied. But by "nature" taken in the former sense, I understand something that is really in things, and thus is not without some truth.

When we say, then, in the case of the body suffering from dropsy, that its "nature" is corrupt, given the fact that it has a parched throat and yet does not need something to drink, "nature" obviously is merely an extrinsic designation. Nevertheless, in the case of the composite, that is, of a mind joined to such a body, it is not a pure designation, but a true error of nature that this body should be thirsty when having something to drink would be harmful to it. It therefore remains to inquire here how the goodness of God does not prevent "nature," thus considered, from being deceptive.

Now my first observation here is that there is a great difference between a mind and a body in that a body, by its very nature, is always divisible. On the other hand, the mind is utterly indivisible. For when I consider the mind, that is, myself insofar as I am only a thinking thing, I cannot distinguish any parts within me; rather, I understand myself to be manifestly one complete thing. Although the entire mind seems to be united to the entire body, nevertheless, were a foot or an arm or any other bodily part to be amputated, I know that nothing has been taken away from the mind on that account. Nor can the faculties of willing, sensing, understanding, and so on be called "parts" of the mind, since it is one and the same mind that wills, senses, and understands. On the other hand, there is no corporeal or extended thing I can think of that I may not in my thought easily divide into parts; and in this way I understand that it is divisible. This consideration alone would suffice to teach me that the mind is wholly diverse from the body, had I not yet known it well enough in any other way.

My second observation is that my mind is not immediately affected by all the parts of the body, but only by the brain, or perhaps even by just one small part of the brain, namely, by that part where the "common" sense is said to reside. Whenever this part of the brain is disposed in the same manner, it presents the same thing to the mind, even if the other parts of the body are able meanwhile to be related in diverse ways. Countless experiments show this, none of which need be reviewed here.

My next observation is that the nature of the body is such that whenever any of its parts can be moved by another part some distance away, it can also be moved in the same manner by any of the parts that lie between them, even if this more distant part is doing nothing. For example, in the cord ABCD, if the final part D is pulled, the first part A would be moved in exactly the same manner as it could be, if one of the intermediate parts B or C were pulled, while the end part D remained immobile. Likewise, when I feel a pain in my foot, physics teaches me that this sensation took place by means of nerves distributed throughout the foot, like stretched cords extending from the foot all the way to the brain. When these nerves are pulled in the foot, they also pull on the inner parts of the brain to which they extend, and produce a certain motion in them. This motion has been constituted by nature so as to affect the mind with a sensation of pain, as if it occurred in the foot. But because these nerves need to pass through the skin, thigh, loins, back, and neck to get from the foot to the brain, it can happen that even if it is not the part in the foot but merely one of the intermediate parts that is being struck, the very same movement will occur in the brain that would occur were the foot badly injured. The inevitable result will be that the mind feels the same pain. The same opinion should hold for any other sensation.

My final observation is that, since any given motion occurring in that part of the brain immediately affecting the mind produces but one sensation in it, I can think of no better arrangement than that it produces the one sensation that, of all the ones it is able to produce, is most especially and most often conducive to the maintenance of a healthy man. Moreover, experience shows that all the sensations bestowed on us by nature

are like this. Hence there is absolutely nothing to be found in them that does not bear witness to God's power and goodness. Thus, for example, when the nerves in the foot are agitated in a violent and unusual manner, this motion of theirs extends through the marrow of the spine to the inner reaches of the brain, where it gives the mind the sign to sense something, namely, the pain as if it is occurring in the foot. This provokes the mind to do its utmost to move away from the cause of the pain, since it is seen as harmful to the foot. But the nature of man could have been so constituted by God that this same motion in the brain might have indicated something else to the mind: for example, either the motion itself as it occurs in the brain, or in the foot, or in some place in between, or something else entirely different. But nothing else would have served so well the maintenance of the body. Similarly, when we need something to drink, a certain dryness arises in the throat that moves the nerves in the throat, and, by means of them, the inner parts of the brain. And this motion affects the mind with a sensation of thirst, because in this entire affair nothing is more useful for us to know than that we need something to drink in order to maintain our health; the same holds in the other cases.

From these considerations it is utterly apparent that, notwithstanding the immense goodness of God, the nature of man, insofar as it is composed of mind and body, cannot help being sometimes mistaken. For if some cause, not in the foot but in some other part through which the nerves extend from the foot to the brain, or perhaps even in the brain itself, were to produce the same motion that would normally be produced by a badly injured foot, the pain will be felt as if it were in the foot, and the senses will naturally be deceived. For since an identical motion in the brain can only bring about an identical sensation in the mind, and it is more frequently the case that this motion is wont to arise on account of a cause that harms the foot than on account of some other thing existing elsewhere, it is reasonable that the motion should always show pain to the mind as something belonging to the foot rather than to some other part. And if dryness in the throat does not arise, as is normal, because taking something to drink contributes to bodily health, but from a contrary cause, as happens in the case of someone with dropsy, then it is far better that it should deceive on that occasion than that it should always be deceptive when the body is in good health. The same holds for the other cases.

This consideration is most helpful, not only for my noticing all the errors to which my nature is liable, but also for enabling me to correct or avoid them without difficulty. To be sure, I know that all the senses set forth what is true more frequently than what is false regarding what concerns the welfare of the body. Moreover, I can nearly always make use of several of them in order to examine the same thing. Furthermore, I can use my memory, which connects current happenings with past ones, and my intellect, which now has examined all the causes of error. Hence I should no longer fear that those things that are daily shown me by the senses are false. On the contrary, the hyperbolic doubts of the last few days ought to be rejected as ludicrous. This goes especially for the chief reason for doubting, which dealt with my failure to distinguish being asleep from being awake. For I now notice that there is a considerable difference between these two; dreams are never joined by the memory with all the other actions of life, as is the case with those actions that occur when one is awake. For surely, if, while I am awake, someone were suddenly to appear to me and then immediately disappear, as occurs in dreams, so that I see neither where he came from nor where he went, it is not without reason that I would judge him to be a ghost or a phantom conjured up in my brain, rather than a true man. But when these things happen, and I notice distinctly where they come from, where they are now, and when they come to me, and when I connect my perception of them without interruption with the whole rest of my life, I am clearly certain that these perceptions have happened to me not while I was dreaming but while I was awake. Nor ought I have even the least doubt regarding the truth of these things, if, having mustered all the senses, in addition to my memory and my intellect, in order to examine them, nothing is passed on to me by one of these sources that conflicts with the others. For from the fact that God is no deceiver, it follows that I am in no way mistaken in these matters. But because the need to get things done does not always permit us the leisure for such a careful inquiry, we must confess that the life of man is apt to commit errors regarding particular things, and we must acknowledge the infirmity of our nature.

Thomas Hobbes

Thomas Hobbes (1588–1679) was born in Malmesbury, Wiltshire, England. Raised by a well-to-do uncle, he entered Oxford at the age of fourteen and received his bachelor's degree in 1608. His early interests were largely classical. In 1629, however, on a visit to the continent his imagination was captured by the method of geometry, in which he saw a superior way of arriving at certain truths. In his masterpiece, *Leviathan*, Hobbes remarks that geometry is “the only science that it hath pleased God hitherto to bestow upon mankind.” On another continental visit, from 1634 through 1637, Hobbes met Galileo in Italy, conversed frequently with eminent thinkers in Paris, and formulated the outlines of his own philosophical position. Returning to England in 1637, he became increasingly concerned about the impending civil war there. His support of monarchy and his fear of the parliamentarians led him to flee to Holland in 1640. Thereafter, Hobbes remained on the continent for eleven productive years, spending a part of this time tutoring the future Charles II. His final years in England, from 1650 on, were marked by continuing controversy over his views and by the banning of his books.

Hobbes' earlier works include the *Little Treatise*, a discussion of sensation (written between 1630 and 1637), and *Elements of Law* (1640), in which he argues for an undivided sovereignty. His masterpiece, *Leviathan* (1651), is a treatise on “the matter, forme, and power of a commonwealth, ecclesiasticall and civil.” Among his other works are a trilogy that includes *De Cive* (1642), *De Corpore* (1655), and *De Homine* (1657); *Of Liberty and Necessity* (published without his consent in 1654); and a historical work, *Behemoth* (1668).

Although *Leviathan* is best known as a contribution to political philosophy, it is really a multifaceted work, containing important insights into metaphysics and psychology. Since Hobbes recognized that any adequate theory of government must grow out of a sound conception of the governed, he attempted to develop a comprehensive view of human life from a mechanistic and materialistic base. *Leviathan* thus begins with the claim that sensation is nothing but motion in the appropriate bodily parts, and that the various forms of imagination that we call “memory,” “dream,” and “apparition” are all echoes of this initial motion. They are, in Hobbes' own vivid phrase, “decaying sense.” Associations between thoughts are echoes of connections between past motions; and desire and aversion, the antecedents of action, are the “small beginnings of motion, within the body of man, before they appear in walking, speaking, striking, and other visible actions.” Although the details of this materialistic account are crude, the views expressed are recognizable ancestors of views hotly debated today.

Hobbes' political philosophy takes as its starting point an extremely pessimistic view of human nature. According to Hobbes, the basic motivation of humankind is “a perpetual and restless desire of power after power, that ceaseth only in death.” Given the universality of this desire for power, life in the state of nature, before the imposition of civil laws backed by sovereign force, must be a perpetual struggle for possessions, supremacy, and glory. In this state, the outcome of one's productive efforts is always uncertain, and life is “solitary, poor, nasty, brutish and short.” To avoid this intolerable situation, the law of nature, which dictates self-preservation, commands people to surrender their liberty (although not their ability to defend their lives or persons) to a single sovereign. By covenanting, or contracting, to lend their force to the sovereign's endeavors, they first create the conditions under which the enforcement of laws, and so too the institutions of property and justice, are possible. Thus is born *Leviathan*, the great artificial being of the commonwealth, whose very soul is sovereignty.

Hobbes' account does not point inevitably to any single form of government. He allows that the sovereignty may reside in a single ruler (monarchy), a group (aristocracy), or the entire population (democracy). He does insist, however, that whatever form the sovereign body takes, its power must be absolute. The reason for this is that the purpose of the original covenant is to create an authority strong enough to protect each member of the populace from the incursions of the others. Given this initial intent, any attempt to separate from the sovereign the abilities to tax, legislate, or deploy the military; to challenge or punish the sovereign's acts; or in any other way to limit his power must violate the original agreement. There may be a risk that the sovereign will abuse his power but for Hobbes this risk is far outweighed by the secure and orderly existence that that power makes possible.

For a good discussion of Hobbes' life and philosophy, see R. S. Peters, *Hobbes* (Baltimore: Penguin Books,

1956). A number of interesting shorter pieces are collected in Keith Brown, ed., *Hobbes Studies* (Cambridge, Mass.: Harvard University Press, 1965). Two important works are Michael Oakshott, *Hobbes on Civil Association* (Berkeley: University of California Press, 1975) and Leo Strauss, *The Political Philosophy of Hobbes* (1936; rpt. Oxford: Oxford University Press, 1963). An influential study of Hobbes' political and moral philosophy is Howard Warrender, *The Political Philosophy of Thomas Hobbes* (Oxford: Oxford University Press, 1957). Hobbes' work is placed in its historical context in Jean Hampton, *Hobbes and the Social Contract Tradition* (New York: Cambridge University Press, 1986). Also noteworthy is Gregory S. Kavka, *Hobbesian Moral and Political Theory* (Princeton: Princeton University Press, 1986).

George Sher

Leviathan*

THE INTRODUCTION

[1] Nature (the art whereby God hath made and governs the world) is by the *art* of man, as in many other things, so in this also imitated, that it can make an artificial animal. For seeing life is but a motion of limbs, the beginning whereof is in some principal part within, why may we not say that all *automata* (engines that move themselves by springs and wheels as doth a watch) have an artificial life? For what is the *heart*, but a *spring*; and the *nerves*, but so many *strings*; and the *joints*, but so many *wheels*, giving motion to the whole body, such as was intended by the artificer? *Art* goes yet further, imitating that rational and most excellent work of nature, man. For by art is created that great LEVIATHAN¹ called a COMMONWEALTH, or STATE (in Latin CIVITAS), which is but an artificial man, though of greater stature and strength than the natural, for whose protection and defence it was intended; and in which the *sovereignty* is an artificial soul, as giving life and motion to the whole body; the *magistrates* and other *officers* of judicature and execution, artificial *joints*; *reward* and *punishment* (by which fastened to the seat of the sovereignty every joint and member is moved to perform his duty) are the *nerves*, that do the same in the body natural; the *wealth* and *riches* of all the particular members are the *strength*; *salus populi* (the people's safety) its *business*; *counsellors*, by whom all things needful for it to know are suggested unto it, are the *memory*; *equity* and *laws*, an artificial *reason* and *will*; *concord*, *health*; *sedition*, *sickness*; and *civil war*, *death*. Lastly, the *pacts* and *covenants* by which the parts of this body politic were at first made, set together, and united, resemble that *fiat*, or the *let us make man*, pronounced by God in the creation.

[2] To describe the nature of this artificial man, I will consider

First, the *matter* thereof, and the *artificer*, both which is *man*.

Secondly, *how* and by what *covenants* it is made; what are the *rights* and *just power* or *authority* of a *sovereign*; and what it is that *preserveth* and *dissolveth* it.

Thirdly, what is a *Christian commonwealth*.

Lastly, what is the *kingdom of darkness*.

[3] Concerning the first, there is a saying much usurped of late, that *wisdom* is acquired, not by reading of *books*, but of *men*. Consequently whereunto, those persons that for the most part can give no other proof of being wise take great delight to show what they think they have read in men, by uncharitable censures of one another behind their backs. But there is another saying not of late understood, by which they might learn truly to read one another, if they would take the pains; and that is, *nosce teipsum*, *read thy self*, which was not meant, as it is now used, to countenance either the barbarous state of men in power towards their inferiors, or to encourage men of low degree to a saucy behaviour towards their betters, but to teach us that for the similitude of the thoughts and passions of one man to the thoughts and passions of another, whosoever looketh into himself and considereth what he doth, when he does *think*, *opine*, *reason*, *hope*, *fear*, &c, and upon what grounds, he shall thereby read and know, what are the thoughts and passions of all other men upon the like occasions. I say the similitude of *passions*, which are the same in all men, *desire*, *fear*, *hope*, &c, not the similitude of the *objects* of the passions, which are the things *desired*, *feared*, *hoped*, &c; for these the constitution individual and particular education do so vary, and they are so easy to be kept from our knowledge, that the characters of man's heart, blotted and confounded as they are with dissembling, lying, counterfeiting, and erroneous doctrines, are legible only to him that searcheth hearts. And though by men's actions we do discover their design sometimes, yet to do it without comparing them with our own, and distinguishing all circumstances by which the case may come to be altered, is to decipher without a key, and be for the most part deceived, by too much trust, or by too much diffidence, as he that reads is himself a good or evil man.

[4] But let one man read another by his actions never so perfectly, it serves him only with his acquaintance, which are but few. He that is to govern a whole nation must read in himself, not this or that particular man, but mankind, which though it be hard to do, harder than to learn any language or science, yet when I shall have set down my own reading orderly and perspicuously, the pains left another will be only to consider if he also find not the same in himself. For this kind of doctrine admitteth no other demonstration.

Part One
OF MAN

CHAPTER 1

Of Sense

[1] Concerning the thoughts of man, I will consider them first *singly*, and afterwards in *train*, or dependence upon one another. *Singly*, they are every one a *representation* or *appearance*, of some quality or other accident, of a body without us, which is commonly called an *object*. Which object worketh on the eyes, ears, and other parts of a man's body, and by diversity of working produceth diversity of appearances.

[2] The original of them all is that which we call SENSE. (For there is no conception in a man's mind which hath not at first, totally or by parts, been begotten upon the organs of sense.) The rest are derived from that original.

[3] To know the natural cause of sense is not very necessary to the business now in hand, and I have elsewhere written of the same at large. Nevertheless, to fill each part of my present method, I will briefly deliver the same in this place.

[4] The cause of sense is the external body, or object, which presseth the organ proper to each sense, either immediately, as in the taste and touch, or mediately, as in seeing, hearing, and smelling; which pressure, by the mediation of nerves and other strings and membranes of the body, continued inwards to the brain and heart, causeth there a resistance, or counter-pressure, or endeavour of the heart to deliver itself; which endeavour, because *outward*, seemeth to be some matter without. And this *seeming*, or *fancy*, is that which men call *sense*; and consisteth, as to the eye, in a *light* or *colour figured*; to the ear, in a *sound*; to the nostril, in an *odour*; to the tongue and palate, in a *savour*; and to the rest of the body, in *heat*, *cold*, *hardness*, *softness*, and such other qualities as we discern by *feeling*. All which qualities called *sensible* are in the object that causeth them but so many several motions of the matter, by which it presseth our organs diversely. Neither in us that are pressed are they anything else but divers motions (for motion produceth nothing but motion). But their appearance to us is fancy, the same waking that dreaming. And as pressing, rubbing, or striking the eye, makes us fancy a light, and pressing the ear, produceth a din, so do the bodies also we see, or hear, produce the same by their strong, though unobserved action. For if those colours and sounds were in the bodies, or objects, that cause them, they could not be severed from them, as by glasses, and in echoes by reflection, we see they are, where we know the thing we see is in one place, the appearance in another. And though at some certain distance the real and very object seem invested with the fancy it begets in us, yet still the object is one thing, the image or fancy is another. So that sense in all cases, is nothing else but original fancy, caused (as I have said) by the pressure, that is, by the motion, of external things upon our eyes, ears, and other organs thereunto ordained.

[5] But the philosophy-schools, through all the universities of Christendom, grounded upon certain texts of *Aristotle*, teach another doctrine, and say, for the cause of *vision*, that the thing seen sendeth forth on every side a *visible species* (in English, a *visible show*, *apparition*, or *aspect*, or a *being seen*), the receiving whereof into the eye is *seeing*. And for the cause of *hearing*, that the thing heard sendeth forth an *audible species*, that is, an *audible aspect*, or *audible being seen*, which entering at the ear maketh *hearing*. Nay for the cause of *understanding* also, they say the thing understood sendeth forth *intelligible species*, that is, an *intelligible being seen*, which coming into the understanding makes us understand. I say not this as disapproving the use of universities; but because I am to speak hereafter of their office in a commonwealth, I must let you see on all occasions by the way, what things would be amended in them, amongst which the frequency of insignificant speech is one.

CHAPTER II Of Imagination

[1] That when a thing lies still, unless somewhat else stir it, it will lie still for ever, is a truth that no man doubts of. But that when a thing is in motion, it will eternally be in motion, unless somewhat else stay it, though the reason be the same (namely, that nothing can change itself), is not so easily assented to. For men measure, not only other men, but all other things, by themselves; and because they find themselves subject after motion to pain and lassitude, think everything else grows weary of motion and seeks repose of its own accord, little considering whether it be not some other motion wherein that desire of rest they find in themselves consisteth. From hence it is that the schools say heavy bodies fall downwards out of an appetite to rest, and to conserve their nature in that place which is most proper for them, ascribing appetite and knowledge of what is good for their conservation (which is more than man has) to things inanimate, absurdly.

[2] When a body is once in motion, it moveth (unless something else hinder it) eternally; and whatsoever hindreth it, cannot in an instant, but in time and by degrees, quite extinguish it. And as we see in the water, though the wind cease, the waves give not over rolling for a long time after, so also it happeneth in that motion which is made in the internal parts of a man, then when he sees, dreams, &c. For after the object is removed, or the eye shut, we still retain an image of the thing seen, though more obscure than when we see it. And this is it, the Latins call *imagination*, from the image made in seeing, and apply the same, though improperly, to all the other senses. But the Greeks call it *fancy*, which signifies *appearance*, and is as proper to one sense as to another. IMAGINATION therefore is nothing but *decaying sense*, and is found in men and many other living creatures, as well sleeping as waking.

[3] The decay of sense in men waking is not the decay of the motion made in sense, but an obscuring of it, in such manner as the light of the sun obscureth the light of the stars; which stars do no less exercise their virtue, by which they are visible, in the day than in the night. But because amongst many strokes which our eyes, ears, and other organs receive from external bodies, the predominant only is sensible, therefore the light of the sun being predominant, we are not affected with the action of the stars. And any object being removed from our eyes, though the impression it made in us remain, yet other objects more present succeeding and working on us, the imagination of the past is obscured and made weak, as the voice of a man is in the noise of the day.

From whence it followeth that the longer the time is after the sight or sense of any object, the weaker is the imagination. For the continual change of man's body destroys in time the parts which in sense were moved, so that distance of time and of place hath one and the same effect in us. For as, at a great distance of place, that which we look at appears dim and without distinction of the smaller parts, and as voices grow weak and inarticulate, so also, after great distance of time, our imagination of the past is weak, and we lose (for example) of cities we have seen, many particular streets, and of actions, many particular circumstances. This *decaying sense*, when we would express the thing itself (I mean *fancy* itself), we call *imagination*, as I said before; but when we would express the *decay*, and signify that the sense is fading, old, and past, it is called *memory*. So that *imagination* and *memory* are but one thing, which for diverse considerations hath diverse names.

[4] Much memory, or memory of many things, is called *experience*. Again, imagination being only of those things which have been formerly perceived by sense, either all at once or by parts at several times, the former (which is the imagining the whole object, as it was presented to the sense) is *simple imagination*; as when one imagineth a man, or horse, which he hath seen before. The other is *compounded*; as when from the sight of a man at one time, and of a horse at another, we conceive in our mind a Centaur. So when a man compoundeth the image of his own person with the image of the actions of another man, as when a man imagines himself a *Hercules* or an *Alexander* (which happeneth often to them that are much taken with reading of romances), it is a compound imagination, and properly but a fiction of the mind. There be also other imaginations that rise in men (though waking) from the great impression made in sense, as from gazing upon the sun, the impression leaves an image of the sun before our eyes a long time after; and from being long and vehemently attent upon geometrical figures, a man shall in the dark (though awake) have the images of lines and angles before his eyes, which kind of fancy hath no particular name, as being a thing that doth not commonly fall into men's discourse.

[5] The imaginations of them that sleep are those we call *dreams*. And these also (as all other imaginations) have been before, either totally or by parcels, in the sense. And because the brain and nerves, which are the necessary organs of sense, are so benumbed in sleep as not easily to be moved by the action of

external objects, there can happen in sleep no imagination, and therefore no dream, but what proceeds from the agitation of the inward parts of man's body, which inward parts, for the connexion they have with the brain and other organs, when they be distempered, do keep the same in motion; whereby the imaginations there formerly made appear as if a man were waking, saving that the organs of sense being now benumbed, so as there is no new object which can master and obscure them with a more vigorous impression, a dream must needs be more clear, in this silence of sense, than are our waking thoughts. And hence it cometh to pass, that it is a hard matter, and by many thought impossible, to distinguish exactly between sense and dreaming. For my part, when I consider that in dreams I do not often, nor constantly, think of the same persons, places, objects, and actions that I do waking, nor remember so long a train of coherent thoughts dreaming as at other times, and because waking I often observe the absurdity of dreams, but never dream of the absurdities of my waking thoughts, I am well satisfied that being awake I know I dream not, though when I dream, I think myself awake.

[6] And seeing dreams are caused by the distemper of some of the inward parts of the body, diverse distempers must needs cause different dreams. And hence it is that lying cold breedeth dreams of fear and raiseth the thought and image of some fearful object (the motion from the brain to the inner parts, and from the inner parts to the brain, being reciprocal); and that as anger causeth heat in some parts of the body when we are awake, so when we sleep the overheating of the same parts causeth anger and raiseth up in the brain the imagination of an enemy. In the same manner as natural kindness, when we are awake, causeth desire, and desire makes heat in certain other parts of the body, so also too much heat in those parts, while we sleep, raiseth in the brain an imagination of some kindness shown. In sum, our dreams are the reverse of our waking imaginations, the motion when we are awake beginning at one end, and when we dream at another.

[7] The most difficult discerning of a man's dream from his waking thoughts is then, when by some accident we observe not that we have slept, which is easy to happen to a man full of fearful thoughts, and whose conscience is much troubled, and that sleepeth without the circumstances of going to bed, or putting off his clothes, as one that noddeth in a chair. For he that taketh pains, and industriously lays himself to sleep, in case any uncouth and exorbitant fancy come unto him, cannot easily think it other than a dream. We read of *Marcus Brutus* (one that had his life given him by *Julius Caesar*, and was also his favourite, and notwithstanding murdered him), how at *Philippi*, the night before he gave battle to *Augustus Caesar*, he saw a fearful apparition, which is commonly related by historians as a vision, but considering the circumstances, one may easily judge to have been but a short dream. For sitting in his tent, pensive and troubled with the horror of his rash act, it was not hard for him, slumbering in the cold, to dream of that which most affrighted him, which fear, as by degrees it made him wake, so also it must needs make the apparition by degrees to vanish; and having no assurance that he slept, he could have no cause to think it a dream, or anything but a vision. And this is no very rare accident; for even they that be perfectly awake, if they be timorous and superstitious, possessed with fearful tales and alone in the dark, are subject to the like fancies, and believe they see spirits and dead men's ghosts walking in churchyards; whereas it is either their fancy only, or else the knavery of such persons as make use of such superstitious fear to pass disguised in the night to places they would not be known to haunt.

[8] From this ignorance of how to distinguish dreams and other strong fancies from vision and sense did arise the greatest part of the religion of the gentiles in times past, that worshipped satyrs, fawns, nymphs, and the like; and now-a-days the opinion that rude people have of fairies, ghosts, and goblins, and of the power of witches. For as for witches, I think not that their witchcraft is any real power, but yet that they are justly punished, for the false belief they have that they can do such mischief, joined with their purpose to do it if they can, their trade being nearer to a new religion than to a craft or science. And for fairies and walking ghosts, the opinion of them has I think been on purpose, either taught or not confuted, to keep in credit the use of exorcism, of crosses, of holy water, and other such inventions of ghostly men.

Nevertheless, there is no doubt but God can make unnatural apparitions. But that he does it so often as men need to fear such things more than they fear the stay or change of the course of nature, which he also can stay and change, is no point of Christian faith. But evil men, under pretext that God can do anything, are so bold as to say anything when it serves their turn, though they think it untrue; it is the part of a wise man to believe them no further than right reason makes that which they say appear credible. If this superstitious fear of spirits were taken away, and with it prognostics from dreams, false prophecies, and many other things depending thereon, by which crafty ambitious persons abuse the simple people, men would be much more fitted than they are for civil obedience.

[9] And this ought to be the work of the schools; but they rather nourish such doctrine. For (not knowing what imagination or the senses are) what they receive, they teach, some saying that imaginations rise of

themselves and have no cause, others that they rise most commonly from the will, and that good thoughts are blown (inspired) into a man by God, and evil thoughts by the Devil, or that good thoughts are poured (infused) into a man by God, and evil ones by the Devil. Some say the senses receive the species of things and deliver them to the common sense, and the common sense delivers them over to the fancy, and the fancy to the memory, and the memory to the judgment, like handing of things from one to another, with many words making nothing understood.

[10] The imagination that is raised in man (or any other creature endued with the faculty of imagining) by words or other voluntary signs is that we generally call *understanding*, and is common to man and beast. For a dog by custom will understand the call or the rating of his master; and so will many other beasts. That understanding which is peculiar to man is the understanding not only his will, but his conceptions and thoughts, by the sequel and contexture of the names of things into affirmations, negations, and other forms of speech; and of this kind of understanding I shall speak hereafter [cf. v, 6].

CHAPTER III

Of the Consequence or *Train* of Imaginations

[1] By *Consequence*, or TRAIN of thoughts, I understand that succession of one thought to another which is called (to distinguish it from discourse in words) *mental discourse*.

[2] When a man thinketh on anything whatsoever, his next thought after, is not altogether so casual as it seems to be. Not every thought to every thought succeeds indifferently. But as we have no imagination whereof we have not formerly had sense, in whole or in parts, so we have no transition from one imagination to another whereof we never had the like before in our senses. The reason whereof is this. All fancies are motions within us, relics of those made in the sense; and those motions that immediately succeed one another in the sense continue also together after sense, insomuch as the former coming again to take place and be predominant, the latter followeth by coherence of the matter moved, in such manner as water upon a plain table is drawn which way any one part of it is guided by the finger. But because in sense, to one and the same thing perceived, sometimes one thing, sometimes another succeedeth, it comes to pass in time that in the imagining of anything there is no certainty what we shall imagine next; only this is certain, it shall be something that succeeded the same before, at one time or another.

[3] This train of thoughts, or mental discourse, is of two sorts. The first is *unguided, without design*, and inconstant, wherein there is no passionate thought to govern and direct those that follow to itself, as the end and scope of some desire or other passion; in which case the thoughts are said to wander, and seem impertinent one to another, as in a dream. Such are commonly the thoughts of men that are not only without company, but also without care of anything, though even then their thoughts are as busy as at other times, but without harmony, as the sound which a lute out of tune would yield to any man, or in tune, to one that could not play. And yet in this wild ranging of the mind, a man may oft-times perceive the way of it, and the dependence of one thought upon another. For in a discourse of our present civil war, what could seem more impertinent than to ask (as one did) what was the value of a Roman penny? Yet the coherence to me was manifest enough. For the thought of the war introduced the thought of the delivering up the king to his enemies; the thought of that brought in the thought of the delivering up of Christ; and that again the thought of the 30 pence which was the price of that treason; and thence easily followed that malicious question; and all this in a moment of time, for thought is quick.

[4] The second is more constant, as being *regulated* by some desire, and design. For the impression made by such things as we desire or fear is strong and permanent, or (if it cease for a time) of quick return; so strong it is sometimes as to hinder and break our sleep. From desire ariseth the thought of some means we have seen produce the like of that which we aim at; and from the thought of that, the thought of means to that mean; and so continually, till we come to some beginning within our own power. And because the end, by the greatness of the impression, comes often to mind, in case our thoughts begin to wander, they are quickly again reduced into the way; which, observed by one of the seven wise men, made him give men this precept, which is now worn out, *Respice finem*, that is to say, in all your actions, look often upon what you would have, as the thing that directs all your thoughts in the way to attain it.

[5] The train of regulated thoughts is of two kinds: one, when of an effect imagined, we seek the causes, or means that produce it; and this is common to man and beast. The other is when, imagining anything whatsoever, we seek all the possible effects that can by it be produced; that is to say, we imagine what we can do with it, when we have it. Of which I have not at any time seen any sign, but in man only; for this is a curiosity hardly incident to the nature of any living creature that has no other passion but sensual, such as are hunger, thirst, lust, and anger. In sum, the discourse of the mind, when it is governed by design, is nothing but *seeking*, or the faculty of invention, which the Latins called *sagacitas*, and *solertia*; a hunting out of the causes of some effect, present or past, or of the effects of some present or past cause. Sometimes a man seeks what he hath lost, and from that place and time wherein he misses it, his mind runs back, from place to place, and time to time, to find where and when he had it; that is to say, to find some certain and limited time and place in which to begin a method of seeking. Again, from thence his thoughts run over the same places and times, to find what action or other occasion might make him lose it. This we call *remembrance*, or calling to mind; the Latins call it *reminiscentia*, as it were a *re-connng* of our former actions.

[6] Sometimes a man knows a place determinate, within the compass whereof he is to seek; and then his thoughts run over all the parts thereof, in the same manner as one would sweep a room to find a jewel, or as a spaniel ranges the field till he find a scent, or as a man should run over the alphabet to start a rhyme.

[7] Sometimes a man desires to know the event of an action; and then he thinketh of some like action

past, and the events thereof one after another, supposing like events will follow like actions. As he that foresees what will become of a criminal re-cons what he has seen follow on the like crime before, having this order of thoughts: the crime, the officer, the prison, the judge, and the gallows. Which kind of thoughts is called *foresight*, and *prudence*, or *providence*, and sometimes *wisdom*, though such conjecture, through the difficulty of observing all circumstances, be very fallacious. But this is certain: by how much one man has more experience of things past than another, by so much also he is more prudent, and his expectations the seldomer fail him. The *present* only has a being in nature; things *past* have a being in the memory only; but things *to come* have no being at all, the *future* being but a fiction of the mind, applying the sequels of actions past to the actions that are present; which with most certainty is done by him that has most experience, but not with certainty enough. And though it be called prudence when the event answereth our expectation, yet in its own nature it is but presumption. For the foresight of things to come, which is providence, belongs only to him by whose will they are to come. From him only, and supernaturally, proceeds prophecy. The best prophet naturally is the best guesser; and the best guesser, he that is most versed and studied in the matters he guesses at, for he hath most *signs* to guess by.

[8] A *sign* is the event antecedent of the consequent, and contrarily, the consequent of the antecedent, when the like consequences have been observed before; and the oftener they have been observed, the less uncertain is the sign. And therefore he that has most experience in any kind of business has most signs whereby to guess at the future time, and consequently is the most prudent; and so much more prudent than he that is new in that kind of business, as not to be equalled by any advantage of natural and extemporary wit, though perhaps many young men think the contrary.

[9] Nevertheless it is not prudence that distinguisheth man from beast. There be beasts that at a year old observe more, and pursue that which is for their good more prudently, than a child can do at ten.

[10] As prudence is a *presumption* of the *future*, contracted from the *experience* of time *past*, so there is a presumption of things past taken from other things (not future but) past also. For he that hath seen by what courses and degrees a flourishing state hath first come into civil war and then to ruin, upon the sight of the ruins of any other state will guess the like war and the like courses have been there also. But this conjecture has the same uncertainty almost with the conjecture of the future, both being grounded only upon experience.

[11] There is no other act of man's mind that I can remember, naturally planted in him so as to need no other thing to the exercise of it but to be born a man, and live with the use of his five senses. Those other faculties of which I shall speak by and by, and which seem proper to man only, are acquired and increased by study and industry, and of most men learned by instruction and discipline, and proceed all from the invention of words and speech. For besides sense, and thoughts, and the train of thoughts, the mind of man has no other motion, though by the help of speech and method the same faculties may be improved to such a height as to distinguish men from all other living creatures.

[12] Whatsoever we imagine is *finite*. Therefore there is no idea or conception of anything we call *infinite*. No man can have in his mind an image of infinite magnitude, nor conceive infinite swiftness, infinite time, or infinite force, or infinite power. When we say anything is infinite, we signify only that we are not able to conceive the ends and bounds of the thing named, having no conception of the thing, but of our own inability. And therefore the name of *God* is used, not to make us conceive him (for he is *incomprehensible*, and his greatness and power are unconceivable), but that we may honour him. Also because whatsoever (as I said before) we conceive has been perceived first by sense, either all at once or by parts, a man can have no thought representing anything not subject to sense. No man therefore can conceive anything, but he must conceive it in some place, and endued with some determinate magnitude, and which may be divided into parts; nor that anything is all in this place, and all in another place at the same time; nor that two or more things can be in one and the same place at once; for none of these things ever have, or can be, incident to sense, but are absurd speeches, taken upon credit (without any signification at all) from deceived philosophers, and deceived or deceiving schoolmen.²

CHAPTER V Of Reason, and Science

[1] When a man *reasoneth*, he does nothing else but conceive a sum total from *addition* of parcels, or conceive a remainder from *subtraction* of one sum from another; which (if it be done by words) is conceiving of the consequence of the names of all the parts to the name of the whole, or from the names of the whole and one part to the name of the other part. And though in some things (as in numbers) besides *adding* and *subtracting* men name other operations, as *multiplying* and *dividing*, yet they are the same; for multiplication is but adding together of things equal, and division, but subtracting of one thing as often as we can. These operations are not incident to numbers only, but to all manner of things that can be added together and taken one out of another. For as arithmeticians teach to add and subtract in *numbers*, so the geometricians teach the same in *lines, figures* (solid and superficial), *angles, proportions, times*, degrees of *swiftness, force, power*, and the like; the logicians teach the same in *consequences of words*, adding together *two names* to make an *affirmation*, and *two affirmations* to make a *syllogism*; and *many syllogisms* to make a *demonstration*; and from the *sum*, or *conclusion*, of a *syllogism* they subtract one *proposition* to find the other. Writers of politics add together *pactions* to find men's *duties*; and lawyers, *laws* and *facts*, to find what is *right* and *wrong* in the actions of private men. In sum, in what matter soever there is place for *addition* and *subtraction*, there also is place for *reason*; and where these have no place, there *reason* has nothing at all to do.

[2] Out of all which we may define (that is to say determine) what that is which is meant by this word *reason*, when we reckon it amongst the faculties of the mind. For REASON, in this sense, is nothing but *reckoning* (that is, adding and subtracting) of the consequences of general names agreed upon for the *marking* and *signifying* of our thoughts; I say *marking* them when we reckon by ourselves, and *signifying*, when we demonstrate or approve our reckonings to other men.

[3] And as in arithmetic, unpractised men must, and professors themselves may, often err and cast up false, so also in any other subject of reasoning, the ablest, most attentive, and most practised men may deceive themselves and infer false conclusions; not but that reason itself is always right reason, as well as arithmetic is a certain and infallible art, but no one man's reason, nor the reason of any one number of men, makes the certainty, no more than an account is therefore well cast up, because a great many men have unanimously approved it. And therefore, as when there is a controversy in an account, the parties must by their own accord set up for right reason the reason of some arbitrator or judge to whose sentence they will both stand, or their controversy must either come to blows or be undecided, for want of a right reason constituted by nature, so is it also in all debates of what kind soever. And when men that think themselves wiser than all others clamour and demand right reason for judge, yet seek no more but that things should be determined by no other men's reason but their own, it is as intolerable in the society of men as it is in play, after trump is turned, to use for trump on every occasion that suit whereof they have most in their hand. For they do nothing else, that will have every of their passions, as it comes to bear sway in them, to be taken for right reason, and that in their own controversies, bewraying their want of right reason by the claim they lay to it.

[4] The use and end of reason is not the finding of the sum and truth of one or a few consequences, remote from the first definitions and settled significations of names, but to begin at these, and proceed from one consequence to another. For there can be no certainty of the last conclusion without a certainty of all those affirmations and negations on which it was grounded and inferred. As when a master of a family, in taking an account, casteth up the sums of all the bills of expense into one sum, and not regarding how each bill is summed up by those that give them in account, nor what it is he pays for, he advantages himself no more than if he allowed the account in gross, trusting to every of the accountants' skill and honesty, so also in reasoning of all other things, he that takes up conclusions on the trust of authors, and doth not fetch them from the first items in every reckoning (which are the significations of names settled by definitions), loses his labour, and does not know anything, but only believeth.

[5] When a man reckons without the use of words, which may be done in particular things (as when upon the sight of any one thing, we conjecture what was likely to have preceded, or is likely to follow upon it), if that which he thought likely to follow, follows not, or that which he thought likely to have preceded it, hath not preceded it, this is called ERROR, to which even the most prudent men are subject. But when we reason in words of general signification, and fall upon a general inference which is false, though it be commonly called *error*, it is indeed an ABSURDITY, or senseless speech. For error is but a deception, in presuming that somewhat is past, or to come, of which, though it were not past, or not to come, yet there was no impossibility discoverable. But when we make a general assertion, unless it be a true one, the possibility of it is inconceivable. And words whereby we conceive nothing but the sound are those we call *absurd, insignificant*,

and *nonsense*. And therefore if a man should talk to me of a *round quadrangle*, or *accidents of bread in cheese*, or *immaterial substances*, or of a *free subject*, a *free will*, or any *free*, but free from being hindered by opposition, I should not say he were in an error, but that his words were without meaning, that is to say, absurd.

[6] I have said before (in the second chapter [¶10]) that a man did excel all other animals in this faculty: that when he conceived anything whatsoever, he was apt to inquire the consequences of it, and what effects he could do with it. And now I add this other degree of the same excellence: that he can by words reduce the consequences he finds to general rules, called *theorems*, or *aphorisms*; that is, he can reason, or reckon, not only in number, but in all other things whereof one may be added unto or subtracted from another.

[7] But this privilege is allayed by another, and that is by the privilege of absurdity, to which no living creature is subject but man only. And of men, those are of all most subject to it that profess philosophy. For it is most true that *Cicero*³ saith of them somewhere: that there can be nothing so absurd, but may be found in the books of philosophers. And the reason is manifest. For there is not one of them that begins his ratiocination from the definitions, or explications of the names they are to use; which is a method that hath been used only in geometry, whose conclusions have thereby been made indisputable.

[8] The first cause of absurd conclusions I ascribe to the want of method, in that they begin not their ratiocination from definitions, that is, from settled significations of their words, as if they could cast account without knowing the value of the numeral words, *one*, *two*, and *three*.

[9] And whereas all bodies enter into account upon diverse considerations [...] these considerations being diversely named, diverse absurdities proceed from the confusion and unfit connexion of their names into assertions. And therefore,

[10] The second cause of absurd assertions I ascribe to the giving of names of *bodies* to *accidents*, or of *accidents* to *bodies*, as they do that say *faith is infused* or *inspired*, when nothing can be *poured* or *breathed* into anything but body, and that *extension is body*, that *phantasms* are *spirits*, &c.

[11] The third I ascribe to the giving of the names of the *accidents of bodies without us* to the *accidents* of our own bodies, as they do that say the *colour is in the body*, the *sound is in the air*, &c.

[12] The fourth, to the giving of the names of *bodies* to *names* or *speeches*, as they do that say that *there be things universal*, that *a living creature is genus*, or *a general thing*, &c.

[13] The fifth, to the giving of the names of *accidents* to *names* and *speeches*, as they do that say *the nature of a thing is its definition*, *a man's command is his will*, and the like.

[14] The sixth, to the use of metaphors, tropes, and other rhetorical figures, instead of words proper. For though it be lawful to say (for example) in common speech *the way goeth*, or *leadeth hither*, or *thither*, *the proverb says this* or *that* (whereas ways cannot go, nor proverbs speak), yet in reckoning and seeking of truth such speeches are not to be admitted.

[15] The seventh, to names that signify nothing, but are taken up and learned by rote from the schools, as *hypostatical*, *transubstantiate*, *consubstantiate*, *eternal-now*, and the like canting of schoolmen.

[16] To him that can avoid these things it is not easy to fall into any absurdity, unless it be by the length of an account, wherein he may perhaps forget what went before. For all men by nature reason alike, and well, when they have good principles. For who is so stupid as both to mistake in geometry, and also to persist in it when another detects his error to him?

[17] By this it appears that reason is not, as sense and memory, born with us, nor gotten by experience only, as prudence is, but attained by industry, first in apt imposing of names, and secondly by getting a good and orderly method in proceeding from the elements, which are names, to assertions made by connexion of one of them to another, and so to syllogisms, which are the connexions of one assertion to another, till we come to a knowledge of all the consequences of names appertaining to the subject in hand; and that is it men call SCIENCE. And whereas sense and memory are but knowledge of fact, which is a thing past and irrevocable, *Science* is the knowledge of consequences, and dependence of one fact upon another, by which, out of that we can presently do, we know how to do something else when we will, or the like, another time; because when we see how anything comes about, upon what causes, and by what manner, when the like causes come into our power, we see how to make it produce the like effects.

[18] Children therefore are not endued with reason at all till they have attained the use of speech, but are called reasonable creatures for the possibility apparent of having the use of reason in time to come. And the most part of men, though they have the use of reasoning a little way, as in numbering to some degree, yet it serves them to little use in common life, in which they govern themselves, some better, some worse, according to their differences of experience, quickness of memory, and inclinations to several ends, but specially

according to good or evil fortune, and the errors of one another. For as for *science*, or certain rules of their actions, they are so far from it that they know not what it is. Geometry they have thought conjuring; but for other sciences, they who have not been taught the beginnings and some progress in them, that they may see how they be acquired and generated, are in this point like children, that having no thought of generation are made believe by the women that their brothers and sisters are not born, but found in the garden.

[19] But yet they that have no *science* are in better and nobler condition with their natural prudence than men that by mis-reasoning, or by trusting them that reason wrong, fall upon false and absurd general rules. For ignorance of causes and of rules does not set men so far out of their way as relying on false rules, and taking for causes of what they aspire to, those that are not so, but rather causes of the contrary.

[20] To conclude, the light of human minds is perspicuous words, but by exact definitions first snuffed and purged from ambiguity; *reason* is the *pace*; increase of *science*, the *way*; and the benefit of mankind, the *end*. And on the contrary, metaphors, and senseless and ambiguous words, are like *ignes fatui* [a fool's fire], and reasoning upon them is wandering amongst innumerable absurdities; and their end, contention and sedition, or contempt.

[21] As much experience is *prudence*, so is much science *sapience*. For though we usually have one name of wisdom for them both, yet the Latins did always distinguish between *prudentia* and *sapientia*, ascribing the former to experience, the latter to science. But to make their difference appear more clearly, let us suppose one man endued with an excellent natural use and dexterity in handling his arms, and another to have added to that dexterity an acquired science of where he can offend or be offended by his adversary in every possible posture or guard; the ability of the former would be to the ability of the latter as prudence to sapience; both useful, but the latter infallible. But they that trusting only to the authority of books follow the blind blindly are like him that, trusting to the false rules of a master of fence, ventures presumptuously upon an adversary that either kills or disgraces him.

[22] The signs of science are some, certain and infallible, some, uncertain. Certain, when he that pretendeth the science of anything can teach the same, that is to say, demonstrate the truth thereof perspicuously to another; uncertain, when only some particular events answer to his pretence, and upon many occasions prove so as he says they must. Signs of prudence are all uncertain, because to observe by experience and remember all circumstances that may alter the success is impossible. But in any business whereof a man has not infallible science to proceed by, to forsake his own natural judgment and be guided by general sentences read in authors (and subject to many exceptions) is a sign of folly, and generally scorned by the name of pedantry. And even of those men themselves that in councils of the commonwealth love to show their reading of politics and history, very few do it in their domestic affairs, where their particular interest is concerned, having prudence enough for their private affairs; but in public they study more the reputation of their own wit than the success of another's business.

CHAPTER VI

Of the Interiour Beginnings of Voluntary Motions Commonly Called the *Passions*, and the Speeches by Which They Are Expressed

[1] There be in animals two sorts of *motions* peculiar to them: one called *vital*, begun in generation and continued without interruption through their whole life, such as are the *course* of the *blood*, the *pulse*, the *breathing*, the *concoction*, *nutrition*, *excretion*, &c, to which motions there needs no help of imagination; the other is *animal motion*, otherwise called *voluntary motion* as to *go*, to *speak*, to *move* any of our limbs, in such manner as is first fancied in our minds. That sense is motion in the organs and interior parts of man's body, caused by the action of the things we see, hear, &c, and that fancy is but the relics of the same motion, remaining after sense, has been already said in the first and second chapters. And because *going*, *speaking*, and the like voluntary motions depend always upon a precedent thought of *whither*, *which way*, and *what*, it is evident that the imagination is the first internal beginning of all voluntary motion. And although unstudied men do not conceive any motion at all to be there, where the thing moved is invisible, or the space it is moved in is (for the shortness of it) insensible, yet that doth not hinder, but that such motions are. For let a space be never so little, that which is moved over a greater space whereof that little one is part must first be moved over that. These small beginnings of motion within the body of man, before they appear in walking, speaking, striking, and other visible actions, are commonly called ENDEAVOUR.

[2] This endeavour, when it is toward something which causes it, is called APPETITE or DESIRE, the latter being the general name, and the other oftentimes restrained to signify the desire of food, namely *hunger* and *thirst*. And when the endeavour is from-ward something, it is generally called AVERSION. These words, *appetite* and *aversion*, we have from the *Latins*, and they both of them signify the motions, one of approaching, the other of retiring. So also do the Greek words for the same, which are *horme* and *aphorme*. For nature itself does often press upon men those truths which afterwards, when they look for somewhat beyond nature, they stumble at. For the Schools find in mere appetite to go, or move, no actual motion at all; but because some motion they must acknowledge, they call it metaphorical motion, which is but an absurd speech; for though words may be called metaphorical, bodies and motions cannot.

[3] That which men desire they are also said to LOVE, and to HATE those things for which they have aversions. So that desire and love are the same thing, save that by desire we always signify the absence of the object; by love, most commonly the presence of the same. So also by aversion we signify the absence, and by hate, the presence of the object.

[4] Of appetites and aversions some are born with men, as appetite of food, appetite of excretion and exoneration (which may also and more properly be called aversions from somewhat they feel in their bodies) and some other appetites, not many. The rest, which are appetites of particular things, proceed from experience and trial of their effects upon themselves or other men. For of things we know not at all, or believe not to be, we can have no further desire than to taste and try. But aversion we have for things, not only which we know have hurt us, but also that we do not know whether they will hurt us or not.

[5] Those things which we neither desire nor hate we are said to *contemn*, CONTEMPT being nothing else but an immobility or contumacy of the heart in resisting the action of certain things, and proceeding from that the heart is already moved otherwise, by other more potent objects, or from want of experience of them.

[6] And because the constitution of a man's body is in continual mutation, it is impossible that all the same things should always cause in him the same appetites and aversions; much less can all men consent in the desire of almost any one and the same object.

[7] But whatsoever is the object of any man's appetite or desire that is it which he for his part calleth *good*; and the object of his hate and aversion, *evil*; and of his contempt, *vile* and *inconsiderable*. For these words of good, evil, and contemptible are ever used with relation to the person that useth them, there being nothing simply and absolutely so, nor any common rule of good and evil to be taken from the nature of the objects themselves, but from the person of the man (where there is no commonwealth), or (in a commonwealth) from the person that representeth it, or from an arbitrator or judge whom men disagreeing shall by consent set up, and make his sentence the rule thereof.

[8] The Latin tongue has two words whose significations approach to those of good and evil, but are not precisely the same; and those are *pulchrum* and *turpe*. Whereof the former signifies that which by some apparent signs promiseth good; and the latter, that which promiseth evil. But in our tongue we have not so

general names to express them by. But for *pulchrum* we say, in some things, *fair*; in others, *beautiful*, or *handsome*, or *gallant*, or *honourable*, or *comely*, or *amiable*, and for *turpe*, *foul*, *deformed*, *ugly*, *base*, *nauseous*, and the like, as the subject shall require; all which words, in their proper places, signify nothing else but the *mien*, or countenance, that promiseth good and evil. So that of good there be three kinds: good in the promise, that is *pulchrum*; good in effect, as the end desired, which is called *jucundum*, *delightful*; and good as the means, which is called *utile*, *profitable*; and as many of evil; for *evil* in promise is that they call *turpe*; evil in effect and end is *molestum*, *unpleasant*, *troublesome*; and evil in the means *inutile*, *unprofitable*, *hurtful*.

[9] As in sense that which is really within us is (as I have said before) only motion caused by the action of external objects (but in appearance, to the sight, light and colour, to the ear, sound, to the nostril, odour, &c.), so when the action of the same object is continued from the eyes, ears, and other organs to the heart, the real effect there is nothing but motion or endeavour, which consisteth in appetite or aversion, to or from the object moving. But the appearance, or sense of that motion, is that we either call DELIGHT, or TROUBLE OF MIND.

[10] This motion which is called appetite, and for the appearance of it *delight* and *pleasure*, seemeth to be a corroboration of vital motion, and a help thereunto; and therefore such things as caused delight were not improperly called *jucunda* (*a juvando*, from helping or fortifying); and the contrary, *molesta*, *offensive*, from hindering and troubling the motion vital.

[11] *Pleasure*, therefore, or *delight*, is the appearance, or sense, of good; and *molestation* or *displeasure*, the appearance, or sense, of evil. And consequently all appetite, desire, and love is accompanied with some delight more or less; and all hatred and aversion, with more or less displeasure and offence.

[12] Of pleasures or delights, some arise from the sense of an object present, and those may be called *pleasures of sense* (the word *sensual*, as it is used by those only that condemn them, having no place till there be laws). Of this kind are all operations and exonerations of the body, as also all that is pleasant in the *sight*, *hearing*, *smell*, *taste*, or *touch*. Others arise from the expectation that proceeds from foresight of the end or consequence of things, whether those things in the sense please or displease. And these are *pleasures of the mind* of him that draweth those consequences, and are generally called JOY. In the like manner displeasures are some in the sense, and called PAIN; others in the expectation of consequences, and are called GRIEF.

[13] These simple passions, called *appetite*, *desire*, *love*, *aversion*, *hate*, *joy*, and *grief*, have their names for diverse considerations diversified. As first, when they one succeed another, they are diversely called from the opinion men have of the likelihood of attaining what they desire. Secondly, from the object loved or hated. Thirdly, from the consideration of many of them together. Fourthly, from the alteration or succession itself.

[14] For *appetite* with an opinion of attaining is called HOPE.

[15] The same without such opinion, DESPAIR.

[16] *Aversion* with opinion of *hurt* from the object, FEAR.

[17] The same with hope of avoiding that hurt by resistance, COURAGE.

[18] Sudden *courage*, ANGER.

[19] Constant *hope*, CONFIDENCE of ourselves.

[20] Constant *despair*, DIFFIDENCE of ourselves.

[21] *Anger* for great hurt done to another, when we conceive the same to be done by injury, INDIGNATION.

[22] *Desire* of good to another, BENEVOLENCE, GOOD WILL, CHARITY. If to man generally, GOOD NATURE.

[23] *Desire* of riches, COVETOUSNESS, a name used always in signification of blame, because men contending for them are displeased with one another's attaining them, though the desire in itself be to be blamed or allowed, according to the means by which those riches are sought.

[24] *Desire* of office or precedence, AMBITION, a name used also in the worse sense, for the reason before mentioned.

[25] *Desire* of things that conduce but a little to our ends, and fear of things that are but of little hindrance, PUSILLANIMITY.

[26] *Contempt* of little helps and hindrances, MAGNANIMITY.

[27] *Magnanimity* in danger of death or wounds, VALOUR, FORTITUDE.

[28] *Magnanimity* in the use of riches, LIBERALITY.

[29] *Pusillanimity*, in the same, WRETCHEDNESS, MISERABLENESS, or PARSIMONY; as it is liked or disliked.

[30] *Love* of persons for society, KINDNESS.

[31] *Love* of persons for pleasing the sense only, NATURAL LUST.

[32] *Love* of the same, acquired from rumination, that is, imagination of pleasure past, LUXURY.

[33] *Love* of one singularly, with desire to be singularly beloved, THE PASSION OF LOVE. The same, with fear that the love is not mutual, JEALOUSY.

[34] *Desire*, by doing hurt to another, to make him condemn some fact of his own, REVENGEFULNESS.

[35] *Desire* to know why, and how, CURIOSITY, such as is in no living creature but *man*, so that man is distinguished, not only by his reason, but also by this singular passion from other *animals*, in whom the appetite of food and other pleasures of sense by predominance take away the care of knowing causes, which is a lust of the mind that by a perseverance of delight in the continual and indefatigable generation of knowledge exceedeth the short vehemence of any carnal pleasure.

[36] *Fear* of power invisible, feigned by the mind, or imagined from tales publicly allowed, RELIGION; not allowed, SUPERSTITION. And when the power imagined is truly such as we imagine, TRUE RELIGION.

[37] *Fear* without the apprehension of why or what, PANIC TERROR, called so from the fables, that make *Pan* the author of them; whereas in truth there is always in him that so feareth first, some apprehension of the cause, though the rest run away by example, every one supposing his fellow to know why. And therefore this passion happens to none but in a throng, or multitude of people.

[38] *Joy* from apprehension of novelty, ADMIRATION; proper to man, because it excites the appetite of knowing the cause.

[39] *Joy* arising from imagination of a man's own power and ability is that exultation of the mind which is called GLORYING; which, if grounded upon the experience of his own former actions, is the same with *confidence*; but if grounded on the flattery of others, or only supposed by himself, for delight in the consequences of it, is called VAINGLORY; which name is properly given, because a well grounded *confidence* begetteth attempt, whereas the supposing of power does not, and is therefore rightly called *vain*.

[40] *Grief* from opinion of want of power is called DEJECTION of mind.

[41] The *vain-glory* which consisteth in the feigning or supposing of abilities in ourselves (which we know are not) is most incident to young men, and nourished by the histories or fictions of gallant persons; and is corrected of oftentimes by age and employment.

[42] *Sudden glory* is the passion which maketh those *grimaces* called LAUGHTER, and is caused either by some sudden act of their own that pleaseth them, or by the apprehension of some deformed thing in another, by comparison whereof they suddenly applaud themselves. And it is incident most to them that are conscious of the fewest abilities in themselves, who are forced to keep themselves in their own favour by observing the imperfections of other men. And therefore much laughter at the defects of others is a sign of pusillanimity. For of great minds one of the proper works is to help and free others from scorn, and compare themselves only with the most able.

[43] On the contrary, *sudden dejection* is the passion that causeth WEeping, and is caused by such accidents as suddenly take away some vehement hope, or some prop of their power; and they are most subject to it that rely principally on helps external, such as are women and children. Therefore some weep for the loss of friends; others for their unkindness; others for the sudden stop made to their thoughts of revenge, by reconciliation. But in all cases, both laughter and weeping are sudden motions, custom taking them both away. For no man laughs at old jests, or weeps for an old calamity.

[44] *Grief* for the discovery of some defect of ability is SHAME, or the passion that discovereth itself in BLUSHING, and consisteth in the apprehension of some thing dishonourable; and in young men is a sign of the love of good reputation and commendable; in old men it is a sign of the same, but because it comes too late, not commendable.

[45] The *contempt* of good reputation is called IMPUDENCE.

[46] *Grief* for the calamity of another is PITY, and ariseth from the imagination that the like calamity may befall himself; and therefore is called also COMPASSION, and in the phrase of this present time a FELLOW-FEELING; and therefore for calamity arriving from great wickedness, the best men have the least pity; and for the same calamity, those have least pity that think themselves least obnoxious to the same.

[47] *Contempt*, or little sense, of the calamity of others is that which men called CRUELTY, proceeding from security of their own fortune. For, that any man should take pleasure in other men's great harms without other end of his own I do not conceive it possible.

[48] *Grief* for the success of a competitor in wealth, honour, or other good, if it be joined with endeavour to enforce our own abilities to equal or exceed him, is called EMULATION; but joined with endeavour to supplant or hinder a competitor, ENVY.

[49] When in the mind of man appetites and aversions, hopes and fears, concerning one and the same thing arise alternately, and diverse good and evil consequences of the doing or omitting the thing propounded come successively into our thoughts, so that sometimes we have an appetite to it, sometimes an aversion from it, sometimes hope to be able to do it, sometimes despair or fear to attempt it, the whole sum of desires, aversions, hopes and fears, continued till the thing be either done or thought impossible, is what we call DELIBERATION.

[50] Therefore of things past, there is no *deliberation*, because manifestly impossible to be changed; nor of things known to be impossible, or thought so, because men know or think such deliberation vain. But of things impossible which we think possible, we may deliberate, not knowing it is in vain. And it is called *deliberation*, because it is a putting an end to the *liberty* we had of doing or omitting, according to our own appetite or aversion.

[51] This alternate succession of appetites, aversions, hopes and fears is no less in other living creatures than in man; and therefore beasts also deliberate.

[52] Every *deliberation* is then said to *end*, when that whereof they deliberate is either done or thought impossible, because till then we retain the liberty of doing or omitting, according to our appetite or aversion.

[53] In deliberation, the last appetite or aversion immediately adhering to the action, or to the omission thereof, is that we call the WILL, the act (not the faculty) of *willing*. And beasts that have *deliberation* must necessarily also have *will*. The definition of the *will* given commonly by the Schools, that it is a *rational appetite*, is not good. For if it were, then could there be no voluntary act against reason. For a *voluntary act* is that which proceedeth from the *will*, and no other. But if instead of a rational appetite, we shall say an appetite resulting from a precedent deliberation, then the definition is the same that I have given here. *Will* therefore is *the last appetite in deliberating*. And though we say in common discourse, a man had a will once to do a thing, that nevertheless he forbore to do, yet that is properly but an inclination, which makes no action voluntary; because the action depends not of it, but of the last inclination or appetite. For if the intervenient appetites make any action voluntary, then by the same reason all intervenient aversions should make the same action involuntary; and so one and the same action should be both voluntary and involuntary.

[54] By this it is manifest that not only actions that have their beginning from covetousness, ambition, lust, or other appetites to the thing propounded, but also those that have their beginning from aversion or fear of those consequences that follow the omission are *voluntary actions*.

[55] The forms of speech by which the passions are expressed are partly the same and partly different from those by which we express our thoughts. And first, generally all passions may be expressed *indicatively*, as *I love, I fear, I joy, I deliberate, I will, I command*; but some of them have particular expressions by themselves, which nevertheless are not affirmations (unless it be when they serve to make other inferences besides that of the passion they proceed from). Deliberation is expressed *subjunctively*, which is a speech proper to signify suppositions, with their consequences, as *if this be done, then this will follow*, and differs not from the language of reasoning, save that reasoning is in general words, but deliberation for the most part is of particulars. The language of desire and aversion is *imperative*, as *do this, forbear that*, which, when the party is obliged to do or forbear, is *command*; otherwise *prayer*, or else *counsel*. The language of vain-glory, of indignation, pity and revengefulness, *optative*; but of the desire to know there is a peculiar expression, called *interrogative*, as *what is it, when shall it, how is it done, and why so?* other language of the passions I find none; for cursing, swearing, reviling, and the like, do not signify as speech, but as the actions of a tongue accustomed.

[56] These forms of speech, I say, are expressions, or voluntary significations, of our passions; but certain signs they be not, because they may be used arbitrarily, whether they that use them have such passions or not. The best signs of passions present are in the countenance, motions of the body, actions, and ends or aims which we otherwise know the man to have.

[57] And because in deliberation the appetites and aversions are raised by foresight of the good and evil consequences and sequels of the action whereof we deliberate, the good or evil effect thereof dependeth on the foresight of a long chain of consequences, of which very seldom any man is able to see to the end. But for so far as a man seeth, if the good in those consequences be greater than the evil, the whole chain is that which writers call *apparent* or *seeming good*. And contrarily, when the evil exceedeth the good, the whole is *apparent* or *seeming evil*; so that he who hath by experience or reason the greatest and surest prospect of consequences deliberates best himself, and is able, when he will, to give the best counsel unto others.

[58] *Continual success* in obtaining those things which a man from time to time desireth, that is to say, continual prospering, is that men call FELICITY; I mean the felicity of this life. For there is no such thing as perpetual tranquillity of mind, while we live here; because life itself is but motion, and can never be without desire, nor without fear, no more than without sense. What kind of felicity God hath ordained to them that devoutly honour Him, a man shall no sooner know than enjoy, being joys that now are as incomprehensible as the word of school-men *beatifical vision* is unintelligible.

[59] The form of speech whereby men signify their opinion of the goodness of anything is PRAISE. That whereby they signify the power and greatness of anything is MAGNIFYING. And that whereby they signify the opinion they have of a man's felicity is by the Greeks called *makarismos*, for which we have no name in our tongue. And thus much is sufficient for the present purpose, to have been said of the PASSIONS.

CHAPTER XI

Of the Difference of *Manners*

[1] By *manners* I mean not here decency of behaviour, as how one man should salute another, or how a man should wash his mouth or pick his teeth before company, and such other points of the *small morals*, but those qualities of mankind that concern their living together in peace and unity. To which end we are to consider that the felicity of this life consisteth not in the repose of a mind satisfied. For there is no such *Finis ultimus* (utmost aim) nor *Summum Bonum* (greatest good) as is spoken of in the books of the old moral philosophers. Nor can a man any more live, whose desires are at an end, than he whose senses and imaginations are at a stand. Felicity is a continual progress of the desire, from one object to another, the attaining of the former being still but the way to the latter. The cause whereof is that the object of man's desire is not to enjoy once only, and for one instant of time, but to assure forever the way of his future desire. And therefore the voluntary actions and inclinations of all men tend, not only to the procuring, but also to the assuring of a contented life, and differ only in the way; which ariseth partly from the diversity of passions in divers men, and partly from the difference of the knowledge or opinion each one has of the causes which produce the effect desired.

[2] So that in the first place, I put for a general inclination of all mankind, a perpetual and restless desire of power after power, that ceaseth only in death. And the cause of this is not always that a man hopes for a more intensive delight than he has already attained to, or that he cannot be content with a moderate power, but because he cannot assure the power and means to live well which he hath present, without the acquisition of more. And from hence it is that kings, whose power is greatest, turn their endeavours to the assuring it at home by laws or abroad by wars; and when that is done, there succeedeth a new desire, in some of fame from new conquest, in others of ease and sensual pleasure, in others of admiration or being flattered for excellence in some art or other ability of the mind.

[3] Competition of riches, honour, command, or other power, inclineth to contention, enmity, and war; because the way of one competitor to the attaining of his desire is to kill, subdue, supplant, or repel the other. Particularly, competition of praise inclineth to a reverence of antiquity. For men contend with the living, not with the dead, to these ascribing more than due, that they may obscure the glory of the other.

[4] Desire of ease and sensual delight disposeth men to obey a common power, because by such desires a man doth abandon the protection might be hoped for from his own industry and labour. Fear of death and wounds disposeth to the same, and for the same reason. On the contrary, needy men, and hardy, not contented with their present condition, as also all men that are ambitious of military command, are inclined to continue the causes of war, and to stir up trouble and sedition; for there is no honour military but by war, nor any such hope to mend an ill game as by causing a new shuffle.

[5] Desire of knowledge, and arts of peace, inclineth men to obey a common power. For such desire containeth a desire of leisure, and consequently protection from some other power than their own.

[6] Desire of praise disposeth to laudable actions, such as please them whose judgment they value; for of those men whom we condemn, we condemn also the praises. Desire of fame after death does the same. And though after death there be no sense of the praise given us on earth, as being joys that are either swallowed up in the unspeakable joys of Heaven, or extinguished in the extreme torments of hell, yet is not such fame vain, because men have a present delight therein, from the foresight of it and of the benefit that may redound thereby to their posterity, which though they now see not, yet they imagine; and anything that is pleasure in the sense, the same also is pleasure in the imagination.

CHAPTER XIII

Of the *Natural Condition of Mankind*, as Concerning Their Felicity, and Misery

[1] Nature hath made men so equal in the faculties of body and mind as that, though there be found one man sometimes manifestly stronger in body or of quicker mind than another, yet when all is reckoned together the difference between man and man is not so considerable as that one man can thereupon claim to himself any benefit to which another may not pretend as well as he. For as to the strength of body, the weakest has strength enough to kill the strongest, either by secret machination, or by confederacy with others that are in the same danger with himself.

[2] And as to the faculties of the mind — setting aside the arts grounded upon words, and especially that skill of proceeding upon general and infallible rules called science (which very few have, and but in few things), as being not a native faculty (born with us), nor attained (as prudence) while we look after somewhat else — I find yet a greater equality amongst men than that of strength. For prudence is but experience, which equal time equally bestows on all men in those things they equally apply themselves unto. That which may perhaps make such equality incredible is but a vain conceit of one's own wisdom, which almost all men think they have in a greater degree than the vulgar, that is, than all men but themselves and a few others whom, by fame or for concurring with themselves, they approve. For such is the nature of men that howsoever they may acknowledge many others to be more witty, or more eloquent, or more learned, yet they will hardly believe there be many so wise as themselves. For they see their own wit at hand, and other men's at a distance. But this proveth rather that men are in that point equal, than unequal. For there is not ordinarily a greater sign of the equal distribution of anything than that every man is contented with his share.

[3] From this equality of ability ariseth equality of hope in the attaining of our ends. And therefore, if any two men desire the same thing, which nevertheless they cannot both enjoy, they become enemies; and in the way to their end, which is principally their own conservation, and sometimes their delectation only, endeavour to destroy or subdue one another. And from hence it comes to pass that, where an invader hath no more to fear than another man's single power, if one plant, sow, build, or possess a convenient seat, others may probably be expected to come prepared with forces united, to dispossess and deprive him, not only of the fruit of his labour, but also of his life or liberty. And the invader again is in the like danger of another.

[4] And from this diffidence of one another, there is no way for any man to secure himself so reasonable as anticipation, that is, by force or wiles to master the persons of all men he can, so long till he see no other power great enough to endanger him. And this is no more than his own conservation requireth, and is generally allowed. Also, because there be some that taking pleasure in contemplating their own power in the acts of conquest, which they pursue farther than their security requires, if others (that otherwise would be glad to be at ease within modest bounds) should not by invasion increase their power, they would not be able, long time, by standing only on their defence, to subsist. And by consequence, such augmentation of dominion over men being necessary to a man's conservation, it ought to be allowed him.

[5] Again, men have no pleasure, but on the contrary a great deal of grief, in keeping company where there is no power able to over-awe them all. For every man looketh that his companion should value him at the same rate he sets upon himself, and upon all signs of contempt, or undervaluing, naturally endeavours, as far as he dares (which amongst them that have no common power to keep them in quiet, is far enough to make them destroy each other), to extort a greater value from his contemnors, by damage, and from others, by the example.

[6] So that in the nature of man we find three principal causes of quarrel: first, competition; secondly, diffidence; thirdly, glory.

[7] The first maketh men invade for gain; the second, for safety; and the third, for reputation. The first use violence to make themselves masters of other men's persons, wives, children, and cattle; the second, to defend them; the third, for trifles, as a word, a smile, a different opinion, and any other sign of undervalue, either direct in their persons, or by reflection in their kindred, their friends, their nation, their profession, or their name.

[8] Hereby it is manifest that during the time men live without a common power to keep them all in awe, they are in that condition which is called war, and such a war as is of every man against every man. For WAR consisteth not in battle only, or the act of fighting, but in a tract of time wherein the will to contend by battle is sufficiently known. And therefore, the notion of *time* is to be considered in the nature of war, as it is in the

nature of weather. For as the nature of foul weather lieth not in a shower or two of rain, but in an inclination thereto of many days together, so the nature of war consisteth not in actual fighting, but in the known disposition thereto during all the time there is no assurance to the contrary. All other time is PEACE.

[9] Whatsoever therefore is consequent to a time of war, where every man is enemy to every man, the same is consequent to the time wherein men live without other security than what their own strength and their own invention shall furnish them withal. In such condition there is no place for industry, because the fruit thereof is uncertain, and consequently, no culture of the earth, no navigation, nor use of the commodities that may be imported by sea, no commodious building, no instruments of moving and removing such things as require much force, no knowledge of the face of the earth, no account of time, no arts, no letters, no society, and which is worst of all, continual fear and danger of violent death, and the life of man, solitary, poor, nasty, brutish, and short.

[10] It may seem strange, to some man that has not well weighed these things, that nature should thus dissociate, and render men apt to invade and destroy one another. And he may, therefore, not trusting to this inference made from the passions, desire perhaps to have the same confirmed by experience. Let him therefore consider with himself—when taking a journey, he arms himself, and seeks to go well accompanied; when going to sleep, he locks his doors; when even in his house, he locks his chests; and this when he knows there be laws, and public officers, armed, to revenge all injuries shall be done him—what opinion he has of his fellow subjects, when he rides armed; of his fellow citizens, when he locks his doors; and of his children and servants, when he locks his chests. Does he not there as much accuse mankind by his actions, as I do by my words? But neither of us accuse man's nature in it. The desires and other passions of man are in themselves no sin. No more are the actions that proceed from those passions, till they know a law that forbids them—which till laws be made they cannot know. Nor can any law be made, till they have agreed upon the person that shall make it.

[11] It may peradventure be thought, there was never such a time nor condition of war as this; and I believe it was never generally so, over all the world. But there are many places where they live so now. For the savage people in many places of *America* (except the government of small families, the concord whereof dependeth on natural lust) have no government at all, and live at this day in that brutish manner as I said before. Howsoever, it may be perceived what manner of life there would be where there were no common power to fear, by the manner of life which men that have formerly lived under a peaceful government use to degenerate into, in a civil war.

[12] But though there had never been any time wherein particular men were in a condition of war one against another, yet in all times kings and persons of sovereign authority, because of their independency, are in continual jealousies and in the state and posture of gladiators, having their weapons pointing and their eyes fixed on one another, that is, their forts, garrisons, and guns upon the frontiers of their kingdoms, and continual spies upon their neighbours, which is a posture of war. But because they uphold thereby the industry of their subjects, there does not follow from it that misery which accompanies the liberty of particular men.

[13] To this war of every man against every man, this also is consequent: that nothing can be unjust. The notions of right and wrong, justice and injustice, have there no place. Where there is no common power, there is no law; where no law, no injustice. Force and fraud are in war the two cardinal virtues. Justice and injustice are none of the faculties neither of the body, nor mind. If they were, they might be in a man that were alone in the world, as well as his senses and passions. They are qualities that relate to men in society, not in solitude. It is consequent also to the same condition that there be no propriety, no dominion, no *mine* and *thine* distinct, but only that to be every man's that he can get, and for so long as he can keep it. And thus much for the ill condition which man by mere nature is actually placed in, though with a possibility to come out of it, consisting partly in the passions, partly in his reason.

[14] The passions that incline men to peace are fear of death, desire of such things as are necessary to commodious living, and a hope by their industry to obtain them. And reason suggesteth convenient articles of peace, upon which men may be drawn to agreement. These articles are they which otherwise are called the Laws of Nature, whereof I shall speak more particularly in the two following chapters.

CHAPTER XIV

Of the First and Second *Natural Laws* and of *Contracts*

[1] The RIGHT OF NATURE, which writers commonly call *jus naturale*, is the liberty each man hath to use his own power, as he will himself, for the preservation of his own nature, that is to say, of his own life, and consequently of doing anything which, in his own judgment and reason, he shall conceive to be the aptest means thereunto.

[2] By LIBERTY is understood, according to the proper signification of the word, the absence of external impediments, which impediments may oft take away part of a man's power to do what he would, but cannot hinder him from using the power left him, according as his judgment and reason shall dictate to him.

[3] A LAW OF NATURE (*lex naturalis*) is a precept or general rule, found out by reason, by which a man is forbidden to do that which is destructive of his life or taketh away the means of preserving the same, and to omit that by which he thinketh it may be best preserved. For though they that speak of this subject use to confound *jus* and *lex* (*right* and *law*), yet they ought to be distinguished, because RIGHT consisteth in liberty to do or to forbear, whereas LAW determineth and bindeth to one of them; so that law and right differ as much as obligation and liberty, which in one and the same matter are inconsistent.

[4] And because the condition of man (as hath been declared in the precedent chapter) is a condition of war of everyone against everyone (in which case everyone is governed by his own reason and there is nothing he can make use of that may not be a help unto him in preserving his life against his enemies), it followeth that in such a condition every man has a right to everything, even to one another's body. And therefore, as long as this natural right of every man to everything endureth, there can be no security to any man (how strong or wise soever he be) of living out the time which nature ordinarily alloweth men to live. And consequently it is a precept, or general rule of reason *that every man ought to endeavour peace, as far as he has hope of obtaining it, and when he cannot obtain it, that he may seek and use all helps and advantages of war*. The first branch of which rule containeth the first and fundamental law of nature, which is *to seek peace, and follow it*. The second, the sum of the right of nature, which is *by all means we can, to defend ourselves*.

[5] From this fundamental law of nature, by which men are commanded to endeavour peace, is derived this second law: *that a man be willing, when others are so too, as far-forth as for peace and defence of himself he shall think it necessary, to lay down this right to all things, and be contented with so much liberty against other men, as he would allow other men against himself*. For as long as every man holdeth this right of doing anything he liketh, so long are all men in the condition of war. But if other men will not lay down their right as well as he, then there is no reason for anyone to divest himself of his; for that were to expose himself to prey (which no man is bound to), rather than to dispose himself to peace. This is that law of the Gospel: "whatsoever you require that others should do to you, that do ye to them." And that law of all men: *quod tibi fieri non vis, alteri ne feceris*.

[6] To lay down a man's right to anything is to divest himself of the liberty of hindering another of the benefit of his own right to the same. For he that renounceth or passeth away his right giveth not to any other man a right which he had not before (because there is nothing to which every man had not right by nature), but only standeth out of his way, that he may enjoy his own original right without hindrance from him, not without hindrance from another. So that the effect which redoundeth to one man by another man's defect of right is but so much diminution of impediments to the use of his own right original.

[7] Right is laid aside either by simply renouncing it or by transferring it to another. By simply RENOUNCING, when he cares not to whom the benefit thereof redoundeth. By TRANSFERRING, when he intendeth the benefit thereof to some certain person or persons. And when a man hath in either manner abandoned or granted away his right, then is he said to be OBLIGED or BOUND not to hinder those to whom such right is granted or abandoned from the benefit of it; and [it is said] that he *ought*, and it is his DUTY, not to make void that voluntary act of his own, and that such hindrance is INJUSTICE, and INJURY, as being *sine jure* [without right], the right being before renounced or transferred. So that *injury* or *injustice*, in the controversies of the world, is somewhat like to that which in the disputations of scholars is called absurdity. For as it is there called an *absurdity* to contradict what one maintained in the beginning, so in the world it is called injustice and injury voluntarily to undo that which from the beginning he had voluntarily done.

The way by which a man either simply renounceth or transferreth his right is a declaration, or signification by some voluntary and sufficient sign or signs, that he doth so renounce or transfer, or hath so renounced or

transferred the same, to him that accepteth it. And these signs are either words only, or actions only, or (as it happeneth most often) both words and actions. And the same are the BONDS by which men are bound and obliged, bonds that have their strength, not from their own nature (for nothing is more easily broken than a man's word) but from fear of some evil consequence upon the rupture.

[8] Whensoever a man transferreth his right or renounceth it, it is either in consideration of some right reciprocally transferred to himself or for some other good he hopeth for thereby. For it is a voluntary act, and of the voluntary acts of every man the object is some *good to himself*. And therefore there be some rights which no man can be understood by any words or other signs to have abandoned or transferred. As, first, a man cannot lay down the right of resisting them that assault him by force, to take away his life, because he cannot be understood to aim thereby at any good to himself. [Second], the same may be said of wounds, and chains, and imprisonment, both because there is no benefit consequent to such patience (as there is to the patience of suffering another to be wounded or imprisoned), as also because a man cannot tell, when he seeth men proceed against him by violence, whether they intend his death or not. [Third], and lastly, the motive and end for which this renouncing and transferring of right is introduced, is nothing else but the security of a man's person, in his life and in the means of so preserving life as not to be weary of it. And therefore if a man by words or other signs seem to despoil himself of the end for which those signs were intended, he is not to be understood as if he meant it, or that it was his will, but that he was ignorant of how such words and actions were to be interpreted.

[9] The mutual transferring of right is that which men call CONTRACT.

[10] There is difference between transferring of right to the thing and transferring (or tradition, that is, delivery) of the thing itself. For the thing may be delivered together with the translation of the right (as in buying and selling with ready money, or exchange of goods or lands); and it may be delivered some time after.

[11] Again, one of the contractors may deliver the thing contacted for on his part, and leave the other to perform his part at some determinate time after (and in the meantime be trusted); and then the contract on his part is called PACT, or COVENANT; or both parts may contract now, to perform hereafter, in which cases he that is to perform in time to come, being trusted, his performance is called *keeping of promise*, or *faith*, and the failing of performance (if it be voluntary) *violation of faith*.

[12] When the transferring of right is not mutual, but one of the parties transferreth in hope to gain thereby friendship or service from another (or from his friends), or in hope to gain the reputation of charity or magnanimity, or to deliver his mind from the pain of compassion, or in hope of reward in heaven, this is not contract, but GIFT, FREE-GIFT, GRACE, which words signify one and the same thing.

[13] Signs of contract are either *express* or *by inference*. Express are words spoken with understanding of what they signify; and such words are either of the time *present* or *past* (as, *I give, I grant, I have given, I have granted, I will that this be yours*), or of the future (as, *I will give, I will grant*), which words of the future are called PROMISE.

[14] Signs by inference are: sometimes the consequence of words, sometimes the consequence of silence; sometimes the consequence of actions, sometimes the consequence of forbearing an action; and generally a sign by inference of any contract is whatsoever sufficiently argues the will of the contractor.

[15] Words alone, if they be of the time to come, and contain a bare promise, are an insufficient sign of a free-gift, and therefore not obligatory. For if they be of the time to come (as, *tomorrow I will give*), they are a sign I have not given yet, and consequently that my right is not transferred, but remaineth till I transfer it by some other act. But if the words be of the time present or past (as, *I have given, or do give to be delivered tomorrow*), then is my tomorrow's right given away today; and that by the virtue of the words, though there were no other argument of my will. And there is a great difference in the signification of these words: *volo hoc tuum esse cras* and *cras dabo* (that is, between *I will that this be thine tomorrow* and *I will give it thee tomorrow*); for the word *I will* in the former manner of speech signifies an act of the will present, but in the latter it signifies a promise of an act of the will to come; and therefore the former words, being of the present, transfer a future right; the latter, that be of the future, transfer nothing.

But if there be other signs of the will to transfer a right besides words, then though the gift be free, yet may the right be understood to pass by words of the future (as, if a man propound a prize to him that comes first to the end of a race, the gift is free, and though the words be of the future, yet the right passeth; for if he would not have his words so be understood, he should not have let them run).

[16] In contracts the right passeth, not only where the words are of the time present or past, but also where they are of the future, because all contract is mutual translation, or change of right; and therefore he that promiseth only (because he hath already received the benefit for which he promiseth) is to be understood

as if he intended the right should pass; for unless he had been content to have his words so understood, the other would not have performed his part first. And for that cause, in buying and selling, and other acts of contract, a promise is equivalent to a covenant, and therefore obligatory.

[17] He that performeth first in the case of a contract is said to MERIT that which he is to receive by the performance of the other, and he hath it as *due*. Also when a prize is propounded to many, which is to be given to him only that winneth (or money is thrown amongst many, to be enjoyed by them that catch it), though this be a free gift, yet so to win (or so to catch) is to *merit*, and to have it as DUE. For the right is transferred in the propounding of the prize (and in throwing down the money), though it be not determined to whom but by the event of the contention.

But there is between these two sorts of merit, this difference: that in contract I merit by virtue of my own power, and the contractor's need; but in this case of free gift, I am enabled to merit only by the benignity of the giver; in contract I merit at the contractor's hand that he should depart with his right; in this case of gift, I merit not that the giver should part with his right, but that when he has parted with it, it should be mine rather than another's.

And this I think to be the meaning of that distinction of the Schools between *meritum congrui* and *meritum condigni*⁴ For God Almighty having promised Paradise to those men (hoodwinked with carnal desires) that can walk through this world according to the precepts and limits prescribed by him, they say: he that shall so walk shall merit Paradise *ex congruo*. But because no man can demand a right to it, by his own righteousness or any other power in himself, but by the free grace of God only, they say: no man can merit Paradise *ex condigno*. This, I say, I think is the meaning of that distinction; but because disputers do not agree upon the signification of their own terms of art longer than it serves their turn, I will not affirm anything of their meaning. Only this I say: when a gift is given indefinitely, as a prize to be contended for, he that winneth meriteth, and may claim the prize as due.

[18] If a covenant be made wherein neither of the parties perform presently, but trust one another, in the condition of mere nature (which is a condition of war of every man against every man) upon any reasonable suspicion it is void; but if there be a common power set over them both, with right and force sufficient to compel performance, it is not void. For he that performeth first has no assurance the other will perform after, because the bonds of words are too weak to bridle men's ambition, avarice, anger, and other passions, without the fear of some coercive power; which in the condition of mere nature, where all men are equal and judges of the justness of their own fears, cannot possibly be supposed. And therefore, he which performeth first does but betray himself to his enemy, contrary to the right (he can never abandon) of defending his life and means of living.

[19] But in a civil estate, where there is a power set up to constrain those that would otherwise violate their faith, that fear is no more reasonable; and for that cause, he which by the covenant is to perform first is obliged so to do.

[20] The cause of fear which maketh such a covenant invalid must be always something arising after the covenant made (as some new fact or other sign of the will not to perform), else it cannot make the covenant void. For that which could not hinder a man from promising, ought not to be admitted as a hindrance of performing.

[21] He that transferreth any right transferreth the means of enjoying it, as far as lieth in his power. As he that selleth land is understood to transfer the herbage and whatsoever grows upon it; nor can he that sells a mill turn away the stream that drives it. And they that give to a man the right of government in sovereignty are understood to give him the right of levying money to maintain soldiers, and of appointing magistrates for the administration of justice.

[22] To make covenants with brute beasts is impossible because, not understanding our speech, they understand not, nor accept of, any translation of right, nor can translate any right to another; and without mutual acceptation, there is no covenant.

[23] To make covenant with God is impossible, but by mediation of such as God speaketh to (either by revelation supernatural or by his lieutenants that govern under him, and in his name); for otherwise we know not whether our covenants be accepted or not. And therefore, they that vow anything [OL: to God] contrary to any law of nature vow in vain, as being a thing unjust to pay such vow. And if it be a thing commanded by the law of nature, [OL: they vow in vain;] it is not the vow, but the law that binds them.

[24] The matter or subject of a covenant is always something that falleth under deliberation (for to covenant is an act of the will; that is to say an act, and the last act, of deliberation) and is therefore always understood to be something to come, and which is judged possible for him that covenanteth to perform.

[25] And therefore, to promise that which is known to be impossible is no covenant. But if that prove impossible afterwards which before was thought possible, the covenant is valid and bindeth, though not to the thing itself, yet to the value; or, if that also be impossible, to the unfeigned endeavour of performing as much as is possible (for to more no man can be obliged).

[26] Men are freed of their covenants two ways: by performing or by being forgiven. For performance is the natural end of obligation; and forgiveness, the restitution of liberty (as being a retransferring of that right in which the obligation consisted).

[27] Covenants entered into by fear, in the condition of mere nature, are obligatory. For example, if I covenant to pay a ransom, or service, for my life, to an enemy, I am bound by it. For it is a contract wherein one receiveth the benefit of life; the other is to receive money, or service, for it; and consequently, where no other law (as in the condition of mere nature) forbiddeth the performance, the covenant is valid. Therefore prisoners of war, if trusted with the payment of their ransom, are obliged to pay it; and if a weaker prince make a disadvantageous peace with a stronger, for fear, he is bound to keep it, unless (as hath been said before [¶20]) there ariseth some new and just cause of fear, to renew the war. And even in commonwealths, if I be forced to redeem myself from a thief by promising him money, I am bound to pay it, till the civil law discharge me. For whatsoever I may lawfully do without obligation, the same I may lawfully covenant to do through fear; and what I lawfully covenant, I cannot lawfully break.

[28] A former covenant makes void a later. For a man that hath passed away his right to one man today, hath it not to pass tomorrow to another; and therefore the later promise passeth no right, but is null.

[29] A covenant not to defend myself from force by force is always void. For (as I have showed before) no man can transfer or lay down his right to save himself from death, wounds, and imprisonment (the avoiding whereof is the only end of laying down any right), and therefore the promise of not resisting force in no covenant transferreth any right, nor is obliging. For though a man may covenant thus *unless I do so, or so, kill me*, he cannot covenant thus *unless I do so, or so, I will not resist you, when you come to kill me*. For man by nature chooseth the lesser evil, which is danger of death in resisting, rather than the greater, which is certain and present death in not resisting. And this is granted to be true by all men, in that they lead criminals to execution and prison with armed men, notwithstanding that such criminals have consented to the law by which they are condemned.

[30] A covenant to accuse oneself, without assurance of pardon, is likewise invalid. For in the condition of nature, where every man is judge, there is no place for accusation; and in the civil state the accusation is followed with punishment, which being force, a man is not obliged not to resist. The same is also true of the accusation of those by whose condemnation a man falls into misery (as, of a father, wife, or benefactor). For the testimony of such an accuser, if it be not willingly given, is presumed to be corrupted by nature, and therefore not to be received; and where a man's testimony is not to be credited, he is not bound to give it. Also accusations upon torture are not to be reputed as testimonies. For torture is to be used but as means of conjecture and light in the further examination and search of truth; and what is in that case confessed tendeth to the ease of him that is tortured, not to the informing of the torturers, and therefore ought not to have the credit of a sufficient testimony; for whether he deliver himself by true or false accusation, he does it by the right of preserving his own life.

[31] The force of words being (as I have formerly noted) too weak to hold men to the performance of their covenants, there are in man's nature but two imaginable helps to strengthen it. And those are either a fear of the consequence of breaking their word, or a glory or pride in appearing not to need to break it. This latter is a generosity too rarely found to be presumed on, especially in the pursuers of wealth, command, or sensual pleasure (which are the greatest part of mankind).

The passion to be reckoned upon is fear, whereof there be two very general objects: one, the power of spirits invisible; the other, the power of those men they shall therein offend. Of these two, though the former be the greater power, yet the fear of the latter is commonly the greater fear. The fear of the former is in every man his own religion, which hath place in the nature of man before civil society. The latter hath not so, at least not place enough to keep men to their promises, because in the condition of mere nature the inequality of power is not discerned but by the event of battle.

So that before the time of civil society, or in the interruption thereof by war, there is nothing can strengthen a covenant of peace agreed on, against the temptations of avarice, ambition, lust, or other strong desire, but the fear of that invisible power which they every one worship as God and fear as a revenger of their perfidy. All therefore that can be done between two men not subject to civil power is to put one another to swear by the God he feareth; which *swearing*, or OATH, is a *form of speech, added to a promise, by which he that*

promiseth signifieth that unless he perform, he renounceth the mercy of his God, or calleth to him for vengeance on himself. Such was the heathen form *Let Jupiter kill me else, as I kill this beast.* So is our form *I shall do thus, and thus, so help me God.* And this, with the rites and ceremonies which everyone useth in his own religion, that the fear of breaking faith might be the greater.

[32] By this it appears that an oath taken according to any other form or rite than his that sweareth is in vain, and no oath, and that there is no swearing by anything which the swearer thinks not God. For though men have sometimes used to swear by their kings, for fear or flattery, yet they would have it thereby understood they attributed to them divine honour. And that swearing unnecessarily by God is but prophaning of his name, and swearing by other things, as men do in common discourse, is not swearing, but an impious custom, gotten by too much vehemence of talking.

[33] It appears also that the oath adds nothing to the obligation. For a covenant, if lawful, binds in the sight of God without the oath as much as with it; if unlawful, bindeth not at all, though it be confirmed with an oath.

CHAPTER XV

Of Other Laws of Nature

[1] From that law of nature by which we are obliged to transfer to another such rights as, being retained, hinder the peace of mankind, there followeth a third, which is this *that men perform their covenants made*, without which covenants are in vain, and but empty words, and the right of all men to all things remaining, we are still in the condition of war.

[2] And in this law of nature consisteth the fountain and original of JUSTICE. For where no covenant hath preceded, there hath no right been transferred, and every man has right to everything; and consequently, no action can be unjust. But when a covenant is made, then to break it is *unjust*; and the definition of INJUSTICE is no other than *the not performance of covenant*. And whatsoever is not unjust, is *just*.

[3] But because covenants of mutual trust where there is a fear of not performance on either part (as hath been said in the former chapter [xiv, 18–20]) are invalid, though the original of justice be the making of covenants, yet injustice actually there can be none till the cause of such fear be taken away, which, while men are in the natural condition of war, cannot be done. Therefore, before the names of just and unjust can have place, there must be some coercive power to compel men equally to the performance of their covenants, by the terror of some punishment greater than the benefit they expect by the breach of their covenant, and to make good that propriety which by mutual contract men acquire, in recompense of the universal right they abandon; and such power there is none before the erection of a commonwealth. And this is also to be gathered out of the ordinary definition of justice in the Schools; for they say that *justice is the constant will of giving to every man his own*. And therefore where there is no *own*, that is, no propriety, there is no injustice; and where there is no coercive power erected, that is, where there is no commonwealth, there is no propriety, all men having right to all things; therefore where there is no commonwealth, there nothing is unjust. So that the nature of justice consisteth in keeping of valid covenants; but the validity of covenants begins not but with the constitution of a civil power sufficient to compel men to keep them; and then it is also that propriety begins.

[4] The fool hath said in his heart: “there is no such thing as justice”; and sometimes also with his tongue, seriously alleging that: “every man’s conservation and contentment being committed to his own care, there could be no reason why every man might not do what he thought conduced thereunto, and therefore also to make or not make, keep or not keep, covenants was not against reason, when it conduced to one’s benefit.” He does not therein deny that there be covenants, and that they are sometimes broken, sometimes kept, and that such breach of them may be called injustice, and the observance of them justice; but he questioneth whether injustice, taking away the fear of God (for the same fool hath said in his heart there is no God), may not sometimes stand with that reason which dictateth to every man his own good; and particularly then, when it conduceth to such a benefit as shall put a man in a condition to neglect, not only the dispraise and revilings, but also the power of other men.

“The kingdom of God is gotten by violence; but what if it could be gotten by unjust violence? were it against [OL: right] reason so to get it, when it is impossible to receive hurt by it [OL: but only the supreme good]? and if it be not against reason, it is not against justice; or else justice is not to be approved for good.”

From such reasoning as this, successful wickedness hath obtained the name of virtue, and some that in all other things have disallowed the violation of faith, yet have allowed it when it is for the getting of a kingdom. And the heathen that believed that *Saturn* was deposed by his son *Jupiter* believed nevertheless the same *Jupiter* to be the avenger of injustice, somewhat like to a piece of law in *Coke’s Commentaries on Littleton*,⁵ where he says: if the right heir of the crown be attainted of treason, yet the crown shall descend to him, and *eo instante* [immediately] the attainder be void; from which instances a man will be very prone to infer that “when the heir apparent of a kingdom shall kill him that is in possession, though his father, you may call it injustice, or by what other name you will, yet it can never be against reason, seeing all the voluntary actions of men tend to the benefit of themselves, and those actions are most reasonable that conduce most to their ends.” This specious reasoning is nevertheless false.

[5] For the question is not of promises mutual where there is no security of performance on either side (as when there is no civil power erected over the parties promising), for such promises are no covenants, but either where one of the parties has performed already, or where there is a power to make him perform, there is the question whether it be against reason, that is, against the benefit of the other to perform or not. And I say it is not against reason. For the manifestation whereof we are to consider: first, that when a man doth a thing

which, notwithstanding anything can be foreseen and reckoned on, tendeth to his own destruction (howsoever some accident which he could not expect, arriving, may turn it to his benefit), yet such events do not make it reasonably or wisely done. Secondly, that in a condition of war wherein every man to every man (for want of a common power to keep them all in awe) is an enemy, there is no man can hope by his own strength or wit to defend himself from destruction without the help of confederates (where everyone expects the same defence by the confederation that anyone else does); and therefore, he which declares he thinks it reason to deceive those that help him can in reason expect no other means of safety than what can be had from his own single power. He, therefore, that breaketh his covenant, and consequently declareth that he thinks he may with reason do so, cannot be received into any society that unite themselves for peace and defence but by the error of them that receive him; nor when he is received, be retained in it without seeing the danger of their error; which errors a man cannot reasonably reckon upon as the means of his security; and therefore, if he be left or cast out of society, he perisheth; and if he live in society, it is by the errors of other men, which he could not foresee nor reckon upon; and consequently [he has acted] against the reason of his preservation, and so as all men that contribute not to his destruction forbear him only out of ignorance of what is good for themselves.

[6] As for the instance of gaining the secure and perpetual felicity of heaven by any way, it is frivolous, there being but one way imaginable, and that is not breaking, but keeping of covenant.

[7] And for the other instance of attaining sovereignty by rebellion, it is manifest that, though the event follow, yet because it cannot reasonably be expected (but rather the contrary), and because (by gaining it so) others are taught to gain the same in like manner, the attempt thereof is against reason. Justice, therefore, that is to say, keeping of covenant, is a rule of reason by which we are forbidden to do anything destructive to our life, and consequently a law of nature.

[8] There be some that proceed further, and will not have the law of nature to be those rules which conduce to the preservation of man's life on earth, but to the attaining of an eternal felicity after death, to which they think the breach of covenant may conduce, and consequently be just and reasonable (such are they that think it a work of merit to kill, or depose, or rebel against the sovereign power constituted over them by their own consent). But because there is no natural knowledge of man's estate after death, much less of the reward that is then to be given to breach of faith, but only a belief grounded upon other men's saying that they know it supernaturally, or that they know those that knew them that knew others that knew it supernaturally, breach of faith cannot be called a precept of reason or nature.

[9] Others, that allow for a law of nature the keeping of faith, do nevertheless make exception of certain persons (as heretics and such as use not to perform their covenant to others); and this also is against reason.

For if any fault of a man be sufficient to discharge our covenant made, the same ought in reason to have been sufficient to have hindered the making of it.

[10] The names of just and unjust, when they are attributed to men, signify one thing; and when they are attributed to actions, another. When they are attributed to men, they signify conformity or inconformity of manners to reason. But when they are attributed to actions, they signify the conformity or inconformity to reason, not of manners or manner of life, but of particular actions. A just man, therefore, is he that taketh all the care he can that his actions may be all just; and an unjust man is he that neglecteth it. And such men are more often in our language styled by the names of righteous and unrighteous, than just and unjust, though the meaning be the same. Therefore a righteous man does not lose that title by one or a few unjust actions that proceed from sudden passion or mistake of things or persons; nor does an unrighteous man lose his character for such actions as he does or forbears to do for fear, because his will is not framed by the justice, but by the apparent benefit of what he is to do. That which gives to human actions the relish of justice is a certain nobleness or gallantness of courage (rarely found) by which a man scorns to be beholden for the contentment of his life to fraud or breach of promise. This justice of the manners is that which is meant where justice is called a virtue, and injustice a vice.

[11] But the justice of actions denominates men, not just, but *guiltless*; and the injustice of the same (which is also called injury) gives them but the name of *guilty*.

[12] Again, the injustice of manners is the disposition or aptitude to do injury, and is injustice before it proceed to act and without supposing any individual person injured. But the injustice of an action (that is to say injury) supposeth an individual person injured, namely, him to whom the covenant was made; and therefore, many times the injury is received by one man, when the damage redoundeth to another. As when the master commandeth his servant to give money to a stranger; if it be not done, the injury is done to the master, whom he had before covenanted to obey, but the damage redoundeth to the stranger, to whom he had no obligation, and therefore could not injure him. And so also in commonwealths, private men may remit to

one another their debts, but not robberies or other violences whereby they are endamaged; because the detaining of debt is an injury to themselves, but robbery and violence are injuries to the person of the commonwealth.

[13] Whatsoever is done to a man conformable to his own will, signified to the doer, is no injury to him. For if he that doeth it hath not passed away his original right to do what he please by some antecedent covenant, there is no breach of covenant, and therefore no injury done him. And if he have, then his will [i.e., that of the person acted on] to have it done being signified, is a release of that covenant; and so again there is no injury done him.

[14] Justice of actions is by writers divided into *commutative* and *distributive*; and the former they say consisteth in proportion arithmetical; the latter, in proportion geometrical. Commutative, therefore, they place in the equality of value of the things contracted for; and distributive, in the distribution of equal benefit to men of equal merit (as if it were injustice to sell dearer than we buy, or to give more to a man than he merits). The value of all things contracted for is measured by the appetite of the contractors; and therefore the just value is that which they be contented to give. And merit (besides that which is by covenant, where the performance on one part meriteth the performance of the other part, and falls under justice commutative, not distributive) is not due by justice, but is rewarded of grace only.

And therefore, this distinction, in the sense wherein it useth to be expounded, is not right. To speak properly, commutative justice is the justice of a contractor, that is, a performance of covenant (in buying and selling, hiring and letting to hire, lending and borrowing, exchanging, bartering, and other acts of contract).

[15] And distributive justice [is] the justice of an arbitrator, that is to say, the act of defining what is just. Wherein (being trusted by them that make him arbitrator) if he perform his trust, he is said to distribute to every man his own; and this is indeed just distribution, and may be called (though improperly) distributive justice (but more properly, equity, which also is a law of nature)...

[16] As justice dependeth on antecedent covenant, so does GRATITUDE depend on antecedent grace, that is to say, antecedent free-gift; and is the fourth law of nature, which may be conceived in this form *that a man which receiveth benefit from another of mere grace endeavour that he which giveth it have no reasonable cause to repent him of his good will*. For no man giveth but with intention of good to himself, because gift is voluntary, and of all voluntary acts the object is to every man his own good; of which, if men see they shall be frustrated, there will be no beginning of benevolence or trust; nor, consequently, of mutual help, nor of reconciliation of one man to another; and therefore they are to remain still in the condition of war, which is contrary to the first and fundamental law of nature, which commandeth men to *seek peace*. The breach of this law is called *ingratitude*, and hath the same relation to grace that injustice hath to obligation by covenant.

[17] A fifth law of nature is COMPLAISANCE, that is to say, *that every man strive to accommodate himself to the rest*. For the understanding whereof we may consider that there is, in men's aptness to society, a diversity of nature rising from their diversity of affections, not unlike to that we see in stones brought together for building of an edifice. For as that stone which (by the asperity and irregularity of figure) takes more room from others than itself fills, and (for the hardness) cannot be easily made plain, and thereby hindereth the building, is by the builders cast away as unprofitable and troublesome, so also a man that (by asperity of nature) will strive to retain those things which to himself are superfluous and to others necessary, and (for the stubbornness of his passions) cannot be corrected, is to be left or cast out of society as cumbersome thereunto. For seeing every man, not only by right, but also by necessity of nature, is supposed to endeavour all he can to obtain that which is necessary for his conservation, he that shall oppose himself against it for things superfluous is guilty of the war that thereupon is to follow; and, therefore, doth that which is contrary to the fundamental law of nature, which commandeth to *seek peace*. The observers of this law may be called SOCIABLE (the Latins call them *commodi*); the contrary, *stubborn, insociable, froward, intractable*.

[18] A sixth law of nature is this *that upon caution of the future time, a man ought to pardon the offences past of them that, repenting, desire it*. For PARDON is nothing but granting of peace, which (though granted to them that persevere in their hostility be not peace but fear, yet) not granted to them that give caution of the future time is sign of an aversion to peace; and therefore contrary to the law of nature.

[19] A seventh is *that in revenges* (that is, retribution of evil for evil) *men look not at the greatness of the evil past, but the greatness of the good to follow*. Whereby we are forbidden to inflict punishment with any other design than for correction of the offender, or direction of others. For this law is consequent to the next before it, that commandeth pardon upon security of the future time. Besides, revenge without respect to the example and profit to come is a triumph, or glorying, in the hurt of another, tending to no end (for the end is always somewhat to come); and glorying to no end is vainglory, and contrary to reason; and to hurt without reason

tendeth to the introduction of war, which is against the law of nature, and is commonly styled by the name of *cruelty*.

[20] And because all signs of hatred or contempt provoke to fight, insomuch as most men choose rather to hazard their life than not to be revenged, we may in the eighth place, for a law of nature, set down this precept *that no man by deed, word, countenance, or gesture, declare hatred or contempt of another*. The breach of which law is commonly called *contumely*.

[21] The question 'who is the better man?' has no place in the condition of mere nature, where (as has been shewn before) all men are equal. The inequality that now is, has been introduced by the laws civil. I know that *Aristotle* (in the first book of his *Politics* [ch. iii—vii], for a foundation of his doctrine) maketh men by nature, some more worthy to command (meaning the wiser sort, such as he thought himself to be for his philosophy), others to serve (meaning those that had strong bodies, but were not philosophers as he), as if master and servant were not introduced by consent of men, but by difference of wit; which is not only against reason, but also against experience. For there are very few so foolish that had not rather govern themselves than be governed by others; nor when the wise in their own conceit contend by force with them who distrust their own wisdom, do they always, or often, or almost at any time, get the victory. If nature therefore have made men equal, that equality is to be acknowledged; or if nature have made men unequal, yet because men that think themselves equal will not enter into conditions of peace but upon equal terms, such equality must be admitted. And therefore for the ninth law of nature, I put this *that every man acknowledge other for his equal by nature*. The breach of this precept is *pride*.

[22] On this law dependeth another: *that at the entrance into conditions of peace, no man require to reserve to himself any right which he is not content should be reserved to every one of the rest*. As it is necessary, for all men that seek peace, to lay down certain rights of nature (that is to say, not to have liberty to do all they list), so is it necessary, for man's life, to retain some (as, right to govern their own bodies, [right to] enjoy air, water, motion, ways to go from place to place, and all things else without which a man cannot live, or not live well). If in this case, at the making of peace, men require for themselves that which they would not have to be granted to others, they do contrary to the precedent law, that commandeth the acknowledgment of natural equality, and therefore also against the law of nature. The observers of this law are those we call *modest*, and the breakers *arrogant* men. The Greeks call the violation of this law *pleonexia*, that is, a desire of more than their share.

[23] Also *if a man be trusted to judge between man and man*, it is a precept of the law of nature that *he deal equally between them*. For without that, the controversies of men cannot be determined but by war. He, therefore, that is partial in judgment doth what in him lies to deter men from the use of judges and arbitrators; and consequently (against the fundamental law of nature), is the cause of war.

[24] The observance of this law (from the equal distribution to each man of that which in reason belongeth to him) is called EQUITY, and (as I have said before) distributive justice; the violation [is called] *acceptation of persons* (*prosopolepsia*).

[25] And from this followeth another law: *that such things as cannot be divided be enjoyed in common, if it can be; and if the quantity of the thing permit, without stint; otherwise proportionably to the number of them that have right*. For otherwise the distribution is unequal, and contrary to equity.

[26] But some things there be that can neither be divided nor enjoyed in common. Then the law of nature which prescribeth equity requireth *that the entire right (or else, making the use alternate, the first possession) be determined by lot*. For equal distribution is of the law of nature, and other means of equal distribution cannot be imagined.

[27] Of *lots* there be two sorts: *arbitrary* and *natural*. Arbitrary is that which is agreed on by the competitors; natural is either *primogeniture* (which the Greek calls *kleronomia*, which signifies, *given by lot*) or *first seizure*.

[28] And therefore those things which cannot be enjoyed in common, nor divided, ought to be adjudged to the first possessor; and in some cases to the firstborn, as acquired by lot.

[29] It is also a law of nature *that all men that mediate peace be allowed safe conduct*. For the law that commandeth peace, as the *end*, commandeth intercession, as the *means*; and to intercession the means is safe conduct.

[30] And because (though men be never so willing to observe these laws) there may nevertheless arise questions concerning a man's action (first, whether it were done or not done; secondly, if done, whether against the law or not against the law; the former whereof is called a question *of fact*; the latter a question *of*

right), therefore unless the parties to the question covenant mutually to stand to the sentence of another, they are as far from peace as ever. This other to whose sentence they submit is called an ARBITRATOR. And therefore it is of the law of nature *that they that are at controversy, submit their right to the judgment of an arbitrator*.

[31] And seeing every man is presumed to do all things in order to his own benefit, *no man is a fit arbitrator in his own cause*; and if he were never so fit, yet (equity allowing to each party equal benefit) if one be admitted to judge, the other is to be admitted also; and so the controversy, that is, the cause of war, remains, against the law of nature.

[32] For the same reason no man in any cause ought to be received for arbitrator, to whom greater profit, or honour, or pleasure apparently ariseth out of the victory of one party, than of the other; for he hath taken (though an unavoidable bribe, yet) a bribe; and no man can be obliged to trust him. And thus also the controversy, and the condition of war remaineth, contrary to the law of nature.

[33] And in a controversy of *fact* the judge (being to give no more credit to one [litigant] than to the other, if there be no other arguments) must give credit to a third [a non-litigant witness], or to a third and fourth; or more; for else the question is undecided, and left to force, contrary to the law of nature.

[34] These are the laws of nature dictating peace for a means of the conservation of men in multitudes; and which only concern the doctrine of civil society. There be other things tending to the destruction of particular men (as drunkenness and all other parts of intemperance), which may therefore also be reckoned amongst those things which the law of nature hath forbidden; but are not necessary to be mentioned, nor are pertinent enough to this place.

[35] And though this may seem too subtle a deduction of the laws of nature to be taken notice of by all men (whereof the most part are too busy in getting food, and the rest too negligent, to understand), yet to leave all men inexcusable they have been contracted into one easy sum, intelligible even to the meanest capacity, and that is *Do not that to another, which thou wouldst not have done to thyself*; which sheweth him that he has no more to do in learning the laws of nature but (when, weighing the actions of other men with his own, they seem too heavy) to put them into the other part of the balance, and his own into their place, that his own passions and self-love may add nothing to the weight; and then there is none of these laws of nature that will not appear unto him very reasonable.

[36] The laws of nature oblige *in foro interno*, that is to say, they bind to a desire they should take place; but *in foro externo*, that is, to the putting them in act, not always. For he that should be modest and tractable, and perform all he promises, in such time and place where no man else should do so, should but make himself a prey to others, and produce his own certain ruin, contrary to the ground of all laws of nature, which tend to nature's preservation. And again, he that having sufficient security that others shall observe the same laws towards him, observes them not himself, seeketh not peace, but war, and consequently the destruction of his nature by violence.

[37] And whatsoever laws bind *in foro interno* may be broken, not only by a fact contrary to the law, but also by a fact according to it, in case a man think it contrary. For though his action in this case be according to the law, yet his purpose was against the law, which, where the obligation is *in foro interno*, is a breach.

[38] The laws of nature are immutable and eternal; for injustice, ingratitude, arrogance, pride, iniquity, acception of persons, and the rest, can never be made lawful. For it can never be that war shall preserve life, and peace destroy it.

[39] The same laws, because they oblige only to a desire and endeavour (I mean an unfeigned and constant endeavour) are easy to be observed. For in that they require nothing but endeavour, he that endeavoureth their performance fulfilleth them; and he that fulfilleth the law is just.

[40] And the science of them [the laws of nature] is the true and only moral philosophy. For moral philosophy is nothing else but the science of what is *good* and *evil* in the conversation and society of mankind. *Good* and *evil* are names that signify our appetites and aversions, which in different tempers, customs, and doctrines of men are different; and divers men differ not only in their judgment on the senses (of what is pleasant and unpleasant to the taste, smell, hearing, touch, and sight), but also of what is conformable or disagreeable to reason in the actions of common life. Nay, the same man in divers times differs from himself, and one time praiseth (that is, calleth good) what another time he dispraiseth (and calleth evil); from whence arise disputes, controversies, and at last war. And therefore so long a man is in the condition of mere nature (which is a condition of war) as private appetite is the measure of good and evil; and consequently, all men agree on this, that peace is good; and therefore also the way or means of peace (which, as I have shewed before, are *justice, gratitude, modesty, equity, mercy*, and the rest of the laws of nature) are good (that is to say,

moral virtues), and their contrary vices, evil.

Now the science of virtue and vice is moral philosophy; and therefore the true doctrine of the laws of nature is the true moral philosophy. But the writers of moral philosophy, though they acknowledge the same virtues and vices, yet not seeing wherein consisted their goodness, nor that they come to be praised as the means of peaceable, sociable, and comfortable living, place them in a mediocrity of passions (as if not the cause, but the degree of daring, made fortitude; or not the cause, but the quantity of a gift, made liberality).

[41] These dictates of reason men use to call by the name of laws, but improperly; for they are but conclusions or theorems concerning what conduceth to the conservation and defence of themselves, whereas law, properly, is the word of him that by right hath command over others. But yet if we consider the same theorems, as delivered in the word of God, that by right commandeth all things; then are they properly called laws.

Part Two
OF COMMONWEALTH
CHAPTER XVII

Of the Causes, Generation, and Definition of a *Commonwealth*

[1] The final cause, end, or design of men (who naturally love liberty and dominion over others) in the introduction of that restraint upon themselves in which we see them live in commonwealths is the foresight of their own preservation, and of a more contented life thereby; that is to say, of getting themselves out from that miserable condition of war, which is necessarily consequent (as hath been shown [ch. xiii]) to the natural passions of men, when there is no visible power to keep them in awe, and tie them by fear of punishment to the performance of their covenants and observation of those laws of nature set down in the fourteenth and fifteenth chapters.

[2] For the laws of nature (as *justice, equity, modesty, mercy*, and (in sum) *doing to others as we would be done to*) of themselves, without the terror of some power to cause them to be observed, are contrary to our natural passions, that carry us to partiality, pride, revenge, and the like. And covenants without the sword are but words, and of no strength to secure a man at all. Therefore notwithstanding the laws of nature (which every one hath then kept, when he has the will to keep them, when he can do it safely), if there be no power erected, or not great enough for our security, every man will, and may lawfully rely on his own strength and art, for caution against all other men. And in all places where men have lived by small families, to rob and spoil one another has been a trade, and so far from being reputed against the law of nature that the greater spoils they gained, the greater was their honour; and men observed no other laws therein but the laws of honour, that is, to abstain from cruelty, leaving to men their lives and instruments of husbandry. And as small families did then, so now do cities and kingdoms (which are but greater families) for their own security enlarge their dominions upon all pretences of danger and fear of invasion or assistance that may be given to invaders, [and] endeavour as much as they can to subdue or weaken their neighbours, by open force and secret arts for want of other caution, justly (and are remembered for it in after ages with honour).

[3] Nor is it the joining together of a small number of men that gives them this security; because in small numbers, small additions on the one side or the other make the advantage of strength so great as is sufficient to carry the victory; and therefore gives encouragement to an invasion. The multitude sufficient to confide in for our security is not determined by any certain number, but by comparison with the enemy we fear, and is then sufficient, when the odds of the enemy is not of so visible and conspicuous moment, to determine the event of war, as to move him to attempt.

[4] And be there never so great a multitude, yet if their actions be directed according to their particular judgments and particular appetites, they can expect thereby no defence, nor protection, neither against a common enemy, nor against the injuries of one another. For being distracted in opinions concerning the best use and application of their strength, they do not help, but hinder one another, and reduce their strength by mutual opposition to nothing; whereby they are easily, not only subdued by a very few that agree together, but also when there is no common enemy, they make war upon each other, for their particular interests. For if we could suppose a great multitude of men to consent in the observation of justice and other laws of nature without a common power to keep them all in awe, we might as well suppose all mankind to do the same; and then there neither would be, nor need to be, any civil government or commonwealth at all, because there would be peace without subjection.

[5] Nor is it enough for the security, which men desire should last all the time of their life, that they be governed and directed by one judgment for a limited time, as in one battle or one war. For though they obtain a victory by their unanimous endeavour against a foreign enemy, yet afterwards, when either they have no common enemy, or he that by one part is held for an enemy is by another part held for a friend, they must needs by the difference of their interests dissolve, and fall again into a war amongst themselves.

[6] It is true that certain living creatures (as bees and ants) live sociably one with another (which are therefore by *Aristotle* numbered amongst political creatures), and yet have no other direction than their particular judgments and appetites, nor speech whereby one of them can signify to another what he thinks expedient for the common benefit; and therefore some man may perhaps desire to know why mankind cannot do the same. To which I answer,

[7] First, that men are continually in competition for honour and dignity, which these creatures are not; and consequently, amongst men there ariseth, on that ground, envy and hatred, and finally war; but amongst these not so.

[8] Secondly, that amongst these creatures the common good differeth not from the private; and being by nature inclined to their private, they procure thereby the common benefit. But man, whose joy consisteth in comparing himself with other men, can relish nothing but what is eminent.

[9] Thirdly, that these creatures (having not, as man, the use of reason) do not see, nor think they see, any fault in the administration of their common business; whereas amongst men there are very many that think themselves wiser, and abler to govern the public, better than the rest; and these strive to reform and innovate, one this way, another that way; and thereby bring it into distraction and civil war.

[10] Fourthly, that these creatures, though they have some use of voice (in making known to one another their desires and other affections), yet they want that art of words by which some men can represent to others that which is good in the likeness of evil, and evil in the likeness of good, and augment or diminish the apparent greatness of good and evil, discontenting men, and troubling their peace at their pleasure.

[11] Fifthly, irrational creatures cannot distinguish between *injury* and *damage*; and therefore, as long as they be at ease, they are not offended with their fellows, whereas man is then most troublesome, when he is most at ease; for then it is that he loves to shew his wisdom, and control the actions of them that govern the commonwealth.

[12] Lastly, the agreement of these creatures is natural; that of men is by covenant only, which is artificial; and therefore, it is no wonder if there be somewhat else required (besides covenant) to make their agreement constant and lasting, which is a common power to keep them in awe, and to direct their actions to the common benefit.

[13] The only way to erect such a common power as may be able to defend them from the invasion of foreigners and the injuries of one another, and thereby to secure them in such sort as that by their own industry, and by the fruits of the earth, they may nourish themselves and live contentedly, is to confer all their power and strength upon one man, or upon one assembly of men, that may reduce all their wills, by plurality of voices, unto one will, which is as much as to say, to appoint one man or assembly of men to bear their person, and every one to own and acknowledge himself to be author of whatsoever he that so beareth their person shall act, or cause to be acted, in those things which concern the common peace and safety, and therein to submit their wills, every one to his will, and their judgments, to his judgment. This is more than consent, or concord; it is a real unity of them all, in one and the same person, made by covenant of every man with every man, in such manner as if every man should say to every man *I authorize and give up my right of governing myself to this man, or to this assembly of men, on this condition, that thou give up thy right to him, and authorize all his actions in like manner*. This done, the multitude so united in one person is called a COMMONWEALTH, in Latin CIVITAS. This is the generation of that great LEVIATHAN, or rather (to speak more reverently) of that *Mortal God* to which we owe, under the *Immortal God*, our peace and defence. For by this authority, given him by every particular man in the commonwealth, he hath the use of so much power and strength conferred on him that by terror thereof he is enabled to conform the wills of them all to peace at home and mutual aid against their enemies abroad. And in him consisteth the essence of the commonwealth, which (to define it) is *one person, of whose acts a great multitude, by mutual covenants one with another, have made themselves every one the author, to the end he may use the strength and means of them all, as he shall think expedient, for their peace and common defence*.

[14] And he that carrieth this person is called SOVEREIGN, and said to have *Sovereign Power*; and every one besides, his SUBJECT.

1. [The leviathan was a biblical sea monster. — S.M.C.]

2. [The term “schoolmen” was applied to medieval theologians and philosophers, often with a connotation of pedantry.]

3. [Marcus Tullius Cicero (106–43 B.C.) was a Roman philosopher.]

4. [Merit by coincidence and merit deserved.]

5. [Edward Coke (1552–1634) was an eminent English jurist who defended common law against encroachments by the crown. Thomas Littleton (c. 1442–1481), an English barrister and judge, wrote a work on property law that, in an edition expanded by Coke, was the standard text on the subject until the nineteenth century.]

Baruch Spinoza

Baruch Spinoza (1632–1677) was born in Amsterdam, his parents Jewish refugees from the Spanish Inquisition. Educated in the traditional religious studies of his people, he absorbed a profound knowledge of the Bible and Hebrew, later mastering Latin, the language in which he wrote.

Spinoza not only kept abreast of the scientific and philosophical developments of his own time but, as a result of his dissatisfaction with anthropomorphism and mysticism, also studied the works of the important Jewish medieval philosophers who had grappled with these issues—men such as Maimonides (1138–1204), Gersonides (1288–1344), and Crescas (1340–1410). When questioned by a tribunal of his congregation, Spinoza was unwilling to disavow his heterodox theological opinions. Subsequently, the Jewish community of Holland, not at that time entitled to citizenship and fearful of reprisals for permitting such heresies, excommunicated him at the age of twenty-four. For the next four years he stayed in Amsterdam, pursuing his studies while earning a living grinding and polishing lenses. He then moved to the small village of Rijnsburg, near Leyden, and later to Voorburg, outside The Hague, continuing his lonely life as a scholar and lens-grinder. He was offered a chair of philosophy at the University of Heidelberg but refused it, fearful of losing his freedom of expression. He died at forty-four, the victim of tuberculosis, his frail constitution weakened by arduous labor as well as by the glass dust he had inhaled while practicing his vocation. He was regarded as a person of great courtesy, unusual modesty, and equanimity.

Only two books by Spinoza appeared during his lifetime: *Principles of Cartesian Philosophy*, an expository volume in geometrical form and the anonymously published *Theological-Political Treatise*. The latter is perhaps the earliest example of what two centuries later became known as “higher criticism,” the study of the Bible as a historical document open to rational interpretation. His posthumous works included an unfinished Hebrew grammar, intended to support his scientific approach to scriptural exegesis; the *Short Treatise on God, Man, and His Well-Being*, an early, partial draft of his philosophical system; the fragmentary *Treatise on the Emendation of the Intellect*, an introduction to his methodology; the incomplete *Political Treatise*, which stresses the value of individual liberty and religious toleration, as well as supporting democracy against the claims of monarchy and aristocracy; and his masterpiece, the *Ethics, Demonstrated in Geometrical Order*, one of the most majestic of all philosophical works.

Spinoza viewed the world as possessing an intelligible structure according to which every event was in principle comprehensible as a necessary part of the whole. The logical order of that whole was to be understood only “through itself” and was variously termed “substance,” “Nature,” or “God.” The geometrical format of the *Ethics* illustrates this central thesis, since the propositions, corollaries, and notes are all intended as deductions from the initial definitions and axioms, which are presented as self-explanatory.

Part I contains Spinoza’s detailed demonstration of the essence of God. In Part II he offers his solution to the traditional philosophical problem of the relation between mind and body, regarding these not, as Descartes had, as two separate substances, but rather as two aspects of the one Substance. The remainder of the *Ethics* (not reprinted here) contains Spinoza’s moral theory and his view of the ideal life. The terms “good” and “bad” are, according to Spinoza, merely words we use to express our own desires. In order to achieve salvation, we need to free ourselves from the bondage of these emotions and strive through reason to achieve knowledge of and identification with the order of the universe, thus coming to possess “the intellectual love of God” that is “blessedness.” By thus reinterpreting the concept of God and imparting spirituality to the study of nature, Spinoza fused his commitment to the scientific model of knowledge with the monotheistic vision of his religious heritage.

An illuminating biography is Steven Nadler, *Spinoza: A Life* (Cambridge: Cambridge University Press, 1999). Helpful overviews of Spinoza’s thought are Stuart Hampshire, *Spinoza* (Middlesex: Penguin Books, 1951) and Henry E. Allison, *Benedict de Spinoza: An Introduction*, Revised Edition (New Haven: Yale University Press, 1987). An incisive presentation of Spinoza’s philosophical perspective is Chapter 5 of John Herman Randall, Jr., *The Career of Philosophy: From the Middle Ages to the Enlightenment* (1962; rpt. New York: Columbia University Press, 1970). Also useful as a concise presentation of the major themes in Spinoza’s system is the essay by P. H. Nidditch in D. J. O’Connor, ed., *A Critical History of Western Philosophy* (Glencoe, Ill.: Free Press, 1964). Two detailed examinations of the *Ethics* are Jonathan Bennett, *A Study of*

Spinoza's "Ethics" (Indianapolis: Hackett Publishing Company, 1984) and Edwin Curley, *Behind the Geometrical Method: A Reading of Spinoza's "Ethics"* (Princeton: Princeton University Press, 1988). A detailed study of Spinoza's view of God is Richard Mason, *The God of Spinoza: A Philosophical Study* (Cambridge: Cambridge University Press, 1997). A useful collection of essays is Derk Pereboom, ed., *The Rationalists: Descartes, Spinoza, Leibniz* (Lanham, Md.: Rowman & Littlefield, 1999). An especially fine essay that penetrates to the heart of Spinoza's thought is the text of a lecture by Frederick J. F. Woodbridge, delivered at Columbia University in 1933 and reprinted in the edition of the *Ethics* edited by James Gutmann (New York: Hafner, 1957). The classic study of the *Ethics* from a historical point of view, exhibiting in immense detail its connections to the work of Aristotle, Descartes, and others, is Harry Austryn Wolfson, *The Philosophy of Spinoza* (1934; rpt. Cleveland: Meridian Books, 1958). A comprehensive guide to Spinoza's thought is Don Garrett, ed., *The Cambridge Companion to Spinoza* (Cambridge: Cambridge University Press, 1996).

Steven M. Cahn

*Ethics**

Part I CONCERNING GOD

DEFINITIONS

1. By that which is self-caused I mean that whose essence involves existence; or that whose nature can be conceived only as existing.
2. A thing is said to be finite in its own kind [*in suo genere finita*] when it can be limited by another thing of the same nature. For example, a body is said to be finite because we can always conceive of another body greater than it. So, too, a thought is limited by another thought. But body is not limited by thought, nor thought by body.
3. By substance I mean that which is in itself and is conceived through itself; that is, that the conception of which does not require the conception of another thing from which it has to be formed.
4. By attribute I mean that which the intellect perceives of substance as constituting its essence.
5. By mode I mean the affections of substance, that is, that which is in something else and is conceived through something else.
6. By God I mean an absolutely infinite being, that is, substance consisting of infinite attributes, each of which expresses eternal and infinite essence.

Explication

I say 'absolutely infinite,' not 'infinite in its kind.' For if a thing is only infinite in its kind, one may deny that it has infinite attributes. But if a thing is absolutely infinite, whatever expresses essence and does not involve any negation belongs to its essence.

7. That thing is said to be free [*liber*] which exists solely from the necessity of its own nature, and is determined to action by itself alone. A thing is said to be necessary [*necessarius*] or rather, constrained [*coactus*], if it is determined by another thing to exist and to act in a definite and determinate way.
8. By eternity I mean existence itself insofar as it is conceived as necessarily following solely from the definition of an eternal thing.

Explication

For such existence is conceived as an eternal truth, just as is the essence of the thing, and therefore cannot be explicated through duration or time, even if duration be conceived as without beginning and end.

AXIOMS

1. All things that are, are either in themselves or in something else.
2. That which cannot be conceived through another thing must be conceived through itself.
3. From a given determinate cause there necessarily follows an effect; on the other hand, if there be no determinate cause, it is impossible that an effect should follow.
4. The knowledge of an effect depends on, and involves, the knowledge of the cause.
5. Things which have nothing in common with each other cannot be understood through each other; that is, the conception of the one does not involve the conception of the other.
6. A true idea must agree with that of which it is the idea [*ideatum*].
7. If a thing can be conceived as not existing, its essence does not involve existence.

PROPOSITION 1

Substance is by nature prior to its affections.

Proof

This is evident from Defs. 3 and 5.

PROPOSITION 2

Two substances having different attributes have nothing in common.

Proof

This too is evident from Def. 3; for each substance must be in itself and be conceived through itself; that is, the conception of the one does not involve the conception of the other.

PROPOSITION 3

When things have nothing in common, one cannot be the cause of the other.

Proof

If things have nothing in common, then (Ax. 5) they cannot be understood through one another, and so (Ax. 4) one cannot be the cause of the other.

PROPOSITION 4

Two or more distinct things are distinguished from one another either by the difference of the attributes of the substances or by the difference of the affections of the substances.

Proof

All things that are, are either in themselves or in something else (Ax. 1); that is (Defs. 3 and 5), nothing exists external to the intellect except substances and their affections. Therefore, there can be nothing external to the intellect through which several things can be distinguished from one another except substances or (which is the same thing) (Def. 4) the attributes and the affections of substances.

PROPOSITION 5

In the universe there cannot be two or more substances of the same nature or attribute.

Proof

If there were several such distinct substances, they would have to be distinguished from one another either by a difference of attributes or by a difference of affections (Pr. 4). If they are distinguished only by a difference of attributes, then it will be granted that there cannot be more than one substance of the same attribute. But if they are distinguished by a difference of affections, then, since substance is by nature prior to its affections (Pr. 1), disregarding therefore its affections and considering substance in itself, that is (Def. 3 and Ax. 6) considering it truly, it cannot be conceived as distinguishable from another substance. That is (Pr. 4), there cannot be several such substances but only one.

PROPOSITION 6

One substance cannot be produced by another substance.

Proof

In the universe there cannot be two substances of the same attribute (Pr. 5), that is (Pr. 2), two substances

having something in common. And so (Pr. 3) one cannot be the cause of the other; that is, one cannot be produced by the other.

Corollary

Hence it follows that substance cannot be produced by anything else. For in the universe there exists nothing but substances and their affections, as is evident from Ax. 1 and Defs. 3 and 5. But, by Pr. 6, it cannot be produced by another substance. Therefore, substance cannot be produced by anything else whatsoever.

Another Proof

This can be proved even more readily by the absurdity of the contradictory. For if substance could be produced by something else, the knowledge of substance would have to depend on the knowledge of its cause (Ax. 4), and so (Def. 3) it would not be substance.

PROPOSITION 7

Existence belongs to the nature of substance.

Proof

Substance cannot be produced by anything else (Cor. Pr. 6) and is therefore self-caused [*causa sui*]; that is (Def. 1), its essence necessarily involves existence; that is, existence belongs to its nature.

PROPOSITION 8

Every substance is necessarily infinite.

Proof

There cannot be more than one substance having the same attribute (Pr. 5), and existence belongs to the nature of substance (Pr. 7). It must therefore exist either as finite or as infinite. But it cannot exist as finite, for (Def. 2) it would have to be limited by another substance of the same nature, and that substance also would have to exist (Pr. 7). And so there would exist two substances of the same attribute, which is absurd (Pr. 5). Therefore, it exists as infinite.

Scholium 1

Since in fact to be finite is in part a negation and to be infinite is the unqualified affirmation of the existence of some nature, it follows from Proposition 7 alone that every substance must be infinite.

Scholium 2

I do not doubt that for those who judge things confusedly and are not accustomed to know things through their primary causes it is difficult to grasp the proof of Proposition 7. Surely, this is because they neither distinguish between the modification of substances and substances themselves, nor do they know how things are produced. And so it comes about that they ascribe to substances a beginning which they see natural things as having; for those who do not know the true causes of things confuse everything. Without any hesitation they imagine trees as well as men talking and stones as well as men being formed from seeds; indeed, any forms whatsoever are imagined to change into any other forms. So too, those who confuse the divine nature with human nature easily ascribe to God human emotions, especially so long as they are ignorant of how the latter are produced in the mind. But if men were to attend to the nature of substance, they would not doubt at all the truth of Proposition 7; indeed, this Proposition would be an axiom to all and would be ranked among universally accepted truisms. For by substance they would understand that which is in itself and is conceived through itself; that is, that the knowledge of which does not require the knowledge of any other thing. By modifications they would understand that which is in another thing, and whose conception is formed from the thing in which they are. Therefore, in the case of nonexistent modifications we can have true ideas of them since their essence is included in something else, with the result that they can be conceived through that

something else, although they do not exist in actuality externally to the intellect. However, in the case of substances, because they are conceived only through themselves, their truth external to the intellect is only in themselves. So if someone were to say that he has a clear and distinct — that is, a true — idea of substance and that he nevertheless doubts whether such a substance exists, this would surely be just the same as if he were to declare that he has a true idea but nevertheless suspects that it may be false (as is obvious to anyone who gives his mind to it). Or if anyone asserts that substance is created, he at the same time asserts that a false idea has become true, than which nothing more absurd can be conceived. So it must necessarily be admitted that the existence of substance is as much an eternal truth as is its essence.

From here we can derive in another way that there cannot be but one [substance] of the same nature, and I think it worthwhile to set out the proof here. Now to do this in an orderly fashion I ask you to note:

1. The true definition of each thing involves and expresses nothing beyond the nature of the thing defined.
Hence it follows that —
2. No definition involves or expresses a fixed number of individuals, since it expresses nothing but the nature of the thing defined. For example, the definition of a triangle expresses nothing other than simply the nature of a triangle, and not a fixed number of triangles.
3. For each individual existent thing there must necessarily be a definite cause for its existence.
4. The cause for the existence of a thing must either be contained in the very nature and definition of the existent thing (in effect, existence belongs to its nature) or must have its being independently of the thing itself.

From these premises it follows that if a fixed number of individuals exist in Nature, there must necessarily be a cause why those individuals and not more or fewer exist. If, for example, in Nature twenty men were to exist (for the sake of greater clarity I suppose that they exist simultaneously and that no others existed in Nature before them), in order to account for the existence of these twenty men, it will not be enough for us to demonstrate the cause of human nature in general; it will furthermore be necessary to demonstrate the cause why not more or fewer than twenty men exist, since (Note 3) there must necessarily be a cause for the existence of each one. But this cause (Notes 2 and 3) cannot be contained in the nature of man, since the true definition of man does not involve the number twenty. So (Note 4) the cause of the existence of these twenty men, and consequently of each one, must necessarily be external to each one, and therefore we can reach the unqualified conclusion that whenever several individuals of a kind exist, there must necessarily be an external cause for their existence. Now since existence belongs to the nature of substance (as has already been shown in this Scholium) the definition of substance must involve necessary existence, and consequently the existence of substance must be concluded solely from its definition. But the existence of several substances cannot follow from the definition of substance (as I have already shown in Notes 2 and 3). Therefore, from the definition of substance it follows necessarily that there exists only one substance of the same nature, as was proposed.

PROPOSITION 9

The more reality or being a thing has, the more attributes it has.

Proof

This is evident from Definition 4.

PROPOSITION 10

Each attribute of one substance must be conceived through itself.

Proof

For an attribute is that which intellect perceives of substance as constituting its essence (Def. 4), and so (Def. 3) it must be conceived through itself.

Scholium

From this it is clear that although two attributes be conceived as really distinct, that is, one without the help of the other, still we cannot deduce therefrom that they constitute two entities, or two different substances. For it is in the nature of substance that each of its attributes be conceived through itself, since all the attributes it possesses have always been in it simultaneously, and one could not have been produced by another; but each expresses the reality or being of substance. So it is by no means absurd to ascribe more than one attribute to one substance. Indeed, nothing in Nature is clearer than that each entity must be conceived under some attribute, and the more reality or being it has, the more are its attributes which express necessity, or eternity, and infinity. Consequently, nothing can be clearer than this, too, that an absolutely infinite entity must necessarily be defined (Def. 6) as an entity consisting of infinite attributes, each of which expresses a definite essence, eternal and infinite. Now if anyone asks by what mark can we distinguish between different substances, let him read the following Propositions, which show that in Nature there exists only one substance, absolutely infinite. So this distinguishing mark would be sought in vain.

PROPOSITION 11

God, or substance consisting of infinite attributes, each of which expresses eternal and infinite essence, necessarily exists.

Proof

If you deny this, conceive, if you can, that God does not exist. Therefore (Ax. 7), his essence does not involve existence. But this is absurd (Pr. 7). Therefore, God necessarily exists.

Second Proof

For every thing a cause or reason must be assigned either for its existence or for its nonexistence. For example, if a triangle exists, there must be a reason, or cause, for its existence. If it does not exist, there must be a reason or cause which prevents it from existing, or which annuls its existence. Now this reason or cause must either be contained in the nature of the thing or be external to it. For example, the reason why a square circle does not exist is indicated by its very nature, in that it involves a contradiction. On the other hand, the reason for the existence of substance also follows from its nature alone, in that it involves existence (Pr. 7). But the reason for the existence or nonexistence of a circle or a triangle does not follow from their nature, but from the order of universal corporeal Nature. For it is from this latter that it necessarily follows that either the triangle necessarily exists at this moment or that its present existence is impossible. This is self-evident, and therefrom it follows that a thing necessarily exists if there is no reason or cause which prevents its existence. Therefore if there can be no reason or cause which prevents God from existing or which annuls his existence, we are bound to conclude that he necessarily exists. But if there were such a reason or cause, it would have to be either within God's nature or external to it; that is, it would have to be in another substance of another nature. For if it were of the same nature, by that very fact it would be granted that God exists. But a substance of another nature would have nothing in common with God (Pr. 2), and so could neither posit nor annul his existence. Since therefore there cannot be external to God's nature a reason or cause that would annul God's existence, then if indeed he does not exist, the reason or cause must necessarily be in God's nature, which would therefore involve a contradiction. But to affirm this of a Being absolutely infinite and in the highest degree perfect is absurd. Therefore neither in God nor external to God is there any cause or reason which would annul his existence. Therefore, God necessarily exists.

A Third Proof

To be able to not exist is weakness; on the other hand, to be able to exist is power, as is self-evident. So if what now necessarily exists is nothing but finite entities, then finite entities are more potent than an absolutely infinite Entity — which is absurd. Therefore either nothing exists, or an absolutely infinite Entity necessarily exists, too. But we do exist, either in ourselves or in something else which necessarily exists (Ax. 1 and Pr. 7). Therefore, an absolutely infinite Entity—that is (Def. 6), God — necessarily exists.

Scholium

In this last proof I decided to prove God's existence *a posteriori* so that the proof may be more easily perceived,

and not because God's existence does not follow *a priori* from this same basis. For since the ability to exist is power, it follows that the greater the degree of reality that belongs to the nature of a thing, the greater amount of energy it has for existence. So an absolutely infinite Entity or God will have from himself absolutely infinite power to exist, and therefore, exists absolutely.

But perhaps many will not readily find this proof convincing because they are used to considering only such things as derive from external causes. Of these things they observe that those which come quickly into being—that is, which readily exist—likewise readily perish, while things which they conceive as more complex they regard as more difficult to bring into being — that is, not so ready to exist. However, to free them from these misconceptions I do not need at this point to show what measure of truth there is in the saying, “Quickly come, quickly go,” neither need I raise the question whether or not everything is equally easy in respect of Nature as a whole. It is enough to note simply this, that I am not here speaking of things that come into being through external causes, but only of substances, which (Pr. 6) cannot be produced by any external cause. For whether they consist of many parts or few, things that are brought about by external causes owe whatever degree of perfection or reality they possess entirely to the power of the external cause, and so their existence has its origin solely in the perfection of the external cause, and not in their own perfection. On the other hand, whatever perfection substance possesses is due to no external cause; therefore its existence, too, must follow solely from its own nature, and is therefore nothing else but its essence. So perfection does not annul a thing's existence: on the contrary, it posits it; whereas imperfection annuls a thing's existence. So there is nothing of which we can be more certain than the existence of an absolutely infinite or perfect Entity; that is, God. For since his essence excludes all imperfection and involves absolute perfection, it thereby removes all reason for doubting his existence and affords the utmost certainty of it. This, I think, must be quite clear to all who give a modicum of attention to the matter.

PROPOSITION 12

No attribute of substance can be truly conceived from which it would follow that substance can be divided.

Proof

The parts into which substance thus conceived would be divided will either retain the nature of substance or they will not. In the first case each part will have to be infinite (Pr. 8) and self-caused (Pr. 6) and consist of a different attribute (Pr. 5); and so several substances could be formed from one substance, which is absurd (Pr. 6). Furthermore, the parts would have nothing in common with the whole (Pr. 2), and the whole could exist and be conceived without its parts (Def. 4 and Pr. 10), the absurdity of which none can doubt. But in the latter case in which the parts will not retain the nature of substance — then when the whole substance would have been divided into equal parts it would lose the nature of substance and would cease to be. This is absurd (Pr. 7).

PROPOSITION 13

Absolutely infinite substance is indivisible.

Proof

If it were divisible, the parts into which it would be divided will either retain the nature of absolutely infinite substance, or not. In the first case, there would therefore be several substances of the same nature, which is absurd (Pr. 5). In the second case, absolutely infinite substance can cease to be, which is also absurd (Pr. 11).

Corollary

From this it follows that no substance, and consequently no corporeal substance, insofar as it is substance, is divisible.

Scholium

The indivisibility of substance can be more easily understood merely from the fact that the nature of substance can be conceived only as infinite, and that a part of substance can mean only finite substance, which involves an obvious contradiction (Pr. 8).

PROPOSITION 14

There can be, or be conceived, no other substance but God.

Proof

Since God is an absolutely infinite being of whom no attribute expressing the essence of substance can be denied (Def. 6) and since he necessarily exists (Pr. 11), if there were any other substance but God, it would have to be explicated through some attribute of God, and so there would exist two substances with the same attribute, which is absurd (Pr. 5). So there can be no substance external to God, and consequently no such substance can be conceived. For if it could be conceived, it would have to be conceived necessarily as existing; but this is absurd (by the first part of this proof). Therefore, no substance can be or be conceived external to God.

Corollary 1

Hence it follows quite clearly that God is one: that is (Def. 6), in the universe there is only one substance, and this is absolutely infinite, as I have already indicated in Scholium Pr. 10.

Corollary 2

It follows that the thing extended and the thing thinking are either attributes of God or (Ax. 1) affections of the attributes of God.

PROPOSITION 15

Whatever is, is in God, and nothing can be or be conceived without God.

Proof

Apart from God no substance can be or be conceived (Pr. 14), that is (Def. 3), something which is in itself and is conceived through itself. Now modes (Def. 5) cannot be or be conceived without substance; therefore, they can be only in the divine nature and can be conceived only through the divine nature. But nothing exists except substance and modes (Ax. 1). Therefore, nothing can be or be conceived without God.

Scholium

Some imagine God in the likeness of man, consisting of mind and body, and subject to passions. But it is clear from what has already been proved how far they stray from the true knowledge of God. These I dismiss, for all who have given any consideration to the divine nature deny that God is corporeal. They find convincing proof of this in the fact that by body we understand some quantity having length, breadth, and depth, bounded by a definite shape; and nothing more absurd than this can be attributed to God, a being absolutely infinite.

At the same time, however, by other arguments which they try to prove their point, they show clearly that in their thinking corporeal or extended substance is set completely apart from the divine nature, and they assert that it is created by God. But they have no idea from what divine power it could have been created, which clearly shows that they don't know what they are saying. Now I have clearly proved — at any rate, in my judgment (Cor. Pr. 6 and Sch. 2 Pr. 8) — that no substance can be produced or created by anything else. Furthermore, in Proposition 14 we showed that apart from God no substance can be or be conceived, and hence we deduced that extended substance is one of God's infinite attributes.

However, for a fuller explanation I will refute my opponents' arguments, which all seem to come down to this. Firstly, they think that corporeal substance, insofar as it is substance, is made up of parts, and so they deny that it can be infinite, and consequently that it can pertain to God. This they illustrate with many examples, of which I will take one or two. They say that if corporeal substance is infinite, suppose it to be divided into two parts. Each of these parts will be either finite or infinite. If the former, then the infinite is made up of two finite parts, which is absurd. If the latter, then there is an infinite which is twice as great as another infinite, which is also absurd.

Again, if an infinite length is measured in feet, it will have to consist of an infinite number of feet; and if it is measured in inches, it will consist of an infinite number of inches. So one infinite number will be twelve times greater than another infinite number.

Lastly, if from one point in an infinite quantity two lines, AB and AC, be drawn of fixed and determinate length, and thereafter be produced to infinity, it is clear that the distance between B and C continues to increase and finally changes from a determinate distance to an indeterminate distance.

As these absurdities follow, they think, from supposing quantity to be infinite, they conclude that corporeal substance must be finite and consequently cannot pertain to God's essence.

The second argument is also drawn from God's consummate perfection. Since God, they say, is a supremely perfect being, he cannot be that which is acted upon. But corporeal substance, being divisible, can be acted upon. It therefore follows that corporeal substance does not pertain to God's essence.

These are the arguments I find put forward by writers who thereby seek to prove that corporeal substance is unworthy of the divine essence and cannot pertain to it. However, the student who looks carefully into these arguments will find that I have already replied to them, since they are all founded on the same supposition that material substance is composed of parts, and this I have already shown to be absurd (Pr. 12 and Cor. Pr. 13). Again, careful reflection will show that all those alleged absurdities (if indeed they are absurdities, which is not now under discussion) from which they seek to prove that extended substance is finite do not at all follow from the supposition that quantity is infinite, but that infinite quantity is measurable and is made up of finite parts. Therefore, from the resultant absurdities no other conclusion can be reached but that infinite quantity is not measurable and cannot be made up of finite parts. And this is exactly what we have already proved (Pr. 12). So the weapon they aimed at us is in fact turned against themselves. If therefore from this 'reductio ad absurdum' argument of theirs they still seek to deduce that extended substance must be finite, they are surely just like one who, having made the supposition that a circle has the properties of a square, deduces therefrom that a circle does not have a center from which all lines drawn to the circumference are equal. For corporeal substance, which can be conceived only as infinite, one, and indivisible (Prs. 8, 5, and 12), they conceive as made up of finite parts, multiplex, and divisible, so as to deduce that it is finite. In the same way others, too, having supposed that a line is composed of points, can find many arguments to prove that a line cannot be infinitely divided. Indeed, it is just as absurd to assert that corporeal substance is composed of bodies or parts as that a body is composed of surfaces, surfaces of lines, and lines of points. This must be admitted by all who know clear reason to be infallible, and particularly those who say that a vacuum cannot exist. For if corporeal substance could be so divided that its parts were distinct in reality, why could one part not be annihilated while the others remain joined together as before? And why should all the parts be so fitted together as to leave no vacuum? Surely, in the case of things which are in reality distinct from one another, one can exist without the other and remain in its original state. Since therefore there is no vacuum in Nature (of which [more] elsewhere) and all its parts must so harmonize that there is no vacuum, it also follows that the parts cannot be distinct in reality; that is, corporeal substance, insofar as it is substance, cannot be divided.

If I am now asked why we have this natural inclination to divide quantity, I reply that we conceive quantity in two ways, to wit, abstractly, or superficially—in other words, as represented in the imagination—or as substance, which we do only through the intellect. If therefore we consider quantity insofar as we represent it in the imagination—and this is what we more frequently and readily do—we find it to be finite, divisible, and made up of parts. But if we consider it intellectually and conceive it insofar as it is substance—and this is very difficult—then it will be found to be infinite, one, and indivisible, as we have already sufficiently proved. This will be quite clear to those who can distinguish between the imagination and the intellect, especially if this point also is stressed, that matter is everywhere the same, and there are no distinct parts in it except insofar as we conceive matter as modified in various ways. Then its parts are distinct, not really but only modally. For example, we conceive water to be divisible and to have separate parts insofar as it is water, but not insofar as it is material substance. In this latter respect it is not capable of separation or division. Furthermore, water, qua water, comes into existence and goes out of existence; but qua substance it does not come into existence nor go out of existence [*corrumpitur*].

I consider that in the above I have also replied to the second argument, since this too is based on the

supposition that matter, insofar as it is substance, is divisible and made up of parts. And even though this were not so, I do not know why matter should be unworthy of the divine nature, since (Pr. 14) there can be no substance external to God by which it can be acted upon. All things, I repeat, are in God, and all things that come to pass do so only through the laws of God's infinite nature and follow through the necessity of his essence (as I shall later show). Therefore, by no manner of reasoning can it be said that God is acted upon by anything else or that extended substance is unworthy of the divine nature, even though it be supposed divisible, as long as it is granted to be eternal and infinite.

But enough of this subject for the present.

PROPOSITION 16

From the necessity of the divine nature there must follow infinite things in infinite ways [modis], (that is, everything that can come within the scope of infinite intellect).

Proof

This proposition should be obvious to everyone who will but consider this point, that from the given definition of any one thing the intellect infers a number of properties which necessarily follow in fact from the definition (that is, from the very essence of the thing), and the more reality the definition of the thing expresses (that is, the more reality the essence of the thing defined involves), the greater the number of its properties. Now since divine nature possesses absolutely infinite attributes (Def. 6), of which each one also expresses infinite essence in its own kind, then there must necessarily follow from the necessity of the divine nature an infinity of things in infinite ways (that is, everything that can come within the scope of the infinite intellect).

Corollary 1: Hence it follows that God is the efficient cause of all things that can come within the scope of the infinite intellect.

Corollary 2: Secondly, it follows that God is the cause through himself, not however *per accidens*.

Corollary 3: Thirdly, it follows that God is absolutely the first cause.

PROPOSITION 17

God acts solely from the laws of his own nature, constrained by none.

Proof

We have just shown that an infinity of things follow, absolutely, solely from the necessity of divine nature, or — which is the same thing — solely from the laws of that same nature (Pr. 16); and we have proved (Pr. 15) that nothing can be or be conceived without God, but that everything is in God. Therefore, there can be nothing external to God by which he can be determined or constrained to act. Thus God acts solely from the laws of his own nature and is constrained by none.

Corollary 1

Hence it follows, firstly, that there is no cause, except the perfection of his nature, which either extrinsically or intrinsically moves God to act.

Corollary 2

It follows, secondly, that God alone is a free cause. For God alone exists solely from the necessity of his own nature (Pr. 11 and Cor. 1 Pr. 14) and acts solely from the necessity of his own nature (Pr. 17). So he alone is a free cause (Def. 7).

Scholium

Others take the view that God is a free cause because—so they think—he can bring it about that those things which we have said follow from his nature—that is, which are within his power—should not come about; that is, they should not be produced by him. But this is as much as to say that God can bring it about that it

should not follow from the nature of a triangle that its three angles are equal to two right angles, or that from a given cause the effect should not follow, which is absurd.

Furthermore, I shall show later on without the help of this proposition that neither intellect nor will pertain to the nature of God. I know indeed that there are many who think they can prove that intellect in the highest degree and free will belong to the nature of God; for they say they know of nothing more perfect which they may attribute to God than that which is the highest perfection in us. Again, although they conceive of God as having in actuality intellect in the highest degree, they yet do not believe he can bring about the existence of everything which in actuality he understands, for they think they would thereby be nullifying God's power. If, they say, he had created everything that is within his intellect, then he would not have been able to create anything more; and this they regard as inconsistent with God's omnipotence. So they have preferred to regard God as indifferent to everything and as creating nothing but what he has decided, by some absolute exercise of will, to create. However, I think I have shown quite clearly (Pr. 16) that from God's supreme power or infinite nature an infinity of things in infinite ways — that is, everything — has necessarily flowed or is always following from that same necessity, just as from the nature of a triangle it follows from eternity to eternity that its three angles are equal to two right angles. Therefore, God's omnipotence has from eternity been actual and will remain for eternity in the same actuality. In this way, I submit, God's omnipotence is established as being far more perfect. Indeed my opponents—let us speak frankly—seem to be denying God's omnipotence. For they are obliged to admit that God understands an infinite number of creatable things which nevertheless he can never create. If this were not so, that is, if he were to create all the things that he understands, he would exhaust his omnipotence, according to them, and render himself imperfect. Thus, to affirm God as perfect they are reduced to having to affirm at the same time that he cannot bring about everything that is within the bounds of his power. I cannot imagine anything more absurd than this, or more inconsistent with God's omnipotence.

Furthermore, I have something here to say about the intellect and will that is usually attributed to God. If intellect and will do indeed pertain to the eternal essence of God, one must understand in the case of both these attributes something very different from the meaning widely entertained. For the intellect and will that would constitute the essence of God would have to be vastly different from human intellect and will, and would have no point of agreement except the name. They could be no more alike than the celestial constellation of the Dog and the dog that barks. This I will prove as follows. If intellect does pertain to the divine nature, it cannot, like man's intellect, be posterior to (as most thinkers hold) or simultaneous with the objects of understanding, since God is prior in causality to all things (Cor. 1 Pr. 16). On the contrary, the truth and formal essence of things is what it is because it exists as such in the intellect of God as an object of thought. Therefore, God's intellect, insofar as it is conceived as constituting God's essence, is in actual fact the cause of things, in respect both of their essence and their existence. This seems to have been recognized also by those who have asserted that God's intellect, will, and power are one and the same. Since therefore God's intellect is the one and only cause of things, both of their essence and their existence, as we have shown, it must necessarily be different from them both in respect of essence and existence. For that which is caused differs from its cause precisely in what it has from its cause. For example, a man is the cause of the existence of another man, but not of the other's essence; for the essence is an eternal truth. So with regard to their essence the two men can be in full agreement, but they must differ with regard to existence; and for that reason if the existence of the one should cease, the existence of the other would not thereby cease. But if the essence of the one could be destroyed and rendered false, so too would the essence of the other. Therefore, a thing which is the cause of the essence and existence of some effect must differ from that effect both in respect of essence and existence. But God's intellect is the cause of the essence and existence of man's intellect. Therefore, God's intellect, insofar as it is conceived as constituting the divine essence, differs from man's intellect both in respect of essence and existence, and cannot agree with it in any respect other than name — which is what I sought to prove. In the matter of will, the proof is the same, as anyone can readily see.

PROPOSITION 18

God is the immanent, not the transitive, cause of all things.

Proof

All things that are, are in God, and must be conceived through God (Pr. 15), and so (Cor. 1 Pr. 16) God is the cause of the things that are in him, which is the first point. Further, there can be no substance external to God (Pr. 14); that is (Def. 3), a thing which is in itself external to God—which is the second point.

Therefore, God is the immanent, not the transitive, cause of all things.

PROPOSITION 19

God [is eternal], that is, all the attributes of God are eternal.

Proof

God is substance (Def. 6) which necessarily exists (Pr. 11); that is (Pr. 7), a thing to whose nature it pertains to exist, or—and this is the same thing—a thing from whose definition existence follows; and so (Def. 8) God is eternal. Further, by the attributes of God must be understood that which expresses the essence of the Divine substance (Def. 4), that is, that which pertains to substance. It is this, I say, which the attributes themselves must involve. But eternity pertains to the nature of substance (as I have shown in Pr. 7). Therefore, each of the attributes must involve eternity, and so they are all eternal.

Scholium

This proposition is also perfectly clear from the manner in which I proved the existence of God (Pr. 11). From this proof, I repeat, it is obvious that God's existence is, like his essence, an eternal truth. Again, I have also proved God's eternity in another way in Proposition 19 of my *Descartes's Principles of Philosophy*, and there is no need here to go over that ground again.

PROPOSITION 20

God's existence and his essence are one and the same.

Proof

God and all his attributes are eternal (Pr. 19); that is, each one of his attributes expresses existence (Def. 8). Therefore, the same attributes of God that explicate his eternal essence (Def. 4) at the same time explicate his eternal existence; that is, that which constitutes the essence of God at the same time constitutes his existence, and so his existence and his essence are one and the same.

Corollary 1

From this it follows, firstly, that God's existence, like his essence, is an eternal truth.

Corollary 2

It follows, secondly, that God is immutable; that is, all the attributes of God are immutable. For if they were to change in respect of existence, they would also have to change in respect of essence (Pr. 10); that is — and this is self-evident — they would have to become false instead of true, which is absurd.

PROPOSITION 21

All things that follow from the absolute nature of any attribute of God must have existed always, and as infinite; that is, through the said attribute they are eternal and infinite.

Proof

Suppose this proposition be denied and conceive, if you can, that something in some attribute of God, following from its absolute nature, is finite and has a determinate existence or duration; for example, the idea of God in Thought. Now Thought, being assumed to be an attribute of God, is necessarily infinite by its own nature (Pr. 11). However, insofar as it has the idea of God, it is being supposed as finite. Now (Def. 2) it cannot be conceived as finite unless it is determined through Thought itself. But it cannot be determined through Thought itself insofar as Thought constitutes the idea of God, for it is in that respect that Thought is supposed to be finite. Therefore, it is determined through Thought insofar as Thought does not constitute the idea of God, which Thought must nevertheless necessarily exist (Pr. 11). Therefore, there must be Thought

which does not constitute the idea of God, and so the idea of God does not follow necessarily from its nature insofar as it is absolute Thought. (For it is conceived as constituting and as not constituting the idea of God.) This is contrary to our hypothesis. Therefore, if the idea of God in Thought, or anything in some attribute of God (it does not matter what is selected, since the proof is universal), follows from the necessity of the absolute nature of the attribute, it must necessarily be infinite. That was our first point.

Furthermore, that which thus follows from the necessity of the nature of some attribute cannot have a determinate existence, or duration. If this be denied, suppose that there is in some attribute of God a thing following from the necessity of the nature of the attribute, for example, the idea of God in Thought, and suppose that this thing either did not exist at some time, or will cease to exist in the future. Now since Thought is assumed as an attribute of God, it must necessarily exist, and as immutable (Pr. 11 and Cor. 2 Pr. 20). Therefore, outside the bounds of the duration of the idea of God (for this idea is supposed at some time not to have existed, or will at some point cease to exist) Thought will have to exist without the idea of God. But this is contrary to the hypothesis, for it is supposed that when Thought is granted the idea of God necessarily follows. Therefore, the idea of God in Thought, or anything that necessarily follows from the absolute nature of some attribute of God, cannot have a determinate existence, but is eternal through that same attribute. That was our second point. Note that the same holds for anything in an attribute of God which necessarily follows from the absolute nature of God.

PROPOSITION 22

Whatever follows from some attribute of God, insofar as the attribute is modified by a modification that exists necessarily and as infinite through that same attribute, must also exist both necessarily and as infinite.

Proof

This proposition is proved in the same way as the preceding one.

PROPOSITION 23

Every mode which exists necessarily and as infinite must have necessarily followed either from the absolute nature of some attribute of God or from some attribute modified by a modification which exists necessarily and as infinite.

Proof

A mode is in something else through which it must be conceived (Def. 5); that is (Pr. 15), it is in God alone and can be conceived only through God. Therefore, if a mode is conceived to exist necessarily and to be infinite, both these characteristics must necessarily be inferred or perceived through some attribute of God insofar as that attribute is conceived to express infinity and necessity of existence, or (and by Def. 8 this is the same) eternity; that is (Def. 6 and Pr. 19), insofar as it is considered absolutely. Therefore, a mode which exists necessarily and as infinite must have followed from the absolute nature of some attribute of God, either directly (Pr. 21) or through the mediation of some modification which follows from the absolute nature of the attribute; that is (Pr. 22), which exists necessarily and as infinite.

PROPOSITION 24

The essence of things produced by God does not involve existence.

Proof

This is evident from Def. 1. For only that whose nature (considered in itself) involves existence is self-caused and exists solely from the necessity of its own nature.

Corollary

Hence it follows that God is the cause not only of the coming into existence of things but also of their continuing in existence, or, to use a scholastic term, God is the cause of the being of things [*essendi rerum*]. For whether things exist or do not exist, in reflecting on their essence we realize that this essence involves neither existence nor duration. So it is not their essence which can be the cause of either their existence or

their duration, but only God, to whose nature alone existence pertains (Cor. 1 Pr. 14).

PROPOSITION 25

God is the efficient cause not only of the existence of things but also of their essence.

Proof

If this is denied, then God is not the cause of the essence of things, and so (Ax. 4) the essence of things can be conceived without God. But this is absurd (Pr. 15). Therefore, God is also the cause of the essence of things.

Scholium

This proposition follows more clearly from Pr. 16; for from that proposition it follows that from the given divine nature both the essence and the existence of things must be inferred. In a word, in the same sense that God is said to be self-caused he must also be said to be the cause of all things. This will be even clearer from the following Corollary.

Corollary

Particular things are nothing but affections of the attributes of God, that is, modes wherein the attributes of God find expression in a definite and determinate way. The proof is obvious from Pr. 15 and Def. 5.

PROPOSITION 26

A thing which has been determined to act in a particular way has necessarily been so determined by God; and a thing which has not been determined by God cannot determine itself to act.

Proof

That by which things are said to be determined to act in a particular way must necessarily be something positive (as is obvious). So God, from the necessity of his nature, is the efficient cause both of its essence and its existence (Prs. 25 and 16) — which was the first point. From this the second point quite clearly follows as well. For if a thing which has not been determined by God could determine itself, the first part of this proposition would be false, which, as I have shown, is absurd.

PROPOSITION 27

A thing which has been determined by God to act in a particular way cannot render itself undetermined.

Proof

This proposition is evident from Axiom 3.

PROPOSITION 28

Every individual thing, i.e., anything whatever which is finite and has a determinate existence, cannot exist or be determined to act unless it be determined to exist and to act by another cause which is also finite and has a determinate existence, and this cause again cannot exist or be determined to act unless it be determined to exist and to act by another cause which is also finite and has a determinate existence, and so ad infinitum.

Proof

Whatever is determined to exist and to act has been so determined by God (Pr. 26 and Cor. Pr. 24). But that which is finite and has a determinate existence cannot have been produced by the absolute nature of one of God's attributes, for whatever follows from the absolute nature of one of God's attributes is infinite and eternal (Pr. 21). It must therefore have followed from God or one of his attributes insofar as that is considered as affected by some mode; for nothing exists but substance and its modes (Ax. 1 and Defs. 3 and 5), and modes (Cor. Pr. 25) are nothing but affections of God's attributes. But neither could a finite and determined

thing have followed from God or one of his attributes insofar as that is affected by a modification which is eternal and infinite (Pr. 22). Therefore, it must have followed, or been determined to exist and to act, by God or one of his attributes insofar as it was modified by a modification which is finite and has a determinate existence. That was the first point. Then again this cause or this mode (the reasoning is the same as in the first part of this proof) must also have been determined by another cause, which is also finite and has a determinate existence, and again this last (the reasoning is the same) by another, and so *ad infinitum*.

Scholium

Since some things must have been produced directly by God (those things, in fact, which necessarily follow from his absolute nature) and others through the medium of these primary things (which other things nevertheless cannot be or be conceived without God), it follows, firstly, that God is absolutely the proximate cause of things directly produced by him. I say 'absolutely' [*absolute*], and not 'in its own kind' [*suo genere*], as some say. For the effects of God can neither be nor be conceived without their cause (Pr. 15 and Cor. Pr. 24). It follows, secondly, that God cannot properly be said to be the remote cause of individual things, unless perchance for the purpose of distinguishing these things from things which he has produced directly, or rather, things which follow from his absolute nature. For by 'remote cause' we understand a cause which is in no way conjoined with its effect. But all things that are, are in God, and depend on God in such a way that they can neither be nor be conceived without him.

PROPOSITION 29

Nothing in nature is contingent, but all things are from the necessity of the divine nature determined to exist and to act in a definite way.

Proof

Whatever is, is in God (Pr. 15). But God cannot be termed a contingent thing, for (Pr. 11) he exists necessarily, not contingently. Again, the modes of the divine nature have also followed from it necessarily, not contingently (Pr. 16), and that, too, whether insofar as the divine nature is considered absolutely (Pr. 21) or insofar as it is considered as determined to act in a definite way (Pr. 27). Furthermore, God is the cause of these modes not only insofar as they simply exist (Cor. Pr. 24), but also insofar as they are considered as determined to a particular action (Pr. 26). Now if they are not determined by God (Pr. 26), it is an impossibility, not a contingency, that they should determine themselves. On the other hand (Pr. 27), if they are determined by God, it is an impossibility, not a contingency, that they should render themselves undetermined. Therefore, all things are determined from the necessity of the divine nature not only to exist but also to exist and to act in a definite way. Thus, there is no contingency.

Scholium

Before I go any further, I wish to explain at this point what we must understand by 'Natura naturans' and 'Natura naturata.' I should perhaps say not 'explain,' but 'remind the reader,' for I consider that it is already clear from what has gone before that by 'Natura naturans' we must understand that which is in itself and is conceived through itself; that is, the attributes of substance that express eternal and infinite essence; or (Cor. 1 Pr. 14 and Cor. 2 Pr. 17), God insofar as he is considered a free cause. By 'Natura naturata' I understand all that follows from the necessity of God's nature, that is, from the necessity of each one of God's attributes; or all the modes of God's attributes insofar as they are considered as things which are in God and can neither be nor be conceived without God.

PROPOSITION 30

The finite intellect in act or the infinite intellect in act must comprehend the attributes of God and the affections of God, and nothing else.

Proof

A true idea must agree with its object [*ideatum*] (Ax. 6); that is (as is self-evident), that which is contained in the intellect as an object of thought must necessarily exist in Nature. But in Nature (Cor. 1 Pr. 14) there is but

one substance — God — and no other affections (Pr. 15) than those which are in God and that can neither be nor be conceived (Pr. 15) without God. Therefore, the finite intellect in act or the infinite intellect in act must comprehend the attributes of God and the affections of God, and nothing else.

PROPOSITION 31

The intellect in act, whether it be finite or infinite, as also will, desire, love etc., must be related to Natura naturata, not to Natura naturans.

Proof

By intellect (as is self-evident) we do not understand absolute thought, but only a definite mode of thinking which differs from other modes such as desire, love, etc., and so (Def. 5) must be conceived through absolute thought—that is (Pr. 15 and Def. 6), an attribute of God which expresses the eternal and infinite essence of thought—in such a way that without this attribute it can neither be nor be conceived; and therefore (Sch. Pr. 29) it must be related to Natura naturata, not to Natura naturans, just like the other modes of thinking.

Scholium

The reason for my here speaking of the intellect in act is not that I grant there can be any intellect in potentiality, but that, wishing to avoid any confusion, I want to confine myself to what we perceive with the utmost clarity, to wit, the very act of understanding, than which nothing is more clearly apprehended by us. For we can understand nothing that does not lead to a more perfect cognition of the understanding.

PROPOSITION 32

Will cannot be called a free cause, but only a necessary cause.

Proof

Will, like intellect, is only a definite mode of thinking, and so (Pr. 28) no single volition can exist or be determined to act unless it is determined by another cause, and this cause again by another, and so *ad infinitum*. Now if will be supposed infinite, it must also be determined to exist and to act by God, not insofar as he is absolutely infinite substance, but insofar as he possesses an attribute which expresses the infinite and eternal essence of Thought (Pr. 23). Therefore, in whatever way will is conceived, whether finite or infinite, it requires a cause by which it is determined to exist and to act; and so (Def. 7) it cannot be said to be a free cause, but only a necessary or constrained cause.

Corollary 1

Hence it follows, firstly, that God does not act from freedom of will.

Corollary 2

It follows, secondly, that will and intellect bear the same relationship to God's nature as motion-and-rest and, absolutely, as all natural phenomena that must be determined by God (Pr. 29) to exist and to act in a definite way. For will, like all the rest, stands in need of a cause by which it may be determined to exist and to act in a definite manner. And although from a given will or intellect infinite things may follow, God cannot on that account be said to act from freedom of will any more than he can be said to act from freedom of motion-and-rest because of what follows from motion-and-rest (for from this, too, infinite things follow). Therefore, will pertains to God's nature no more than do other natural phenomena. It bears the same relationship to God's nature as does motion-and-rest and everything else that we have shown to follow from the necessity of the divine nature and to be determined by that divine nature to exist and to act in a definite way.

PROPOSITION 33

Things could not have been produced by God in any other way or in any other order than is the case.

Proof

All things have necessarily followed from the nature of God (Pr. 16) and have been determined to exist and to act in a definite way from the necessity of God's nature (Pr. 29). Therefore, if things could have been of a different nature or been determined to act in a different way so that the order of Nature would have been different, then God's nature, too, could have been other than it now is, and therefore (Pr. 11) this different nature, too, would have had to exist, and consequently there would have been two or more Gods, which (Cor. 1 Pr. 14) is absurd. Therefore, things could not have been produced by God in any other way or in any other order than is the case.

Scholium 1

Since I have here shown more clearly than the midday sun that in things there is absolutely nothing by virtue of which they can be said to be 'contingent,' I now wish to explain briefly what we should understand by 'contingent'; but I must first deal with 'necessary' and 'impossible.' A thing is termed 'necessary' either by reason of its essence or by reason of its cause. For a thing's existence necessarily follows either from its essence and definition or from a given efficient cause. Again, it is for these same reasons that a thing is termed 'impossible' — that is, either because its essence or definition involves a contradiction or because there is no external cause determined to bring it into existence. But a thing is termed 'contingent' for no other reason than the deficiency of our knowledge. For if we do not know whether the essence of a thing involves a contradiction, or if, knowing full well that its essence does not involve a contradiction, we still cannot make any certain judgment as to its existence because the chain of causes is hidden from us, then that thing cannot appear to us either as necessary or as impossible. So we term it either 'contingent' or 'possible.'

Scholium 2

It clearly follows from the above that things have been brought into being by God with supreme perfection, since they have necessarily followed from a most perfect nature. Nor does this imply any imperfection in God, for it is his perfection that has constrained us to make this affirmation. Indeed, from its contrary it would clearly follow (as I have just shown) that God is not supremely perfect, because if things had been brought into being in a different way by God, we should have to attribute to God another nature different from that which consideration of a most perfect Being has made us attribute to him.

However, I doubt not that many will ridicule this view as absurd and will not give their minds to its examination, and for this reason alone, that they are in the habit of attributing to God another kind of freedom very different from that which we (Def. 7) have assigned to him, that is, an absolute will. Yet I do not doubt that if they were willing to think the matter over and carefully reflect on our chain of proofs they would in the end reject the kind of freedom which they now attribute to God not only as nonsensical but as a serious obstacle to science. It is needless for me here to repeat what was said in the Scholium to Proposition 17. Yet for their sake I shall proceed to show that, even if it were to be granted that will pertains to the essence of God, it would nevertheless follow from his perfection that things could not have been created by God in any other way or in any other order. This will readily be shown if we first consider — as they themselves grant — that on God's decree and will alone does it depend that each thing is what it is. For otherwise God would not be the cause of all things. Further, there is the fact that all God's decrees have been sanctioned by God from eternity, for otherwise he could be accused of imperfection and inconstancy. But since the eternal does not admit of 'when' or 'before' or 'after,' it follows merely from God's perfection that God can never decree otherwise nor ever could have decreed otherwise; in other words, God could not have been prior to his decrees nor can he be without them. "But," they will say, "granted the supposition that God had made a different universe, or that from eternity he had made a different decree concerning Nature and her order, no imperfection in God would follow therefrom." But if they say this, they will be granting at the same time that God can change his decrees. For if God's decrees had been different from what in fact he has decreed regarding Nature and her order—that is, if he had willed and conceived differently concerning Nature—he would necessarily have had a different intellect and a different will from that which he now has. And if it is permissible to attribute to God a different intellect and a different will without any change in his essence and perfection, why should he not now be able to change his decrees concerning created things, and nevertheless remain equally perfect? For his intellect and will regarding created things and their order have the same relation to his essence and perfection, in whatever manner it be conceived.

Then again, all philosophers whom I have read grant that in God there is no intellect in potentiality but

only intellect in act. Now since all of them also grant that his intellect and will are not distinct from his essence, it therefore follows from this, too, that if God had had a different intellect in act and a different will, his essence too would necessarily have been different. Therefore—as I deduced from the beginning—if things had been brought into being by God so as to be different from what they now are, God’s intellect and will — that is (as is granted), God’s essence—must have been different, which is absurd. Therefore, since things could not have been brought into being by God in any other way or order—and it follows from God’s supreme perfection that this is true—surely we can have no sound reason for believing that God did not wish to create all the things that are in his intellect through that very same perfection whereby he understands them.

“But,” they will say, “there is in things no perfection or imperfection; that which is in them whereby they are perfect or imperfect, and are called good or bad, depends only on the will of God. Accordingly, if God had so willed it he could have brought it about that that which is now perfection should be utmost imperfection, and vice versa.” But what else is this but an open assertion that God, who necessarily understands that which he wills, can by his will bring it about that he should understand things in a way different from the way he understands them—and this, as I have just shown, is utterly absurd. So I can turn their own argument against them, as follows. All things depend on the power of God. For things to be able to be otherwise than as they are, God’s will, too, would necessarily have to be different. But God’s will cannot be different (as we have just shown most clearly from the consideration of God’s perfection). Therefore, neither can things be different.

I admit that this view which subjects everything to some kind of indifferent will of God and asserts that everything depends on his pleasure diverges less from the truth than the view of those who hold that God does everything with the good in mind. For these people seem to posit something external to God that does not depend upon him, to which in acting God looks as if it were a model, or to which he aims, as if it were a fixed target. This is surely to subject God to fate; and no more absurd assertion can be made about God, whom we have shown to be the first and the only free cause of both the essence and the existence of things. So I need not spend any more time in refuting this absurdity.

PROPOSITION 34

God’s power is his very essence.

Proof

From the sole necessity of God’s essence it follows that God is self-caused (Pr. 11) and the cause of all things (Pr. 16 and Cor.). Therefore, God’s power, whereby he and all things are and act, is his very essence.

PROPOSITION 35

Whatever we conceive to be within God’s power necessarily exists.

Proof

Whatever is within God’s power must be so comprehended in his essence (Pr. 34) that it follows necessarily from it, and thus necessarily exists.

PROPOSITION 36

Nothing exists from whose nature an effect does not follow.

Proof

Whatever exists expresses God’s nature or essence in a definite and determinate way (Cor. Pr. 25); that is (Pr. 34), whatever exists expresses God’s power, which is the cause of all things, in a definite and determinate way, and so (Pr. 16) some effect must follow from it.

APPENDIX

I have now explained the nature and properties of God: that he necessarily exists, that he is one alone, that he is and acts solely from the necessity of his own nature, that he is the free cause of all things and how so, that

all things are in God and are so dependent on him that they can neither be nor be conceived without him, and lastly, that all things have been predetermined by God, not from his free will or absolute pleasure, but from the absolute nature of God, his infinite power. Furthermore, whenever the opportunity arose I have striven to remove prejudices that might hinder the apprehension of my proofs. But since there still remain a considerable number of prejudices, which have been, and still are, an obstacle — indeed, a very great obstacle — to the acceptance of the concatenation of things in the manner which I have expounded, I have thought it proper at this point to bring these prejudices before the bar of reason.

Now all the prejudices which I intend to mention here turn on this one point, the widespread belief among men that all things in Nature are like themselves in acting with an end in view. Indeed, they hold it as certain that God himself directs everything to a fixed end; for they say that God has made everything for man's sake and has made man so that he should worship God. So this is the first point I shall consider, seeking the reason why most people are victims of this prejudice and why all are so naturally disposed to accept it. Secondly, I shall demonstrate its falsity; and lastly I shall show how it has been the source of misconceptions about good and bad, right and wrong, praise and blame, order and confusion, beauty and ugliness, and the like.

However, it is not appropriate here to demonstrate the origin of these misconceptions from the nature of the human mind. It will suffice at this point if I take as my basis what must be universally admitted, that all men are born ignorant of the causes of things, that they all have a desire to seek their own advantage, a desire of which they are conscious. From this it follows, firstly, that men believe that they are free, precisely because they are conscious of their volitions and desires; yet concerning the causes that have determined them to desire and will they do not think, not even dream about, because they are ignorant of them. Secondly, men act always with an end in view, to wit, the advantage that they seek. Hence it happens that they are always looking only for the final causes of things done, and are satisfied when they find them, having, of course, no reason for further doubt. But if they fail to discover them from some external source, they have no recourse but to turn to themselves, and to reflect on what ends would normally determine them to similar actions, and so they necessarily judge other minds by their own. Further, since they find within themselves and outside themselves a considerable number of means very convenient for the pursuit of their own advantage—as, for instance, eyes for seeing, teeth for chewing, cereals and living creatures for food, the sun for giving light, the sea for breeding fish — the result is that they look on all the things of Nature as means to their own advantage. And realizing that these were found, not produced by them, they come to believe that there is someone else who produced these means for their use. For looking on things as means, they could not believe them to be self-created, but on the analogy of the means which they are accustomed to produce for themselves, they were bound to conclude that there was some governor or governors of Nature, endowed with human freedom, who have attended to all their needs and made everything for their use. And having no information on the subject, they also had to estimate the character of these rulers by their own, and so they asserted that the gods direct everything for man's use so that they may bind men to them and be held in the highest honor by them. So it came about that every individual devised different methods of worshipping God as he thought fit in order that God should love him beyond others and direct the whole of Nature so as to serve his blind cupidity and insatiable greed. Thus it was that this misconception developed into superstition and became deep-rooted in the minds of men, and it was for this reason that every man strove most earnestly to understand and to explain the final causes of all things. But in seeking to show that Nature does nothing in vain — that is, nothing that is not to man's advantage — they seem to have shown only this, that Nature and the gods are as crazy as mankind.

Consider, I pray, what has been the upshot. Among so many of Nature's blessings they were bound to discover quite a number of disasters, such as storms, earthquakes, diseases, and so forth, and they maintained that these occurred because the gods were angry at the wrongs done to them by men, or the faults committed in the course of their worship. And although daily experience cried out against this and showed by any number of examples that blessings and disasters befall the godly and the ungodly alike without discrimination, they did not on that account abandon their ingrained prejudice. For they found it easier to regard this fact as one among other mysteries they could not understand and thus maintain their innate condition of ignorance rather than to demolish in its entirety the theory they had constructed and devise a new one. Hence they made it axiomatic that the judgment of the gods is far beyond man's understanding. Indeed, it is for this reason, and this reason only, that truth might have evaded mankind forever had not Mathematics, which is concerned not with ends but only with the essences and properties of figures, revealed to men a different standard of truth. And there are other causes too—there is no need to mention them here—which could have made men aware of these widespread misconceptions and brought them to a true knowledge of things.

I have thus sufficiently dealt with my first point. There is no need to spend time in going on to show that Nature has no fixed goal and that all final causes are but figments of the human imagination. For I think that this is now quite evident, both from the basic causes from which I have traced the origin of this misconception and from Proposition 16 and the Corollaries to Proposition 32, and in addition from the whole set of proofs I have adduced to show that all things in Nature proceed from all eternal necessity and with supreme perfection. But I will make this additional point, that this doctrine of Final Causes turns Nature completely upside down, for it regards as an effect that which is in fact a cause, and vice versa. Again, it makes that which is by nature first to be last; and finally, that which is highest and most perfect is held to be the most imperfect. Omitting the first two points as self-evident, Propositions 21, 22, and 23 make it clear that that effect is most perfect which is directly produced by God, and an effect is the less perfect in proportion to the number of intermediary causes required for its production. But if the things produced directly by God were brought about to enable him to attain an end, then of necessity the last things for the sake of which the earlier things were brought about would excel all others. Again, this doctrine negates God's perfection; for if God acts with an end in view, he must necessarily be seeking something that he lacks. And although theologians and metaphysicians may draw a distinction between a purpose arising from want and an assimilative purpose, they still admit that God has acted in all things for the sake of himself, and not for the sake of the things to be created. For prior to creation they are not able to point to anything but God as a purpose for God's action. Thus they have to admit that God lacked and desired those things for the procurement of which he willed to create the means—as is self-evident.

I must not fail to mention here that the advocates of this doctrine, eager to display their talent in assigning purpose to things, have introduced a new style of argument to prove their doctrine, i.e., a reduction, not to the impossible, but to ignorance, thus revealing the lack of any other argument in its favor. For example, if a stone falls from the roof on somebody's head and kills him, by this method of arguing they will prove that the stone fell in order to kill the man; for if it had not fallen for this purpose by the will of God, how could so many circumstances (and there are often many coinciding circumstances) have chanced to concur? Perhaps you will reply that the event occurred because the wind was blowing and the man was walking that way. But they will persist in asking why the wind blew at that time and why the man was walking that way at that very time. If you again reply that the wind sprang up at that time because on the previous day the sea had begun to toss after a period of calm and that the man had been invited by a friend, they will again persist — for there is no end to questions —“But why did the sea toss, and why was the man invited for that time?” And so they will go on and on asking the causes of causes, until you take refuge in the will of God—that is, the sanctuary of ignorance. Similarly, when they consider the structure of the human body, they are astonished, and being ignorant of the causes of such skillful work they conclude that it is fashioned not by mechanical art but by divine or supernatural art, and is so arranged that no one part shall injure another.

As a result, he who seeks the true causes of miracles and is eager to understand the works of Nature as a scholar, and not just to gape at them like a fool, is universally considered an impious heretic and denounced by those to whom the common people bow down as interpreters of Nature and the gods. For these people know that the dispelling of ignorance would entail the disappearance of that astonishment, which is the one and only support for their argument and for safeguarding their authority. But I will leave this subject and proceed to the third point that I proposed to deal with.

When men become convinced that everything that is created is created on their behalf, they were bound to consider as the most important quality in every individual thing that which was most useful to them, and to regard as of the highest excellence all those things by which they were most benefited. Hence they came to form these abstract notions to explain the natures of things: Good, Bad, Order, Confusion, Hot, Cold, Beauty, Ugliness; and since they believe that they are free, the following abstract notions came into being: Praise, Blame, Right, Wrong. The latter I shall deal with later on after I have treated of human nature; at this point I shall briefly explain the former.

All that conduces to well being and to the worship of God they call Good, and the contrary, Bad. And since those who do not understand the nature of things, but only imagine things, make no affirmative judgments about things themselves and mistake their imagination for intellect, they are firmly convinced that there is order in things, ignorant as they are of things and of their own nature. For when things are in such arrangement that, being presented to us through our senses, we can readily picture them and thus readily remember them, we say that they are well arranged; if the contrary, we say that they are ill arranged, or confused. And since those things we can readily picture we find pleasing compared with other things, men prefer order to confusion, as though order were something in Nature other than what is relative to our imagination. And they say that God has created all things in an orderly way, without realizing that they are

thus attributing human imagination to God—unless perchance they mean that God, out of consideration for the human imagination, arranged all things in the way that men could most easily imagine. And perhaps they will find no obstacle in the fact that there are any number of things that far surpass our imagination, and a considerable number that confuse the imagination because of its weakness.

But I have devoted enough time to this. Other notions, too, are nothing but modes of imagining whereby the imagination is affected in various ways, and yet the ignorant consider them as important attributes of things because they believe — as I have said — that all things were made on their behalf, and they call a thing's nature good or bad, healthy or rotten and corrupt, according to its effect on them. For instance, if the motion communicated to our nervous system by objects presented through our eyes is conducive to our feeling of well being, the objects which are its cause are said to be beautiful, while the objects which provoke a contrary motion are called ugly. Those things that we sense through the nose are called fragrant or fetid; through the tongue, sweet or bitter, tasty or tasteless; those that we sense by touch are called hard or soft, rough or smooth, and so on. Finally, those that we sense through our ears are said to give forth noise, sound, or harmony, the last of which has driven men to such madness that they used to believe that even God delights in harmony. There are philosophers who have convinced themselves that the motions of the heavens give rise to harmony. All this goes to show that everyone's judgment is a function of the disposition of his brain, or rather, that he mistakes for reality the way his imagination is affected. Hence it is no wonder — as we should note in passing— that we find so many controversies arising among men, resulting finally in skepticism. For although human bodies agree in many respects, there are very many differences, and so one man thinks good what another thinks bad; what to one man is well ordered, to another is confused; what to one is pleasing, to another is displeasing, and so forth. I say no more here because this is not the place to treat at length of this subject, and also because all are well acquainted with it from experience. Everybody knows those sayings: "So many heads, so many opinions," "everyone is wise in his own sight," "brains differ as much as palates," all of which show clearly that men's judgment is a function of the disposition of the brain, and they are guided by imagination rather than intellect. For if men understood things, all that I have put forward would be found, if not attractive, at any rate convincing, as Mathematics attests.

We see therefore that all the notions whereby the common people are wont to explain Nature are merely modes of imagining, and denote not the nature of any thing but only the constitution of the imagination. And because these notions have names as if they were the names of entities existing independently of the imagination I call them 'entities of imagination' [*entia imaginationis*] rather than 'entities of reason' [*entia rationis*]. So all arguments drawn from such notions against me can be easily refuted. For many are wont to argue on the following lines: If everything has followed from the necessity of God's most perfect nature, why does Nature display so many imperfections, such as rottenness to the point of putridity, nauseating ugliness, confusion, evil, sin, and so on? But, as I have just pointed out, they are easily refuted. For the perfection of things should be measured solely from their own nature and power; nor are things more or less perfect to the extent that they please or offend human senses, serve or oppose human interests. As to those who ask why God did not create men in such a way that they should be governed solely by reason, I make only this reply, that he lacked not material for creating all things from the highest to the lowest degree of perfection; or, to speak more accurately, the laws of his nature were so comprehensive as to suffice for the production of everything that can be conceived by an infinite intellect, as I proved in Proposition 16.

These are the misconceptions which I undertook to deal with at this point. Any other misconception of this kind can be corrected by everyone with a little reflection.

Part II

OF THE NATURE AND ORIGIN OF THE MIND

I now pass on to the explication of those things that must necessarily have followed from the essence of God, the eternal and infinite Being; not indeed all of them—for we proved in Proposition 16 Part I that from his essence there must follow infinite things in infinite ways — but only those things that can lead us as it were by the hand to the knowledge of the human mind and its utmost blessedness.

DEFINITIONS

1. By 'body' I understand a mode that expresses in a definite and determinate way God's essence insofar as he is considered as an extended thing. (See Cor. Pr. 25, I.)
2. I say that there pertains to the essence of a thing that which, when granted, the thing is necessarily posited, and by the annulling of which the thing is necessarily annulled; or that without which the thing can neither be nor be conceived, and, vice versa, that which cannot be or be conceived without the thing.
3. By idea I understand a conception of the Mind which the Mind forms because it is a thinking thing.

Explication

I say 'conception' rather than 'perception' because the term perception seems to indicate that the Mind is passive to its object, whereas conception seems to express an activity of the Mind.

4. By an adequate idea I mean an idea which, insofar as it is considered in itself without relation to its object, has all the properties — that is, intrinsic characteristics — of a true idea [*ideatum*].

Explication

I say 'intrinsic' so as to exclude the extrinsic characteristic— to wit, the agreement of the idea with that of which it is an idea.

5. Duration is the indefinite continuance of existing.

Explication

I say 'indefinite' because it can in no wise be determined through the nature of the existing thing, nor again by the thing's efficient cause which necessarily posits, but does not annul, the existence of the thing.

6. By reality and perfection I mean the same thing.
7. By individual things [*res singulares*] I mean things that are finite and have a determinate existence. If several individual things concur in one act in such a way as to be all together the simultaneous cause of one effect, I consider them all, in that respect, as one individual.

AXIOMS

1. The essence of man does not involve necessary existence; that is, from the order of Nature it is equally possible that a certain man exists or does not exist.
2. Man thinks.
3. Modes of thinking such as love, desire, or whatever emotions are designated by name, do not occur unless there is in the same individual the idea of the thing loved, desired, etc. But the idea can be without any other mode of thinking.
4. We feel a certain body to be affected in many ways.

5. We do not feel or perceive any individual things except bodies and modes of thinking. [N.B.: For Postulates, see after Proposition 13.]

PROPOSITION 1

Thought is an attribute of God; i.e., God is a thinking thing.

Proof

Individual thoughts, or this and that thought, are modes expressing the nature of God in a definite and determinate way (Cor. Pr. 25, I). Therefore there belongs to God (Def. 5, I) an attribute the conception of which is involved in all individual thoughts, and through which they are conceived. Thought, therefore, is one of God's infinite attributes, expressing the eternal and infinite essence of God (Def. 6, I); that is, God is a thinking thing.

Scholium

This Proposition is also evident from the fact that we can conceive of an infinite thinking being. For the more things a thinking being can think, the more reality or perfection we conceive it to have. Therefore a being that can think infinite things in infinite ways is by virtue of its thinking necessarily infinite. Since therefore by merely considering Thought we conceive an infinite being, Thought is necessarily one of the infinite attributes of God (Defs. 4 and 6, I), as we set out to prove.

PROPOSITION 2

Extension is an attribute of God; i.e., God is an extended thing.

Proof

This Proposition is proved in the same way as the preceding proposition.

PROPOSITION 3

In God there is necessarily the idea both of his essence and of everything that necessarily follows from his essence.

Proof

For God can (Pr. 1, II) think infinite things in infinite ways, or (what is the same thing, by Pr. 16, I) can form the idea of his own essence and of everything that necessarily follows from it. But all that is in God's power necessarily exists (Pr. 35, I). Therefore such an idea necessarily exists, and only in God (Pr. 15, I).

Scholium

By God's power the common people understand free will and God's right over all things that are, which things are therefore commonly considered as contingent. They say that God has power to destroy everything and bring it to nothing. Furthermore, they frequently compare God's power with that of kings. But this doctrine we have refuted in Cors. 1 and 2, Pr. 32, I; and in Pr. 16, I, we proved that God acts by the same necessity whereby he understands himself; that is, just as it follows from the necessity of the divine nature (as is universally agreed) that God understands himself, by that same necessity it also follows that God acts infinitely in infinite ways. Again, we showed in Pr. 34, I that God's power is nothing but God's essence in action, and so it is as impossible for us to conceive that God does not act as that God does not exist. Furthermore, if one wished to pursue the matter, I could easily show here that the power that common people assign to God is not only a human power (which shows that they conceive God as a man or like a man) but also involves negation of power. But I am reluctant to hold forth so often on the same subject. I merely request the reader most earnestly to reflect again and again on what we said on this subject in Part I from Proposition 16 to the end. For nobody will rightly apprehend what I am trying to say unless he takes great care not to confuse God's power with a king's human power or right.

PROPOSITION 4

The idea of God, from which infinite things follow in infinite ways, must be one, and one only.

Proof

Infinite intellect comprehends nothing but the attributes of God and his affections (Pr. 30, I). But God is one, and one only (Cor. 1 Pr. 14, I). Therefore the idea of God, from which infinite things follow in infinite ways, must be one, and one only.

PROPOSITION 5

The formal being of ideas recognizes God as its cause only insofar as he is considered as a thinking thing, and not insofar as he is explicated by any other attribute; that is, the ideas both of God's attributes and of individual things recognize as their efficient cause not the things of which they are ideas, — that is, the things perceived, — but God himself insofar as he is a thinking thing.

Proof

This is evident from Pr. 3, II. For there our conclusion that God can form the idea of his own essence and of everything that necessarily follows therefrom was inferred solely from God's being a thinking thing, and not from his being the object of his own idea. Therefore the formal being of ideas recognizes God as its cause insofar as he is a thinking thing. But there is another proof, as follows. The formal being of ideas is a mode of thinking (as is self-evident); that is (Cor. Pr. 25, I), a mode which expresses in a definite manner the nature of God insofar as he is a thinking thing, and so does not involve (Pr. 10, I) the conception of any other attribute of God. Consequently (Ax. 4, I), it is the effect of no other attribute but Thought; and so the formal being of ideas recognizes God as its cause only insofar as he is considered as a thinking thing.

PROPOSITION 6

The modes of any attribute have God for their cause only insofar as he is considered under that attribute, and not insofar as he is considered under any other attribute.

Proof

Each attribute is conceived through itself independently of any other (Pr. 10, I). Therefore the modes of any attribute involve the conception of their own attribute, and not that of any other. Therefore they have God for their cause only insofar as he is considered under the attribute of which they are modes, and not insofar as he is considered under any other attribute (Ax. 4, I).

Corollary

Hence it follows that the formal being of things that are not modes of thinking does not follow from the nature of God by reason of his first having known them; rather, the objects of ideas follow and are inferred from their own attributes in the same way and by the same necessity as we have shown ideas to follow from the attribute of Thought.

PROPOSITION 7

The order and connection of ideas is the same as the order and connection of things.

Proof

This is evident from Ax. 4, I; for the idea of what is caused depends on the knowledge of the cause of which it is the effect.

Corollary

Hence it follows that God's power of thinking is coextensive with his actualized power of acting. That is,

whatever follows formally from the infinite nature of God, all this follows from the idea of God as an object of thought in God according to the same order and connection.

Scholium

At this point, before proceeding further, we should recall to mind what I have demonstrated above — that whatever can be perceived by infinite intellect as constituting the essence of substance pertains entirely to the one sole substance. Consequently, thinking substance and extended substance are one and the same substance, comprehended now under this attribute, now under that. So, too, a mode of Extension and the idea of that mode are one and the same thing, expressed in two ways. This truth seems to have been glimpsed by some of the Hebrews,¹ who hold that God, God's intellect, and the things understood by God are one and the same. For example, a circle existing in Nature and the idea of the existing circle — which is also in God—are one and the same thing, explicated through different attributes. And so, whether we conceive Nature under the attribute of Extension or under the attribute of Thought or under any other attribute, we find one and the same order, or one and the same connection of causes—that is, the same things following one another. When I said that God is the cause, e.g., of the idea of a circle only insofar as he is a thinking thing, and of a circle only insofar as he is an extended thing, my reason was simply this, that the formal being of the idea of a circle can be perceived only through another mode of thinking as its proximate cause, and that mode through another, and so *ad infinitum*, with the result that as long as things are considered as modes of thought, we must explicate the order of the whole of Nature, or the connection of causes, through the attribute of Thought alone; and insofar as things are considered as modes of Extension, again the order of the whole of Nature must be explicated through the attribute of Extension only. The same applies to other attributes. Therefore God, insofar as he consists of infinite attributes, is in fact the cause of things as they are in themselves. For the present, I cannot give a clearer explanation.

PROPOSITION 8

The ideas of nonexistent individual things or modes must be comprehended in the infinite idea of God in the same way as the formal essences of individual things or modes are contained in the attributes of God.

Proof

This proposition is obvious from the preceding one, but may be understood more clearly from the preceding Scholium.

Corollary

Hence it follows that as long as individual things do not exist except insofar as they are comprehended in the attributes of God, their being as objects of thought—that is, their ideas—do not exist except insofar as the infinite idea of God exists; and when individual things are said to exist not only insofar as they are comprehended in the attributes of God but also insofar as they are said to have duration, their ideas also will involve the existence through which they are said to have duration.

Scholium

Should anyone want an example for a clearer understanding of this matter, I can think of none at all that would adequately explicate the point with which I am here dealing, for it has no parallel. Still, I shall try to illustrate it as best I can. The nature of a circle is such that the rectangles formed from the segments of its intersecting chords are equal. Hence an infinite number of equal rectangles are contained in a circle, but none of them can be said to exist except insofar as the circle exists, nor again can the idea of any one of these rectangles be said to exist except insofar as it is comprehended in the idea of the circle. Now of this infinite number of intersecting chords let two, E and D, exist. Now indeed their ideas also exist not only insofar as they are merely comprehended in the idea of the circle but also insofar as they involve the existence of those rectangles, with the result that they are distinguished from the other ideas of the other rectangles.

PROPOSITION 9

The idea of an individual thing existing in actuality has God for its cause not insofar as he is infinite but insofar as he is considered as affected by another idea of a thing existing in actuality, of which God is the cause insofar as he is affected by a third idea, and so ad infinitum.

Proof

The idea of an individual actually existing thing is an individual mode of thinking distinct from other modes (Cor. and Sch. Pr. 8, II), and so (Pr. 6, II) it has God as its cause only insofar as he is a thinking thing. But not (Pr. 28, I) insofar as he is a thinking thing absolutely, but insofar as he is considered as affected by another definite mode of thinking. And of this latter God is also the cause insofar as he is affected by another definite mode of thinking, and so *ad infinitum*. But the order and connection of ideas is the same as the order and connection of causes (Pr. 7, II). Therefore an individual idea is caused by another idea; i.e., God insofar as he is considered as affected by another idea. And this last idea is caused by God, insofar as he is affected by yet another idea, and so *ad infinitum*.

Corollary

Whatsoever happens in the individual object of any idea, knowledge of it is in God only insofar as he has the idea of that object.

Proof

Whatsoever happens in the object of any idea, the idea of it is in God (Pr. 3, II) not insofar as he is infinite, but insofar as he is considered as affected by another idea of an individual thing (preceding Pr.). But the order and connection of ideas is the same as the order and connection of things (Pr. 7, II). Therefore the knowledge of what happens in an individual object is in God only insofar as he has the idea of that object.

PROPOSITION 10

The being of substance does not pertain to the essence of man; i.e., substance does not constitute the form [forma] of man.

Proof

The being of substance involves necessary existence (Pr. 7, I). So if the being of substance pertained to the essence of man, man would necessarily be granted together with the granting of substance (Def. 2, II), and consequently man would necessarily exist, which is absurd (Ax. 1, II). Therefore ... etc.

Scholium

This Proposition is also proved from Pr. 5, I, which states that there cannot be two substances of the same nature. Now since many men can exist, that which constitutes the form of man is not the being of substance. This Proposition is furthermore evident from the other properties of substance — that substance is by its own nature infinite, immutable, indivisible, etc., as everyone can easily see.

Corollary

Hence it follows that the essence of man is constituted by definite modifications of the attributes of God.

Proof

For the being of substance does not pertain to the essence of man (preceding Pr.), which must therefore (Pr. 15, I) be something that is in God, and which can neither be nor be conceived without God; i.e., an affection or mode (Cor. Pr. 25, I) which expresses the nature of God in a definite and determinate way.

Scholium

All must surely admit that nothing can be or be conceived without God. For all are agreed that God is the sole cause of all things, both of their essence and their existence; that is, God is the cause of things not only in respect of their coming into being [*secundum fieri*], as they say, but also in respect of their being. But at the same time many assert that that without which a thing can neither be nor be conceived pertains to the essence of the thing, and so they believe that either the nature of God pertains to the essence of created things or that created things can either be or be conceived without God; or else, more probably, they hold no consistent opinion. I think that the reason for this is their failure to observe the proper order of philosophical enquiry. For the divine nature, which they should have considered before all else— it being prior both in cognition and in Nature — they have taken to be last in the order of cognition, and the things that are called objects of sense they have taken as prior to everything. Hence it has come about that in considering natural phenomena, they have completely disregarded the divine nature. And when thereafter they turned to the contemplation of the divine nature, they could find no place in their thinking for those fictions on which they had built their natural science, since these fictions were of no avail in attaining knowledge of the divine nature. So it is little wonder that they have contradicted themselves on all sides.

But I pass over these points, for my present purpose is restricted to explaining why I have not said that that without which a thing can neither be nor be perceived pertains to the essence of the thing. My reason is that individual things can neither be nor be conceived without God, and yet God does not pertain to their essence. But I did say that that necessarily constitutes the essence of a thing which, when posited, posits the thing, and by the annulling of which the thing is annulled; i.e., that without which the thing can neither be nor be conceived, and vice versa, that which can neither be nor be conceived without the thing.

PROPOSITION 11

That which constitutes the actual being of the human mind is basically nothing else but the idea of an individual actually existing thing.

Proof

The essence of man (Cor. Pr. 10, II) is constituted by definite modes of the attributes of God, to wit (Ax. 2, II), modes of thinking. Of all these modes the idea is prior in nature (Ax. 3, II), and when the idea is granted, the other modes—modes to which the idea is prior by nature—must be in the same individual (Ax. 3, II). And so the idea is that which basically constitutes the being of the human mind. But not the idea of a nonexistent thing; for then (Cor. Pr. 8, II) the idea itself could not be said to exist. Therefore, it is the idea of an actually existing thing. But not the idea of an infinite thing, for an infinite thing (Prs. 21 and 22, I) must always necessarily exist, and this is absurd (Ax. 1, II). Therefore that which first constitutes the actual being of the human mind is the idea of an individual actually existing thing.

Corollary

Hence it follows that the human mind is part of the infinite intellect of God; and therefore when we say that the human mind perceives this or that, we are saying nothing else but this: that God — not insofar as he is infinite but insofar as he is explicated through the nature of the human mind, that is, insofar as he constitutes the essence of the human mind — has this or that idea. And when we say that God has this or that idea not only insofar as he constitutes the essence of the human mind but also insofar as he has the idea of another thing simultaneously with the human mind, then we are saying that the human mind perceives a thing partially or inadequately.

Scholium

At this point our readers will no doubt find themselves in some difficulty and will think of many things that

will give them pause. So I ask them to proceed slowly step by step with me, and to postpone judgment until they have read to the end.

PROPOSITION 12

Whatever happens in the object of the idea constituting the human mind is bound to be perceived by the human mind; i.e., the idea of that thing will necessarily be in the human mind. That is to say, if the object of the idea constituting the human mind is a body, nothing can happen in that body without its being perceived by the mind.

Proof

Whatever happens in the object of any idea, knowledge thereof is necessarily in God (Cor. Pr. 9, II) insofar as he is considered as affected by the idea of that object; that is, (Pr. 11, II) insofar as he constitutes the mind of some thing. So whatever happens in the object of the idea constituting the human mind, knowledge thereof is necessarily in God insofar as he constitutes the nature of the human mind; that is (Cor. Pr. 11, II), knowledge of that thing is necessarily in the mind; i.e., the mind perceives it.

Scholium

This Proposition is also obvious, and is more clearly understood from Sch. Pr. 7, II, q.v.

PROPOSITION 13

The object of the idea constituting the human mind is the body — i.e., a definite mode of extension actually existing, and nothing else.

Proof

If the body were not the object of the human mind, the ideas of the affections of the body would not be in God (Cor. Pr. 9, II) insofar as he constitutes our mind, but insofar as he constitutes the mind of another thing; that is, (Cor. Pr. 11, II) the ideas of the affections of the body would not be in our mind. But (Ax. 4, II) we do have ideas of the affections of a body. Therefore the object of the idea constituting the human mind is a body, a body actually existing (Pr. 11, II). Again, if there were another object of the mind apart from the body, since nothing exists from which some effect does not follow (Pr. 36, I), there would necessarily have to be in our mind the idea of some effect of it (Pr. 12, II). But (Ax. 5, II) there is no such idea. Therefore the object of our mind is an existing body, and nothing else.

Corollary

Hence it follows that man consists of mind and body, and the human body exists according as we sense it.

Scholium

From the above we understand not only that the human Mind is united to the Body but also what is to be understood by the union of Mind and Body. But nobody can understand this union adequately or distinctly unless he first gains adequate knowledge of the nature of our body. For what we have so far demonstrated is of quite general application, and applies to men no more than to other individuals, which are all animate, albeit in different degrees. For there is necessarily in God an idea of each thing whatever, of which idea God is the cause in the same way as he is the cause of the idea of the human body. And so whatever we have asserted of the idea of the human body must necessarily be asserted of the idea of each thing. Yet we cannot deny, too, that ideas differ among themselves as do their objects, and that one is more excellent and contains more reality than another, just as the object of one idea is more excellent than that of another and contains more reality. Therefore, in order to determine the difference between the human mind and others and in what way it surpasses them, we have to know the nature of its object, (as we have said); that is, the nature of the human body. Now I cannot here explain this nature, nor is it essential for the points that I intend to demonstrate. But I will make this general assertion, that in proportion as a body is more apt than other bodies to act or be acted upon simultaneously in many ways, so is its mind more apt than other minds to perceive many things simultaneously; and in proportion as the actions of one body depend on itself alone and the less that other

bodies concur with it in its actions, the more apt is its mind to understand distinctly. From this we can realise the superiority of one mind over others, and we can furthermore see why we have only a very confused knowledge of our body, and many other facts which I shall deduce from this basis in what follows. Therefore I have thought it worthwhile to explicate and demonstrate these things more carefully. To this end there must be a brief preface concerning the nature of bodies.

Axiom 1

All bodies are either in motion or at rest.

Axiom 2

Each single body can move at varying speeds.

Lemma 1

Bodies are distinguished from one another in respect of motion and rest, quickness and slowness, and not in respect of substance.

Proof

The first part of this Lemma I take to be self-evident. As to bodies not being distinguished in respect of substance, this is evident from both Pr. 5 and Pr. 8, Part I, and still more clearly from Sch. Pr. 15, Part I.

Lemma 2

All bodies agree in certain respects.

Proof

All bodies agree in this, that they involve the conception of one and the same attribute (Def. 1, II), and also in that they may move at varying speeds, and may be absolutely in motion or absolutely at rest.

Lemma 3

A body in motion or at rest must have been determined to motion or rest by another body, which likewise has been determined to motion or rest by another body, and that body by another, and so *ad infinitum*.

Proof

Bodies are individual things (Def. 1, II) which are distinguished from one another in respect of motion and rest (Lemma 1), and so (Pr. 28, I) each body must have been determined to motion or rest by another individual thing, namely, another body (Pr. 6, II), which is also in motion or at rest (Ax. 1). But this body again — by the same reasoning — could not have been in motion or at rest unless it had been determined to motion or rest by another body, and this body again—by the same reasoning—by another body, and so on, *ad infinitum*.

Corollary

Hence it follows that a body in motion will continue to move until it is determined to rest by another body, and a body at rest continues to be at rest until it is determined to move by another body. This, too, is self-evident; for when I suppose, for example, that a body A is at rest and I give no consideration to other moving bodies, I can assert nothing about body A but that it is at rest. Now if it should thereafter happen that body A is in motion, this surely could not have resulted from the fact that it was at rest; for from that fact nothing else could have followed than that body A should be at rest. If on the other hand A were supposed to be in motion, as long as we consider only A, we can affirm nothing of it but that it is in motion. If it should thereafter happen that A should be at rest, this surely could not have resulted from its previous motion; for from its motion nothing else could have followed but that A was in motion. So this comes about from a thing

that was not in A, namely, an external cause by which the moving body A was determined to rest.

Axiom 1

All the ways in which a body is affected by another body follow from the nature of the affected body together with the nature of the body affecting it, so that one and the same body may move in various ways in accordance with the various natures of the bodies causing its motion; and, on the other hand, different bodies may be caused to move in different ways by one and the same body.

Axiom 2

When a moving body collides with a body at rest and is unable to cause it to move, it is reflected so as to continue its motion, and the angle between the line of motion of the reflection and the plane of the body at rest with which it has collided is equal to the angle between the line of incidence of motion and the said plane.

So far we have been discussing the simplest bodies, those which are distinguished from one another solely by motion and rest, quickness and slowness. Now let us advance to composite bodies.

Definition

When a number of bodies of the same or different magnitude form close contact with one another through the pressure of other bodies upon them, or if they are moving at the same or different rates of speed so as to preserve an unvarying relation of movement among themselves, these bodies are said to be united with one another and all together to form one body or individual thing, which is distinguished from other things through this union of bodies.

Axiom 3

The degree of difficulty with which the parts of an individual thing or composite body can be made to change their position and consequently the degree of difficulty with which the individual takes on different shapes, is proportional to the extent of the surface areas along which they are in close contact. Hence bodies whose parts maintain close contact along large areas of their surfaces I term hard; those whose parts maintain contact along small surface areas I term soft; while those whose parts are in a state of motion among themselves I term liquid.

Lemma 4

If from a body, or an individual thing composed of a number of bodies, certain bodies are separated, and at the same time a like number of other bodies of the same nature take their place, the individual thing will retain its nature as before, without any change in its form [*forma*].

Proof

Bodies are not distinguished in respect of substance (Lemma 1). That which constitutes the form of the individual thing consists in a union of bodies (preceding definition). But this union, by hypothesis, is retained in spite of the continuous change of component bodies. Therefore the individual thing will retain its own nature as before, both in respect of substance and of mode.

Lemma 5

If the parts of an individual thing become greater or smaller, but so proportionately that they all preserve the same mutual relation of motion-and-rest as before, the individual thing will likewise retain its own nature as before without any change in its form.

Proof

The reasoning is the same as in the preceding Lemma.

Lemma 6

If certain bodies composing an individual thing are made to change the existing direction of their motion, but in such a way that they can continue their motion and keep the same mutual relation as before, the individual thing will likewise preserve its own nature without any change of form.

Proof

This is self-evident; for, by hypothesis, the individual thing retains all that we, in defining it, asserted as constituting its form.

Lemma 7

Furthermore, the individual thing so composed retains its own nature, whether as a whole it is moving or at rest, and in whatever direction it moves, provided that each constituent part retains its own motion and continues to communicate this motion to the other parts.

Proof

This is evident from its definition, which you will find preceding Lemma 4.

Scholium

We thus see how a composite individual can be affected in many ways and yet preserve its nature. Now hitherto we have conceived an individual thing composed solely of bodies distinguished from one another only by motion-and-rest and speed of movement; that is, an individual thing composed of the simplest bodies. If we now conceive another individual thing composed of several individual things of different natures, we shall find that this can be affected in many other ways while still preserving its nature. For since each one of its parts is composed of several bodies, each single part can therefore (preceding Lemma), without any change in its nature, move with varying degrees of speed and consequently communicate its own motion to other parts with varying degrees of speed. Now if we go on to conceive a third kind of individual things composed of this second kind, we shall find that it can be affected in many other ways without any change in its form. If we thus continue to infinity, we shall readily conceive the whole of Nature as one individual whose parts — that is, all the constituent bodies — vary in infinite ways without any change in the individual as a whole.

If my intention had been to write a full treatise on body, I should have had to expand my explications and demonstrations. But I have already declared a different intention, and the only reason for my dealing with this subject is that I may readily deduce therefrom what I have set out to prove.

POSTULATES

1. The human body is composed of very many individual parts of different natures, each of which is extremely complex.
2. Of the individual components of the human body, some are liquid, some are soft, and some are hard.
3. The individual components of the human body, and consequently the human body itself, are affected by external bodies in a great many ways.
4. The human body needs for its preservation a great many other bodies, by which, as it were [*quasi*], it is continually regenerated.
5. When a liquid part of the human body is determined by an external body to impinge frequently on another part which is soft, it changes the surface of that part and impresses on it certain traces of the external body acting upon it.

6. The human body can move external bodies and dispose them in a great many ways.

PROPOSITION 14

The human mind is capable of perceiving a great many things, and this capacity will vary in proportion to the variety of states which its body can assume.

Proof

The human body (Posts. 3 and 6) is affected by external bodies in a great many ways and is so structured that it can affect external bodies in a great many ways. But the human mind must perceive all that happens in the human body (Pr. 12, II). Therefore the human mind is capable of perceiving very many things, and ... etc.

PROPOSITION 15

The idea which constitutes the formal being of the human mind is not simple, but composed of very many ideas.

Proof

The idea which constitutes the formal being of the human mind is the idea of the body (Pr. 13, II), which is composed of a great number of very composite individual parts (Postulate 1). But in God there is necessarily the idea of every individual component part (Cor. Pr. 8, II). Therefore (Pr. 7, II) the idea of the human body is composed of these many ideas of the component parts.

PROPOSITION 16

The idea of any mode wherein the human body is affected by external bodies must involve the nature of the human body together with the nature of the external body.

Proof

All the modes wherein a body is affected follow from the nature of the body affected together with the nature of the affecting body (Ax. 1 after Cor. Lemma 3). Therefore the idea of these modes will necessarily involve the nature of both bodies (Ax. 4, I). So the idea of any mode wherein the human body is affected by an external body involves the nature of the human body and the external body.

Corollary 1

Hence it follows that the human mind perceives the nature of very many bodies along with the nature of its own body.

Corollary 2

Secondly, the ideas that we have of external bodies indicate the constitution of our own body more than the nature of external bodies. This I have explained with many examples in Appendix, Part I.

PROPOSITION 17

If the human body is affected in a way [modo] that involves the nature of some external body, the human mind will regard that same external body as actually existing, or as present to itself, until the human body undergoes a further modification which excludes the existence or presence of the said body.

Proof

This is evident; for as long as the human body is thus affected, so long will the human mind (Pr. 12, II) regard this affection of the body; that is (by the preceding Proposition), so long will it have the idea of a mode existing in actuality, an idea involving the nature of an external body; that is, an idea which does not exclude but posits the existence or presence of the nature of the external body. So the mind (Cor. 1 of the preceding Proposition) will regard the external body as actually existing, or as present, until ... etc.

Corollary

The mind is able to regard as present external bodies by which the human body has been once affected, even if they do not exist and are not present.

Proof

When external bodies so determine the fluid parts of the human body that these frequently impinge on the softer parts, they change the surfaces of these softer parts (Post. 5). Hence it comes about (Ax. 2 after Cor. Lemma 3) that the fluid parts are reflected therefrom in a manner different from what was previously the case; and thereafter, again coming into contact with the said changed surfaces in the course of their own spontaneous motion, they are reflected in the same way as when they were impelled towards those surfaces by external bodies. Consequently, in continuing this reflected motion they affect the human body in the same manner, which manner will again be the object of thought in the mind (Pr. 12, II); that is (Pr. 17, II), the mind will again regard the external body as present. This will be repeated whenever the fluid parts of the human body come into contact with those same surfaces in the course of their own spontaneous motion. Therefore, although the external bodies by which the human body has once been affected may no longer exist, the mind will regard them as present whenever this activity of the body is repeated.

Scholium

So we see how it can come about that we regard as present things which are not so, as often happens. Now it is possible that there are other causes for this fact, but it is enough for me at this point to have indicated one cause through which I can explicate the matter just as if I had demonstrated it through its true cause. Yet I do not think that I am far from the truth, since all the postulates that I have assumed contain scarcely anything inconsistent with experience; and after demonstrating that the human body exists just as we sense it (Cor. Pr. 13, II), we may not doubt experience.

In addition (preceding Cor. and Cor. 2 Pr. 16, II), this gives a clear understanding of the difference between the idea, e.g., of Peter which constitutes the essence of Peter's mind, and on the other hand the idea of Peter which is in another man, say Paul. The former directly explicates the essence of Peter's body, and does not involve existence except as long as Peter exists. The latter indicates the constitution of Paul's body rather than the nature of Peter; and so, while that constitution of Paul's body continues to be, Paul's mind will regard Peter as present to him although Peter may not be in existence. Further, to retain the usual terminology, we will assign the word 'images' [*imagines*] to those affections of the human body the ideas of which set forth external bodies as if they were present to us, although they do not represent shapes. And when the mind regards bodies in this way, we shall say that it 'imagines' [*imaginari*].

At this point, to begin my analysis of error, I should like you to note that the imaginations of the mind, looked at in themselves, contain no error; i.e., the mind does not err from the fact that it imagines, but only insofar as it is considered to lack the idea which excludes the existence of those things which it imagines to be present to itself. For if the mind, in imagining nonexistent things to be present to it, knew at the same time that those things did not exist in fact, it would surely impute this power of imagining not to the defect but to the strength of its own nature, especially if this faculty of imagining were to depend solely on its own nature; that is (Def. 7, I), if this faculty of imagining were free.

PROPOSITION 18

If the human body has once been affected by two or more bodies at the same time, when the mind afterwards imagines one of them, it will straightway remember the others too.

Proof

The mind imagines (preceding Cor.) any given body for the following reason, that the human body is affected and conditioned by the impressions of an external body in the same way as it was affected when certain of its parts were acted upon by the external body. But, by hypothesis, the human mind was at that time conditioned in such a way that the mind imagined two bodies at the same time. Therefore it will now also imagine two bodies at the same time, and the mind, in imagining one of them, will straightway remember the other as well.

Scholium

Hence we clearly understand what memory is. It is simply a linking of ideas involving the nature of things outside the human body, a linking which occurs in the mind parallel to the order and linking of the affections of the human body. I say, firstly, that it is only the linking of those ideas that involve the nature of things outside the human body, not of those ideas that explicate the nature of the said things. For they are in fact (Pr. 16, II) ideas of the affections of the human body which involve the nature both of the human body and of external bodies. Secondly, my purpose in saying that this linking occurs in accordance with the order and linking of the affections of the human body is to distinguish it from the linking of ideas in accordance with the order of the intellect whereby the mind perceives things through their first causes, and which is the same in all men.

Furthermore, from this we clearly understand why the mind, from thinking of one thing, should straightway pass on to thinking of another thing which has no likeness to the first. For example, from thinking of the word 'pomum' [apple] a Roman will straightway fall to thinking of the fruit, which has no likeness to that articulated sound nor anything in common with it other than that the man's body has often been affected by them both; that is, the man has often heard the word 'pomum' while seeing the fruit. So everyone will pass on from one thought to another according as habit in each case has arranged the images in his body. A soldier, for example, seeing the tracks of a horse in the sand will straightway pass on from thinking of the horse to thinking of the rider, and then thinking of war, and so on. But a peasant, from thinking of a horse, will pass on to thinking of a plough, and of a field, and so on. So every person will pass on from thinking of one thing to thinking of another according as he is in the habit of joining together and linking the images of things in various ways.

PROPOSITION 19

The human mind has no knowledge of the body, nor does it know it to exist, except through ideas of the affections by which the body is affected.

Proof

The human mind is the very idea or knowledge of the human body (Pr. 13, II), and this idea is in God (Pr. 9, II) insofar as he is considered as affected by another idea of a particular thing; or, since (Post. 4) the human body needs very many other bodies by which it is continually regenerated, and the order and connection of ideas is the same (Pr. 7, II) as the order and connection of causes, this idea is in God insofar as he is considered as affected by the ideas of numerous particular things. Therefore God has the idea of the human body, or knows the human body, insofar as he is affected by numerous other ideas, and not insofar as he constitutes the nature of the human mind; that is, (Cor. Pr. 11, II), the human mind does not know the human body. But the ideas of the affections of the body are in God insofar as he does constitute the nature of human mind; i.e., the human mind perceives these affections (Pr. 12, II) and consequently perceives the human body (Pr. 16, II), and perceives it as actually existing (Pr. 17, II). Therefore, it is only to that extent that the human mind perceives the human body.

PROPOSITION 20

There is also in God the idea or knowledge of the human mind, and this follows in God and is related to God in the same way as the idea or knowledge of the human body.

Proof

Thought is an attribute of God (Pr. 1, II), and so (Pr. 3, II) the idea of both Thought and its affections — and consequently of the human mind as well — must necessarily be in God. Now this idea or knowledge of the mind does not follow in God insofar as he is infinite, but insofar as he is affected by another idea of a particular thing (Pr. 9, II). But the order and connection of ideas is the same as the order and connection of causes (Pr. 7, II). Therefore, the idea or knowledge of the mind follows in God and is related to God in the same way as the idea or knowledge of the body.

PROPOSITION 21

This idea of the mind is united to the mind in the same way as the mind is united to the body.

Proof

That the mind is united to the body we have shown from the fact that the body is the object of the mind (Prs. 12 and 13, II), and so by the same reasoning the idea of the mind must be united to its object— that is, to the mind itself—in the same way as the mind is united to the body.

Scholium

This proposition is understood far more clearly from Sch. Pr. 7, II. There we showed that the idea of the body and the body itself—that is, (Pr. 13, II) mind and body—are one and the same individual thing, conceived now under the attribute of Thought and now under the attribute of Extension. Therefore, the idea of the mind and the mind itself are one and the same thing, conceived under one and the same attribute, namely, Thought. The idea of the mind, I repeat, and the mind itself follow in God by the same necessity and from the same power of thought. For in fact the idea of the mind—that is, the idea of an idea — is nothing other than the form [*forma*] of the idea insofar as the idea is considered as a mode of thinking without relation to its object. For as soon as anyone knows something, by that very fact he knows that he knows, and at the same time he knows that he knows that he knows, and so on *ad infinitum*. But I will deal with this subject later.

PROPOSITION 22

The human mind perceives not only the affections of the body but also the ideas of these affections.

Proof

The ideas of ideas of affections follow in God and are related to God in the same way as ideas of affections, which can be proved in the same manner as Pr. 20, II. But the ideas of affections of the body are in the human mind (Pr. 12, II); that is (Cor. Pr. 11, II), in God insofar as he constitutes the essence of the human mind. Therefore the ideas of these ideas will be in God insofar as he has knowledge or the idea of the human mind; that is (Pr. 21, II), they will be in the human mind itself, which therefore perceives not only the affections of the body but also the ideas of these affections.

PROPOSITION 23

The mind does not know itself except insofar as it perceives ideas of affections of the body.

Proof

The idea or knowledge of the mind (Pr. 20, II) follows in God and is related to God in the same way as the idea or knowledge of the body. But since (Pr. 19, II) the human mind does not know the human body— that is, (Cor. Pr. 11, II) since the knowledge of the human body is not related to God insofar as he constitutes the nature of the human mind — therefore neither is knowledge of the mind related to God insofar as he constitutes the essence of the human mind. And so (Cor. Pr. 11, II) the human mind to that extent does not know itself. Again, the ideas of the affections by which the body is affected involve the nature of the human body (Pr. 16, II); that is, (Pr. 13, II) they are in agreement [*conveniunt*] with the nature of the mind. Therefore, the knowledge of these ideas will necessarily involve knowledge of the mind. But (preceding Pr.) the knowledge of these ideas is in the human mind. Therefore, the human mind knows itself only to that extent.

PROPOSITION 24

The human mind does not involve an adequate knowledge of the component parts of the human body.

Proof

The component parts of the human body do not pertain to the essence of the body itself save insofar as they preserve an unvarying relation of motion with one another (Def. after Cor. Lemma 3), and not insofar as they

can be considered as individual things apart from their relation to the human body. For the parts of the human body (Post. 1) are very composite individual things, whose parts can be separated from the human body (Lemma 4) without impairing in any way its nature and specific reality [*forma*], and can establish a quite different relation of motion with other bodies (Ax. 1 after Lemma 3). Therefore (Pr. 3, II), the idea or knowledge of any component part will be in God, and will be so (Pr. 9, II) insofar as he is considered as affected by another idea of a particular thing, a particular thing which is prior in Nature's order to the part itself (Pr. 7, II). Further, the same holds good of any part of an individual component part of the human body, and so of any component part of the human body there is knowledge in God insofar as he is affected by very many ideas of things, and not insofar as he has the idea only of the human body, that is (Pr. 13, II), the idea that constitutes the nature of the human mind. So (Cor. Pr. 11, II) the human mind does not involve adequate knowledge of the component parts of the human body.

PROPOSITION 25

The idea of any affection of the human body does not involve an adequate knowledge of an external body.

Proof

We have shown that the idea of an affection of the human body involves the nature of an external body insofar as the external body determines the human body in some definite way (Pr. 16, II). But insofar as the external body is an individual thing that is not related to the human body, the idea or knowledge of it is in God (Pr. 9, II) insofar as God is considered as affected by the idea of another thing which is (Pr. 7, II) prior in nature to the said external body. Therefore, an adequate knowledge of the external body is not in God insofar as he has the idea of an affection of the human body; i.e., the idea of an affection of the human body does not involve an adequate knowledge of an external body.

PROPOSITION 26

The human mind does not perceive any external body as actually existing except through the ideas of affections of its own body.

Proof

If the human body is not affected in any way by an external body, then (Pr. 7, II) neither is the idea of the human body — that is (Pr. 13, II), the human mind — affected in any way by the idea of the existence of that body; i.e., it does not in any way perceive the existence of that external body. But insofar as the human body is affected in some way by an external body, to that extent it perceives the external body (Pr. 16, II, with Cor.1).

Corollary

Insofar as the human mind imagines [*imaginatur*] an external body, to that extent it does not have an adequate knowledge of it.

Proof

When the human mind regards external bodies through the ideas of affections of its own body, we say that it imagines [*imaginatur*] (see Sch. Pr. 17, II), and in no other way can the mind imagine external bodies as actually existing (preceding Pr.). Therefore, insofar as the mind imagines external bodies (Pr. 25, II), it does not have adequate knowledge of them.

PROPOSITION 27

The idea of any affection of the human body does not involve adequate knowledge of the human body.

Proof

Any idea whatsoever of any affection of the human body involves the nature of the human body only to the extent that the human body is considered to be affected in some definite way (Pr. 16, II). But insofar as the

human body is an individual thing that can be affected in many other ways, the idea ... etc. (See Proof Pr. 25, II.)

PROPOSITION 28

The ideas of the affections of the human body, insofar as they are related only to the human mind, are not clear and distinct, but confused.

Proof

The ideas of the affections of the human body involve the nature both of external bodies and of the human body itself (Pr. 16, II), and must involve the nature not only of the human body but also of its parts. For affections are modes in which parts of the human body (Post. 3), and consequently the body as a whole, is affected. But (Prs. 24 and 25, II) an adequate knowledge of external bodies, as also of the component parts of the human body, is not in God insofar as he is considered as affected by the human mind, but insofar as he is considered as affected by other ideas. Therefore, these ideas of affections, insofar as they are related only to the human mind, are like conclusions without premises; that is, as is self-evident, confused ideas.

Scholium

The idea that constitutes the nature of the human mind is likewise shown, when considered solely in itself, not to be clear and distinct, as is also the idea of the human mind and the ideas of affections of the human body insofar as they are related only to the human mind, as everyone can easily see.

PROPOSITION 29

The idea of the idea of any affection of the human body does not involve adequate knowledge of the human mind.

Proof

The idea of an affection of the human body (Pr. 27, II) does not involve adequate knowledge of the body itself; in other words, it does not adequately express the nature of the body; that is (Pr. 13, II), it does not adequately agree [*convenit*] with the nature of the mind. So (Ax. 6, I) the idea of this idea does not adequately express the nature of the human mind; i.e., it does not involve an adequate knowledge of it.

Corollary

Hence it follows that whenever the human mind perceives things after the common order of nature, it does not have an adequate knowledge of itself, nor of its body, nor of external bodies, but only a confused and fragmentary knowledge. For the mind does not know itself save insofar as it perceives ideas of the affections of the body (Pr. 23, II). Now it does not perceive its own body (Pr. 19, II) except through ideas of affections of the body, and also it is only through these affections that it perceives external bodies (Pr. 26, II). So insofar as it has these ideas, it has adequate knowledge neither of itself (Pr. 29, II) nor of its own body (Pr. 27, II) nor of external bodies (Pr. 25, II), but only a fragmentary [*multilatum*] and confused knowledge (Pr. 28, II and Sch.).

Scholium

I say expressly that the mind does not have an adequate knowledge, but only a confused and fragmentary knowledge, of itself, its own body, and external bodies whenever it perceives things from the common order of nature, that is, whenever it is determined externally — namely, by the fortuitous run of circumstance— to regard this or that, and not when it is determined internally, through its regarding several things at the same time, to understand their agreement, their differences, and their opposition. For whenever it is conditioned internally in this or in another way, then it sees things clearly and distinctly, as I shall later show.

PROPOSITION 30

We can have only a very inadequate knowledge of the duration of our body.

Proof

The duration of our body does not depend on its essence (Ax. 1, II), nor again on the absolute nature of God (Pr. 21, I), but (Pr. 28, I) it is determined to exist and to act by causes which are also determined by other causes to exist and to act in a definite and determinate way, and these again by other causes, and so *ad infinitum*. Therefore, the duration of our body depends on the common order of nature and the structure of the universe. Now there is in God adequate knowledge of the structure of the universe insofar as he has ideas of all the things in the universe, and not insofar as he has only the idea of the human body (Cor. Pr. 9, II). Therefore, knowledge of the duration of our body is very inadequate in God insofar as he is considered only to constitute the nature of the human mind. That is (Cor. Pr. 11, II), this knowledge is very inadequate in the human mind.

PROPOSITION 31

We can have only a very inadequate knowledge of the duration of particular things external to us.

Proof

Each particular thing, just like the human body, must be determined by another particular thing to exist and to act in a definite and determinate way, and this latter thing again by another, and so on *ad infinitum* (Pr. 28, I). Now since we have shown in the preceding Proposition that from this common property of particular things we can have only a very inadequate knowledge of the duration of the human body, in the case of the duration of particular things we have to come to the same conclusion: that we can have only a very inadequate knowledge thereof.

Corollary

Hence it follows that all particular things are contingent and perishable. For we can have no adequate knowledge of their duration (preceding Pr.), and that is what is to be understood by contingency and perishability (Sch. I, Pr. 33, I). For apart from this there is no other kind of contingency (Pr. 29, I).

PROPOSITION 32

All ideas are true insofar as they are related to God.

Proof

All ideas, which are in God, agree completely with the objects of which they are ideas (Cor. Pr. 7, II), and so they are all true (Ax. 6, I).

PROPOSITION 33

There is nothing positive in ideas whereby they can be said to be false.

Proof

If this be denied, conceive, if possible, a positive mode of thinking which constitutes the form [*forma*] of error or falsity. This mode of thinking cannot be in God (preceding Pr.), but neither can it be or be conceived externally to God (Pr. 15, I). Thus there can be nothing positive in ideas whereby they can be called false.

PROPOSITION 34

Every idea which in us is absolute, that is, adequate and perfect, is true.

Proof

When we say that there is in us an adequate and perfect idea, we are saying only this (Cor. Pr. 11, II), that there is an adequate and perfect idea in God insofar as he constitutes the essence of our mind. Consequently we are saying only this, that such an idea is true (Pr. 32, II).

PROPOSITION 35

Falsity consists in the privation of knowledge which inadequate ideas, that is, fragmentary and confused ideas, involve.

Proof

There is nothing positive in ideas which constitutes the form [*forma*] of falsity (Pr. 33, II). But falsity cannot consist in absolute privation (for minds, not bodies, are said to err and be deceived), nor again in absolute ignorance, for to be ignorant and to err are different. Therefore it consists in that privation of knowledge which inadequate knowledge, that is, inadequate and confused ideas, involves.

Scholium

In Sch. Pr. 17, II I explained how error consists in the privation of knowledge, but I will give an example to enlarge on this explanation. Men are deceived in thinking themselves free, a belief that consists only in this, that they are conscious of their actions and ignorant of the causes by which they are determined. Therefore, the idea of their freedom is simply the ignorance of the cause of their actions. As to their saying that human actions depend on the will, these are mere words without any corresponding idea. For none of them knows what the will is and how it moves the body, and those who boast otherwise and make up stories of dwelling places and habitations of the soul provoke either ridicule or disgust.

As another example, when we gaze at the sun, we see it as some two hundred feet distant from us. The error does not consist in simply seeing the sun in this way but in the fact that while we do so we are not aware of the true distance and the cause of our seeing it so. For although we may later become aware that the sun is more than six hundred times the diameter of the earth distant from us, we shall nevertheless continue to see it as close at hand. For it is not our ignorance of its true distance that causes us to see the sun to be so near; it is that the affection of our body involves the essence of the sun only to the extent that the body is affected by it.

PROPOSITION 36

Inadequate and confused ideas follow by the same necessity as adequate, or clear and distinct, ideas.

Proof

All ideas are in God (Pr. 15, I), and insofar as they are related to God, they are true (Pr. 32, II) and adequate (Cor. Pr. 7, II). So there are no inadequate or confused ideas except insofar as they are related to the particular mind of someone (see Prs. 24 and 28, II). So all ideas, both adequate and inadequate, follow by the same necessity (Cor. Pr. 6, II).

PROPOSITION 37

That which is common to all things (see Lemma 2 above) and is equally in the part as in the whole, does not constitute the essence of any one particular thing.

Proof

If this be denied, conceive, if possible, that it does constitute the essence of one particular thing, B. Therefore it can neither be nor be conceived without B (Def. 2, II). But this is contrary to our hypothesis. Therefore, it does not pertain to B's essence, nor does it constitute the essence of any other particular thing.

PROPOSITION 38

Those things that are common to all things and are equally in the part as in the whole, can be conceived only adequately.

Proof

Let A be something common to all bodies, and equally in the part of any body as in the whole. I say that A

can be conceived only adequately. For its idea (Cor. Pr. 7, II) will necessarily be in God both insofar as he has the idea of the human body and insofar as he has the ideas of affections of the human body, affections which partly involve the natures of both the human body and external bodies (Prs. 16, 25 and 27, II). That is (Prs. 12 and 13, II), this idea will necessarily be adequate in God insofar as he constitutes the human mind; that is, insofar as he has the ideas which are in the human mind. Therefore, the mind (Cor. Pr. 11, II) necessarily perceives A adequately, and does so both insofar as it perceives itself and insofar as it perceives its own body or any external body; nor can A be perceived in any other way.

Corollary

Hence it follows that there are certain ideas or notions common to all men. For (by Lemma 2) all bodies agree in certain respects, which must be (preceding Pr.) conceived by all adequately, or clearly and distinctly.

PROPOSITION 39

Of that which is common and proper to the human body and to some external bodies by which the human body is customarily affected, and which is equally in the part as well as in the whole of any of these bodies, the idea also in the mind will be adequate.

Proof

Let A be that which is common and proper to the human body and to some external bodies and which is equally in the human body as in those same external bodies, and which is finally equally in the part of any external body as in the whole. There will be in God an adequate idea of A (Cor. Pr. 7, II) both insofar as he has the idea of the human body and insofar as he has ideas of those posited external bodies. Let it now be supposed that the human body is affected by an external body through that which is common to them both, that is, A. The idea of this affection will involve the property A (Pr. 16, II), and so (Cor. Pr. 7, II) the idea of this affection, insofar as it involves the property A, will be adequate in God insofar as he is affected by the idea of the human body; that is (Pr. 13, II), insofar as he constitutes the nature of the human mind. So this idea will also be adequate in the human mind (Cor. Pr. 11, II).

Corollary

Hence it follows that the mind is more capable of perceiving more things adequately in proportion as its body has more things in common with other bodies.

PROPOSITION 40

Whatever ideas follow in the mind from ideas that are adequate in it are also adequate.

Proof

This is evident. For when we say that an idea follows in the human mind from ideas that are adequate in it, we are saying no more than that there is in the divine intellect an idea of which God is the cause, not insofar as he is infinite nor insofar as he is affected by ideas of numerous particular things, but only insofar as he constitutes the essence of the human mind.

Scholium 1

I have here set forth the cause of those notions that are called ‘common,’ and which are the basis of our reasoning processes. Now certain axioms or notions have other causes which it would be relevant to set forth by this method of ours; for thus we could establish which notions are more useful compared with others, and which are of scarcely any value. And again, we could establish which notions are common to all, which ones are clear and distinct only to those not laboring under prejudices [*praejudiciis*] and which ones are ill-founded. Furthermore, this would clarify the origin of those notions called ‘secondary’ — and consequently the axioms which are based on them—as well as other related questions to which I have for some time given thought. But I have decided not to embark on these questions at this point because I have set them aside for another treatise,² and also to avoid wearying the reader with too lengthy a discussion of this subject. Nevertheless, to

omit nothing that it is essential to know, I shall briefly deal with the question of the origin of the so-called 'transcendental terms,' such as 'entity,' 'thing,' 'something' [*ens, res, aliquid*].

These terms originate in the following way. The human body, being limited, is capable of forming simultaneously in itself only a certain number of distinct images. (I have explained in Sch. Pr. 17, II what an image is.) If this number be exceeded, these images begin to be confused, and if the number of distinct images which the body is capable of forming simultaneously in itself be far exceeded, all the images will be utterly confused with one another. This being so, it is evident from Cor. Pr. 17 and Pr. 18, II that the human mind is able to imagine simultaneously and distinctly as many bodies as there are images that can be formed simultaneously in its body. But when the images in the body are utterly confused, the mind will also imagine all the bodies confusedly without any distinction, and will comprehend them, as it were, under one attribute, namely, that of entity, thing, etc. This conclusion can also be reached from the fact that images are not always equally vivid, and also from other causes analogous to these, which I need not here explicate. For it all comes down to this, that these terms signify ideas confused in the highest degree.

Again, from similar causes have arisen those notions called 'universal,' such as 'man,' 'horse,' 'dog,' etc; that is to say, so many images are formed in the human body simultaneously (e.g., of man) that our capacity to imagine them is surpassed, not indeed completely, but to the extent that the mind is unable to imagine the unimportant differences of individuals (such as the complexion and stature of each, and their exact number) and imagines distinctly only their common characteristic insofar as the body is affected by them. For it was by this that the body was affected most repeatedly, by each single individual. The mind expresses this by the word 'man,' and predicates this word of an infinite number of individuals. For, as we said, it is unable to imagine the determinate number of individuals.

But it should be noted that not all men form these notions in the same way; in the case of each person the notions vary according as that thing varies whereby the body has more frequently been affected, and which the mind more readily imagines or calls to mind. For example, those who have more of ten regarded with admiration the stature of men will understand by the word 'man' an animal of upright stature, while those who are wont to regard a different aspect will form a different common image of man, such as that man is a laughing animal, a featherless biped, or a rational animal. Similarly, with regard to other aspects, each will form universal images according to the conditioning of his body. Therefore, it is not surprising that so many controversies have arisen among philosophers who have sought to explain natural phenomena through merely the images of these phenomena.

Scholium 2

From all that has already been said it is quite clear that we perceive many things and form universal notions:

1. From individual objects presented to us through the senses in a fragmentary [*mutilate*] and confused manner without any intellectual order (see Cor. Pr. 29, II); and therefore I call such perceptions 'knowledge from casual experience.'
2. From symbols. For example, from having heard or read certain words we call things to mind and we form certain ideas of them similar to those through which we imagine things (Sch. Pr. 18, II). Both these ways of regarding things I shall in future refer to as 'knowledge of the first kind,' 'opinion' or 'imagination.'
3. From the fact that we have common notions and adequate ideas of the properties of things (see Cor. Pr. 38 and 39 with its Cor., and Pr. 40, II). I shall refer to this as 'reason' and 'knowledge of the second kind.'

Apart from these two kinds of knowledge there is, as I shall later show, a third kind of knowledge, which I shall refer to as 'intuition.' This kind of knowledge proceeds from an adequate idea of the formal essence of certain attributes of God to an adequate knowledge of the essence of things. I shall illustrate all these kinds of knowledge by one single example. Three numbers are given; it is required to find a fourth which is related to the third as the second to the first. Tradesmen have no hesitation in multiplying the second by the third and dividing the product by the first, either because they have not yet forgotten the rule they learnt without proof from their teachers, or because they have in fact found this correct in the case of very simple numbers, or else from the force of the proof of Proposition 19 of the Seventh Book of Euclid, to wit, the common property of proportionals. But in the case of very simple numbers, none of this is necessary. For example, in the case of the given numbers 1, 2, 3, everybody can see that the fourth proportional is 6, and all the more clearly because we infer in one single intuition the fourth number from the ratio we see the first number bears to the second.

PROPOSITION 41

Knowledge of the first kind is the only cause of falsity; knowledge of the second and third kind is necessarily true.

Proof

In the preceding Scholium we asserted that all those ideas which are inadequate and confused belong to the first kind of knowledge; and thus (Pr. 35, II), this knowledge is the only cause of falsity. Further, we asserted that to knowledge of the second and third kind there belong those ideas which are adequate. Therefore (Pr. 34, II), this knowledge is necessarily true.

PROPOSITION 42

Knowledge of the second and third kind, and not knowledge of the first kind, teaches us to distinguish true from false.

Proof

This Proposition is self-evident. For he who can distinguish the true from the false must have an adequate idea of the true and the false; that is (Sch. 2 Pr. 40, II), he must know the true and the false by the second or third kind of knowledge.

PROPOSITION 43

He who has a true idea knows at the same time that he has a true idea, and cannot doubt its truth.

Proof

A true idea in us is one which is adequate in God insofar as he is explicated through the nature of the human mind (Cor. Pr. 11, II). Let us suppose, then, that there is in God, insofar as he is explicated through the nature of the human mind, an adequate idea, A. The idea of this idea must also necessarily be in God, and is related to God in the same way as the idea A (Pr. 20, II, the proof being of general application). But by our supposition the idea A is related to God insofar as he is explicated through the nature of the human mind. Therefore, the idea of the idea A must be related to God in the same way; that is (Cor. Pr. 11, II), this adequate idea of the idea A will be in the mind which has the adequate idea A. So he who has an adequate idea, that is, he who knows a thing truly (Pr. 34, II), must at the same time have an adequate idea, that is, a true knowledge of his knowledge; that is, (as is self-evident) he is bound at the same time to be certain.

Scholium

I have explained in the Scholium to Pr. 21, II what is an idea of an idea; but it should be noted that the preceding proposition is sufficiently self-evident. For nobody who has a true idea is unaware that a true idea involves absolute certainty. To have a true idea means only to know a thing perfectly, that is, to the utmost degree. Indeed, nobody can doubt this, unless he thinks that an idea is some dumb thing like a picture on a tablet, and not a mode of thinking, to wit, the very act of understanding. And who, pray, can know that he understands some thing unless he first understands it? That is, who can know that he is certain of something unless he is first certain of it? Again, what standard of truth can there be that is clearer and more certain than a true idea? Indeed, just as light makes manifest both itself and darkness, so truth is the standard both of itself and falsity.

I think I have thus given an answer to those questions which can be stated as follows: If a true idea is distinguished from a false one only inasmuch as it is said to correspond with that of which it is an idea, then a true idea has no more reality or perfection than a false one (since they are distinguished only by an extrinsic characteristic) and consequently neither is a man who has true ideas superior to one who has only false ideas. Secondly, how do we come to have false ideas? And finally, how can one know for certain that one has ideas which correspond with that of which they are ideas? I have now given an answer, I repeat, to these problems. As regards the difference between a true and a false idea, it is clear from Pr. 35, II that the former is to the latter as being to non-being. The causes of falsity I have quite clearly shown from Propositions 19 to 35 with the latter's Scholium, from which it is likewise obvious what is the difference between a man who has true ideas and one who has only false ideas. As to the last question, how can a man know that he has an idea which

corresponds to that of which it is an idea, I have just shown, with abundant clarity, that this arises from the fact that he does have an idea that corresponds to that of which it is an idea; that is, truth is its own standard. Furthermore, the human mind, insofar as it perceives things truly, is part of the infinite intellect of God (Cor. Pr. 11, II), and thus it is as inevitable that the clear and distinct ideas of the mind are true as that God's ideas are true.

PROPOSITION 44

It is not in the nature of reason to regard things as contingent, but as necessary.

Proof

It is in the nature of reason to perceive things truly (Pr. 41, II), to wit, (Ax. 6, I) as they are in themselves; that is (Pr. 29, I), not as contingent, but as necessary.

Corollary 1

Hence it follows that it solely results from imagination [*imaginatio*] that we regard things, both in respect of the past and of the future, as contingent.

Scholium

I shall explain briefly how this comes about. We have shown above (Pr. 17, II and Cor.) that although things may not exist, the mind nevertheless always imagines them as present unless causes arise which exclude their present existence. Further, we have shown (Pr. 18, II) that if the human body has once been affected by two external bodies at the same time, when the mind later imagines one of them, it will straightway call the other to mind as well; that is, it will regard both as present to it unless other causes arise which exclude their present existence. Furthermore, nobody doubts that time, too, is a product of the imagination, and arises from the fact that we see some bodies move more slowly than others, or more quickly, or with equal speed. Let us therefore suppose that yesterday a boy saw Peter first of all in the morning, Paul at noon, and Simon in the evening, and that today he again sees Peter in the morning. From Pr. 18, II it is clear that as soon as he sees the morning light, forthwith he will imagine the sun as traversing the same tract of sky as on the previous day, that is, he will imagine a whole day, and he will imagine Peter together with morning, Paul with midday, and Simon with evening; that is, he will imagine the existence of Paul and Simon with reference to future time. On the other hand, on seeing Simon in the evening he will refer Paul and Peter to time past by imagining them along with time past. This train of events will be the more consistent the more frequently he sees them in that order. If it should at some time befall that on another evening he sees James instead of Simon, then the following morning he will imagine along with evening now Simon, now James, but not both together. For we are supposing that he has seen only one of them in the evening, not both at the same time. Therefore, his imagination will waver, and he will imagine, along with a future evening, now one, now the other; that is, he will regard neither of them as going to be there for certain, but both of them contingently. This wavering of the imagination occurs in the same way if the imagination be of things which we regard with relation to past or present time, and consequently we shall imagine things, as related both to present and past or future time, as contingent.

Corollary 2

It is in the nature of reason to perceive things in the light of eternity [*sub quadam specie aeternitatis*].

Proof

It is in the nature of reason to regard things as necessary, not as contingent (previous Pr.). Now it perceives this necessity truly (Pr. 41, II); that is, as it is in itself (Ax. 6, I). But (Pr. 16, I) this necessity is the very necessity of God's eternal nature. Therefore, it is in the nature of reason to regard things in this light of eternity. Furthermore, the basic principles of reason are those notions (Pr. 38, II) which explicate what is common to all things, and do not explicate (Pr. 37, II) the essence of any particular thing, and therefore must be conceived without any relation to time, but in the light of eternity.

PROPOSITION 45

Every idea of any body or particular thing existing in actuality necessarily involves the eternal and infinite essence of God.

Proof

The idea of a particular thing actually existing necessarily involves both the essence and the existence of the thing (Cor. Pr. 8, II). But particular things cannot be conceived without God (Pr. 15, I). Now since they have God for their cause (Pr. 6, II) insofar as he is considered under that attribute of which the things themselves are modes, their ideas (Ax. 4, I) must necessarily involve the conception of their attribute; that is (Def. 6, I), the eternal and infinite essence of God.

Scholium

Here by existence I do not mean duration, that is, existence insofar as it is considered in the abstract as a kind of quantity. I am speaking of the very nature of existence, which is attributed to particular things because they follow in infinite numbers in infinite ways from the eternal necessity of God's nature (Pr. 16, I). I am speaking, I repeat, of the very existence of particular things insofar as they are in God. For although each particular thing is determined by another particular thing to exist in a certain manner, the force by which each perseveres in existing follows from the eternal necessity of God's nature. See Cor. Pr. 24, I.

PROPOSITION 46

The knowledge of the eternal and infinite essence of God which each idea involves is adequate and perfect.

Proof

The proof of the preceding proposition is universally valid, and whether a thing be considered as a part or a whole, its idea, whether of whole or part, involves the eternal and infinite essence of God (preceding Pr.). Therefore, that which gives knowledge of the eternal and infinite essence of God is common to all things, and equally in the part as in the whole. And so this knowledge will be adequate (Pr. 38, II).

PROPOSITION 47

The human mind has an adequate knowledge of the eternal and infinite essence of God.

Proof

The human mind has ideas (Pr. 22, II) from which (Pr. 23, II) it perceives itself, its own body (Pr. 19, II) and external bodies (Cor. 1, Pr. 16 and Pr. 17, II) as actually existing, and so it has an adequate knowledge of the eternal and infinite essence of God (Prs. 45 and 46, II).

Scholium

Hence we see that God's infinite essence and his eternity are known to all. Now since all things are in God and are conceived through God, it follows that from this knowledge we can deduce a great many things so as to know them adequately and thus to form that third kind of knowledge I mentioned in Sch. 2 Pr. 40, II, of the superiority and usefulness of which we shall have occasion to speak in Part V. That men do not have as clear a knowledge of God as they do of common notions arises from the fact that they are unable to imagine God as they do bodies, and that they have connected the word 'God' with the images of things which they commonly see; and this they can scarcely avoid, being affected continually by external bodies. Indeed, most errors result solely from the incorrect application of words to things. When somebody says that the lines joining the center of a circle to its circumference are unequal, he surely understands by circle, at least at that time, something different from what mathematicians understand. Likewise, when men make mistakes in arithmetic, they have different figures in mind from those on paper. So if you look only to their minds, they indeed are not mistaken; but they seem to be wrong because we think that they have in mind the figures on the page. If this were not the case, we would not think them to be wrong, just as I did not think that person to

be wrong whom I recently heard shouting that his hall had flown into his neighbour's hen, for I could see clearly what he had in mind. Most controversies arise from this, that men do not correctly express what is in their mind, or they misunderstand another's mind. For, in reality, while they are hotly contradicting one another, they are either in agreement or have different things in mind, so that the apparent errors and absurdities of their opponents are not really so.

PROPOSITION 48

In the mind there is no absolute, or free, will. The mind is determined to this or that volition by a cause, which is likewise determined by another cause, and this again by another, and so ad infinitum.

Proof

The mind is a definite and determinate mode of thinking (Pr. 11, II), and thus (Cor. 2, Pr. 17, I) it cannot be the free cause of its actions: that is, it cannot possess an absolute faculty of willing and nonwilling. It must be determined to will this or that (Pr. 28, I) by a cause, which likewise is determined by another cause, and this again by another, etc.

Scholium

In the same way it is proved that in the mind there is no absolute faculty of understanding, desiring, loving, etc. Hence it follows that these and similar faculties are either entirely fictitious or nothing more than metaphysical entities or universals which we are wont to form from particulars. So intellect and will bear the same relation to this or that idea, this or that volition, as stoniness to this or that stone, or man to Peter and Paul. As to the reason why men think they are free, we explained that in the Appendix to Part I.

But before proceeding further, it should here be noted that by the will I mean the faculty of affirming and denying, and not desire. I mean, I repeat, the faculty whereby the mind affirms or denies what is true or what is false, not the desire whereby the mind seeks things or shuns them. But now that we have proved that these faculties are universal notions which are not distinct from the particulars from which we form them, we must inquire whether volitions themselves are anything more than ideas of things. We must inquire, I say, whether there is in the mind any other affirmation and denial apart from that which the idea, insofar as it is an idea, involves. On this subject see the following proposition and also Def. 3, II, lest thought becomes confused with pictures. For by ideas I do not mean images such as are formed at the back of the eye — or, if you like, in the middle of the brain — but conceptions of thought.

PROPOSITION 49

There is in the mind no volition, that is, affirmation and negation, except that which an idea, insofar as it is an idea, involves.

Proof

There is in the mind (preceding Pr.) no absolute faculty of willing and non-willing, but only particular volitions, namely, this or that affirmation, and this or that negation. Let us therefore conceive a particular volition, namely, a mode of thinking whereby the mind affirms that the three angles of a triangle are equal to two right angles. This affirmation involves the conception, or idea, of a triangle; that is, it cannot be conceived without the idea of a triangle. For to say that A must involve the conception of B is the same as to say that A cannot be conceived without B. Again, this affirmation (Ax. 3, II) cannot even be without the idea of a triangle. Therefore, this idea can neither be nor be conceived without the idea of a triangle. Furthermore, this idea of a triangle must involve this same affirmation, namely, that its three angles are equal to two right angles. Therefore, vice versa, this idea of a triangle can neither be nor be conceived without this affirmation, and so (Def. 2, II) this affirmation belongs to the essence of the idea of a triangle, and is nothing more than the essence itself. And what I have said of this volition (for it was arbitrarily selected) must also be said of every volition, namely, that it is nothing but an idea.

Corollary

Will and intellect are one and the same thing.

Proof

Will and intellect are nothing but the particular volitions and ideas (Pr. 48, II and Sch.). But a particular volition and idea are one and the same thing (preceding Pr.). Therefore will and intellect are one and the same thing.

Scholium

By this means we have removed the cause to which error is commonly attributed. We have previously shown that falsity consists only in the privation that fragmentary and confused ideas involve. Therefore, a false idea, insofar as it is false, does not involve certainty. So when we say that a man acquiesces in what is false and has no doubt thereof, we are not thereby saying that he is certain, but only that he does not doubt, or that he acquiesces in what is false because there is nothing to cause his imagination to waver. On this point see Sch. Pr. 44, II. So however much we suppose a man to adhere to what is false, we shall never say that he is certain. For by certainty we mean something positive (Pr. 43, II and Sch.), not privation of doubt. But by privation of certainty we mean falsity.

But for a fuller explanation of the preceding proposition some things remain to be said. Then, again, there is the further task of replying to objections that may be raised against this doctrine of ours. Finally, to remove every shred of doubt, I have thought it worthwhile to point out certain advantages of this doctrine. I say certain advantages, for the most important of them will be better understood from what we have to say in Part V.

I begin, then, with the first point, and I urge my readers to make a careful distinction between an idea — i.e., a conception of the mind — and the images of things that we imagine. Again, it is essential to distinguish between ideas and the words we use to signify things. For since these three—images, words, and ideas—have been utterly confused by many, or else they fail to distinguish between them through lack of accuracy, or, finally, through lack of caution, our doctrine of the will, which it is essential to know both for theory and for the wise ordering of life, has never entered their minds. For those who think that ideas consist in images formed in us from the contact of external bodies are convinced that those ideas of things whereof we can form no like image are not ideas, but mere fictions fashioned arbitrarily at will. So they look on ideas as dumb pictures on a tablet, and misled by this preconception they fail to see that an idea, insofar as it is an idea, involves affirmation or negation. Again, those who confuse words with idea, or with the affirmation which an idea involves, think that when they affirm or deny something merely by words contrary to what they feel, they are able to will contrary to what they feel. Now one can easily dispel these misconceptions if one attends to the nature of thought, which is quite removed from the concept of extension. Then one will clearly understand that an idea, being a mode of thinking, consists neither in the image of a thing nor in words. For the essence of words and images is constituted solely by corporeal motions, far removed from the concept of thought. With these few words of warning, I turn to the aforementioned objections.

The first of these rests on the confident claim that the will extends more widely than the intellect, and therefore is different from it. The reason for their belief that the will extends more widely than the intellect is that they find — so they say—that they do not need a greater faculty of assent, that is, of affirming and denying, than they already possess, in order to assent to an infinite number of other things that we do not perceive, but that we do need an increased faculty of understanding. Therefore will is distinct from intellect, the latter being finite and the former infinite.

Second, it may be objected against us that experience appears to tell us most indisputably that we are able to suspend judgment so as not to assent to things that we perceive, and this is also confirmed by the fact that nobody is said to be deceived insofar as he perceives something, but only insofar as he assents or dissents. For instance, he who imagines a winged horse does not thereby grant that there is a winged horse; that is, he is not thereby deceived unless at the same time he grants that there is a winged horse. So experience appears to tell us most indisputably that the will, that is, the faculty of assenting, is free, and different from the faculty of understanding.

Third, it may be objected that one affirmation does not seem to contain more reality than another; that is, we do not seem to need greater power in order to affirm that what is true is true than to affirm that what is false is true. On the other hand, we do perceive that one idea has more reality or perfection than another. For some ideas are more perfect than others in proportion as some objects are superior to others. This, again, is a clear indication that there is a difference between will and intellect.

Fourthly, it may be objected that if man does not act from freedom of will, what would happen if he

should be in a state of equilibrium like Buridan's ass? Will he perish of hunger and thirst? If I were to grant this, I would appear to be thinking of an ass or a statue, not of a man. If I deny it, then the man will be determining himself, and consequently will possess the faculty of going and doing whatever he wants.

Besides these objections there may possibly be others. But since I am not obliged to stress every objection that can be dreamed up, I shall make it my task to reply to these objections only, and as briefly as possible.

To the first objection I reply that, if by the intellect is meant clear and distinct ideas only, I grant that the will extends more widely than the intellect, but I deny that the will extends more widely than perceptions, that is, the faculty of conceiving. Nor indeed do I see why the faculty of willing should be termed infinite any more than the faculty of sensing. For just as by the same faculty of willing we can affirm an infinite number of things (but in succession, for we cannot affirm an infinite number of things simultaneously), so also we can sense or perceive an infinite number of bodies (in succession) by the same faculty of sensing. If my objectors should say that there are an infinite number of things that we cannot sense, I retort that we cannot grasp them by any amount of thought, and consequently by any amount of willing. But, they say, if God wanted to bring it about that we should perceive these too, he would have had to give us a greater faculty of perceiving, but not a greater faculty of willing than he has already given us. This is the same as saying that if God wishes to bring it about that we should understand an infinite number of other entities, he would have to give us a greater intellect than he already has, so as to encompass these same infinite entities, but not a more universal idea of entity. For we have shown that the will is a universal entity, or the idea whereby we explicate all particular volitions; that is, that which is common to all particular volitions. So if they believe that this common or universal idea of volitions is a faculty, it is not at all surprising that they declare this faculty to extend beyond the limits of the intellect to infinity. For the term 'universal' is applied equally to one, to many, and to an infinite number of individuals.

To the second objection I reply by denying that we have free power to suspend judgment. For when we say that someone suspends judgment, we are saying only that he sees that he is not adequately perceiving the thing. So suspension of judgment is really a perception, not free will. To understand this more clearly, let us conceive a boy imagining a winged horse and having no other perception. Since this imagining involves the existence of a horse (Cor. Pr. 17, II), and the boy perceives nothing to annul the existence of the horse, he will regard the horse as present and he will not be able to doubt its existence, although he is not certain of it. We experience this quite commonly in dreams, nor do I believe there is anyone who thinks that while dreaming he has free power to suspend judgment regarding the contents of his dream, and of bringing it about that he should not dream what he dreams that he sees. Nevertheless, it does happen that even in dreams we suspend judgment, to wit, when we dream that we are dreaming. Furthermore, I grant that nobody is deceived insofar as he has a perception; that is, I grant that the imaginings of the mind, considered in themselves, involve no error (see Sch. Pr. 17, II). But I deny that a man makes no affirmation insofar as he has a perception. For what else is perceiving a winged horse than affirming wings of a horse? For if the mind were to perceive nothing apart from the winged horse, it would regard the horse as present to it, and would have no cause to doubt the existence of the horse, nor would it have any faculty of dissenting, unless the imagining of the winged horse were joined to an idea which annuls the existence of the said horse, or unless the mind perceives that the idea which it has of the winged horse is inadequate. Then it will either necessarily deny the existence of the said horse or it will necessarily doubt it.

In the above I think I have also answered the third objection by my assertion that the will is a universal term predicated of all ideas and signifying only what is common to all ideas, namely, affirmation, the adequate essence of which, insofar as it is thus conceived as an abstract term, must be in every single idea, and the same in all in this respect only. But not insofar as it is considered as constituting the essence of the idea, for in that respect particular affirmations differ among themselves as much as do ideas. For example, the affirmation which the idea of a circle involves differs from the affirmation which the idea of a triangle involves as much as the idea of a circle differs from the idea of a triangle. Again, I absolutely deny that we need an equal power of thinking to affirm that what is true is true as to affirm that what is false is true. For these two affirmations, if you look to their meaning and not to the words alone, are related to one another as being to non-being. For there is nothing in ideas that constitutes the form of falsity (see Pr. 35, II with Sch. and Sch. Pr. 47, II). Therefore, it is important to note here how easily we are deceived when we confuse universals with particulars, and mental constructs [*entia rationis*] and abstract terms with the real.

As to the fourth objection, I readily grant that a man placed in such a state of equilibrium (namely, where he feels nothing else but hunger and thirst and perceives nothing but such-and-such food and drink at equal distances from him) will die of hunger and thirst. If they ask me whether such a man is not to be reckoned an ass rather than a man, I reply that I do not know, just as I do not know how one should reckon a man who

hangs himself, or how one should reckon babies, fools, and madmen.

My final task is to show what practical advantages accrue from knowledge of this doctrine, and this we shall readily gather from the following points:

1. It teaches that we act only by God's will, and that we share in the divine nature, and all the more as our actions become more perfect and as we understand God more and more. Therefore this doctrine, apart from giving us complete tranquillity of mind, has the further advantage of teaching us wherein lies our greatest happiness or blessedness, namely, in the knowledge of God alone, as a result of which we are induced only to such actions as are urged on us by love and piety. Hence we clearly understand how far astray from the true estimation of virtue are those who, failing to understand that virtue itself and the service of God is happiness itself and utmost freedom, expect God to bestow on them the highest rewards in return for their virtue and meritorious actions as if in return for the basest slavery.
2. It teaches us what attitude we should adopt regarding fortune, or the things that are not in our power, that is, the things that do not follow from our nature; namely, to expect and to endure with patience both faces of fortune. For all things follow from God's eternal decree by the same necessity as it follows from the essence of a triangle that its three angles are equal to two right angles.
3. This doctrine assists us in our social relations, in that it teaches us to hate no one, despise no one, ridicule no one, be angry with no one, envy no one. Then again, it teaches us that each should be content with what he has and should help his neighbor, not from womanish pity, or favour, or superstition, but solely from the guidance of reason as occasion and circumstance require. This I shall demonstrate in Part IV.
4. Finally, this doctrine is also of no small advantage to the commonwealth, in that it teaches the manner in which citizens should be governed and led; namely, not so as to be slaves, but so as to do freely what is best.

And thus I have completed the task I undertook in this Scholium, and thereby I bring to an end Part II, in which I think I have explained the nature of the human mind and its properties at sufficient length and as clearly as the difficult subject matter permits, and that from my account can be drawn many excellent lessons, most useful and necessary to know, as will partly be disclosed in what is to follow.

Gottfried Leibniz

Leibniz was born in 1646 in Leipzig, in what is now Germany, the son of a professor of moral philosophy. He studied at the University of Leipzig from 1661 until 1666 and then at the University of Altdorf from 1666 to 1667, earning degrees in law and philosophy. After graduating, he rejected an academic offer from the University of Leipzig and instead entered the service of the Elector of Mainz. In 1672 he traveled to Paris as a diplomat, where he stayed until 1676. There, benefiting from the guidance of Christian Huygens, one of the most important physicists of the time, he became thoroughly acquainted with modern science and philosophy. In Paris he also developed calculus, independently of Newton, who developed it around the same time. After his years in Paris, Leibniz traveled to England and then to the Netherlands, where he met Spinoza. When he returned to Germany he became a counselor at the court in Hanover, which was to be his principal residence until his death in 1716.

In Hanover, Leibniz wrote numerous philosophical works, many of which were not published until after his death. In several of these works—the *Discourse on Metaphysics* (1686), the *New System of Nature* (1695), and the *Monadology* (1714)—he displays his metaphysical system in outline form. Leibniz's philosophical views on physics are set out in the *Specimen of Dynamics* (1698), *On Nature Itself* (1697), and in his correspondence with De Volder (1699–1706) and with Samuel Clarke, Newton's friend (1715–1716). Theology is treated at length in the *Theodicy*, published in 1710, and in his correspondence with Antoine Arnauld (1686–1690). In 1704 Leibniz finished a substantial commentary of Locke's *Essay*, entitled *New Essays on Human Understanding*.

At the center of Leibniz's system is the notion of a *monad*, which is an immaterial, simple, mind-like entity, modeled on the Cartesian soul. In Leibniz's view, monads are the only substances that exist. Matter, therefore, is not among the fundamental constituents of reality, but is rather an appearance of systems of monads: Matter is *phenomenal*. Hence physics is a study of appearances, and not of ultimately real things. Metaphysics, by contrast, since it has monads in its purview, is about ultimately real things.

In Leibniz's conception, monads are *windowless*, that is, they do not have any real causal relations with other monads. All causal relations among different created things are merely phenomenal. God gives each monad its own internal program that consists of various perceptions, none of which involve real interactions with other monads. However, God does set up all of the monads in preestablished harmony, so that, for example, when the monad that is you has a perception of speaking to me, God has set up my monad so that at the same time I will have a perception of you speaking to me, despite the fact that you are not *really* interacting with me at all. Leibniz's idea comes partly from his view that all relations, like *speaking to* and *being next to* must, in the end, be reducible to *intrinsic* properties, properties that are not relational at all, and thus make no reference to any entity other than the thing that possesses it. In his analysis of Leibniz, Kant points out that the Cartesian soul provides a model of a substance all of whose properties—thoughts or perceptions—are intrinsic to it, and that this is why Leibniz believes that all substances are like Cartesian souls.

In Leibniz's view, all of the monads *express* the entire universe: Each of them has perceptions of everything that has occurred, is occurring, and will occur in the universe. In this respect, all monads are the very same. But each of them differs from every other in the *point of view* from which it expresses the universe. This is partly a matter of which perceptions are clear and distinct, and which are more confused and obscure. Certain perceptions may be conscious and clear in you but merely unconscious and confused in me, for example, perceptions of what you did in the last hour. Some monads, such as those that provide the metaphysical foundations of rocks and buildings, lack any conscious perceptions at all.

Leibniz was a determinist in that he held that, in virtue of choosing the best of all possible worlds, God determines every event that occurs, including each of our actions. One of Leibniz's great philosophical struggles involved attempting to show that human moral responsibility is compatible with this divine determinism. He devised several solutions to this problem, one of which involves the renowned formulation that in our choices, God inclines our souls without necessitating them.

• • •

For a classic account of Leibniz's philosophical system, see Bertrand Russell, *A Critical Exposition of the Philosophy of Leibniz* (London, 1900). Nicholas Rescher's *The Philosophy of Leibniz* (Englewood Cliffs, N.J.:

Prentice-Hall, 1967) provides a good introduction to Leibniz's views. Important critical studies include Robert M. Adams, *Leibniz: Determinist, Theist, Idealist* (Oxford: Oxford University Press, 1994); Nicholas Jolley, *Leibniz and Locke* (Oxford: Oxford University Press, 1984); Robert McRae, *Leibniz: Perception, Apperception, and Thought* (Toronto: University of Toronto Press, 1976); Robert Sleigh, *Leibniz and Arnauld* (New Haven: Yale University Press, 1990); and Catherine Wilson, *Leibniz's Metaphysics: A Comparative and Historical Study* (Princeton: Princeton University Press, 1989). Some collections of essays on Leibniz are Harry Frankfurt, ed., *Leibniz: A Collection of Critical Essays* (Garden City, N.J.: Doubleday, 1972); Michael Hooker, ed., *Leibniz: Critical and Interpretive Essays* (Minneapolis: University of Minnesota Press, 1982); R. S. Woolhouse, ed., *Leibniz: Metaphysics and Philosophy of Science* (Oxford: Oxford University Press, 1981); and Derk Pereboom, ed., *The Rationalists: Descartes, Spinoza, Leibniz* (Lanham, Md.: Rowman & Littlefield, 1999).

Derk Pereboom

*Discourse on Metaphysics**

1. *On divine perfection, and that God does everything in the most desirable way.* The most widely accepted and meaningful notion we have of God is expressed well enough in these words, that God is an absolutely perfect being; yet the consequences of these words are not sufficiently considered. And, to penetrate more deeply into this matter, it is appropriate to remark that there are several entirely different perfections in nature, that God possesses all of them together, and that each of them belongs to him in the highest degree.

We must also know what a perfection is. A fairly sure test for being a perfection is that forms or natures that are not capable of a highest degree are not perfections, as for example, the nature of number or figure. For the greatest of all numbers (or even the number of all numbers), as well as the greatest of all figures, imply a contradiction, but the greatest knowledge and omnipotence do not involve any impossibility. Consequently, power and knowledge are perfections, and, insofar as they belong to God, they do not have limits.

Whence it follows that God, possessing supreme and infinite wisdom, acts in the most perfect manner, not only metaphysically, but also morally speaking, and that, with respect to ourselves, we can say that the more enlightened and informed we are about God's works, the more we will be disposed to find them excellent and in complete conformity with what we might have desired.

2. *Against those who claim that there is no goodness in God's works, or that the rules of goodness and beauty are arbitrary.* Thus I am far removed from the opinion of those who maintain that there are no rules of goodness and perfection in the nature of things or in the ideas God has of them and who say that the works of God are good solely for the formal reason that God has made them.¹ For, if this were so, God, knowing that he is their author, would not have had to consider them afterwards and find them good, as is testified by the Sacred Scriptures — which seem to have used such anthropomorphic expressions only to make us understand that the excellence of God's works can be recognized by considering them in themselves, even when we do not reflect on this empty external denomination which relates them to their cause. This is all the more true, since it is by considering his works that we can discover the creator. His works must therefore carry his mark in themselves. I confess that the contrary opinion seems to me extremely dangerous and very near to the opinion of the recent innovators² who hold that the beauty of the universe and the goodness we attribute to the works of God are but the chimeras of those who conceive of God in terms of themselves. Thus, in saying that things are not good by virtue of any rule of goodness but solely by virtue of the will of God, it seems to me that we unknowingly destroy all of God's love and all of his glory. For why praise him for what he has done if he would be equally praiseworthy in doing the exact contrary? Where will his justice and wisdom reside if there remains only a certain despotic power, if will holds the place of reason, and if, according to the definition of tyrants, justice consists in whatever pleases the most powerful? Besides, it seems that all acts of will presuppose a reason for willing and that this reason is naturally prior to the act of will. That is why I also find completely strange the expression of some other philosophers who say that the eternal truths of metaphysics and geometry and consequently also the rules of goodness, justice, and perfection are merely the effects of the will of God; instead, it seems to me, they are only the consequences of his understanding, which, assuredly, does not depend on his will, any more than does his essence.

3. *Against those who believe that God might have made things better.* Nor can I approve of the opinion of some moderns who maintain boldly that what God has made is not of the highest perfection and that he could have done much better.³ For it seems to me that the consequences of this opinion are wholly contrary to the glory of God: as a lesser evil is relatively good, so a lesser good is relatively evil. And to act with less perfection than one could have is to act imperfectly. To show that an architect could have done better is to find fault with his work. This opinion is also contrary to the Sacred Scripture, which assure us of the goodness of God's works. For, if their view were sufficient, then since the series of imperfections descends to infinity, God's works would always have been good in comparison with those less perfect, no matter how he created them but something is hardly praiseworthy if it can be praised only in this way. I also believe that a great many passages

from Sacred Scripture and the holy fathers will be found favoring my opinion, but scarcely any will be found favoring the opinion of these moderns, an opinion which is, in my judgment, unknown to all antiquity and which is based only on the inadequate knowledge we have of the general harmony of the universe and of the hidden reasons for God's conduct. This enables us to judge audaciously that many things could have been rendered better. Besides, these moderns insist on certain dubious subtleties, for they imagine that nothing is so perfect that there is not something more perfect — this is an error.

They also believe that in this way they are able to safeguard God's freedom, as though it were not freedom of the highest sort to act in perfection following sovereign reason. For to believe that God does something without having any reason for his will— overlooking the fact that this seems impossible—is an opinion that conforms little to his glory. Let us assume, for example, that God chooses between A and B and that he takes A without having any reason to prefer it to B. I say that this action of God is at the very least not praiseworthy; for all praise must be based on some reason, and by hypothesis there is none here. Instead I hold that God does nothing for which he does not deserve to be glorified.

4. *That the love of God requires our complete satisfaction and acquiescence with respect to what he has done without our being quietists as a result.* The general knowledge of this great truth, that God acts always in the most perfect and desirable way possible, is, in my judgment, the foundation of the love that we owe God in all things, since he who loves seeks his satisfaction in the happiness or perfection of the object loved and in his actions. To will the same and dislike the same is true friendship. And I believe that it is difficult to love God well when we are not disposed to will what God wills, when we might have the power to change it. In fact, those who are not satisfied with what God does seem to me like dissatisfied subjects whose attitudes are not much different from those of rebels.

I hold, therefore, that, according to these principles, in order to act in accordance with the love of God, it is not sufficient to force ourselves to be patient; rather, we must truly be satisfied with everything that has come to us according to his will. I mean this acquiescence with respect to the past. As for the future, we must not be quietists⁴ and stand ridiculously with arms folded, awaiting that which God will do, according to the sophism that the ancients called *logon aergon*, the lazy reason. But we must act in accordance with what we presume to be the *will of God*, insofar as we can judge it, trying with all our might to contribute to the general good and especially to the embellishment and perfection of that which affects us or that which is near us, that which is, so to speak, in our grasp. For, although the outcome might perhaps demonstrate that God did not wish our good will to have effect at present, it does not follow that he did not wish us to act as we have. On the contrary, since he is the best of all masters, he never demands more than the right intention, and it is for him to know the proper hour and place for letting the good designs succeed.

5. *What the rules of the perfection of divine conduct consist in, and that the simplicity of the ways is in balance with the richness of the effects.* Therefore it is sufficient to have the confidence that God does everything for the best and that nothing can harm those who love him. But to know in detail the reasons that could have moved him to choose this order of the universe — to allow sins, to dispense his saving grace in a certain way — surpasses the power of a finite mind, especially when it has not yet attained the enjoyment of the vision of God.

However, we can make some general remarks concerning the course of providence in the governance of things. We can therefore say that one who acts perfectly is similar to an excellent geometer who can find the best constructions for a problem; or to a good architect who makes use of his location and the funds set aside for a building in the most advantageous manner, allowing nothing improper or lacking in the beauty of which it is capable; or to a good householder, who makes use of his holdings in such a way that there remains nothing uncultivated and sterile; or to a skilled machinist who produces his work in the least difficult way possible; or to a learned author who includes the greatest number of truths [*realités*] in the smallest possible volume. Now, the most perfect of all beings, those that occupy the least volume, that is, those that least interfere with one another, are minds, whose perfections consist in their virtues. That is why we mustn't doubt that the happiness of minds is the principal aim of God and that he puts this into practice to the extent that general harmony permits it. We shall say more about this below.

As for the simplicity of the ways of God, this holds properly with respect to his means, as opposed to the variety, richness, and abundance, which holds with respect to his ends or effects. And the one must be in balance with the others, as are the costs of a building and the size and beauty one demands of it. It is true that nothing costs God anything—even less than it costs a philosopher to build the fabric of his imaginary world out of hypotheses—since God has only to make decrees in order that a real world come into being. But in matters of wisdom, decrees or hypotheses take the place of expenditures to the extent that they are more

independent of one another, because reason requires that we avoid multiplying hypotheses or principles, in somewhat the same way that the simplest system is always preferred in astronomy.

6. *God does nothing which is not orderly and it is not even possible to imagine events that are not regular.* The volitions or acts of God are commonly divided into ordinary or extraordinary. But it is good to consider that God does nothing which is not orderly. Thus, what passes for extraordinary is extraordinary only with some particular order established among creatures; for everything is in conformity with respect to the universal order. This is true to such an extent that not only does nothing completely irregular occur in the world, but we would not even be able to imagine such a thing. Thus, let us assume, for example, that someone jots down a number of points at random on a piece of paper, as do those who practice the ridiculous art of geomancy.⁵¹ maintain that it is possible to find a geometric line whose notion is constant and uniform, following a certain rule, such that this line passes through all the points in the same order in which the hand jotted them down.

And if someone traced a continuous line which is sometimes straight, sometimes circular, and sometimes of another nature, it is possible to find a notion, or rule, or equation common to all the points of this line, in virtue of which these very changes must occur. For example, there is no face whose contours are not part of a geometric line and cannot be traced in one stroke by a certain regular movement. But, when a rule is extremely complex, what is in conformity with it passes for irregular.

Thus, one can say, in whatever manner God might have created the world, it would always have been regular and in accordance with a certain general order. But God has chosen the most perfect world, that is, the one which is at the same time the simplest in hypotheses and the richest in phenomena, as might be a line in geometry whose construction is easy and whose properties and effects are extremely remarkable and widespread. I use these comparisons to sketch an imperfect likeness of divine wisdom and to point out something that can at least elevate our minds to conceive in some way what cannot be sufficiently expressed. But I do not claim to explain in this way the great mystery upon which the entire universe depends.

7. *That miracles conform to the general order, even though they may be contrary to the subordinate maxims; and about what God wills or permits by a general or particular volition.* Now, since nothing can happen which is not in the order, one can say that miracles are as much within the order as are natural operations, operations which are called natural because they are in conformity with certain subordinate maxims that we call the nature of things. For one can say that this nature is only God's custom, with which he can dispense for any stronger reason than the one which moved him to make use of these maxims.

As for the general or particular volitions, depending upon how the matter is understood, we can say that God does everything following his most general will, which is in conformity with the most perfect order he has chosen, but we can also say that he has particular volitions which are exceptions to these aforementioned subordinate maxims. For the most general of God's laws, the one that rules the whole course of the universe, is without exception.

We can say also that God wills everything that is an object of his particular volition. But we must make a distinction with respect to the objects of his general volition, such as the actions of other creatures, particularly the actions of those that are reasonable, actions with which God wishes to concur. For, if the action is good in itself, we can say that God wills it and sometimes commands it, even when it does not take place. But if the action is evil in itself and becomes good only by accident, because the course of things (particularly punishment and atonement) corrects its evilness and repays the evil with interest in such a way that in the end there is more perfection in the whole sequence than if the evil had not occurred, then we must say that God permits this but does not will it, even though he concurs with it because of the laws of nature he has established and because he knows how to draw a greater good from it.

8. *To distinguish the actions of God from those of creatures we explain the notion of an individual substance.* It is rather difficult to distinguish the actions of God from those of creatures; for some believe that God does everything, while others imagine that he merely conserves the force he has given to creatures. What follows will let us see the extent to which we can say the one or the other. And since actions and passions properly belong to individual substances [*actiones sunt suppositorum*],⁶ it will be necessary to explain what such an individual substance is.

It is indeed true that when several predicates are attributed to a single subject and this subject is attributed to no other, it is called an individual substance; but this is not sufficient, and such an explanation is merely nominal. We must therefore consider what it is to be attributed truly to a certain subject.

Now it is evident that all true predication has some basis in the nature of things and that, when a

proposition is not an identity, that is, when the predicate is not explicitly contained in the subject, it must be contained in it virtually. That is what the philosophers call *in-esse*, when they say that the predicate is in the subject. Thus the subject term must always contain the predicate term, so that one who understands perfectly the notion of the subject would also know that the predicate belongs to it.

Since this is so, we can say that the nature of an individual substance or of a complete being is to have a notion so complete that it is sufficient to contain and to allow us to deduce from it all the predicates of the subject to which this notion is attributed. An accident, on the other hand, is a being whose notion does not include everything that can be attributed to the subject to which the notion is attributed. Thus, taken in abstraction from the subject, the quality of being a king which belongs to Alexander the Great is not determinate enough to constitute an individual and does not include the other qualities of the same subject, nor does it include everything that the notion of this prince includes. On the other hand, God, seeing Alexander's individual notion or haecceity,⁷ sees in it at the same time the basis and reason for all the predicates which can be said truly of him, for example, that he vanquished Darius and Porus; he even knows *a priori* (and not by experience) whether he died a natural death or whether he was poisoned, something we can know only through history. Thus when we consider carefully the connection of things, we can say that from all time in Alexander's soul there are vestiges of everything that has happened to him and marks of everything that will happen to him and even traces of everything that happens in the universe, even though God alone could recognize them all.

9. *That each singular substance expresses the whole universe in its own way, and that all its events, together with all their circumstances and the whole sequence of external things, are included in its notion.* Several notable paradoxes follow from this; among others, it follows that it is not true that two substances can resemble each other completely and differ only in number [*solo numero*], and that what Saint Thomas asserts on this point about angels or intelligences (that here every individual is a lowest species)⁸ is true of all substances, provided that one takes the specific difference as the geometers do with respect to their figures. It also follows that a substance can begin only by creation and end only by annihilation; that a substance is not divisible into two; that one substance cannot be constructed from two; and that thus the number of substances does not naturally increase and decrease, though they are often transformed.

Moreover, every substance is like a complete world and like a mirror of God or of the whole universe, which each one expresses in its own way, somewhat as the same city is variously represented depending upon the different positions from which it is viewed. Thus the universe is in some way multiplied as many times as there are substances, and the glory of God is likewise multiplied by as many entirely different representations of his work. It can even be said that every substance bears in some way the character of God's infinite wisdom and omnipotence and imitates him as much as it is capable. For it expresses, however confusedly, everything that happens in the universe, whether past, present, or future — this has some resemblance to an infinite perception or knowledge. And since all other substances in turn express this substance and accommodate themselves to it, one can say that it extends its power over all the others, in imitation of the creator's omnipotence.

10. *That the belief in substantial forms has some basis, but that these forms do not change anything in the phenomena and must not be used to explain particular effects.* It seems that the ancients, as well as many able men accustomed to deep meditation who have taught theology and philosophy some centuries ago (some of whom are respected for their saintliness) have had some knowledge of what we have just said; this is why they introduced and maintained the substantial forms which are so decried today. But they are not so distant from the truth nor so ridiculous as the common lot of our new philosophers imagines.

I agree that the consideration of these forms serves no purpose in the details of physics and must not be used to explain particular phenomena. That is where the Scholastics failed, as did the physicians of the past who followed their example, believing that they could account for the properties of bodies by talking about forms and qualities without taking the trouble to examine their manner of operation. It is as if we were content to say that a clock has a quality of clockness derived from its form without considering in what all of this consists; that would be sufficient for the person who buys the clock, provided that he turns over its care to another.

But this misunderstanding and misuse of forms must not cause us to reject something whose knowledge is so necessary in metaphysics that, I hold, without it one cannot properly know the first principles or elevate our minds sufficiently well to the knowledge of incorporeal natures and the wonders of God.

However, just as a geometer does not need to burden his mind with the famous labyrinth of the

composition of the continuum, there is no need for any moral philosopher and even less need for a jurist or statesman to trouble himself with the great difficulties involved in reconciling free will and God's providence, since the geometer can achieve all his demonstrations and the statesman can complete all his deliberations without entering into these discussions, discussions that remain necessary and important in philosophy and theology. In the same way, a physicist can explain some experiments, at times using previous simpler experiments and at times using geometric and mechanical demonstrations, without needing general considerations from another sphere. And if he uses God's concurrence, or else a soul, animating force [*archée*], or something else of this nature, he is raving just as much as the person who, in the course of an important practical deliberation, enters into a lofty discussion concerning the nature of destiny and the nature of our freedom. In fact, people often commit this fault without thinking when they encumber their minds with the consideration of fatalism and sometimes are even diverted from a good resolution or a necessary duty in this way.

11. *That the thoughts of the theologians and philosophers who are called Scholastics are not entirely to be disdained.* I know that I am advancing a great paradox by attempting to rehabilitate the old philosophy in some fashion and to restore the almost banished substantial forms to their former place. But perhaps I will not be condemned so easily when it is known that I have long meditated upon the modern philosophy, that I have given much time to experiments in physics and demonstrations in geometry, and that I had long been persuaded about the futility of these beings, which I finally was required to embrace in spite of myself and, as it were, by force, after having myself carried out certain studies. These studies made me recognize that our moderns do not give enough credit to Saint Thomas and to the other great men of his time and that there is much more solidity than one imagines in the opinions of the Scholastic philosophers and theologians, provided that they are used appropriately and in their proper place. I am even convinced that, if some exact and thoughtful mind took the trouble to clarify and summarize their thoughts after the manner of the analytic geometers, he would find there a great treasure of extremely important and wholly demonstrative truths.

12. *That the notions involved in extension contain something imaginary and cannot constitute the substance of body.* But, to resume the thread of our discussion, I believe that anyone who will meditate about the nature of substance, as I have explained it above, will find that the nature of body does not consist merely in extension, that is, in size, shape, and motion, but that we must necessarily recognize in body something related to souls, something we commonly call substantial form, even though it makes no change in the phenomena, any more than do the souls of animals, if they have any. It is even possible to demonstrate that the notions of size, shape, and motion are not as distinct as is imagined and that they contain something imaginary and relative to our perception, as do (though to a greater extent) color, heat, and other similar qualities, qualities about which one can doubt whether they are truly found in the nature of things outside ourselves. That is why qualities of this kind cannot constitute any substance. And if there were no other principle of identity in body other than the one just mentioned, a body could not subsist for more than a moment.

Yet the souls and substantial forms of other bodies are entirely different from intelligent souls, which alone know their actions. Not only don't intelligent souls perish naturally, but they also always preserve the basis for the knowledge of what they are; this is what renders them alone susceptible to punishment and reward and makes them citizens of the republic of the universe, whose monarch is God. It also follows that all other creatures must serve them — something which we will later discuss more fully.

13. *Since the individual notion of each person includes once and for all everything that will ever happen to him, one sees in it the a priori proofs of the truth of each event, or, why one happened rather than another. But these truths, however certain, are nevertheless contingent, being based on the free will of God or of his creatures, whose choice always has its reasons, which incline without necessitating.* But before going further, we must attempt to resolve a great difficulty that can arise from the foundations we have set forth above. We have said that the notion of an individual substance includes once and for all everything that can ever happen to it and that, by considering this notion, one can see there everything that can truly be said of it, just as we can see in the nature of a circle all the properties that can be deduced from it. But it seems that this would eliminate the difference between contingent and necessary truths, that there would be no place for human freedom, and that an absolute fatalism would rule all our actions as well as all the other events of the world. To this I reply that we must distinguish between what is certain and what is necessary. Everyone grants that future contingents are certain, since God foresees them, but we do not concede that they are necessary on that account. But (someone will say) if a conclusion can be deduced infallibly from a definition or notion, it is necessary. And it is true that we are maintaining that everything that must happen to a person is already contained virtually in his nature or

notion, just as the properties of a circle are contained in its definition; thus the difficulty still remains. To address it firmly, I assert that connection or following [*consécution*] is of two kinds. The one whose contrary implies a contradiction is absolutely necessary; this deduction occurs in the eternal truths, for example, the truths of geometry. The other is necessary only *ex hypothesi* and, so to speak, accidentally, but it is contingent in itself, since its contrary does not imply a contradiction. And this connection is based not purely on ideas and God's simple understanding, but on his free decrees and on the sequence of the universe.

Let us take an example. Since Julius Caesar will become perpetual dictator and master of the republic and will overthrow the freedom of the Romans, this action is contained in his notion, for we assume that it is the nature of such a perfect notion of a subject to contain everything, so that the predicate is included in the subject, *ut possit inesse subjecto*.⁹ It could be said that it is not in virtue of this notion or idea that he must perform this action, since it pertains to him only because God knows everything. But someone might insist that his nature or form corresponds to this notion, and, since God has imposed this personality on him, it is henceforth necessary for him to satisfy it. I could reply by citing future contingents, since they have no reality as yet, save in God's understanding and will, and, because God gave them this form in advance, they must in the same way correspond to it.

But I much prefer to overcome difficulties rather than to excuse them by giving some other similar difficulties, and what I am about to say will illuminate the one as well as the other. It is here, then, that we must apply the distinction concerning connections, and I say that whatever happens in conformity with these predeterminations [*avances*] is certain but not necessary, and if one were to do the contrary, he would not be doing something impossible in itself, even though it would be impossible [*ex hypothesi*] for this to happen. For if someone were able to carry out the whole demonstration by virtue of which he could prove this connection between the subject, Caesar, and the predicate, his successful undertaking, he would in fact be showing that Caesar's future dictatorship is grounded in his notion or nature, that there is a reason why he crossed the Rubicon rather than stopped at it and why he won rather than lost at Pharsalus and that it was reasonable, and consequently certain, that this should happen. But this would not show that it was necessary in itself nor that the contrary implies a contradiction. It is reasonable and certain in almost the same way that God will always do the best, even though what is less perfect does not imply a contradiction.

For it will be found that the demonstration of this predicate of Caesar is not as absolute as those of numbers or of geometry, but that it supposes the sequence of things that God has freely chosen, a sequence based on God's first free decree always to do what is most perfect and on God's decree with respect to human nature, following out of the first decree, that man will always do (although freely) that which appears to be best. But every truth based on these kinds of decrees is contingent, even though it is certain; for these decrees do not change the possibility of things, and, as I have already said, even though it is certain that God always chooses the best, this does not prevent something less perfect from being and remaining possible in itself, even though it will not happen, since it is not its impossibility but its imperfection which causes it to be rejected. And nothing is necessary whose contrary is possible.

We will therefore be in a position to satisfy these sorts of difficulties, however great they may appear (and in fact they are not made any the less pressing by considering the other thinkers who have ever treated this matter), as long as we recognize that all contingent propositions have reasons to be one way rather than another or else (what comes to the same thing) that they have *a priori* proofs of their truth which render them certain and which show that the connection between subject and predicate of these propositions has its basis in the natures of both. But they do not have necessary demonstrations, since these reasons are based only on the principle of contingency or the principle of the existence of things, that is, based on what is or appears to be best from among several equally possible things. On the other hand, necessary truths are based on the principle of contradiction and on the possibility or impossibility of essences themselves, without regard to the free will of God or his creatures.

14. *God produces various substances according to the different views he has of the universe, and through God's intervention the proper nature of each substance brings it about that what happens to one corresponds with what happens to all the others, without their acting upon one another directly.* After having seen, in some way, what the nature of substances consists in, we must try to explain the dependence they have upon one another and their actions and passions. Now, first of all, it is very evident that created substances depend upon God, who preserves them and who even produces them continually by a kind of emanation, just as we produce our thoughts. For God, so to speak, turns on all sides and in all ways the general system of phenomena which he finds it good to produce in order to manifest his glory, and he views all the faces of the world in all ways possible, since there is no relation that escapes his omniscience. The result of each view of the universe, as

seen from a certain position, is a substance which expresses the universe in conformity with this view, should God see fit to render his thought actual and to produce this substance. And since God's view is always true, our perceptions are always true; it is our judgments, which come from ourselves, that deceive us.

Now we said above, and it follows from what we have just said, that each substance is like a world apart, independent of all other things, except for God; thus all our phenomena, that is, all the things that can ever happen to us, are only consequences of our being. And since these phenomena maintain a certain order in conformity with our nature or, so to speak, in conformity with the world which is in us, an order which enables us to make useful observations to regulate our conduct, observations justified by the success of future phenomena, an order which thus allows us often to judge the future from the past without error, this would be sufficient to enable us to say that these phenomena are true without bothering with whether they are outside us and whether others also perceive them. Nevertheless, it is very true that the perceptions or expressions of all substances mutually correspond in such a way that each one, carefully following certain reasons or laws it has observed, coincides with others doing the same — in the same way that several people who have agreed to meet in some place at some specified time can really do this if they so desire. But although they all express the same phenomena, it does not follow that their expressions are perfectly similar; it is sufficient that they are proportional. In just the same way, several spectators believe that they are seeing the same thing and agree among themselves about it, even though each sees and speaks in accordance with his view.

And God alone (from whom all individuals emanate continually and who sees the universe not only as they see it but also entirely differently from all of them) is the cause of this correspondence of their phenomena and makes that which is particular to one of them public to all of them; otherwise, there would be no interconnection. We could therefore say in some way and properly speaking, though not in accordance with common usage, that one particular substance never acts upon another particular substance nor is acted upon by it, if we consider that what happens to each is solely a consequence of its complete idea or notion alone, since this idea already contains all its predicates or events and expresses the whole universe. In fact, nothing can happen to us except thoughts and perceptions, and all our future thoughts and perceptions are merely consequences, though contingent, of our preceding thoughts and perceptions, in such a way that, if I were capable of considering distinctly everything that happens or appears to me at this time, I could see in it everything that will ever happen or appear to me. This would never fail, and it would happen to me regardless, even if everything outside of me were destroyed, provided there remained only God and me. But since we attribute what we perceive in a certain way to other things as causes acting on us, we must consider the basis for this judgment and the element of truth there is in it.

15. *The action of one finite substance on another consists only in the increase of degree of its expression together with the diminution of the expression of the other, insofar as God requires them to accommodate themselves to one another.* But, without entering into a long discussion, in order to reconcile the language of metaphysics with practice, it is sufficient for now to remark that we ascribe to ourselves — and with reason — the phenomena that we express most perfectly and that we attribute to other substances the phenomena that each expresses best. Thus a substance, which is of infinite extension insofar as it expresses everything, becomes limited in proportion to its more or less perfect manner of expression. This, then, is how one can conceive that substances impede or limit each other, and consequently one can say that, in this sense, they act upon one another and are required, so to speak, to accommodate themselves to one another. For it can happen that a change that increases the expression of one diminishes that of another. Now, the efficacy [*vertu*] a particular substance has is to express well the glory of God, and it is by doing this that it is less limited. And whenever something exercises its efficacy or power, that is, when it acts, it improves and extends itself insofar as it acts. Therefore, when a change takes place by which several substances are affected (in fact every change affects all of them), I believe one may say that the substance which immediately passes to a greater degree of perfection or to a more perfect expression exercises its power and *acts*, and the substance which passes to a lesser degree shows its weakness and is *acted upon* [*pâtit*]. I also hold that every action of a substance which has perfection involves some *pleasure*, and every passion some *pain* and vice versa. However, it can happen that a present advantage is destroyed by a greater evil in what follows, whence one can sin in acting, that is, in exercising one's power and finding pleasure.

16. *God's extraordinary concurrence is included in that which our essence expresses, for this expression extends to everything. But this concurrence surpasses the powers of our nature or of our distinct expression, which is finite and follows certain subordinate maxims.* It now only remains to explain how God can sometimes influence men and other substances by an extraordinary and miraculous concurrence, since it seems that nothing extraordinary and supernatural can happen to them, given that all their events are only consequences of their nature. But we

must remember what we have said above concerning miracles in the universe—that they are always in conformity with the universal law of the general order, even though they may be above the subordinate maxims. And to the extent that every person or substance is like a small world expressing the large world, we can say equally that the extraordinary action of God on this substance does not fail to be miraculous, despite the fact that it is included in the general order of the universe insofar as it is expressed by the essence or individual notion of this substance. That is why, if we include in our nature everything that it expresses, nothing is supernatural to it, for our nature extends everywhere, since an effect always expresses its cause and God is the true cause of substances. But what our nature expresses more perfectly belongs to it in a particular way, since it is in this that its power consists. But since it is limited, as I have just explained, there are many things that surpass the powers of our nature and even surpass the powers of all limited natures. Thus, to speak more clearly, I say that God's miracles and extraordinary concurrence have the peculiarity that they cannot be foreseen by the reasoning of any created mind, no matter how enlightened, because the distinct comprehension of the general order surpasses all of them. On the other hand, everything that we call natural depends on the less general maxims that creatures can understand. Thus, in order that my words may be as irreproachable as my meaning, it would be good to connect certain ways of speaking with certain thoughts. We could call that which includes everything we express our essence or idea; since this expresses our union with God himself, it has no limits and nothing surpasses it. But that which is limited in us could be called our nature or our power; and in that sense, that which surpasses the natures of all created substances is supernatural.

17. *An example of a subordinate maxim or law of nature; in which it is shown, against the Cartesians and many others, that God always conserves the same force but not the same quantity of motion.* I have already mentioned the subordinate maxims or laws of nature often enough, and it seems appropriate to give an example of one. Our new philosophers commonly make use of the famous rule that God always conserves the same quantity of motion in the world. In fact, this rule is extremely plausible, and, in the past, I held it as indubitable. But I have since recognized what is wrong with it. It is that Descartes and many other able mathematicians have believed that the quantity of motion, that is, the speed multiplied by the size of the moving body, coincides exactly with the moving force, or, to speak geometrically, that the forces are proportional to the product of the speeds and [sizes of] bodies. Now, it is extremely reasonable that the same force is always conserved in the universe. Also, when we attend to the phenomena, we see that there is no perpetual mechanical motion, because then the force of a machine, which is always diminished somewhat by friction and which must sooner or later come to an end, would restore itself, and consequently would increase by itself without any new external impulsion. We observe also that the force of a body is diminished only in proportion to the force it imparts to some bodies contiguous to it or to its own parts, insofar as they have separate motion.

Thus they believed that what can be said about force can also be said about the quantity of motion. But to show the difference between them, I assume that a body falling from a certain height acquires the force to rise up that height, if its direction carries it that way, at least, if there are no impediments. For example, a pendulum would rise again exactly to the height from which it descended if the resistance of the air and some other small obstacles did not diminish its acquired force a little.

I *assume* also that as much force is required to elevate A, a body of one pound, to CD, a height of four fathoms, as to elevate B, a body of four pounds, to EF, a height of one fathom. All this is admitted by our new philosophers.

It is therefore evident that, having fallen from height CD, body A acquired exactly as much force as did body B, which fell from height EF; for since body (B) reached F and acquired the force to rise to E (by the first assumption), it has the force to carry a body of four pounds, that is, itself, to EF, the height of one fathom; similarly, since body (A) reached D and acquired the force to rise to C, it has the force to carry a body of one pound, that is, itself, to CD, a height of four fathoms. Therefore (by the second assumption), the force of these two bodies is equal.

Let us now see whether the quantity of motion is also the same in each. But here we will be surprised to find a very great difference. For Galileo demonstrated that the speed acquired by the fall CD is twice the speed acquired by the fall EF, even though the one height is four times the other. Let us therefore multiply body A, proportional to 1, with its speed, proportional to 2; the product or quantity of motion will be proportional to 2. On the other hand, let us multiply body B, proportional to 4, by its speed, proportional to 1; the product or quantity of motion will be proportional to 4. Therefore the quantity of motion of body (A) at point D is half of the quantity of motion of body (B) at point F; yet their forces are equal. Hence, there is a great difference between quantity of motion and force — which is what needed to be proved.

Thus we see that force must be calculated from the quantity of the effect it can produce, for example, by the height to which a heavy body of a certain size and kind can be raised; this is quite different from the speed that can be imparted to it. And to give it double the speed, it must be given more than double the force.

Nothing is simpler than this proof. Descartes fell into error here only because he had too much confidence in his own thoughts, even when they were not sufficiently ripe. But I am surprised that his followers have not since then discovered this mistake; and I fear that they are beginning, little by little, to imitate some of the Peripatetics, whom they ridicule, like them gradually acquiring the habit of consulting their master's writings rather than reason and nature.

18. *The distinction between force and quantity of motion is important, among other reasons, for judging that one must have recourse to metaphysical considerations distinct from extension in order to explain the phenomena of bodies.* This consideration, the distinction between force and quantity of motion, is rather important, not only in physics and mechanics, in order to find the true laws of nature and rules of motion and even to correct the several errors of practice which have slipped into the writings of some able mathematicians, but also in metaphysics, in order to understand the principles better. For if we consider only what motion contains precisely and formally, that is, change of place, motion is not something entirely real, and when several bodies change position among themselves, it is not possible to determine, merely from a consideration of these changes, to which body we should attribute motion or rest, as I could show geometrically, if I wished to stop and do this now.

But the force or proximate cause of these changes is something more real, and there is sufficient basis to attribute it to one body more than to another. Also, it is only in this way that we can know to which body the motion belongs. Now, this force is something different from size, shape, and motion, and one can therefore judge that not everything conceived in body consists solely in extension and in its modifications, as our moderns have persuaded themselves. Thus we are once again obliged to reestablish some beings or forms they have banished. And it becomes more and more apparent that, although all the particular phenomena of nature can be explained mathematically or mechanically by those who understand them, nevertheless the general principles of corporeal nature and of mechanics itself are more metaphysical than geometrical, and belong to some indivisible forms or natures as the causes of appearances, rather than to corporeal mass or extension. This is a reflection capable of reconciling the mechanical philosophy of the moderns with the caution of some intelligent and well-intentioned persons who fear, with some reason, that we are withdrawing too far from immaterial beings, to the disadvantage of piety.

19. *The utility of final causes in physics.* Since I do not like to judge people wrongly, I do not accuse our new philosophers, who claim to banish final causes from physics.¹⁰ But I am nevertheless obliged to confess that the consequences of this opinion appear dangerous to me, especially if I combine it with the one I refuted at the beginning of this discourse, which seems to go so far as to eliminate final causes altogether, as if God proposed no end or good in acting or as if the good were not the object of his will. As for myself, I hold, on the contrary, that it is here we must seek the principle of all existences and laws of nature, because God always

intends the best and most perfect.

I am quite willing to admit that we are subject to deception when we wish to determine God's ends or counsels. But this is only when we try to limit them to some particular design, believing that he had only one thing in view, when instead he regards everything at the same time. For instance, it is a great mistake to believe that God made the world only for us, although it is quite true that he made it in its entirety for us and that there is nothing in the universe which does not affect us and does not also accommodate itself in accordance with his regard for us, following the principles set forth above. Thus when we see some good effect or perfection occurring or ensuing from God's works, we can say with certainty that God had proposed it. For he does nothing by chance and is not like us, who sometimes fail to do the good. That is why, far from being able to fall into error in this, as do extreme politicians who imagine too much subtlety in the designs of princes or as do commentators who look for too much erudition in their author, we cannot attribute too much reflection to this infinite wisdom, and there is no subject in which error is to be feared less, provided we limit ourselves to affirmations and avoid negative propositions that limit God's designs.

Anyone who sees the admirable structure of animals will find himself forced to recognize the wisdom of the author of things. And I advise those who have any feelings of piety and even feelings of true philosophy to keep away from the phrases of certain would-be free thinkers who say that we see because it happens that we have eyes and not that eyes were made for seeing. When one seriously holds these opinions ascribing everything to the necessity of matter or to some chance (even though both must appear ridiculous to those who understand what we have explained above), it is difficult to recognize an intelligent author of nature. For the effect must correspond to its cause; indeed, the effect is best recognized through a knowledge of the cause. Moreover, it is unreasonable to introduce a supreme intelligence as orderer of things and then, instead of using his wisdom, use only the properties of matter to explain the phenomena. This is as if, in order to account for the conquest of an important place by a great prince, a historian were to claim that it occurred because the small particles of gunpowder, set off by the contact of a spark, escaped with sufficient speed to push a hard and heavy body against the walls of the place, while the little particles that make up the brass of the cannon were so firmly interlaced that this speed did not separate them, instead of showing how the foresight of the conqueror enabled him to choose the suitable means and times and how his power overcame all obstacles.

20. *A noteworthy passage by Socrates in Plato against the philosophers who are overly materialistic.* This reminds me of a beautiful passage by Socrates in Plato's *Phaedo*. This passage agrees marvelously with my opinions on this point and seems to be directed expressly against our overly materialistic philosophers. Thus I have been tempted to translate this account, even though it is a little long; perhaps this sample will give an incentive to some of us to share in many of the other beautiful and solid thoughts which can be found in the writings of this famous author.¹¹

21. *If mechanical rules depended only on geometry without metaphysics, the phenomena would be entirely different.* Now, since we have always recognized God's wisdom in the detail of the mechanical structure of some particular bodies, it must also be displayed in the general economy of the world and in the constitution of the laws of nature. This is true to such an extent that one can observe the counsels of this wisdom in the laws of motion in general. For if there were nothing in bodies but extended mass and nothing in motion but change of place and if everything should and could be deduced solely from these definitions by geometrical necessity, it would follow, as I have shown elsewhere, that, upon contact, the smallest body would impart its own speed to the largest body without losing any of this speed; and we would have to accept a number of such rules which are completely contrary to the formation of a system. But the decree of divine wisdom always to conserve the same total force and the same total direction has provided for this.

I even find that several effects of nature can be demonstrated doubly, that is, by considering first the efficient cause and then by considering the final cause, making use, for example, of God's decree always to produce his effect by the easiest and most determinate ways, as I have shown elsewhere in accounting for the rules of catoptrics and dioptrics;¹² I shall say more about this soon.

22. *Reconciliation of two ways of explaining things, by final causes and by efficient causes, in order to satisfy both those who explain nature mechanically and those who have recourse to incorporeal natures.* It is appropriate to make this remark in order to reconcile those who hope to explain mechanically the formation of the first tissue of an animal and the whole machinery of its parts, with those who account for this same structure using final causes. Both ways are good and both can be useful, not only for admiring the skill of the Great Worker, but also for

discovering something useful in physics and in medicine. And the authors who follow these different routes should not malign each other.

For I see that those who apply themselves to explaining the beauty of the divine anatomy laugh at others who imagine that a movement of certain fluids that seems fortuitous could have produced such a beautiful variety of limbs, and call these people rash and profane. And the latter, on the other hand, call the former simple and superstitious, comparing them to the ancients who regarded physicists as impious when they maintained that it is not Jupiter that thunders, but some matter present in the clouds. It would be best to join together both considerations, for if it is permitted to use a humble comparison I recognize and praise the skill of a worker not only by showing his designs in making the parts of his machine, but also by explaining the instruments he used in making each part, especially when these instruments are simple and cleverly contrived. *And God is a skillful enough artisan* to produce a machine which is a thousand times more ingenious than that of our body, while using only some very simple fluids explicitly concocted in such a way that only the ordinary laws of nature are required to arrange them in the right way to produce so admirable an effect; but it is also true that this would not happen at all unless God were the author of nature.

However, I find that the way of efficient causes, which is in fact deeper and in some sense more immediate and *a priori*, is, on the other hand, quite difficult when one comes to details, and I believe that, for the most part, our philosophers are still far from it. But the way of final causes is easier, and is not infrequently of use in divining important and useful truths which one would be a long time in seeking by the other, more physical way; anatomy can provide significant examples of this. I also believe that Snell, who first discovered the rules of refraction, would have waited a long time before discovering them if he first had to find out how light is formed. But he apparently followed the method which the ancients used for catoptrics, which is in fact that of final causes. For, by seeking the easiest way to lead a ray from a given point to another point given by reflection on a given plane (assuming that this is nature's design), they discovered the equality of angles of incidence and angles of reflection, as can be seen in a little treatise by Heliodorus of Larissa, and elsewhere.¹³ That is what, I believe, Snell and Fermat after him (though without knowing anything about Snell) have most ingeniously applied to refraction. For when, in the same media, rays observe the same proportion between sines (which is proportional to the resistances of the media), this happens to be the easiest or, at least, the most determinate way to pass from a given point in a medium to a given point in another. And the demonstration Descartes attempted to give of this same theorem by way of efficient causes is not nearly as good. At least there is room for suspicion that he would never have found the law in this way, if he had learned nothing in Holland of Snell's discovery.¹⁴

23. *To return to immaterial substances, we explain how God acts on the understanding of minds and whether we always have the idea of that about which we think.* I found it appropriate to insist a bit on these considerations of final causes, incorporeal natures, and an intelligent cause with respect to bodies, in order to show their use even in physics and mathematics: on the one hand, to purge the mechanical philosophy of the impiety with which it is charged and, on the other hand, to elevate the minds of our philosophers from material considerations alone to nobler meditations. It is now appropriate to return from bodies to immaterial natures, in particular to minds, and to say something of the means God uses to enlighten them and act on them. In this matter, too, we must not doubt that there are certain laws of nature, of which I could speak more fully elsewhere. But for now it will be sufficient to touch somewhat on ideas, whether we see all things in God and how God is our light.

It may be appropriate to observe that the improper use of ideas gives rise to several errors. For when we reason about something, we imagine ourselves to have the idea of that thing; and that is the foundation upon which certain ancient and new philosophers have built a certain extremely imperfect demonstration of God. For, they say, I must have an idea of God or of a perfect being since I think of him, and one cannot think without an idea. Now, the idea of this being contains all perfections, and existence is a perfection, so consequently he exists. But since we often think of impossible chimeras — for example, of the highest degree of speed, of the greatest number, of the intersection of the conchoid with its base or rule—this reasoning is insufficient. It is therefore in this sense that we can say that there are true and false ideas, depending upon whether the thing in question is possible or not. And it is only when we are certain of its possibility that we can boast of having an idea of the thing. Thus the argument above proves, at least, that God exists necessarily, if he is possible. It is indeed a prerogative of divine nature, one that surpasses all others, that divine nature needs only its possibility or essence in order actually to exist, and it is precisely this that is called *ens a se*.

24. *What is clear or obscure, distinct or confused, adequate and intuitive or suppositive knowledge; nominal, real,*

causal, and essential definition. In order to understand better the nature of ideas, we must to some extent touch on the varieties of knowledge. When I can recognize a thing from among others without being able to say what its differences or properties consist in, the knowledge is *confused*. It is in this way that we sometimes know something *clearly*, without being in any doubt whether a poem or a picture is done well or badly, simply because it has a certain something, I know not what, that satisfies or offends us. But when I can explain the marks which I have, the knowledge is called *distinct*. And such is the knowledge of an assayer, who discerns the true from the false by means of certain tests or marks which make up the definition of gold.

But distinct knowledge has degrees, for ordinarily the notions that enter into the definition would themselves need definition and are known only confusedly. But when everything that enters into a distinct definition or distinct knowledge is known distinctly, down to the primitive notions, I call this knowledge *adequate*. And when my mind understands all the primitive ingredients of a notion at once and distinctly, it has *intuitive* knowledge of it; this is extremely rare, since the greater part of human knowledge is only confused or *suppositive*.

It is also good to distinguish nominal and real definitions. I call a definition *nominal* when one can still doubt whether the notion defined is possible, as, for example, if I say that an endless helix is a solid line whose parts are congruent or can be superimposed on one another; anyone who does not know from elsewhere what an endless helix is could doubt whether such a line is possible, even though having such congruent parts is in fact one of the reciprocal properties of the endless helix, for other lines whose parts are congruent (which are only the circumference of a circle and the straight line) are planar, that is, they can be inscribed on a plane. This shows that any reciprocal property can serve as a nominal definition; but when the property makes known the possibility of the thing, it constitutes a real definition. As long as we have only a nominal definition, we cannot be certain of the consequences we derive, for if it concealed some contradiction or impossibility, the opposite conclusions could be derived from it. That is why truths do not depend upon names and are not arbitrary, as some new philosophers have believed.¹⁵

Furthermore, there are still great differences between the kinds of real definitions. For when possibility is proved only by experience, as in the definition of quicksilver, whose possibility we know because we know that there actually is such a body which is an extremely heavy but rather volatile fluid, the definition is merely real and nothing more; but when the proof of the possibility is *a priori*, the definition is both real and *causal*, as when it contains the possible generation of the thing. And when a definition pushes the analysis back to the primitive notions without assuming anything requiring an *a priori* proof of its possibility, it is perfect or *essential*.

25. *In what case our knowledge is joined to the contemplation of the idea.* Now, it is evident that we have no idea of a notion when it is impossible. And in the case where knowledge is only *suppositive*, even when we have the idea, we do not contemplate it, for such a notion is only known in the way in which we know notions involving a hidden impossibility [*occultement impossibles*]; and if a notion is possible, we do not learn its possibility in this way. For example, when I think of a thousand or of a chiliagon, I often do this without contemplating the idea—as when I say that a thousand is ten times a hundred without bothering to think of what 10 and 100 are because I *suppose* I know it and do not believe I need to stop now and conceive it. Thus, it could happen, as in fact it often happens, that I am mistaken with respect to a notion I suppose or believe that I understand, although in fact the notion is impossible, or at least incompatible with those to which I join it. And whether I am mistaken or not, this suppositive way of conceiving remains the same. Therefore, only in confused notions when our knowledge is *clear* or in distinct notions when it is *intuitive* do we see the entire idea in them.

26. *That we have all ideas in us; and of Plato's doctrine of reminiscence.* In order properly to conceive what an idea is, we must prevent an equivocation. For some take the idea to be the form or difference of our thoughts, and thus we have an idea in the mind only insofar as we think of it; every time we think of it again, we have other ideas of the same thing, though similar to the preceding ideas. But it seems that others take the idea as an immediate object of thought or as some permanent form that remains when we are not contemplating it. And, in fact, our soul always has in it the quality of representing to itself any nature or form whatsoever, when the occasion to think of it presents itself. And I believe that this quality of our soul, insofar as it expresses some nature, form, or essence, is properly the idea of the thing, which is in us and which is always in us, whether we think of it or not. For our soul expresses God, the universe, and all essences, as well as all existences.

This agrees with my principles, for nothing ever enters into our mind naturally from the outside; and we have a bad habit of thinking of our soul as if it received certain species as messengers and as if it has doors and

windows. We have all these forms in our mind; we even have forms from all time, for the mind always expresses all its future thoughts and already thinks confusedly about everything it will ever think about distinctly. And nothing can be taught to us whose idea we do not already have in our mind, an idea which is like the matter of which that thought is formed.

This is what Plato so excellently recognized when he proposed his doctrine of reminiscence, a very solid doctrine, provided that it is taken rightly and purged of the error of preexistence and provided that we do not imagine that at some earlier time the soul must already have known and thought distinctly what it learns and thinks now. Plato also strengthened his view by way of a fine experiment, introducing a little boy, whom he leads insensibly to extremely difficult truths of geometry concerning incommensurables without teaching him anything, merely by asking appropriate questions in proper order.¹⁶ This demonstrates that our soul knows all these things virtually and requires only *attention* to recognize truths, and that, consequently, it has, at very least, the ideas upon which these truths depend. One can even say that it already possesses these truths, if they are taken as relations of ideas.

27. *How our soul can be compared to empty tablets and how our notions come from the senses.* Aristotle preferred to compare our soul to tablets that are still blank, where there is room for writing,¹⁷ and he maintained that nothing is in our understanding that does not come from the senses. That agrees better with the popular notions, as is Aristotle's way, but Plato goes deeper. However, these kinds of doxologies or practicologies may be acceptable in ordinary usage, much as we see that those who follow Copernicus do not stop saying that the sun rises and sets. I even find that they can be given a good sense, a sense according to which they have nothing false in them, just as I have already noted how one can truly say that particular substances act on one another. In this same way, one can also say that we receive knowledge from the outside by way of the senses, because some external things contain or express more particularly the reasons that determine our soul to certain thoughts. But when we are concerned with the exactness of metaphysical truths, it is important to recognize the extent and independence of our soul, which goes infinitely further than is commonly thought, though in ordinary usage in life we attribute to it only what we perceive most manifestly and what belongs to us most particularly, for it serves no purpose to go any further.

However, it would be good to choose terms proper to each conception [*sens*] in order to avoid equivocation. Thus, the expressions in our soul, whether we conceive them or not, can be called *ideas*, but those we conceive or form can be called *notions*, *concepts* [*conceptus*]. But however we take these expressions, it is always false to say that all our notions come from the external senses, for the notions I have of myself and of my thoughts, and consequently of being, substance, action, identity, and of many others, arise from an internal experience.

28. *God alone is the immediate object of our perceptions, which exist outside of us, and he alone is our light.* Now, in rigorous metaphysical truth, there is no external cause acting on us except God alone, and he alone communicates himself to us immediately in virtue of our continual dependence. From this it follows that there is no other external object that touches our soul and immediately excites our perception. Thus we have ideas of everything in our soul only by virtue of God's continual action on us, that is to say, because every effect expresses its cause, and thus the essence of our soul is a certain expression, imitation or image of the divine essence, thought, and will, and of all the ideas comprised in it. It can then be said that God is our immediate external object and that we see all things by him. For example, when we see the sun and the stars, it is God who has given them to us and who conserves the ideas of them in us, and it is God who determines us really to think of them by his ordinary concurrence while our senses are disposed in a certain manner, according to the laws he has established. God is the sun and the light of souls, the light that lights every man that comes into this world,¹⁸ and this is not an opinion new to our times. After Holy Scripture and the Church Fathers, who have always preferred Plato to Aristotle, I remember having previously noted that from the time of the Scholastics, several believed that God is the light of the soul and, in their way of speaking, the active intellect of the rational soul. The Averroists gave the sense of this a bad turn,¹⁹ but others, among whom was, I believe, William of St. Amour, and several mystical theologians, have taken it in a manner worthy of God and capable of elevating the soul to the knowledge of its good.

29. *Yet we think immediately through our own ideas and not through those of God.* However, I am not of the opinion of certain able philosophers who seem to maintain that our very ideas are in God and not at all in us.²⁰ In my opinion, this arises from the fact that they have not yet considered sufficiently either what we have just explained about substances or the full extent and independence of our soul, which makes it contain

everything that happens to us and makes it express God and, with him, all possible and actual beings, just as an effect expresses its cause. Also, it is inconceivable that I think through the ideas of others. The soul must actually be affected in a certain way when it thinks of something, and it must already have in itself not only the passive power of being able to be affected in this way (which is already wholly determined) but also an active power, a power by virtue of which there have always been in its nature marks of the future production of this thought and dispositions to produce it in its proper time. And all this already involves the idea included in this thought.

30. *How God inclines our soul without necessitating it; that we do not have the right to complain and that we must not ask why Judas sins but only why Judas the sinner is admitted to existence in preference to some other possible persons. On original imperfection before sin and on the degrees of grace.* There are a number of considerations with respect to the action of God on human will which are so difficult that it would be inordinately lengthy to pursue them here. Roughly speaking, however, here is what can be said. In concurring with our actions, God ordinarily does no more than follow the laws he has established, that is, he continually conserves and produces our being in such a way that thoughts come to us spontaneously or freely in the order that the notion pertaining to our individual substance contains them, a notion in which they could be foreseen from all eternity. Moreover, in virtue of his decree that the will always tend toward the apparent good, expressing or imitating his will in certain particular respects (so that this apparent good always has some truth in it), God determines our will to choose what seems better, without, however, necessitating it. For, absolutely speaking, the will is in a state of indifference, as opposed to one of necessity, and it has the power to do otherwise or even to suspend its action completely; these two alternatives are possible and remain so.

Therefore the soul must guard itself against deceptive appearances [*les surprises des apparences*] through a firm will to reflect and neither to act nor to judge in certain circumstances except after having deliberated fully. But it is true, and it is even assured from all eternity, that a certain soul will not make use of this power in such a situation. But who is to blame? Can the soul complain about anything other than itself? All these complaints after the fact are unjust, if they would have been unjust before the fact. Now, could this soul, a little before sinning, complain about God in good faith, as if God determined it to sin? Since God's determinations in these matters cannot be foreseen, how does the soul know that it is determined to sin, unless it is actually sinning already? It is only a matter of not willing, and God could not put forth an easier and more just condition; thus judges do not seek the reasons which have disposed a man to have a bad will, but only stop to consider the extent to which this particular will is bad. But perhaps it is certain from all eternity that I shall sin? Answer this question for yourself: perhaps not; and without considering what you cannot know and what can give you no light, act according to your duty, which you do know.

But someone else will say, why is it that this man will assuredly commit this sin? The reply is easy: otherwise he would not be this man. For God sees from all time that there will be a certain Judas whose notion or idea (which God has) contains this free and future action. Therefore only this question remains, why does such a Judas, the traitor, who is merely possible in God's idea, actually exist? But no reply to this question is to be expected on earth, except that, in general, one must say that, since God found it good that he should exist, despite the sin that God foresaw, it must be that this sin is paid back with interest in the universe, that God will derive a greater good from it, and that it will be found that, in sum, the sequence of things in which the existence of that sinner is included is the most perfect among all the possible sequences. But we cannot always explain the admirable economy of this choice while we are travellers in this world; it is enough to know it without understanding it. And here is the occasion to recognize the *altitudinem divitarum*, the depth and abyss of divine wisdom, without seeking a detail that involves infinite considerations.²¹

Yet one sees clearly that God is not the cause of evil. For not only did original sin take possession of the soul after the innocence of men had been lost, but even before this, there was an original imperfection or limitation connatural to all creatures, which makes them liable to sin or capable of error. Thus, the supralapsarians²² raise no more problems than the others do. And it is to this, in my view, that we must reduce the opinion of Saint Augustine and other authors, the opinion that the root of evil is in nothingness, that is to say, in the privation or limitation of creatures, which God graciously remedies by the degree of perfection it pleases him to give. This grace of God, whether ordinary or extraordinary, has its degrees and its measures; in itself, it is always efficacious in producing a certain proportionate effect, and, further, it is always sufficient, not only to secure us from sin, but even to produce salvation, assuming that man unites himself to it by what derives from him. But it is not always sufficient to overcome man's inclinations, for otherwise he would have nothing more to strive for; this is reserved solely for the absolutely efficacious grace which is always victorious, whether it is so by itself or by way of appropriate circumstances.

31. *On the motives of election, on faith foreseen, on middle knowledge, on the absolute decree and that it all reduces to the reason why God has chosen for existence such a possible person whose notion includes just such a sequence of graces and free acts; this puts an end to all difficulties at once.* Finally, God's graces are wholly pure graces, upon which creatures have no claim. However, just as it is not sufficient to appeal to God's absolute or conditional foresight into the future actions of men in order to account for his choice in the dispensation of these graces, we also must not imagine absolute decrees that have no reasonable motive. As for God's foreknowledge of faith or good works, it is very true that he has elected only those whose faith and charity he foresaw, whom he foreknew he would endow with faith. But the same question returns, why will God give the grace of faith or of good works to some rather than to others? And as for this knowledge God has, which is the foresight not of faith and good works, but of their grounds [*matière*] and predisposition, that is, foresight of what a man would contribute to them on his side (for it is true that there are differences among men whenever there are differences in grace and that, in fact, although a man needs to be stimulated to the good and be converted, he must also act in that direction afterward), it seems to several people that one could say that God, seeing what a man would do without grace or extraordinary assistance, or at least seeing the sort of person he is, leaving grace aside, might resolve to give grace to those whose natural dispositions were better or, at least, less imperfect or less bad. But even if that were the case, one can say that these natural dispositions, insofar as they are good, are still the effect of grace, although ordinary grace, since God has favored some more than others. And since he knows that these natural advantages he gives will serve as motives for grace or extraordinary assistance, is it not true, according to this doctrine, that in the end everything is completely reduced to his mercy?

Since we do not know how much and in what way God takes account of natural dispositions in the dispensation of grace, I believe, then, that the most exact and surest thing to say, according to our principles, as I have already noted, is that among the possible beings there must be the person of Peter or John, whose notion or idea contains this entire sequence of ordinary and extraordinary graces and all the rest of these events with their circumstances, and that it pleased God to choose him for actual existence from among an infinity of equally possible persons. After this it seems that there is nothing more to ask and that all difficulties vanish.

For, with respect to this single great question, why it pleased God to choose him from among so many other possible persons, one would have to be very unreasonable not to be content with the general reasons we have given, reasons whose details lie beyond us. Thus, instead of having recourse to an absolute decree which is unreasonable, since it is without reason, or to reasons which do not solve the difficulty completely and are in need of further reasons, it would be best to say with Saint Paul, that God here followed certain great reasons of wisdom or appropriateness, unknown to mortals and based on the general order, whose aim is the greatest perfection of the universe. It is to this that the motives of the glory of God and the manifestation of his justice are reduced, as well as of his mercy and generally of his perfections and finally the immense depth of his riches, with which the soul of Saint Paul was enraptured.

32. *The utility of these principles in matters of piety and religion.* For the rest, it seems that the thoughts we have just explained, particularly the great principle of the perfection of the operations of God and the principle that the notion of a substance contains all its events with all their circumstances, far from harming, serve to confirm religion, to dispel enormous difficulties, to enflame souls with a divine love, and to elevate minds to the knowledge of incorporeal substances, much more than hypotheses we have seen until now. For one sees clearly that all other substances depend on God, in the same way as thoughts emanate from our substance, that God is all in all, and that he is intimately united with all creatures, in proportion to their perfection, that it is he alone who determines them from the outside by his influence, and, if to act is to determine immediately, it can be said in this sense, in the language of metaphysics, that God alone operates on me, and God alone can do good or evil to me; the other substances contribute only by reason of these determinations, because God, having regard for all, shares his blessings and requires them to accommodate themselves to one another. Hence God alone brings about the connection and communication among substances, and it is through him that the phenomena of any substance meet and agree with those of others and consequently, that there is reality in our perceptions. But, in practice, one ascribes an action to particular reasons in the sense that I have explained above, because it is not necessary always to mention the universal cause in particular cases.

We also see that every substance has a perfect spontaneity (which becomes freedom in intelligent substances), that everything that happens to it is a consequence of its idea or of its being, and that nothing determines it, except God alone. And that is why a person of very exalted mind, revered for her saintliness, was in the habit of saying that the soul must often think as if there were nothing but God and itself in the

world.²³

Now, nothing gives us a stronger understanding of immortality than the independence and extent of the soul in question here, which shelters it absolutely from all external things, since the soul alone makes up its whole world and is sufficient to itself with God. And it is as impossible that it should perish without annihilation, as it is that the world (of which it is a perpetual living expression) should destroy itself; hence, it is impossible that the changes in this extended mass called our body should do anything to the soul or that the dissolution of this body should destroy what is indivisible.

33. *Explanation of the union of soul and body, a matter which has been considered as inexplicable or miraculous, and on the origin of confused perceptions.* We also see the unexpected illumination of this great mystery of the union of the soul and the body, that is, how it happens that the passions and actions of the one are accompanied by the actions and passions, or by the corresponding phenomena, of the other. For there is no way to conceive that the one has any influence on the other, and it is unreasonable simply to appeal to the extraordinary operation of the universal cause in an ordinary and particular thing. But here is the true reason: we have said that everything that happens to the soul and to each substance follows from its notion, and therefore the very idea or essence of the soul carries with it the fact that all its appearances or perceptions must arise spontaneously from its own nature and precisely in such a way that they correspond by themselves to what happens in the whole universe. But they correspond more particularly and more perfectly to what happens in the body assigned to it, because the soul expresses the state of the universe in some way and for some time, according to the relation other bodies have to its own body. This also allows us to know how our body belongs to us, without, however, being attached to our essence. And I believe that persons who can meditate will judge our principles favorably, because they will be able to see easily what the connection between the soul and the body consists in, a connection which seems inexplicable in any other way.

We also see that the perceptions of our senses, even when they are clear, must necessarily contain some confused feelings [*sentiment*], for our body receives the impression of all other bodies, since all the bodies of the universe are in sympathy, and, even though our senses are related to everything, it is impossible for our soul to attend to everything in particular; that is why our confused sensations are the result of a truly infinite variety of perceptions. This is almost like the confused murmur coming from the innumerable set of breaking waves heard by those who approach the seashore. Now, if from several perceptions (which do not come together to make one), there is none which stands out before the others and if they make impressions that are almost equally strong or equally capable of gaining the attention of the soul, the soul can only perceive them confusedly.

34. *On the difference between minds and other substances, souls or substantial forms, and that the immortality required includes memory.* Assuming that the bodies that make up an *unum per se*, as does man, are substances, that they have substantial forms, and that animals have souls, we must admit that these souls and these substantial forms cannot entirely perish, no more than atoms or the ultimate parts of matter can, on the view of other philosophers. For no substance perishes, although it can become completely different. They also express the whole universe, although more imperfectly than minds do. But the principal difference is that they do not know what they are nor what they do, and consequently, since they do not reflect on themselves, they cannot discover necessary and universal truths. It is also because they lack reflection about themselves that they have no moral qualities. As a result, though they may pass through a thousand transformations, like those we see when a caterpillar changes into a butterfly, yet from the moral or practical point of view, the result is as if they had perished; indeed, we may even say that they have perished physically, in the sense in which we say that bodies perish through their corruption. But the intelligent soul, knowing what it is — having the ability to utter the word “I,” a word so full of meaning — does not merely remain and subsist metaphysically, which it does to a greater degree than the others, but also remains the same morally and constitutes the same person. For it is memory or the knowledge of this self that renders it capable of punishment or reward. Thus the immortality required in morality and religion does not consist merely in this perpetual subsistence common to all substances, for without the memory of what one has been, there would be nothing desirable about it. Suppose that some person all of a sudden becomes the king of China, but only on the condition that he forgets what he has been, as if he were born anew; practically, or as far as the effects could be perceived, wouldn’t that be the same as if he were annihilated and a king of China created at the same instant in his place? That is something this individual would have no reason to desire.

35. *The excellence of minds and that God considers them preferable to other creatures. That minds express God rather than the world, but that the other substances express the world rather than God.* But so that we may judge by

natural reasons that God will always preserve not only our substance, but also our person, that is, the memory and knowledge of what we are (though distinct knowledge is sometimes suspended during sleep and fainting spells), we must join morals to metaphysics, that is, we must not only consider God as the principle and cause of all substances and all beings, but also as the leader of all persons or intelligent substances and as the absolute monarch of the most perfect city or republic, which is what the universe composed of all minds together is, God himself being the most perfect of all minds and the greatest of all beings. For certainly minds are the most perfect beings and best express divinity. And since the whole nature, end, virtue, and function of substance is merely to express God and the universe, as has been sufficiently explained, there is no reason to doubt that the substances which express the universe with the knowledge of what they are doing and which are capable of knowing great truths about God and the universe, express it incomparably better than do those natures, which are either brutish and incapable of knowing truths or completely destitute of sensation and knowledge. And the difference between intelligent substances and substances that have no intelligence at all is just as great as the difference between a mirror and someone who sees.

Since God himself is the greatest and wisest of all minds, it is easy to judge that the beings with whom he can, so to speak, enter into conversation, and even into a society—by communicating to them his views and will in a particular manner and in such a way that they can know and love their benefactor—must be infinitely nearer to him than all other things, which can only pass for the instruments of minds. So we see that all wise persons value a man infinitely more than any other thing, no matter how precious it is, and it seems that the greatest satisfaction that a soul, content in other ways, can have is to see itself loved by others. With respect to God, though, there is the difference that his glory and our worship cannot add anything to his satisfaction, since knowledge of creatures is only a consequence of his supreme and perfect happiness—far from contributing to it or being its partial cause. However, what is good and reasonable in finite minds is found preeminently in him, and, just as we would praise a king who would prefer to preserve the life of a man rather than the most precious and rarest of his animals, we should not doubt that the most enlightened and most just of all monarchs is of the same opinion.

36. *God is the monarch of the most perfect republic, composed of all minds, and the happiness of this city of God is his principal purpose.* Indeed, minds are the most perfectible substances, and their perfections are peculiar in that they interfere with each other the least, or rather they aid one another the most, for only the most virtuous can be the most perfect friends. Whence it obviously follows that God, who always aims for the greatest perfection in general, will pay the greatest attention to minds and will give them the greatest perfection that universal harmony can allow, not only in general, but to each of them in particular.

One can even say that God, insofar as he is a mind, is the originator of existences; otherwise, if he lacked the will to choose the best, there would be no reason for a possible thing to exist in preference to others. Thus the quality that God has of being a mind himself takes precedence over all the other considerations he can have toward creatures; only minds are made in his image and are, as it were, of his race or like children of his household, since they alone can serve him freely and act with knowledge in imitation of the divine nature; a single mind is worth a whole world, since it does not merely express the world but it also knows it and it governs itself after the fashion of God. In this way we may say that, although all substances express the whole universe, nevertheless the other substances express the world rather than God, while minds express God rather than the world. And this nature of minds, so noble that it brings them as near to divinity as it is possible for simple creatures, has the result that God draws infinitely more glory from them than from all other beings, or rather the other beings only furnish minds the matter for glorifying him.

That is why this moral quality God has, which makes him the lord or monarch of minds, relates to him, so to speak, personally and in a quite singular manner. It is because of this that he humanizes himself, that he is willing to allow anthropomorphism, and that he enters into society with us, as a prince with his subjects; and this consideration is so dear to him that the happy and flourishing state of his empire, which consists in the greatest possible happiness of its inhabitants, becomes the highest of his laws. For happiness is to people what perfection is to beings. And if the first principle of the existence of the physical world is the decree to give it the greatest perfection possible, the first intent of the moral world or the City of God, which is the noblest part of the universe, must be to diffuse in it the greatest possible happiness.

Therefore we must not doubt that God has ordered everything in such a way that minds not only may live always, which is certain, but also that they may always preserve their moral quality, so that the city does not lose a single person, just as the world does not lose any substance. And consequently they will always know what they are, otherwise they would not be susceptible to reward or punishment, something, however, essential to a republic, but above all essential to the most perfect republic, in which nothing can be neglected.

Finally, since God is at the same time the most just and most good-natured of monarchs and since he demands only a good will, as long as it is sincere and serious, his subjects cannot wish for a better condition, and, to make them perfectly happy, he wants only for them to love him.

37. *Jesus Christ has revealed to men the mystery and admirable laws of the kingdom of heaven and the greatness of the supreme happiness that God prepares for those who love him.* The ancient philosophers knew very little of these important truths; Jesus Christ alone has expressed them divinely well and in a manner so clear and familiar that the coarsest of minds have grasped them. Thus his gospel has entirely changed the course of human affairs; he has brought us to know the kingdom of heaven, or that perfect republic of minds which deserves the title of City of God, whose admirable laws he has disclosed to us. He alone has made us see how much God loves us and with what exactitude he has provided for everything that concerns us; that, caring for sparrows, he will not neglect the rational beings which are infinitely more dear to him; that all the hairs on our head are numbered; that heaven and earth will perish rather than the word of God and what pertains to the economy of our salvation; that God has more regard for the least of the intelligent souls than for the whole machinery of the world; that we must not fear those who can destroy bodies but cannot harm souls, because God alone can make souls happy or unhappy; and that the souls of the just, in his hands, are safe from all the upheavals of the universe, God alone being able to act upon them; that none of our actions are forgotten; that everything is taken account of, even idle words or a spoonful of water well used; finally, that everything must result in the greatest welfare of those who are good; that the just will be like suns; and that neither our senses nor our mind has ever tasted anything approaching the happiness that God prepares for those who love him.

*Monadology**

1. The monad, which we shall discuss here, is nothing but a simple substance that enters into composites — simple, that is, without parts.

2. And there must be simple substances, since there are composites; for the composite is nothing more than a collection, or *aggregate*, of simples.

3. But where there are no parts, neither extension, nor shape, nor divisibility is possible. These monads are the true atoms of nature and, in brief, the elements of things.

4. There is also no dissolution to fear, and there is no conceivable way in which a simple substance can perish naturally.

5. For the same reason, there is no conceivable way a simple substance can begin naturally, since it cannot be formed by composition.

6. Thus, one can say that monads can only begin or end all at once, that is, they can only begin by creation and end by annihilation, whereas composites begin or end through their parts.

7. There is also no way of explaining how a monad can be altered or changed internally by some other creature, since one cannot transpose anything in it, nor can one conceive of any internal motion that can be excited, directed, augmented, or diminished within it, as can be done in composites, where there can be change among the parts. The monads have no windows through which something can enter or leave. Accidents cannot be detached, nor can they go about outside of substances, as the sensible species of the Scholastics once did. Thus, neither substance nor accident can enter a monad from without.

8. However, monads must have some qualities, otherwise they would not even be beings. And if simple substances did not differ at all in their qualities, there would be no way of perceiving any change in things, since what there is in a composite can only come from its simple ingredients; and if the monads had no qualities, they would be indiscernible from one another, since they also do not differ in quantity. As a result, assuming a plenum, in motion, each place would always receive only the equivalent of what it already had, and one state of things would be indistinguishable from another.

9. It is also necessary that each monad be different from each other. For there are never two beings in nature that are perfectly alike, two beings in which it is not possible to discover an internal difference, that is, one founded on an intrinsic denomination.

10. I also take for granted that every created being, and consequently the created monad as well, is subject to change, and even that this change is continual in each thing.

11. It follows from what we have just said that the monad's natural changes come from an *internal principle*, since no external cause can influence it internally.

12. But, besides the principle of change, there must be *diversity [un detail] in that which changes*, which produces, so to speak, the specification and variety of simple substances.

13. This diversity must involve a multitude in the unity or in the simple. For, since all natural change is produced by degrees, something changes and something remains. As a result, there must be a plurality of properties [*affections*] and relations in the simple substance, although it has no parts.

14. The passing state which involves and represents a multitude in the unity or in the simple substance is nothing other than what one calls *perception*, which should be distinguished from apperception, or consciousness, as will be evident in what follows. This is where the Cartesians have failed badly, since they took no account of the perceptions that we do not apperceive. This is also what made them believe that minds alone are monads and that there are no animal souls or other entelechies. With the common people, they have confused a long stupor with death, properly speaking, which made them fall again into the Scholastic prejudice of completely separated souls, and they have even confirmed unsound minds in the belief in the mortality of souls.

15. The action of the internal principle which brings about the change or passage from one perception to

another can be called *appetition*; it is true that the appetite cannot always completely reach the whole perception toward which it tends, but it always obtains something of it, and reaches new perceptions.

16. We ourselves experience a multitude in a simple substance when we find that the least thought we ourselves apperceive involves variety in its object. Thus, all those who recognize that the soul is a simple substance should recognize this multitude in the monad; and Mr. Bayle should not find any difficulty in this as he has done in his *Dictionary* article, “Rorarius.”¹

17. Moreover, we must confess that the *perception*, and what depends on it, is *inexplicable in terms of mechanical reasons*, that is, through shapes and motions. If we imagine that there is a machine whose structure makes it think, sense, and have perceptions, we could conceive it enlarged, keeping the same proportions, so that we could enter into it, as one enters into a mill. Assuming that, when inspecting its interior, we will only find parts that push one another, and we will never find anything to explain a perception. And so, we should seek perception in the simple substance and not in the composite or in the machine. Furthermore, this is all one can find in the simple substance — that is, perception and their changes. It is also in this alone that all the *internal actions* of simple substances can consist.

18. One can call all simple substances or created monads entelechies, for they have in themselves a certain perfection (*echousi to enteles*); they have a sufficiency (*autarkeia*) that makes them the sources of their internal actions, and, so to speak, incorporeal automata.

19. If we wish to call *soul* anything that has *perceptions* and *appetites* in the general sense I have just explained, then all simple substances or created monads can be called souls. But, since sensation is something more than a simple perception, I think that the general name of monad and entelechy is sufficient for simple substances which only have perceptions, and that we should only call those substances *souls* where perception is more distinct and accompanied by memory.

20. For we experience within ourselves a state in which we remember nothing and have no distinct perception; this is similar to when we faint or when we are overwhelmed by a deep, dreamless sleep. In this state the soul does not differ sensibly from a simple monad; but since this state does not last, and since the soul emerges from it, our soul is something more.

21. And it does not at all follow that in such a state the simple substance is without any perception. This is not possible for the previous reasons; for it cannot perish, and it also cannot subsist without some property [*affection*], which is nothing other than its perception. But when there is a great multitude of small perceptions in which nothing is distinct, we are stupefied. This is similar to when we continually spin in the same direction several times in succession, from which arises a dizziness that can make us faint and does not allow us to distinguish anything. Death can impart this state to animals for a time.

22. And since every present state of a simple substance is a natural consequence of its preceding state, the present is pregnant with the future.

23. Therefore, since on being awakened from a stupor we apperceive our perceptions, it must be the case that we had some perceptions immediately before, even though we did not apperceive them; for a perception can only come naturally from another perception, as a motion can only come naturally from a motion.

24. From this we see that if, in our perceptions, we had nothing distinct or, so to speak, in relief and stronger in flavor, we would always be in a stupor. And this is the state of bare monads.

25. We also see that nature has given heightened perceptions to animals from the care she has taken to furnish them organs that collect several rays of light or several waves of air, in order to make them more effectual by bringing them together. There is something similar to this in odor, taste, and touch, and perhaps in many other senses which are unknown to us. I will soon explain how what occurs in the soul represents what occurs in the organs.

26. Memory provides a kind of sequence in souls, which imitates reason, but which must be distinguished from it. We observe that when animals have the perception of something which strikes them, and when they previously had a similar perception of that thing, then, through a representation in their memory, they expect that which was attached to the thing in the preceding perception, and are led to have sensations similar to those they had before. For example, if we show dogs a stick, they remember the pain that it caused them and they flee.

27. And the strong imagination that strikes and moves them comes from the magnitude or the multitude of the preceding perceptions. For often a strong impression produces, all at once, the effect produced by a long *habit* or by many lesser, reiterated perceptions.

28. Men act like beasts insofar as the sequence of their perceptions results from the principle of memory

alone; they resemble the empirical physicians who practice without theory. We are all mere Empirics in three fourths of our actions. For example, when we expect that the day will dawn tomorrow, we act like an Empiric,² because until now it has always been thus. Only the astronomer judges this by reason.

29. But the knowledge of eternal and necessary truths is what distinguishes us from simple animals and furnishes us with *reason* and the sciences, by raising us to a knowledge of ourselves and of God. And that is what we call the rational soul, or *mind*, in ourselves.

30. It is also through the knowledge of necessary truths and through their abstractions that we rise to *reflective acts*, which enable us to think of that which is called "I" and enable us to consider that this or that is in us. And thus, in thinking of ourselves, we think of being, or substance, of the simple and of the composite, of the immaterial and of God himself, by conceiving that that which is limited in us is limitless in him. And these reflective acts furnish the principal objects of our reasonings.

31. Our reasonings are based on *two great principles, that of contradiction*, in virtue of which we judge that which involves a contradiction to be false, and that which is opposed or contradictory to the false to be true.

32. And *that of sufficient reason*, by virtue of which we consider that we can find no true or existent fact, no true assertion, without there being a sufficient reason why it is thus and not otherwise, although most of the time these reasons cannot be known to us.

33. There are also two kinds of *truths*, those of *reasoning* and those of *fact*. The truths of reasoning are necessary and their opposite is impossible; the truths of fact are contingent, and their opposite is possible. When a truth is necessary, its reason can be found by analysis, resolving it into simpler ideas and simpler truths until we reach the primitives.

34. This is how the speculative *theorems* and practical *canons* of mathematicians are reduced by analysis to *definitions, axioms, and postulates*.

35. And there are, finally, *simple ideas*, whose definition cannot be given. There are also axioms and postulates, in brief, *primitive principles*, which cannot be proved and which need no proof. And these are *identical propositions*, whose opposite contains an explicit contradiction.

36. But there must also be a *sufficient reason in contingent truths, or truths of fact*, that is, in the series of things distributed throughout the universe of creatures, where the resolution into particular reasons could proceed into unlimited detail because of the immense variety of things in nature and because of the division of bodies to infinity. There is an infinity of past and present shapes and motions that enter into the efficient cause of my present writing, and there is an infinity of small inclinations and dispositions of my soul, present and past, that enter into its final cause.

37. And since all this *detail* involves nothing but other prior or more detailed contingents, each of which needs a similar analysis in order to give its reason, we do not make progress in this way. It must be the case that the sufficient or ultimate reason is outside the sequence or *series* of this multiplicity of contingencies, however infinite it may be.

38. And that is why the ultimate reason of things must be in a necessary substance in which the diversity of changes is only eminent, as in its source. This is what we call *God*.

39. Since this substance is a sufficient reason for all this diversity, which is utterly interconnected, *there is only one God, and this God is sufficient*.

40. We can also judge that this supreme substance which is unique, universal, and necessary must be incapable of limits and must contain as much reality as is possible, insofar as there is nothing outside it which is independent of it, and insofar as it is a simple consequence of its possible existence.

41. From this it follows that God is absolutely perfect— *perfection* being nothing but the magnitude of positive reality considered as such, setting aside the limits or bounds in the things which have it. And here, where there are no limits, that is, in God, perfection is absolutely infinite.

42. It also follows that creatures derive their perfections from God's influence, but that they derive their imperfections from their own nature, which is incapable of being without limits. For it is in this that they are distinguished from God.

43. It is also true that God is not only the source of existences, but also that of essences insofar as they are real, that is, or the source of that which is real in possibility. This is because God's understanding is the realm of eternal truths or that of the ideas on which they depend; without him there would be nothing real in possibles, and not only would nothing exist, but also nothing would be possible.

44. For if there is reality in essences or possibles, or indeed, in eternal truths, this reality must be grounded

in something existent and actual, and consequently, it must be grounded in the existence of the necessary being, in whom essence involves existence, that is, in whom possible being is sufficient for actual being.

45. Thus God alone (or the necessary being) has this privilege, that he must exist if he is possible. And since nothing can prevent the possibility of what is without limits, without negation, and consequently without contradiction, this by itself is sufficient for us to know the existence of God *a priori*. We have also proved this by the reality of the eternal truths. But we have also just proved it *a posteriori* since there are contingent beings, which can only have their final or sufficient reason in the necessary being, a being that has the reason of its existence in itself.

46. However, we should not imagine, as some do, that since the eternal truths depend on God, they are arbitrary and depend on his will, as Descartes appears to have held, and after him Mr. Poirer.³ This is true only of contingent truths, whose principle is *fitness* [*convenance*] or the choice of the *best*. But necessary truths depend solely on his understanding, and are its internal object.

47. Thus God alone is the primitive unity or the first [*originnaire*] simple substance; all created or derivative monads are products, and are generated, so to speak, by continual fulgurations of the divinity from moment to moment, limited by the receptivity of the creature, to which it is essential to be limited.

48. God has *power*, which is the source of everything, *knowledge*, which contains the diversity of ideas, and finally *will*, which brings about changes or products in accordance with the principle of the best. And these correspond to what, in created monads, is the subject or the basis, the perceptive faculty and the appetitive faculty. But in God these attributes are absolutely infinite or perfect, while in the created monads or in entelechies (or *perfectihabies*, as Hermolaus Barbarus translated that word)⁴ they are only imitations of it, in proportion to the perfection that they have.

49. The creature is said to *act* externally insofar as it is perfect, and *to be acted upon* [*patir*] by another, insofar as it is imperfect. Thus we attribute *action* to a monad insofar as it has distinct perceptions, and *passion*, insofar as it has confused perceptions.

50. And one creature is more perfect than another insofar as one finds in it that which provides an *a priori* reason for what happens in the other; and this is why we say that it acts on the other.

51. But in simple substances the influence of one monad over another can only be ideal, and can only produce its effect through God's intervention, when in the ideas of God a monad reasonably asks that God take it into account in regulating the others from the beginning of things. For, since a created monad cannot have an internal physical influence upon another, this is the only way in which one can depend on another.

52. It is in this way that actions and passions among creatures are mutual. For God, comparing two simple substances, finds in each reasons that require him to adjust the other to it; and consequently, what is active in some respects is passive from another point of view: *active* insofar as what is known distinctly in one serves to explain what happens in another; and *passive* insofar as the reason for what happens in one is found in what is known distinctly in another.

53. Now, since there is an infinity of possible universes in God's ideas, and since only one of them can exist, there must be a sufficient reason for God's choice, a reason which determines him towards one thing rather than another.

54. And this reason can only be found in *fitness*, or in the degree of perfection that these worlds contain, each possible world having the right to claim existence in proportion to the perfection it contains.

55. And this is the cause of the existence of the best, which wisdom makes known to God, which his goodness makes him choose, and which his power makes him produce.

56. This interconnection or accommodation of all created things to each other, and each to all the others, brings it about that each simple substance has relations that express all the others, and consequently, that each simple substance is a perpetual, living mirror of the universe.

57. Just as the same city viewed from different directions appears entirely different and, as it were, multiplied perspectively, in just the same way it happens that, because of the infinite multitude of simple substances, there are, as it were, just as many different universes, which are, nevertheless, only perspectives on a single one, corresponding to the different points of view of each monad.

58. And this is the way of obtaining as much variety as possible, but with the greatest order possible, that is, it is the way of obtaining as much perfection as possible.

59. Moreover, this is the only hypothesis (which I dare say is demonstrated) that properly enhances God's greatness. Mr. Bayle recognized this when, in his *Dictionary* (article "Rorarius"), he set out objections to it;

indeed, he was tempted to believe that I ascribed too much to God, more than is possible. But he was unable to present any reason why this universal harmony, which results in every substance expressing exactly all the others through the relations it has to them, is impossible.

60. Furthermore, in what I have just discussed, we can see the *a priori* reasons why things could not be otherwise. Because God, in regulating the whole, had regard for each part, and particularly for each monad, and since the nature of the monad is representative, nothing can limit it to represent only a part of things. However, it is true that this representation is only confused as to the detail of the whole universe, and can only be distinct for a small portion of things, that is, either for those that are closest, or for those that are greatest with respect to each monad, otherwise each monad would be a divinity. Monads are limited, not as to their objects, but with respect to the modifications of their knowledge of them. Monads all go confusedly to infinity, to the whole; but they are limited and differentiated by the degrees of their distinct perceptions.

61. In this respect, composites are analogous to simples. For everything is a plenum, which makes all matter interconnected. In a plenum, every motion has some effect on distant bodies, in proportion to their distance. For each body is affected, not only by those in contact with it, and in some way feels the effects of everything that happens to them, but also, through them, it feels the effects of those in contact with the bodies with which it is itself immediately in contact. From this it follows that this communication extends to any distance whatsoever. As a result, every body is affected by everything that happens in the universe, to such an extent that he who sees all can read in each thing what happens everywhere, and even what has happened or what will happen, by observing in the present what is remote in time as well as in space. "All things conspire [*sympnoia panta*]," said Hippocrates. But a soul can read in itself only what is distinctly represented there; it cannot unfold all its folds at once, because they go to infinity.

62. Thus, although each created monad represents the whole universe, it more distinctly represents the body which is particularly affected by it, and whose entelechy it constitutes. And just as this body expresses the whole universe through the interconnection of all matter in the plenum, the soul also represents the whole universe by representing this body, which belongs to it in a particular way.

63. The body belonging to a monad (which is the entelechy or soul of that body) together with an entelechy constitutes what may be called a *living being*, and together with a soul constitutes what is called an *animal*. Now, the body of a living being or an animal is always organized; for, since every monad is a mirror of the universe in its way, and since the universe is regulated in a perfect order, there must also be an order in the representing being, that is, in the perceptions of the soul, and consequently, in the body in accordance with which the universe is represented therein.

64. Thus each organized body of a living being is a kind of divine machine or natural automaton, which infinitely surpasses all artificial automata. For a machine constructed by man's art is not a machine in each of its parts. For example, the tooth of a brass wheel has parts or fragments which, for us, are no longer artificial things, and no longer have any marks to indicate the machine for whose use the wheel was intended. But natural machines, that is, living bodies, are still machines in their least parts, to infinity. That is the difference between nature and art, that is, between divine art and our art.

65. And the author of nature has been able to practice this divine and infinitely marvelous art, because each portion of matter is not only divisible to infinity, as the ancients have recognized, but is also actually subdivided without end, each part divided into parts having some motion of their own; otherwise, it would be impossible for each portion of matter to express the whole universe.

66. From this we see that there is a world of creatures, of living beings, of animals, of entelechies, of souls in the least part of matter.

67. Each portion of matter can be conceived as a garden full of plants, and as a pond full of fish. But each branch of a plant, each limb of an animal, each drop of its humors, is still another such garden or pond.

68. And although the earth and air lying between the garden plants, or the water lying between the fish of the pond, are neither plant nor fish, they contain yet more of them, though of a subtleness imperceptible to us, most often.

69. Thus there is nothing fallow, sterile, or dead in the universe, no chaos and no confusion except in appearance, almost as it looks in a pond at a distance, where we might see the confused and, so to speak, teeming motion of the fish in the pond, without discerning the fish themselves.

70. Thus we see that each living body has a dominant entelechy, which in the animal is the soul; but the limbs of this living body are full of other living beings, plants, animals, each of which also has its entelechy, or its dominant soul.

71. But we must not imagine, as some who have misunderstood my thought do, that each soul has a mass or portion of matter of its own, always proper to or allotted by it, and that it consequently possesses other lower living beings, forever destined to serve it. For all bodies are in a perpetual flux, like rivers, and parts enter into them and depart from them continually.

72. Thus the soul changes body only little by little and by degrees, so that it is never stripped at once of all its organs. There is often metamorphosis in animals, but there is never metempsychosis nor transmigration of souls; there are also no completely *separated souls*, nor spirits [*Génies*] without bodies. God alone is completely detached from bodies.

73. That is why there is never total generation nor, strictly speaking, perfect death, death consisting in the separation of the soul. And what we call *generations* are developments and growths, as what we call deaths are enfoldings and diminutions.

74. Philosophers have been greatly perplexed about the origin of forms, entelechies, or souls. But today, when exact inquiries on plants, insects, and animals have shown us that organic bodies in nature are never produced from chaos or putrefaction, but always through seeds in which there is, no doubt, some *preformation*, it has been judged that, not only the organic body was already there before conception, but there was also a soul in this body; in brief, the animal itself was there, and through conception this animal was merely prepared for a great transformation, in order to become an animal of another kind. Something similar is seen outside generation, as when worms become flies, and caterpillars become butterflies.

75. Those *animals*, some of which are raised by conception to the level of the larger animals, can be called *spermatic*. But those of them that remain among those of their kind, that is, the majority, are born, multiply, and are destroyed, just like the larger animals. There are but a small number of Elect that pass onto a larger stage [*théâtre*].

76. But this was only half the truth. I have, therefore, held that if the animal never begins naturally, it does not end naturally, either; and not only will there be no generation, but also no complete destruction, nor any death, strictly speaking. These *a posteriori* reasonings, derived from experience, agree perfectly with my principles deduced *a priori*, as above.

77. Thus one can state that not only is the soul (mirror of an indestructible universe) indestructible, but so is the animal itself, even though its mechanism often perishes in part, and casts off or puts on its organic coverings.

78. These principles have given me a way of naturally explaining the union, or rather the conformity of the soul and the organic body. The soul follows its own laws and the body also follows its own; and they agree in virtue of the harmony pre-established between all substances, since they are all representations of a single universe.

79. Souls act according to the laws of final causes, through appetitions, ends, and means. Bodies act according to the laws of efficient causes or of motions. And these two kingdoms, that of efficient causes and that of final causes, are in harmony with each other.

80. Descartes recognized that souls cannot impart a force to bodies because there is always the same quantity of force in matter. However, he thought that the soul could change the direction of bodies. But that is because the law of nature, which also affirms the conservation of the same total direction in matter, was not known at that time. If he had known it, he would have hit upon my system of pre-established harmony.

81. According to this system, bodies act as if there were no souls (though this is impossible); and souls act as if there were no bodies; and both act as if each influenced the other.

82. As for *minds* or rational souls, I find that, at bottom, what we just said holds for all living beings and animals, namely that animals and souls begin only with the world and do not end any more than the world does. However, rational animals have this peculiarity, that their little spermatic animals, as long as they only remain in this state, have only ordinary or sensitive souls. But that as soon as the Elect among them, so to speak, attain human nature by actual conception, their sensitive souls are elevated to the rank of reason and to the prerogative of minds.

83. Among other differences which exist between ordinary souls and minds, some of which I have already noted, there are also the following: that souls, in general, are living mirrors or images of the universe of creatures, but that minds are also images of the divinity itself, or of the author of nature, capable of knowing the system of the universe, and imitating something of it through their schematic representations [*échantillons architectoniques*] of it, each mind being like a little divinity in its own realm.

84. That is what makes minds capable of entering into a kind of society with God, and allows him to be,

in relation to them, not only what an inventor is to his machine (as God is in relation to the other creatures) but also what a prince is to his subjects, and even what a father is to his children.

85. From this it is easy to conclude that the collection of all minds must make up the city of God, that is, the most perfect possible state under the most perfect of monarchs.

86. This city of God, this truly universal monarchy, is a moral world within the natural world, and the highest and most divine of God's works. The glory of God truly consists in this city, for he would have none if his greatness and goodness were not known and admired by minds. It is also in relation to this divine city that God has goodness, properly speaking, whereas his wisdom and power are evident everywhere.

87. Since earlier we established a perfect harmony between two natural kingdoms, the one of efficient causes, the other the final causes, we ought to note here yet another harmony between the physical kingdom of nature and the moral kingdom of grace, that is, between God considered as the architect of the mechanism of the universe, and God considered as the monarch of the divine city of minds.

88. This harmony leads things to grace through the very path of nature. For example, this globe must be destroyed and restored by natural means at such times as the governing of minds requires it, for the punishment of some and the reward of others.

89. It can also be said that God the architect pleases in every respect God the legislator, and, as a result, sins must carry their penalty with them by the order of nature, and even in virtue of the mechanical structure of things. Similarly, noble actions will receive their rewards through mechanical means with regard to bodies, even though this cannot, and must not, always happen immediately.

90. Finally, under this perfect government, there will be no good action that is unrewarded, no bad action that goes unpunished, and everything must result in the well-being of the good, that is, of those who are not dissatisfied in this great state, those who trust in providence, after having done their duty, and who love and imitate the author of all good, as they should, finding pleasure in the consideration of his perfections according to the nature of genuinely *pure love*, which takes pleasure in the happiness of the beloved. This is what causes wise and virtuous persons to work for all that appears to be in conformity with the presumptive or antecedent divine will, and nevertheless, to content themselves with what God brings about by his secret, consequent, or decisive will, since they recognize that if we could understand the order of the universe well enough, we would find that it surpasses all the wishes of the wisest, and that it is impossible to make it better than it is.⁵ This is true not only for the whole in general, but also for ourselves in particular, if we are attached, as we should be, to the author of the whole, not only as the architect and efficient cause of our being, but also as to our master and final cause; he ought to be the whole aim of our will, and he alone can make us happy.

John Locke

John Locke was born in Wrington, England, a town near Bristol, in 1632. He was raised in a Puritan household and there received an elementary education, as well as instruction in theology and politics. He entered Westminster School in 1647 and then was elected to a scholarship at Christ Church, Oxford. Locke was to make Oxford his home for about thirty years. For his bachelor's and master's degrees he studied metaphysics, logic, rhetoric, and classical languages. The philosophy taught at Oxford at the time was Aristotelian, and his lack of enthusiasm for that system was to be reflected in his mature views. During this period he developed an interest in medicine, which he pursued with an eye toward understanding the methodology of experimental science. Consideration of this methodology, as well as his friendships with the chemist Robert Boyle and the physicist Isaac Newton, was to influence his philosophical views profoundly. From 1675 to 1679, he went to France due to his poor health, where he devoted his time to his studies. For many years Locke served as physician and later also as secretary and advisor to Lord Ashley, later Earl of Shaftesbury. In 1683, because of his connections with Shaftesbury's anti-Stuart politics, he felt compelled to flee to the Netherlands. Here he was able to finish his two greatest works, *Two Treatises of Government* (1690) and *An Essay Concerning Human Understanding* (1690). Another work he completed during this time is *A Letter Concerning Toleration* (1689). Locke returned to England in 1689 with William of Orange, who, together with his wife Mary, assumed the British throne in the Glorious Revolution. He then retired to Oates in Essex, the home of his friend Lady Masham and her husband, where he spent the remainder of his life. Works published in this final period include *Some Thoughts Concerning Education* (1693) and *The Reasonableness of Christianity* (1695). Locke died in 1704.

In *An Essay Concerning Human Understanding* Locke develops an empiricist account of science and of knowledge. In his view, all of our ideas and all of our knowledge have their origin in sensory experience. Locke contrasts this position with the rationalist claim that some of our ideas and consequently some of our knowledge are *innate*, that is, part of the structure of the mind from birth. By contrast, Locke argues that all human ideas and knowledge derive either from sensation of the external world or from reflection, a kind of sensation of the elements of one's mind: "All those sublime thoughts, which tower above the clouds, and reach as high as heaven itself, take their rise and footing here: In all that great extent wherein the mind wanders, in those remote speculations, it may seem to be elevated with, it stirs not one jot beyond those ideas, which sense or reflection have offered for its contemplation" (*Essay* 2.1.24).

Locke associates his empiricist view with a degree of pessimism about the extent of our ability to acquire knowledge. Human beings have only a limited range of sensory capacities, and our understanding is limited in its operations to the ideas it can acquire by means of these capacities. And further, our understanding is limited in its power, so that, for example, it cannot apprehend the relations among all of its ideas at once.

In the *Essay*, Locke also develops views about the central issues that faced the emerging modern scientific conception of the physical world. He criticizes Descartes' claim that the essence of matter consists solely in extension—spatial three-dimensionality—on the grounds that this claim leads to unacceptable results, such as the indistinguishability of matter and space and the inconceivability of a vacuum. In Locke's view, the essence of matter does not consist simply in extension, but also in solidity or impenetrability—the physical force that hinders the approach of two bodies when they are moving toward each other. His view is akin to the *dynamical* views of matter of Leibniz and Kant, according to which its essence consists primarily in force.

Siding with Galileo and Descartes, Locke also argues that the real characteristics of matter are the primary qualities, such as extension and motion, and that by contrast with the Aristotelian view, matter has no qualities that resemble secondary-quality ideas, such as the ideas of color, shape, sound, taste, odor, and temperature. Locke presents a much-discussed *perceptual relativity* argument for claims of this sort: If one hand is initially warm, and the other cold, and both are placed in the same bowl of water, it will feel cooler to one hand than the other. Since the water couldn't have a quality that resembles the temperature sensations of each of the hands, one should conclude that the water really has no such quality at all. Nevertheless Locke does want to maintain the commonsensical view that physical objects really have secondary qualities, and accordingly he characterizes a secondary quality as a power that an object has in virtue of its primary qualities to produce a secondary-quality idea in a perceiver. Redness, therefore, is not a quality in a physical object that resembles one's sensation of red, but rather a power that an object has in virtue of its primary qualities—perhaps in virtue of its surface texture—to produce sensations of red in perceivers.

A further feature of the *Essay* is Locke's attack on Aristotelian science, which he thought to be on the wrong track, since its primary concerns seemed to him to involve characterizing natural kinds by merely superficial definitions of their essences. According to his own account, inspired by the revival of the ancient Greek atomism, natural kinds have "corpuscular" real essences, consisting of arrangements of unobservable particles, from which their observable primary qualities result. Yet Locke does not think that we can gain any genuine knowledge of real essences of material substances. He also denies that we can come to know the nature of the connections between the real essences of material substances and the secondary-quality ideas they produce in us. The only hypothesis we can grasp on this issue, he claims, is that this connection is established by God. Locke does, however, argue that we can acquire knowledge of real essences in geometry and in morality.

Locke believes in dualism of body and mind—that the body is material while the mind is immaterial—but he does not think that this view can be firmly established, since the hypothesis that God annexes thought to a purely material system cannot be ruled out. What makes us the same persons over time, he argues, is continuity of consciousness or memory. Locke also claims that the existence of God can be established with "mathematical certainty." His religion is in a sense rationalist, since he maintains that beliefs based solely on revelation are inferior to beliefs supported by reasoned argument. In this respect, Locke's religion is a forerunner of the deism that was to become so influential in the eighteenth century.

Important scholarly books on Locke include Peter Alexander, *Ideas, Qualities, and Corpuscles: Locke and Boyle on the External World* (Cambridge: Cambridge University Press, 1985); Michael R. Ayers, *Locke* (London: Routledge and Kegan Paul, 1991); Jonathan Bennett, *Locke, Berkeley, Hume: Central Themes* (Oxford: Oxford University Press, 1971); Nicholas Jolley, *Leibniz and Locke* (Oxford: Oxford University Press, 1984); J. L. Mackie, *Problems from Locke* (Oxford: Oxford University Press, 1971); and R. S. Woolhouse, *Locke* (Brighton: Harvester Press, 1983). Good collections of essays are C. B. Martin and D. M. Armstrong, eds., *Locke and Berkeley: A Collection of Critical Essays* (Garden City, N.J.: Doubleday, 1968) and Margaret Atherton, ed., *The Empiricists: Locke, Berkeley, Hume* (Lanham, Md.: Rowman & Littlefield, 1998).

Derk Pereboom

An Essay Concerning Human Understanding

INTRODUCTION

1. *An Inquiry into the Understanding pleasant and useful.* Since it is the *understanding* that sets man above the rest of sensible beings, and gives him all the advantage and dominion which he has over them; it is certainly a subject, even for its nobleness, worth our labour to inquire into. The understanding, like the eye, whilst it makes us see and perceive all other things, takes no notice of itself; and it requires art and pains to set it at a distance and make it its own object. But whatever be the difficulties that lie in the way of this inquiry; whatever it be that keeps us so much in the dark to ourselves; sure I am that all the light we can let in upon our minds, all the acquaintance we can make with our own understandings, will not only be very pleasant, but bring us great advantage, in directing our thoughts in the search of other things.

2. *Design.* This, therefore, being my purpose — to inquire into the original, certainty, and extent of *human knowledge*, together with the grounds and degrees of *belief*, *opinion*, and *assent*; — I shall not at present meddle with the physical consideration of the mind; or trouble myself to examine wherein its essence consists; or by what motions of our spirits or alterations of our bodies we come to have any *sensation* by our organs, or any *ideas* in our understandings; and whether those ideas do in their formation, any or all of them, depend on matter or not. These are speculations which, however curious and entertaining, I shall decline, as lying out of my way in the design I am now upon. It shall suffice to my present purpose, to consider the discerning faculties of a man, as they are employed about the objects which they have to do with. And I shall imagine I have not wholly misemployed myself in the thoughts I shall have on this occasion, if, in this historical, plain method, I can give any account of the ways whereby our understandings come to attain those notions of things we have; and can set down any measures of the certainty of our knowledge; or the grounds of those persuasions which are to be found amongst men, so various, different, and wholly contradictory; and yet asserted somewhere or other with such assurance and confidence, that he that shall take a view of the opinions of mankind, observe their opposition, and at the same time consider the fondness and devotion wherewith they are embraced, the resolution and eagerness wherewith they are maintained, may perhaps have reason to suspect, that either there is no such thing as truth at all, or that mankind hath no sufficient means to attain a certain knowledge of it.

3. *Method.* It is therefore worth while to search out the bounds between opinion and knowledge; and examine by what measures, in things whereof we have no certain knowledge, we ought to regulate our assent and moderate our persuasion. In order whereunto I shall pursue this following method: —

First, I shall inquire into the original of those *ideas*, notions, or whatever else you please to call them, which a man observes, and is conscious to himself he has in his mind; and the ways whereby the understanding comes to be furnished with them.

Secondly, I shall endeavour to show what *knowledge* the understanding hath by those ideas; and the certainty, evidence, and extent of it.

Thirdly, I shall make some inquiry into the nature and grounds of *faith* or *opinion*: whereby I mean that assent which we give to any proposition as true, of whose truth yet we have no certain knowledge. And here we shall have occasion to examine the reasons and degrees of *assent*.

8. *What Idea stands for.* Before I proceed on to what I have thought on this subject, I must here in the entrance beg pardon of my reader for the frequent use of the word *idea*, which he will find in the following treatise. It being that term which, I think, serves best to stand for whatsoever is the *object* of the understanding when a man thinks, I have used it to express whatever is meant by *phantasm*, *notion*, *species*, or *whatever it is which the mind can be employed about in thinking*; and I could not avoid frequently using it.

I presume it will be easily granted me, that there are such *ideas* in men's minds: every one is conscious of

them in himself; and men's words and actions will satisfy him that they are in others.

BOOK I

NEITHER PRINCIPLES NOR IDEAS ARE INNATE

Chapter I

NO INNATE SPECULATIVE PRINCIPLES

1. *The way shown how we come by any knowledge, sufficient to prove it not innate.* It is an established opinion amongst some men, that there are in the understanding certain *innate principles*; some primary notions, *νοῦν καὶ ἐννοιαὶ* characters, as it were, stamped upon the mind of man; which the soul receives in its very first being, and brings into the world with it. It would be sufficient to convince unprejudiced readers of the falseness of this supposition, if I should only show (as I hope I shall in the following parts of this Discourse) how men, barely by the use of their natural faculties, may attain to all the knowledge they have, without the help of any innate impressions; and may arrive at certainty, without any such original notions or principles. For I imagine any one will easily grant that it would be impertinent to suppose the ideas of colours innate in a creature to whom God hath given sight, and a power to receive them by the eyes from external objects; and no less unreasonable would it be to attribute several truths to the impressions of nature, and innate characters, when we may observe in ourselves faculties fit to attain as easy and certain knowledge of them as if they were originally imprinted on the mind.

But because a man is not permitted without censure to follow his own thoughts in the search of truth, when they lead him ever so little out of the common road, I shall set down the reasons that made me doubt of the truth of that opinion, as an excuse for my mistake, if I be in one; which I leave to be considered by those who, with me, dispose themselves to embrace truth wherever they find it.

2. *General Assent the great Argument.* There is nothing more commonly taken for granted than that there are certain *principles*, both *speculative* and *practical*, (for they speak of both), universally agreed upon by all mankind: which therefore, they argue, must needs be the constant impressions which the souls of men receive in their first beings, and which they bring into the world with them, as necessarily and really as they do any of their inherent faculties.

3. *Universal Consent proves nothing innate.* This argument, drawn from universal consent, has this misfortune in it, that if it were true in matter of fact, that there were certain truths wherein all mankind agreed, it would not prove them innate, if there can be any other way shown how men may come to that universal agreement, in the things they do consent in, which I presume may be done.

4. *“What is, is,” and “It is impossible for the same Thing to be and not to be,” not universally assented to.* But, which is worse, this argument of universal consent which is made use of to prove innate principles, seems to me a demonstration that there are none such: because there are none to which all mankind give an universal assent. I shall begin with the speculative, and instance in those magnified principles of demonstration, ‘Whatsoever is, is,’ and ‘It is impossible for the same thing to be and not to be’; which, of all others, I think have the most allowed title to innate. These have so settled a reputation of maxims universally received, that it will no doubt be thought strange if any one should seem to question it. But yet I take liberty to say, that these propositions are so far from having an universal assent, that there are a great part of mankind to whom they are not so much as known.

5. *Not on the Mind naturally imprinted, because not known to Children, Idiots, &c.* For, first, it is evident, that all children and idiots have not the least apprehension or thought of them. And the want of that is enough to destroy that universal assent which must needs be the necessary concomitant of all innate truths: it seeming to me near a contradiction to say, that there are truths imprinted on the soul, which it perceives or understands not: imprinting, if it signify anything, being nothing else but the making certain truths to be perceived. For to imprint anything on the mind without the mind’s perceiving it, seems to me hardly intelligible. If therefore children and idiots have souls, have minds, with those impressions upon them, *they* must unavoidably perceive them, and necessarily know and assent to these truths; which since they do not, it is evident that there are no such impressions. For if they are not notions naturally imprinted, how can they be innate? and if they are notions imprinted, how can they be unknown? To say a notion is imprinted on the mind, and yet at the same

time to say, that the mind is ignorant of it, and never yet took notice of it, is to make this impression nothing. No proposition can be said to be in the mind which it never yet knew, which it was never yet conscious of. For if any one may, then, by the same reason, all propositions that are true, and the mind is capable ever of assenting to, may be said to be in the mind, and to be imprinted: since, if any one can be said to be in the mind, which it never yet knew, it must be only because it is capable of knowing it; and so the mind is of all truths it ever shall know. Nay, thus truths may be imprinted on the mind which it never did, nor ever shall know; for a man may live long, and die at last in ignorance of many truths which his mind was capable of knowing, and that with certainty. So that if the capacity of knowing be the natural impression contended for, all the truths a man ever comes to know will, by this account, be every one of them innate; and this great point will amount to no more, but only to a very improper way of speaking; which, whilst it pretends to assert the contrary, says nothing different from those who deny innate principles. For nobody, I think, ever denied that the mind was capable of knowing several truths. The capacity, they say, is innate; the knowledge acquired. But then to what end such contest for certain innate maxims? If truths can be imprinted on the understanding without being perceived, I can see no difference there can be between any truths the mind is *capable* of knowing in respect of their original: they must all be innate or all adventitious: in vain shall a man go about to distinguish them. He therefore that talks of innate notions in the understanding, cannot (if he intend thereby any distinct sort of truths) mean such truths to be in the understanding as it never perceived, and is yet wholly ignorant of. For if these words 'to be in the understanding' have any propriety, they signify to be understood. So that to be in the understanding, and not to be understood; to be in the mind and never to be perceived, is all one as to say anything is and is not in the mind or understanding. If therefore these two propositions, 'Whatsoever is, is,' and 'It is impossible for the same thing to be and not to be,' are by nature imprinted, children cannot be ignorant of them: infants, and all that have souls, must necessarily have them in their understandings, know the truth of them, and assent to it.

BOOK II

OF IDEAS

Chapter I

OF IDEAS IN GENERAL, AND THEIR ORIGINAL

1. *Idea is the Object of Thinking.* Every man being conscious to himself that he thinks; and that which his mind is applied about whilst thinking being the *ideas* that are there, it is past doubt that men have in their minds several ideas, — such as are those expressed by the words *whiteness, hardness, sweetness, thinking, motion, man, elephant, army, drunkenness*, and others: it is in the first place then to be inquired, *How he comes by them?*

I know it is a received doctrine, that men have native ideas, and original characters, stamped upon their minds in their very first being. This opinion I have at large examined already; and, I suppose what I have said in the foregoing Book will be much more easily admitted, when I have shown whence the understanding may get all the ideas it has; and by what ways and degrees they may come into the mind;— for which I shall appeal to every one's own observation and experience.

2. *All Ideas come from Sensation or Reflection.* Let us then suppose the mind to be, as we say, white paper, void of all characters, without any ideas:— How comes it to be furnished? Whence comes it by that vast store which the busy and boundless fancy of man has painted on it with an almost endless variety? Whence has it all the *materials* of reason and knowledge? To this I answer, in one word, from EXPERIENCE. In that all our knowledge is founded; and from that it ultimately derives itself. Our observation employed either, about external sensible objects, or about the internal operations of our minds perceived and reflected on by ourselves, is that which supplies our understandings with all the *materials* of thinking. These two are the fountains of knowledge, from whence all the ideas we have, or can naturally have, do spring.

3. *The Objects of Sensation and Source of Ideas.* First, our Senses, conversant about particular sensible objects, do convey into the mind several distinct perceptions of things, according to those various ways wherein those objects do affect them. And thus we come by those *ideas* we have of *yellow, white, heat, cold, soft, hard, bitter, sweet*, and all those which we call sensible qualities; which when I say the senses convey into the mind, I mean, they from external objects convey into the mind what produces there those perceptions. This great source of most of the ideas we have, I call our senses, and derived by them to the understanding, I call SENSATION.

4. *The Operations of our Minds, the other Source of them.* Secondly, the other fountain from which experience furnisheth the understanding with ideas is, — the perception of the operations of our own mind within us, as it is employed about the ideas it has got;—which operations, when the soul comes to reflect on and consider, do furnish the understanding with another set of ideas, which could not be had from things without. And such are *perception, thinking, doubting, believing, reasoning, knowing, willing*, and all the different actings of our own minds;—which we being conscious of, and observing in ourselves, do from these receive into our understandings as distinct ideas as we do from bodies affecting our senses. This source of ideas every man has wholly in himself; and though it be not sense, as having nothing to do with external objects, yet it is very like it, and might properly enough be called *internal sense*. But as I call the other *sensation*, so I call this REFLECTION, the ideas it affords being such only as the mind gets by reflecting on its own operations within itself. By reflection then, in the following part of this discourse, I would be understood to mean, that notice which the mind takes of its own operations, and the manner of them, by reason whereof there come to be ideas of these operations in the understanding. These two, I say, viz. external material things, as the objects of SENSATION, and the operations of our own minds within, as the objects of REFLECTION, are to me the only originals from whence all our ideas take their beginnings. The term *operations* here I use in a large sense, as comprehending not barely the actions of the mind about its ideas, but some sort of passions arising sometimes from them, such as is the satisfaction or uneasiness arising from any thought.

5. *All our Ideas are of the one or the other of these.* The understanding seems to me not to have the least glimmering of any ideas which it doth not receive from one of these two. *External objects* furnish the mind with the ideas of sensible qualities, which are all those different perceptions they produce in us; and *the mind*

furnishes the understanding with ideas of its own operations.

These, when we have taken a full survey of them, and their several modes, combinations, and relations, we shall find to contain all our whole stock of ideas; and that we have nothing in our minds which did not come in one of these two ways. Let any one examine his own thoughts, and thoroughly search into his understanding; and then let him tell me, whether all the original ideas he has there, are any other than of the objects of his senses, or of the operations of his mind, considered as objects of his reflection. And how great a mass of knowledge soever he imagines to be lodged there, he will, upon taking a strict view, see that he has not any idea in his mind but what one of these two have imprinted;—though perhaps, with infinite variety compounded and enlarged by the understanding, as we shall see hereafter.

10. *The Soul thinks not always; for this wants Proofs.* But whether the soul be supposed to exist antecedent to, or coeval with, or some time after the first rudiments of organization, or the beginnings of life in the body, I leave to be disputed by those who have better thought of that matter. I confess myself to have one of those dull souls, that doth not perceive itself always to contemplate ideas; nor can conceive it any more necessary for the soul always to think, than for the body always to move: the perception of ideas being (as I conceive) to the soul, what motion is to the body; not its essence, but one of its operations. And therefore, though thinking be supposed never so much the proper action of the soul, yet it is not necessary to suppose that it should be always thinking, always in action. That, perhaps, is the privilege of the infinite Author and Preserver of all things, who ‘never slumbers nor sleeps’; but is not competent to any finite being, at least not to the soul of man. We know certainly, by experience, that we *sometimes* think; and thence draw this infallible consequence, — that there is something in us that has a power to think. But whether that substance *perpetually* thinks or no, we can be no further assured than experience informs us. For, to say that actual thinking is essential to the soul, and inseparable from it, is to beg what is in question, and not to prove it by reason;—which is necessary to be done, if it be not a self-evident proposition. But whether this, ‘That the soul always thinks,’ be a self-evident proposition, that everybody assents to at first hearing, I appeal to mankind. It is doubted whether I thought at all last night or no. The question being about a matter of fact, it is begging it to bring, as a proof for it, an hypothesis, which is the very thing in dispute: by which way one may prove anything, and it is but supposing that all watches, whilst the balance beats, think, and it is sufficiently proved, and past doubt, that my watch thought all last night. But he that would not deceive himself, ought to build his hypothesis on matter of fact, and make it out by sensible experience, and not presume on matter of fact, because of his hypothesis, that is, because he supposes it to be so; which way of proving amounts to this, that I must necessarily think all last night, because another supposes I always think, though I myself cannot perceive that I always do so.

But men in love with their opinions may not only suppose what is in question, but allege wrong matter of fact. How else could any one make it an inference of mine, that a thing is not, because we are not sensible of it in our sleep? I do not say there is no *soul* in a man, because he is not sensible of it in his sleep; but I do say, he cannot *think* at any time, waking or sleeping, without being sensible of it. Our being sensible of it is not necessary to anything but to our thoughts; and to them it is; and to them it always will be necessary, till we can think without being conscious of it.

Chapter II

OF SIMPLE IDEAS

1. *Uncompounded Appearances.* The better to understand the nature, manner, and extent of our knowledge, one thing is carefully to be observed concerning the ideas we have; and that is, that some of them are *simple* and some *complex*.

Though the qualities that affect our senses are, in the things themselves, so united and blended, that there is no separation, no distance between them; yet it is plain, the ideas they produce in the mind enter by the senses simple and unmixed. For, though the sight and touch often take in from the same object, at the same time, different ideas;—as a man sees at once motion and colour; the hand feels softness and warmth in the same piece of wax: yet the simple ideas thus united in the same subject, are as perfectly distinct as those that come in by different senses. The coldness and hardness which a man feels in a piece of ice being as distinct ideas in the mind as the smell and whiteness of a lily; or as the taste of sugar, and smell of a rose. And there is nothing can be plainer to a man than the clear and distinct perception he has of those simple ideas; which, being each in itself uncompounded, contains in it nothing but *one uniform appearance, or conception in the mind*, and is not distinguishable into different ideas.

2. *The Mind can neither make nor destroy them.* These simple ideas, the materials of all our knowledge, are suggested and furnished to the mind only by those two ways above mentioned, viz. sensation and reflection. When the understanding is once stored with these simple ideas, it has the power to repeat, compare, and unite them, even to an almost infinite variety, and so can make at pleasure new complex ideas. But it is not in the power of the most exalted wit, or enlarged understanding, by any quickness or variety of thought, to *invent* or *frame* one new simple idea in the mind, not taken in by the ways before mentioned: nor can any force of the understanding *destroy* those that are there. The dominion of man, in this little world of his own understanding being much what the same as it is in the great world of visible things; wherein his power, however managed by art and skill, reaches no farther than to compound and divide the materials that are made to his hand; but can do nothing towards the making the least particle of new matter, or destroying one atom of what is already in being. The same inability will every one find in himself, who shall go about to fashion in his understanding one simple idea, not received in by his senses from external objects, or by reflection from the operations of his own mind about them. I would have any one try to fancy any taste which had never affected his palate; or frame the idea of a scent he had never smelt: and when he can do this, I will also conclude that a blind man hath ideas of colours, and a deaf man true distinct notions of sounds.

Chapter III

OF SIMPLE IDEAS OF SENSE

1. *Division of simple Ideas.* The better to conceive the ideas we receive from sensation, it may not be amiss for us to consider them, in reference to the different ways whereby they make their approaches to our minds, and make themselves perceivable by us.

First, then, There are some which come into our minds *by one sense only*.

Secondly, There are others that convey themselves into the mind *by more senses than one*.

Thirdly, Others that are had from *reflection only*.

Fourthly, There are some that make themselves way, and are suggested to the mind *by all the ways of sensation and reflection*.

We shall consider them apart under these several heads.

Ideas of one Sense.—There are some ideas which have admittance only through one sense, which is peculiarly adapted to receive them. Thus light and colours, as white, red, yellow, blue, with their several degrees or shades and mixtures, as green, scarlet, purple, sea-green, and the rest, come in only by the eyes. All kinds of noises, sounds, and tones, only by the ears. The several tastes and smells, by the nose and palate. And if these organs, or the nerves which are the conduits to convey them from without to their audience in the brain, — the mind's presence-room (as I may so call it) — are any of them so disordered as not to perform their functions, they have no postern to be admitted by; no other way to bring themselves into view, and be perceived by the understanding.

The most considerable of those belonging to the touch, are heat and cold, and solidity: all the rest, consisting almost wholly in the sensible configuration, as smooth and rough; or else, more or less firm adhesion of the parts, as hard and soft, tough and brittle, are obvious enough.

2. *Few simple Ideas have Names.* I think it will be needless to enumerate all the particular simple ideas belonging to each sense. Nor indeed is it possible if we would; there being a great many more of them belonging to most of the senses than we have names for. The variety of smells, which are as many almost, if not more, than species of bodies in the world, do most of them want names. Sweet and stinking commonly serve our turn for these ideas, which in effect is little more than to call them pleasing or displeasing; though the smell of a rose and violet, both sweet, are certainly very distinct ideas. Nor are the different tastes, that by our palates we receive ideas of, much better provided with names. Sweet, bitter, sour, harsh, and salt are almost all the epithets we have to denominate that numberless variety of relishes, which are to be found distinct, not only in almost every sort of creatures, but in the different parts of the same plant, fruit, or animal. The same may be said of colours and sounds. I shall, therefore, in the account of simple ideas I am here giving, content myself to set down only such as are most material to our present purpose, or are in themselves less apt to be taken notice of though they are very frequently the ingredients of our complex ideas; amongst

which, I think, I may well account solidity, which therefore I shall treat of in the next chapter.

Chapter IV

IDEA OF SOLIDITY

1. *We receive this Idea from Touch.* The idea of *solidity* we receive by our touch: and it arises from the resistance which we find in body to the entrance of any other body into the place it possesses, till it has left it. There is no idea which we receive more constantly from sensation than solidity. Whether we move or rest, in what posture soever we are, we always feel something under us that supports us, and hinders our further sinking downwards; and the bodies which we daily handle make us perceive that, whilst they remain between them, they do, by an insurmountable force, hinder the approach of the parts of our hands that press them. *That which thus hinders the approach of two bodies, when they are moved one towards another, I call solidity.* I will not dispute whether this acceptance of the word solid be nearer to its original signification than that which mathematicians use it in. It suffices that I think the common notion of solidity will allow, if not justify, this use of it; but if any one think it better to call it *impenetrability*, he has my consent. Only I have thought the term solidity the more proper to express this idea, not only because of its vulgar use in that sense, but also because it carries something more of positive in it than impenetrability; which is negative, and is perhaps more a consequence of solidity, than solidity itself. This, of all other, seems the idea most intimately connected with, and essential to body; so as nowhere else to be found or imagined, but only in matter. And though our senses take no notice of it, but in masses of matter, of a bulk sufficient to cause a sensation in us: yet the mind, having once got this idea from such grosser sensible bodies, traces it further, and considers it, as well as figure, in the minutest particle of matter that can exist; and finds it inseparably inherent in body, wherever or however modified.

2. *Solidity fills Space.* This is the idea which belongs to body, whereby we conceive it to fill space. The idea of which filling of space is, — that where we imagine any space taken up by a solid substance, we conceive it so to possess it, that it excludes all other solid substances; and will for ever hinder any other two bodies, that move towards one another in a straight line, from coming to touch one another, unless it removes from between them in a line not parallel to that which they move in. This idea of it, the bodies which we ordinarily handle sufficiently furnish us with.

6. *What Solidity is.* If any one asks me, *What this solidity is*, I send him to his senses to inform him. Let him put a flint or a football between his hands, and then endeavour to join them, and he will know. If he thinks this not a sufficient explication of solidity, what it is, and wherein it consists; I promise to tell him what it is, and wherein it consists, when he tells me what thinking is, or wherein it consists; or explains to me what extension or motion is, which perhaps seems much easier. The simple ideas we have, are such as experience teaches them us; but if, beyond that, we endeavour by words to make them clearer in the mind, we shall succeed no better than if we went about to clear up the darkness of a blind man's mind by talking; and to discourse into him the ideas of light and colours. The reason of this I shall show in another place.

Chapter V

OF SIMPLE IDEAS OF DIVERS SENSES

Ideas received both by seeing and touching. The ideas we get by more than one sense are, of *space* or *extension*, *figure*, *rest*, and *motion*. For these make perceivable impressions, both on the eyes and touch; and we can receive and convey into our minds the ideas of the extension, figure, motion, and rest of bodies, both by seeing and feeling. But having occasion to speak more at large of these in another place, I here only enumerate them.

Chapter VI

OF SIMPLE IDEAS OF REFLECTION

1. *Simple Ideas are the Operations of Mind about its other Ideas.* The mind receiving the ideas mentioned in the foregoing chapters from without, when it turns its view inward upon itself, and observes its own actions about those ideas it has, takes from thence other ideas, which are as capable to be the objects of its contemplation as any of those it received from foreign things.

2. *The Idea of Perception, and Idea of Willing, we have from Reflection.* The two great and principal actions of the mind, which are most frequently considered, and which are so frequent that every one that pleases may take notice of them in himself, are these two:—

Perception, or Thinking, and Volition, or Willing.

The power of thinking is called the *Understanding*, and the power of volition is called the *Will*; and these two powers or abilities in the mind are denominated faculties.

Of some of the *modes* of these simple ideas of reflection, such as are *remembrance, discerning, reasoning, judging, knowledge, faith, &c.*, I shall have occasion to speak hereafter.

Chapter VII

OF SIMPLE IDEAS OF BOTH SENSATION AND REFLECTION

1. *Ideas of Pleasure and Pain.* There be other simple ideas which convey themselves into the mind by all the ways of sensation and reflection, viz, *pleasure or delight*, and its opposite, *pain*, or *uneasiness; power, existence; unity.*

2. *Mix with almost all our other Ideas.* Delight or uneasiness, one or other of them, join themselves to almost all our ideas both of sensation and reflection: and there is scarce any affection of our senses from without, any retired thought of our mind within, which is not able to produce in us pleasure or pain. By pleasure and pain, I would be understood to signify, whatsoever delights or molests us; whether it arises from the thoughts of our minds, or anything operating on our bodies. For, whether we call it satisfaction, delight, pleasure, happiness, &c., on the one side, or uneasiness, trouble, pain, torment, anguish, misery, &c., on the other, they are still but different degrees of the same thing, and belong to the ideas of pleasure and pain, delight or uneasiness; which are the names I shall most commonly use for those two sorts of ideas.

7. *Ideas of Existence and Unity.* *Existence* and *Unity* are two other ideas that are suggested to the understanding by every object without, and every idea within. When ideas are in our minds, we consider them as being actually there, as well as we consider things to be actually without us; — which is, that they exist, or have existence. And whatever we can consider as one thing, whether a real being or idea, suggests to the understanding the idea of unity.

8. *Idea of Power.* *Power* also is another of those simple ideas which we receive from sensation and reflection. For, observing in ourselves that we do and can think, and that we can at pleasure move several parts of our bodies which were at rest; the effects, also, that natural bodies are able to produce in one another, occurring every moment to our senses,—we both these ways get the idea of power.

9. *Idea of Succession.* Besides these there is another idea, which, though suggested by our senses, yet is more constantly offered to us by what passes in our minds; and that is the idea of *succession*. For if we look immediately into ourselves, and reflect on what is observable there, we shall find our ideas always, whilst we are awake, or have any thought, passing in train, one going and another coming, without intermission.

10. *Simple Ideas the materials of all our Knowledge.* These, if they are not all, are at least (as I think) the most considerable of those simple ideas which the mind has, and out of which is made all its other knowledge; all which it receives only by the two forementioned ways of sensation and reflection.

Nor let any one think these too narrow bounds for the capacious mind of man to expatiate in, which takes its flight further than the stars, and cannot be confined by the limits of the world; that extends its thoughts often even beyond the utmost expansion of Matter, and makes excursions into that incomprehensible Inane. I grant all this, but desire any one to assign any *simple idea* which is not received from one of those inlets before mentioned, or any *complex idea* not made out of those simple ones. Nor will it be so strange to think these few simple ideas sufficient to employ the quickest thought, or largest capacity; and to furnish the materials of all that various knowledge, and more various fancies and opinions of all mankind, if we consider how many words may be made out of the various composition of twenty-four letters; or if, going one step further, we will but reflect on the variety of combinations that may be made with barely one of the above-mentioned ideas, viz. number, whose stock is inexhaustible and truly infinite: and what a large and immense field doth extension alone afford the mathematicians?

Chapter VIII

SOME FURTHER CONSIDERATIONS CONCERNING OUR SIMPLE IDEAS OF SENSATION

7. *Ideas in the Mind, Qualities in Bodies.* To discover the nature of our *ideas* the better, and to discourse of them intelligibly, it will be convenient to distinguish them *as they are ideas or perceptions in our minds*; and *as they are modifications of matter in the bodies that cause such perceptions in us*: that so we may not think (as perhaps usually is done) that they are exactly the images and resemblances of something inherent in the subject; most of those of sensation being in the mind no more the likeness of something existing without us, than the names that stand for them are the likeness of our ideas, which yet upon hearing they are apt to excite in us.

8. *Our Ideas and the Qualities of Bodies.* Whatsoever the mind perceives *in itself*, or is the immediate object of perception, thought, or understanding, that I call *idea*; and the power to produce any idea in our mind, I call *quality* of the subject wherein that power is. Thus a snowball having the power to produce in us the ideas of white, cold, and round, — the power to produce those ideas in us, as they are in the snowball, I call qualities; and as they are sensations or perceptions in our understandings, I call them ideas; which *ideas*, if I speak of sometimes as in the things themselves, I would be understood to mean those qualities in the objects which produce them in us.

9. *Primary Qualities of Bodies.* Qualities thus considered in bodies are,

First, such as are utterly inseparable from the body, in what state soever it be; and such as in all the alterations and changes it suffers, all the force can be used upon it, it constantly keeps; and such as sense constantly finds in every particle of matter which has bulk enough to be perceived; and the mind finds inseparable from every particle of matter, though less than to make itself singly be perceived by our senses: v.g. Take a grain of wheat, divide it into two parts; each part has still solidity, extension, figure, and mobility: divide it again, and it retains still the same qualities; and so divide it on, till the parts become insensible; they must retain still each of them all those qualities. For division (which is all that a mill, or pestle, or any other body, does upon another, in reducing it to insensible parts) can never take away either solidity, extension, figure or mobility from any body, but only makes two or more distinct separate masses of matter, of that which was but one before; all which distinct masses, reckoned as so many distinct bodies, after division, make a certain number. These I call *original* or *primary qualities* of body, which I think we may observe to produce simple ideas in us, viz. solidity, extension, figure, motion or rest, and number.

10. *Secondary Qualities of Bodies.* *Secondly*, such qualities which in truth are nothing in the objects themselves but powers to produce various sensations in us by their primary qualities, i.e. by the bulk, figure, texture, and motion of their insensible parts, as colours, sounds, tastes, &c. These I call *secondary qualities*. To these might be added a *third* sort, which are allowed to be barely powers; though they are as much real qualities in the subject as those which I, to comply with the common way of speaking, call qualities, but for distinction, secondary qualities. For the power in fire to produce a new colour, or consistency, in *wax* or *clay*, — by its primary qualities, is as much a quality in fire, as the power it has to produce in *me* a new idea or sensation of warmth or burning, which I felt not before,—by the same primary qualities, viz. the bulk, texture, and motion of its insensible parts.

11. *How Bodies produce Ideas in us.* The next thing to be considered is, how bodies produce ideas in us; and that is manifestly by impulse, the only way which we can conceive bodies to operate in.

12. *By motions, external, and in our organism.* If then external objects be not united to our minds when they produce ideas therein; and yet we perceive these *original* qualities in such of them as singly fall under our senses, it is evident that some motion must be thence continued by our nerves, or animal spirits, by some parts of our bodies, to the brains or the seat of sensation, there to produce in our minds the particular ideas we have of them. And since the extension, figure, number, and motion of bodies of an observable bigness, may be perceived at a distance by the sight, it is evident some singly imperceptible bodies must come from them to the eyes, and thereby convey to the brain some motion; which produces these ideas which we have of them in us.

13. *How secondary Qualities produce their ideas.* After the same manner that the ideas of these original qualities are produced in us, we may conceive that the ideas of *secondary* qualities are also produced, viz. by the operation of insensible particles on our senses. For, it being manifest that there are bodies and good store of

bodies, each whereof are so small, that we cannot by any of our senses discover either their bulk, figure, or motion, — as is evident in the particles of the air and water, and others extremely smaller than those; perhaps as much smaller than the particles of air and water, as the particles of air and water are smaller than peas or hail-stones; — let us suppose at present that the different motions and figures, bulk and number, of such particles, affecting the several organs of our senses, produce in us those different sensations which we have from the colours and smells of bodies; v.g. that a violet, by the impulse of such insensible particles of matter, of peculiar figures and bulks, and in different degrees and modifications of their motions, causes the ideas of the blue colour, and sweet scent of that flower to be produced in our minds. It being no more impossible to conceive that God should annex such ideas to such motions, with which they have no similitude, than that he should annex the idea of pain to the motion of a piece of steel dividing our flesh, with which that idea hath no resemblance.

14. *They depend on the primary Qualities.* What I have said concerning colours and smells may be understood also of tastes and sounds, and other the like sensible qualities; which, whatever reality we by mistake attribute to them, are in truth nothing in the objects themselves, but powers to produce various sensations in us; and depend on those primary qualities, viz. bulk, figure, texture, and motion of parts as I have said.

15. *Ideas of primary Qualities are Resemblances; of secondary, not.* From whence I think it easy to draw this observation, — that the ideas of primary qualities of bodies are resemblances of them, and their patterns do really exist in the bodies themselves, but the ideas produced in us by these secondary qualities have no resemblance of them at all. There is nothing like our ideas, existing in the bodies themselves. They are, in the bodies we denominate from them, only a power to produce those sensations in us; and what is sweet, blue, or warm in idea, is but the certain bulk, figure, and motion of the insensible parts, in the bodies themselves, which we call so.

16. *Examples.* Flame is denominated hot and light; snow, white and cold; and manna, white and sweet, from the ideas they produce in us. Which qualities are commonly thought to be the same in those bodies that those ideas are in us, the one the perfect resemblance of the other, as they are in a mirror, and it would by most men be judged very extravagant if one should say otherwise. And yet he that will consider that the same fire that, at one distance produces in us the sensation of warmth, does, at a nearer approach, produce in us the far different sensation of pain, ought to bethink himself what reason he has to say—that this idea of warmth, which was produced in him by the fire, is *actually in the fire*; and his idea of pain, which the same fire produced in him the same way, is *not* in the fire. Why are whiteness and coldness in snow, and pain not, when it produces the one and the other idea in us; and can do neither, but by the bulk, figure, number, and motion of its solid parts?

17. *The ideas of the Primary alone really exist.* The particular bulk, number, figure, and motion of the parts of fire or snow are really in them, — whether any one's senses perceive them or no: and therefore they may be called *real* qualities, because they really exist in those bodies. But light, heat, whiteness, or coldness, are no more really in them than sickness or pain is in manna. Take away the sensation of them; let not the eyes see light or colours, nor the ears hear sounds; let the palate not taste, nor the nose smell, and all colours, tastes, odours, and sounds, *as they are such particular ideas*, vanish and cease, and are reduced to their causes, i.e. bulk, figure, and motion of parts.

18. *The secondary exist in things only as modes of the primary.* A piece of manna of a sensible bulk is able to produce in us the idea of a round or square figure; and by being removed from one place to another, the idea of motion. This idea of motion represents it as it really is in manna moving: a circle or square are the same, whether in idea or existence, in the mind or in the manna. And this, both motion and figure, are really in the manna, whether we take notice of them or no: this everybody is ready to agree to. Besides, manna, by the bulk, figure, texture, and motion of its parts, has a power to produce the sensations of sickness, and sometimes of acute pains or gripings in us. That these ideas of sickness and pain are *not* in the manna, but effects of its operations on us, and are nowhere when we feel them not; this also every one readily agrees to. And yet men are hardly to be brought to think that sweetness and whiteness are not really in manna; which are but the effects of the operations of manna, by the motion, size, and figure of its particles, on the eyes and palate: as the pain and sickness caused by manna are confessedly nothing but the effects of its operations on the stomach and guts, by the size, motion, and figure of its insensible parts, (for by nothing else can a body operate, as has been proved): as if it could not operate on the eyes and palate, and thereby produce in the mind particular distinct ideas, which in itself it has not, as well as we allow it can operate on the guts and stomach, and

thereby produce distinct ideas, which in itself it has not. These ideas, being all effects of the operations of manna on several parts of our bodies, by the size, figure, number, and motion of its parts; — why those produced by the eyes and palate should rather be thought to be really in the manna, than those produced by the stomach and guts; or why the pain and sickness, ideas that are the effect of manna, should be thought to be nowhere when they are not felt; and yet the sweetness and whiteness, effects of the same manna on other parts of the body, by ways equally as unknown, should be thought to exist in the manna, when they are not seen or tasted, would need some reason to explain.

19. *Examples.* Let us consider the red and white colours in porphyry. Hinder light from striking on it, and its colours vanish; it no longer produces any such ideas in us: upon the return of light it produces these appearances on us again. Can any one think any real alterations are made in the porphyry by the presence or absence of light; and that those ideas of whiteness and redness are really in porphyry in the light, when it is plain *it has no colour in the dark*? It has, indeed, such a configuration of particles, both night and day, as are apt, by the rays of light rebounding from some parts of that hard stone, to produce in us the idea of redness, and from others the idea of whiteness; but whiteness or redness are not in it at any time, but such a texture that hath the power to produce such a sensation in us.

20. Pound an almond, and the clear white colour will be altered into a dirty one, and the sweet taste into an oily one. What real alteration can the beating of the pestle make in any body, but an alteration of the texture of it?

21. *Explains how water felt as cold by one hand may be warm to the other.* Ideas being thus distinguished and understood, we may be able to give an account how the same water, at the same time, may produce the idea of cold by one hand and of heat by the other: whereas it is impossible that the same water, if those ideas were really in it, should at the same time be both hot and cold. For, if we imagine *warmth*, as it is in our hands, to be nothing but a certain sort and degree of motion in the minute particles of our nerves or animal spirits, we may understand how it is possible that the same water may, at the same time, produce the sensations of heat in one hand and cold in the other; which yet *figure* never does, that never producing the idea of a square by one hand which has produced the idea of a globe by another. But if the sensation of heat and cold be nothing but the increase or diminution of the motion of the minute parts of our bodies, caused by the corpuscles of any other body, it is easy to be understood, that if that motion be greater in one hand than in the other; if a body be applied to the two hands, which has in its minute particles a greater motion than in those of one of the hands, and a less than in those of the other, it will increase the motion of the one hand and lessen it in the other; and so cause the different sensations of heat and cold that depend thereon.

23. *Three Sorts of Qualities in Bodies.* The qualities, then, that are in bodies, rightly considered, are of three sorts:—

First, The bulk, figure, number, situation, and motion or rest of their solid parts. Those are in them, whether we perceive them or not; and when they are of that size that we can discover them, we have by these an idea of the thing as it is in itself; as is plain in artificial things. These I call *primary qualities*.

Secondly, The power that is in any body, by reason of its insensible primary qualities, to operate after a peculiar manner on any of our senses, and thereby produce in *us* the different ideas of several colours, sounds, smells, tastes, &c. These are usually called *sensible qualities*.

Thirdly, The power that is in any body, by reason of the particular constitution of its primary qualities, to make such a change in the bulk, figure, texture, and motion of *another body*, as to make it operate on our senses differently from what it did before. Thus the sun has a power to make wax white, and fire to make lead fluid. These are usually called *powers*.

The first of these, as has been said, I think may be properly called real, original, or primary qualities; because they are in the things themselves, whether they are perceived or not: and upon their different modifications it is that the secondary qualities depend.

The other two are only powers to act differently upon other things: which powers result from the different modifications of those primary qualities.

24. *The first are Resemblances; the second thought to be Resemblances, but are not; the third neither are, nor are*

thought so. But, though the two latter sorts of qualities are powers barely, and nothing but powers, relating to several other bodies, and resulting from the different modifications of the original qualities, yet they are generally otherwise thought of. For the *second* sort, viz. the powers to produce several ideas in us, by our senses, are looked upon as real qualities in the things thus affecting us: but the *third* sort are called and esteemed barely powers. v.g. The idea of heat or light, which we receive by our eyes, or touch, from the sun, are commonly thought real qualities existing in the sun, and something more than mere powers in it. But when we consider the sun in reference to wax, which it melts or blanches, we look on the whiteness and softness produced in the wax, not as qualities in the sun, but effects produced by powers in it. Whereas, if rightly considered, these qualities of light and warmth, which are perceptions in me when I am warmed or enlightened by the sun, are no otherwise in the sun, than the changes made in the wax, when it is blanched or melted, are in the sun. They are all of them equally *powers in the sun, depending on its primary qualities*; whereby it is able, in the one case, so to alter the bulk, figure, texture, or motion of some of the insensible parts of my eyes or hands, as thereby to produce in me the idea of light or heat; and in the other, it is able so to alter the bulk, figure, texture, or motion of the insensible parts of the wax, as to make them fit to produce in me the distinct ideas of white and fluid.

Chapter IX

OF PERCEPTION

1. *Perception the first simple Idea of Reflection.* PERCEPTION, as it is the first faculty of the mind exercised about our ideas; so it is the first and simplest idea we have from reflection, and is by some called thinking in general. Though thinking, in the propriety of the English tongue, signifies that sort of operation in the mind about its ideas, wherein the mind is active; where it, with some degree of voluntary attention, considers anything. For in bare naked perception, the mind is, for the most part, only passive; and what it perceives, it cannot avoid perceiving.

2. *Reflection alone can give us the idea of what perception is.* What perception is, every one will know better by reflecting on what he does himself, when he sees, hears, feels, &c., or thinks, than by any discourse of mine. Whoever reflects on what passes in his own mind cannot miss it. And if he does not reflect, all the words in the world cannot make him have any notion of it.

3. *Arises in sensation only when the mind notices the organic impression.* This is certain, that whatever alterations are made in the body, if they reach not the mind; whatever impressions are made on the outward parts, if they are not taken notice of within, there is no perception. Fire may burn our bodies with no other effect than it does a billet, unless the motion be continued to the brain, and there the sense of heat, or idea of pain, be produced in the mind; wherein consists actual perception.

4. *Impulse on the organ insufficient.* How often may a man observe in himself, that whilst his mind is intently employed in the contemplation of some objects, and curiously surveying some ideas that are there, it takes no notice of impressions of sounding bodies made upon the organ of hearing, with the same alteration that uses to be for the producing the idea of sound? A sufficient impulse there may be on the organ; but it not reaching the observation of the mind, there follows no perception: and though the motion that uses to produce the idea of sound be made in the ear, yet no sound is heard. Want of sensation, in this case, is not through any defect in the organ, or that the man's ears are less affected than at other times when he does hear: but that which uses to produce the idea, though conveyed in by the usual organ, not being taken notice of in the understanding, and so imprinting no idea in the mind, there follows no sensation. So that wherever there is sense or perception, there some idea is actually produced, and present in the understanding.

8. *Sensations often changed by the Judgment.* We are further to consider concerning perception, that the ideas we receive by sensation are often, in grown people, altered by the judgment, without our taking notice of it. When we set before our eyes a round globe of any uniform colour, v.g. gold, alabaster, or jet, it is certain that the idea thereby imprinted on our minds is of a flat circle, variously shadowed, with several degrees of light and brightness coming to our eyes. But we having, by use, been accustomed to perceive what kind of appearance convex bodies are wont to make in us; what alterations are made in the reflections of light by the difference of the sensible figures of bodies; — the judgment presently, by an habitual custom, alters the appearances into their causes. So that from that which is truly variety of shadow or colour, collecting the figure, it makes it pass for a mark of figure, and frames to itself the perception of a convex figure and an

uniform colour; when the idea we receive from thence is only a plane variously coloured, as is evident in painting. To which purpose I shall here insert a problem of that very ingenious and studious promoter of real knowledge, the learned and worthy Mr. Molineux,¹ which he was pleased to send me in a letter some months since; and it is this: — ‘Suppose a man *born* blind, and now adult, and taught by his *touch* to distinguish between a cube and a sphere of the same metal, and nighly of the same bigness, so as to tell, when he felt one and the other, which is the cube, which the sphere. Suppose then the cube and sphere placed on a table, and the blind man be made to see: *quaere*, whether *by his sight, before he touched them*, he could now distinguish and tell which is the globe, which the cube?’ To which the acute and judicious proposer answers, ‘Not. For, though he has obtained the experience of how a globe, how a cube affects his touch, yet he has not yet obtained the experience, that what affects his touch so or so, must affect his sight so or so; or that a protuberant angle in the cube, that pressed his hand unequally, shall appear to his eye as it does in the cube.’— I agree with this thinking gentleman, whom I am proud to call my friend, in his answer to this problem; and am of opinion that the blind man, at first sight, would not be able with certainty to say which was the globe, which the cube, whilst he only saw them; though he could unerringly name them by his touch, and certainly distinguish them by the difference of their figures felt. This I have set down, and leave with my reader, as an occasion for him to consider how much he may be beholden to experience, improvement, and acquired notions, where he thinks he had not the least use of, or help from them. And the rather, because this observing gentleman further adds, that ‘having, upon the occasion of my book, proposed this to divers very ingenious men, he hardly ever met with one that at first gave the answer to it which he thinks true, till by hearing his reasons they were convinced.’

Chapter X

OF RETENTION

1. *Contemplation.* The next faculty of the mind, whereby it makes a further progress towards knowledge, is that which I call *retention*; or the keeping of those simple ideas which from sensation or reflection it hath received. This is done two ways.

First, by keeping the idea which is brought into it, for some time actually in view, which is called *contemplation*.

2. *Memory.* The other way of retention is, the power to revive again in our minds those ideas which, after imprinting, have disappeared, or have been as it were laid aside out of sight. And thus we do, when we conceive heat or light, yellow or sweet, — the object being removed. This is *memory*, which is as it were the storehouse of our ideas. For, the narrow mind of man not being capable of having many ideas under view and consideration at once, it was necessary to have a repository, to lay up those ideas which, at another time, it might have use of. But, our *ideas* being nothing but actual perceptions in the mind, which cease to be anything when there is no perception of them; this laying up of our ideas in the repository of the memory signifies no more but this,— that the mind has a power in many cases to revive perceptions which it has once had, with this additional perception annexed to them, that *it has had them before*. And in this sense it is that our ideas are said to be in our memories, when indeed they are actually nowhere;—but only there is an ability in the mind when it will to revive them again, and as it were paint them anew on itself, though some with more, some with less difficulty; some more lively, and other more obscurely. And thus it is, by the assistance of this faculty, that we are said to have all those ideas in our understandings which, though we do not actually contemplate, yet we *can* bring in sight, and make appear again, and be the objects of our thoughts, without the help of those sensible qualities which first imprinted them there.

7. *In Remembering, the Mind is often active.* In this secondary perception, as I may so call it, or viewing again the ideas that are lodged in the memory, the mind is oftentimes more than barely passive; the appearance of those dormant pictures depending sometimes on the *will*. The mind very often sets itself on work in search of some hidden idea, and turns as it were the eye of the soul upon it; though sometimes too they start up in our minds of their own accord, and offer themselves to the understanding; and very often are roused and tumbled out of their dark cells into open daylight, by turbulent and tempestuous passions; our affections bringing ideas to our memory, which had otherwise lain quiet and unregarded. This further is to be observed, concerning ideas lodged in the memory, and upon occasion revived by the mind, that they are not only (as the word *revive* imports) none of them new ones, but also that the mind takes notice of them as of a former impression, and renews its acquaintance with them, as with ideas it had known before. So that though ideas formerly imprinted are not all constantly in view, yet in remembrance they are constantly known to be such as have

been formerly imprinted; i.e. in view, and taken notice of before, by the understanding.

Chapter XI

OF DISCERNING, AND OTHER OPERATIONS OF THE MIND

1. *No Knowledge without Discernment.* Another faculty we may take notice of in our minds is that of *discerning* and *distinguishing* between the several ideas it has. It is not enough to have a confused perception of something in general. Unless the mind had a distinct perception of different objects and their qualities, it would be capable of very little knowledge, though the bodies that affect us were as busy about us as they are now, and the mind were continually employed in thinking. On this faculty of distinguishing one thing from another depends the evidence and certainty of several, even very general, propositions, which have passed for innate truths;—because men, overlooking the true cause why those propositions find universal assent, impute it wholly to native uniform impressions; whereas it in truth depends upon this clear discerning faculty of the mind, whereby it *perceives* two ideas to be the same, or different. But of this more hereafter.

4. *Comparing.* The COMPARING them one with another, in respect of extent, degrees, time, place, or any other circumstances, is another operation of the mind about its ideas, and is that upon which depends all that large tribe of ideas comprehended under *relation*; which, of how vast an extent it is, I shall have occasion to consider hereafter.

6. *Compounding.* The next operation we may observe in the mind about its ideas is COMPOSITION; whereby it puts together several of those simple ones it has received from sensation and reflection, and combines them into complex ones. Under this of composition may be reckoned also that of *enlarging*, wherein, though the composition does not so much appear as in more complex ones, yet it is nevertheless a putting several ideas together, though of the same kind. Thus, by adding several units together, we make the idea of a dozen; and putting together the repeated ideas of several perches, we frame that of a furlong.

8. *Naming.* When children have, by repeated sensations, got ideas fixed in their memories, they begin by degrees to learn the use of signs. And when they have got the skill to apply the organs of speech to the framing of articulate sounds, they begin to make use of words, to signify their ideas to others. These verbal signs they sometimes borrow from others, and sometimes make themselves, as one may observe among the new and unusual names children often give to things in the first use of language.

9. *Abstraction.* The use of words then being to stand as outward marks of our internal ideas, and those ideas being taken from particular things, if every particular idea that we take in should have a distinct name, names must be endless. To prevent this, the mind makes the particular ideas received from particular objects to become general; which is done by considering them as they are in the mind such appearances,— separate from all other existences, and the circumstances of real existence, as time, place, or any other concomitant ideas. This is called ABSTRACTION, whereby ideas taken from particular beings become general representatives of all of the same kind; and their names general names, applicable to whatever exists conformable to such abstract ideas. Such precise, naked appearances in the mind, without considering how, whence, or with what others they came there, the understanding lays up (with names commonly annexed to them) as the standards to rank real existences into sorts, as they agree with these patterns, and to denominate them accordingly. Thus the same colour being observed to-day in chalk or snow, which the mind yesterday received from milk, it considers that appearance alone, makes it a representative of all of that kind; and having given it the name *whiteness*, it by that sound signifies the same quality wheresoever to be imagined or met with; and thus universals, whether ideas or terms, are made.

10. *Brutes abstract not.* If it may be doubted whether beasts compound and enlarge their ideas that way to any degree; this, I think, I may be positive in, — that the power of abstracting is not at all in them; and that the having of general ideas is that which puts a perfect distinction betwixt man and brutes, and is an excellency which the faculties of brutes do by no means attain to. For it is evident we observe no footsteps in them of making use of general signs for universal ideas; from which we have reason to imagine that they have not the faculty of abstracting, or making general ideas, since they have no use of words, or any other general signs.

11. *Brutes abstract not, yet are not bare machines.* Nor can it be imputed to their want of fit organs to frame articulate sounds, that they have no use or knowledge of general words; since many of them, we find, can fashion such sounds, and pronounce words distinctly enough, but never with any such application. And, on

the other side, men who, through some defect in the organs, want words, yet fail not to express their universal ideas by signs, which serve them instead of general words, a faculty which we see beasts come short in. And, therefore, I think, we may suppose, that it is in this that the species of brutes are discriminated from man: and it is that proper difference wherein they are wholly separated, and which at last widens to so vast a distance. For if they have any ideas at all, and are not bare machines, (as some would have them,) ² we cannot deny them to have some reason. It seems as evident to me, that they do reason, as that they have sense; but it is only in particular ideas, just as they received them from their senses. They are the best of them tied up within those narrow bounds, and have not (as I think) the faculty to enlarge them by any kind of abstraction.

15. *The true Beginning of Human Knowledge.* And thus I have given a short, and, I think, true *history of the first beginnings of human knowledge*; — whence the mind has its first objects; and by what steps it makes it progress to the laying in and storing up those ideas, out of which is to be framed all the knowledge it is capable of: wherein I must appeal to experience and observation whether I am in the right: the best way to come to truth being to examine things as really they are, and not to conclude they are, as we fancy of ourselves, or have been taught by others to imagine.

17. *Dark Room.* I pretend not to teach, but to inquire; and therefore cannot but confess here again, — that external and internal sensation are the only passages I can find of knowledge to the understanding. These alone, as far as I can discover, are the windows by which light is let into this *dark room*. For, methinks, the understanding is not much unlike a closet wholly shut from light, with only some little openings left, to let in external visible resemblances, or ideas of things without: would the pictures coming into such a dark room but stay there, and lie so orderly as to be found upon occasion, it would very much resemble the understanding of a man, in reference to all objects of sight, and the ideas of them.

These are my guesses concerning the means whereby the understanding comes to have and retain simple ideas, and the modes of them, with some other operations about them.

I proceed now to examine some of these simple ideas and their modes a little more particularly.

Chapter XII

OF COMPLEX IDEAS

1. *Made by the Mind out of simple Ones.* We have hitherto considered those ideas, in the reception whereof the mind is only passive, which are those simple ones received from sensation and reflection before mentioned, whereof the mind cannot make one to itself, nor have any idea which does not wholly consist of them. But as the mind is wholly passive in the reception of all its simple ideas, so it exerts several acts of its own, whereby out of its simple ideas, as the materials and foundations of the rest, the others are framed. The acts of the mind, wherein it exerts its power over its simple ideas, are chiefly these three: (1) Combining several simple ideas into one compound one; and thus all *complex ideas* are made. (2) The second is bringing two ideas, whether simple or complex, together, and setting them by one another, so as to take a view of them at once, without uniting them into one; by which way it gets all its *ideas of relations*. (3) The third is separating them from all other ideas that accompany them in their real existence: this is called abstraction: and thus all its *general ideas* are made. This shows man's power, and its ways of operation, to be much the same in the material and intellectual world. For the materials in both being such as he has no power over, either to make or destroy, all that man can do is either to unite them together, or to set them by one another, or wholly separate them. I shall here begin with the first of these in the consideration of complex ideas, and come to the other two in their due places. As simple ideas are observed to exist in several combinations united together, so the mind has a power to consider several of them united together as one idea; and that not only as they are united in external objects, but as itself has joined them together. Ideas thus made up of several simple ones put together, I call *complex*; — such as are beauty, gratitude, a man, an army, the universe; which, though complicated of various simple ideas, or complex ideas made up of simple ones, yet are, when the mind pleases, considered each by itself, as one entire thing, and signified by one name.

2. *Made voluntarily.* In this faculty of repeating and joining together its ideas, the mind has great power in varying and multiplying the objects of its thoughts, infinitely beyond what sensation or reflection furnished it with: but all this still confined to those simple ideas which it received from those two sources, and which are the ultimate materials of all its compositions. For simple ideas are all from things themselves, and of these the mind *can* have no more, nor other than what are suggested to it. It can have no other ideas of sensible qualities

than what come from without by the senses; nor any ideas of other kind of operations of a thinking substance, than what it finds in itself. But when it has once got these simple ideas, it is not confined barely to observation, and what offers itself from without; it can, by its own power, put together those ideas it has, and make new complex ones, which it never received so united.

3. *Complex ideas are either of Modes, Substances, or Relations.* *Complex ideas*, however compounded and decompounded, though their number be infinite, and the variety endless, wherewith they fill and entertain the thoughts of men; yet I think they may be all reduced under these three heads: —

1. *Modes.*

2. *Substances.*

3. *Relations.*

4. *Ideas of Modes.* First, *Modes* I call such complex ideas which, however compounded, contain not in them the supposition of subsisting by themselves, but are considered as dependences on, or affections of substances; — such as are the ideas signified by the words triangle, gratitude, murder, &c. And if in this I use the word mode in somewhat a different sense from its ordinary signification, I beg pardon; it being unavoidable in discourses, differing from the ordinary received notions, either to make new words, or to use old words in somewhat a new signification; the later whereof, in our present case, is perhaps the more tolerable of the two.

5. *Simple and mixed Modes of simple ideas.* Of these *modes*, there are two sorts which deserve distinct consideration:—

First, there are some which are only variations, or different combinations of the same simple idea, without the mixture of any other; — as a dozen, or score; which are nothing but the ideas of so many distinct units added together, and these I call *simple modes* as being contained within the bounds of one simple idea.

Secondly, there are others compounded of simple ideas of several kinds, but together to make one complex one; — v.g. beauty, consisting of a certain composition of colour and figure, causing delight to the beholder; theft, which being the concealed change of the possession of anything, without the consent of the proprietor, contains, as is visible, a combination of several ideas of several kinds: and these I call *mixed modes*.

6. *Ideas of Substances, single or collective.* Secondly, the ideas of *substances* are such combinations of simple ideas as are taken to represent distinct *particular* things subsisting by themselves; in which the supposed or confused idea of substance, such as it is, is always the first and chief. Thus if to substance be joined the simple idea of a certain dull whitish colour, with certain degrees of weight, hardness, ductility, and fusibility, we have the idea of lead; and a combination of the ideas of a certain sort of figure, with the powers of motion, thought and reasoning, joined to substance, make the ordinary idea of a man. Now of substances also, there are two sorts of ideas:—one of *single* substances, as they exist separately, as of a man or a sheep; the other of several of those put together, as an army of men, or flock of sheep — which *collective* ideas of several substances thus put together are as much each of them one single idea as that of a man or an unit.

7. *Ideas of Relation.* Thirdly, the last sort of complex ideas is that we call *relation*, which consists in the consideration and comparing one idea with another.

Of these several kinds we shall treat in their order.

Chapter XXI

OF POWER

1. *This Idea, how got.* The mind being every day informed, by the senses, of the alteration of those simple ideas it observes in things without; and taking notice how one comes to an end, and ceases to be, and another begins to exist which was not before; reflecting also on what passes within itself, and observing a constant change of its ideas, sometimes by the impression of outward objects on the senses, and sometimes by the determination of its own choice; and concluding from what it has so constantly observed to have been, that the like changes will for the future be made in the same things, by like agents, and by the like ways,— considers in one thing the possibility of having any of its simple ideas changed, and in another the possibility of making that change; and so comes by the idea which we call *power*. Thus we say, Fire has a power to melt

gold, i.e. to destroy the consistency of its insensible parts, and consequently its hardness, and make it fluid; and gold has a power to be melted; that the sun has a power to blanch wax, and wax a power to be blanched by the sun, whereby the yellowness is destroyed, and whiteness made to exist in its room. In which, and the like cases, the power we consider is in reference to the change of perceivable ideas. For we cannot observe any alteration to be made in, or operation upon anything, but by the observable change of its sensible ideas; nor conceive any alteration to be made, but by conceiving a change of some of its ideas.

2. *Power, active and passive.* Power thus considered is two-fold, viz. as able to make, or able to receive any change. The one may be called *active*, and the other *passive* power. Whether matter be not wholly destitute of active power, as its author, God, is truly above all passive power; and whether the intermediate state of created spirits be not that alone which is capable of both active and passive power, may be worth consideration. I shall not now enter into that inquiry, my present business being not to search into the original of power, but how we come by the *idea* of it. But since active powers make so great a part of our complex ideas of natural substances, (as we shall see hereafter,) and I mention them as such, according to common apprehension; yet they being not, perhaps, so truly *active* powers as our hasty thoughts are apt to represent them, I judge it not amiss, by this intimation, to direct our minds to the consideration of God and spirits, for the clearest idea of *active* power.

4. *The clearest Idea of active Power had from Spirit.* We are abundantly furnished with the idea of *passive* power by almost all sorts of sensible things. In most of them we cannot avoid observing their sensible qualities, nay, their very substances, to be in a continual flux. And therefore with reason we look on them as liable still to the same change. Nor have we of *active* power (which is the more proper signification of the word power) fewer instances. Since whatever change is observed, the mind must collect a power somewhere able to make that change, as well as a possibility in the thing itself to receive it. But yet, if we will consider it attentively, bodies, by our senses, do not afford us so clear and distinct an idea of active power, as we have from reflection on the operations of our minds. For all power relating to action, and there being but two sorts of action whereof we have an idea, viz. thinking and motion, let us consider whence we have the clearest ideas of the powers which produce these actions. (1) Of thinking, body affords us no idea at all; it is only from reflection that we have that. (2) Neither have we from body any idea of the beginning of motion. A body at rest affords us no idea of any active power to move; and when it is set in motion itself, that motion is rather a passion than an action in it. For, when the ball obeys the motion of a billiard-stick, it is not any action of the ball, but bare passion. Also when by impulse it sets another ball in motion that lay in its way, it only communicates the motion it had received from another, and loses in itself so much as the other received: which gives us but a very obscure idea of an *active* power of moving in body, whilst we observe it only to *transfer*, but not *produce* any motion. For it is but a very obscure idea of power which reaches not the production of the action, but the continuation of the passion. For so is motion in a body impelled by another; the continuation of the alteration made in it from rest to motion being little more an action, than the continuation of the alteration of its figure by the same blow is an action. The idea of the *beginning* of motion we have only from reflection on what passes in ourselves; where we find by experience, that, barely by willing it, barely by a thought of the mind, we can move the parts of our bodies, which were before at rest. So that it seems to me, we have, from the observation of the operation of bodies by our senses, but a very imperfect obscure idea of *active* power; since they afford us not any idea in themselves of the power to begin any action, either motion or thought.

5. *Will and Understanding two Powers in Mind or Spirit.* This, at least, I think evident, — That we find in ourselves a power to begin or forbear, continue or end several actions of our minds, and motions of our bodies, barely by a thought or preference of the mind ordering, or as it were commanding, the doing or not doing such or such a particular action. This power which the mind has thus to order the consideration of any idea, or the forbearing to consider it; or to prefer the motion of any part of the body to its rest, and *vice versa*, in any particular instance, is that which we call the *Will*. The actual exercise of that power, by directing any particular action, or its forbearance, is that which we call *volition* or *willing*. The forbearance of that action, consequent to such order or command of the mind, is called *voluntary*. And whatsoever action is performed without such a thought of the mind, is called *involuntary*. The power of perception is that which we call the *Understanding*. Perception, which we make the act of the understanding, is of three sorts: — 1. The perception of ideas in our minds. 2. The perception of the signification of signs. 3. The perception of the connexion or repugnancy, agreement or disagreement, that there is between any of our ideas. All these are attributed to the understanding, or perceptive power, though it be the two latter only that use allows us to say we understand.

7. *Whence the idea of liberty and necessity.* Everyone, I think, finds in himself a power to begin or forbear,

continue or put an end to several actions in himself. From the consideration of the extent of this power of the mind over the actions of the man, which everyone finds in himself, arise the ideas of liberty and necessity.

8. *Liberty, what.* All the actions that we have any idea of reducing themselves, as has been said, to these two, viz. thinking and motion; so far as a man has power to think or not to think, to move or not to move, according to the preference or direction of his own mind, so far is a man *free*. Whenever any performance or forbearance are not equally in a man's power; wherever doing or not doing will not equally *follow* upon the preference of his mind directing it, there he is not free, though perhaps the action may be voluntary. So, that the idea of *liberty* is, the idea of a power in any agent to do or forbear any particular action, according to the determination or thought of the mind, whereby either of them is preferred to the other: where either of them is not in the power of the agent to be produced by him according to his volition, there he is not at liberty; that agent is under *necessity*. So that liberty cannot be where there is no thought, no volition, no will; but there may be thought, there may be will, there may be volition, where there is no liberty. A little consideration of an obvious instance or two may make this clear.

9. *Supposes Understanding and Will.* A tennis-ball, whether in motion by the stroke of a racket, or lying still at rest, is not by any one taken to be a free agent. If we inquire into the reason, we shall find it is because we conceive not a tennis-ball to think, and consequently not to have any volition, or *preference* of motion to rest, or *vice versa*; and therefore has not liberty, is not a free agent; but all its both motion and rest come under our idea of necessary, and are so called. Likewise a man falling into the water, (a bridge breaking under him,) has not herein liberty, is not a free agent. For though he has volition, though he prefers his not falling to falling; yet the forbearance of that motion not being in his power, the stop or cessation of that motion follows not upon his volition; and therefore herein he is not free. So a man striking himself, or his friend, by a convulsive motion of his arm, which it is not in his power, by volition or the direction of his mind, to stop or forbear, nobody thinks he has in this liberty; every one pities him, as acting by necessity and constraint.

10. *Belongs not to Volition.* Again: suppose a man be carried, whilst fast asleep, into a room where is a person he longs to see and speak with; and be there locked fast in, beyond his power to get out: he awakes, and is glad to find himself in so desirable company, which he stays willingly in, i.e. prefers his stay to going away. I ask, is not this stay voluntary? I think nobody will doubt it: and yet, being locked fast in, it is evident he is not at liberty not to stay, he has not freedom to be gone. So that liberty is not an idea belonging to volition, or preferring; but to the person having the power of doing, or forbearing to do, according as the mind shall choose or direct. Our idea of liberty reaches as far as that power, and no farther. For wherever restraint comes to check that power, or compulsion takes away that indifferency of ability to act, or to forbear acting, there liberty, and our notion of it, presently ceases.

11. *Voluntary opposed to involuntary, not to necessary.* We have instances enough, and often more than enough, in our own bodies. A man's heart beats, and the blood circulates, which it is not in his power by any thought or volition to stop; and therefore in respect of these motions, where rest depends not on his choice, nor would follow the determination of his mind, if it should prefer it, he is not a free agent. Convulsive motions agitate his legs, so that though he wills it ever so much, he cannot by any power of his mind stop their motion, (as in that odd disease called *chorea sancti viti*), but he is perpetually dancing; he is not at liberty in this action, but under as much necessity of moving, as a stone that falls, or a tennis-ball struck with a racket. On the other side, a palsy or the stocks hinder his legs from obeying the determination of his mind, if it would thereby transfer his body to another place. In all these there is want of freedom; though the sitting still, even of a paralytic, whilst he prefers it to a removal, is truly voluntary. Voluntary, then, is not opposed to necessary, but to involuntary. For a man may prefer what he can do, to what he cannot do; the state he is in, to its absence or change; though necessity has made it in itself unalterable.

12. *Liberty, what.* As it is in the motions of the body, so it is in the thoughts of our minds: where any one is such, that we have power to take it up, or lay it by, according to the preference of the mind, there we are at liberty. A waking man, being under the necessity of having some ideas constantly in his mind, is not at liberty to think or not to think; no more than he is at liberty, whether his body shall touch any other or no: but whether he will remove his contemplation from one idea to another is many times in his choice; and then he is, in respect of his ideas, as much at liberty as he is in respect of bodies he rests on; he can at pleasure remove himself from one to another. But yet some ideas to the mind, like some motions to the body, are such as in certain circumstances it cannot avoid, nor obtain their absence by the utmost effort it can use. A man on the rack is not at liberty to lay by the idea of pain, and divert himself with other contemplations: and sometimes a

boisterous passion hurries our thoughts, as a hurricane does our bodies, without leaving us the liberty of thinking on other things, which we would rather choose. But as soon as the mind regains the power to stop or continue, begin or forbear, any of these motions of the body without, or thoughts within, according as it thinks fit to prefer either to the other, we then consider the man as a *free agent* again.

13. *Necessity, what.* Wherever thought is wholly wanting, or the power to act or forbear according to the direction of thought, there necessity takes place. This, in an agent capable of volition, when the beginning or continuation of any action is contrary to that preference of his mind, is called compulsion; when the hindering or stopping any action is contrary to his volition, it is called restraint. Agents that have no thought, no volition at all, are in everything *necessary agents*.

14. *Liberty belongs not to the Will.* If this be so, (as I imagine it is,) I leave it to be considered, whether it may not help to put an end to that long agitated, and, I think, unreasonable, because unintelligible question, viz. *Whether man's will be free or no?* For if I mistake not, it follows from what I have said, that the question itself is altogether improper; and it is as insignificant to ask whether man's *will* be free, as to ask whether his sleep be swift, or his virtue square: liberty being as little applicable to the will, as swiftness of motion is to sleep, or squareness to virtue. Every one would laugh at the absurdity of such a question as either of these: because it is obvious that the modifications of motion belong not to sleep, nor the difference of figure to virtue; and when any one well considers it, I think he will as plainly perceive that liberty, which is but a power, belongs only to *agents*, and cannot be an attribute or modification of the will, which is also but a power.

15. *Volition.* Such is the difficulty of explaining and giving clear notions of internal actions by sounds, that I must here warn my reader, that *ordering, directing, choosing, preferring, &c.*, which I have made use of, will not distinctly enough express volition, unless he will reflect on what he himself does when he wills. For example, preferring, which seems perhaps best to express the act of volition, does it not precisely. For though a man would prefer flying to walking, yet who can say he ever wills it? Volition, it is plain, is an act of the mind knowingly exerting that dominion it takes itself to have over any part of the man, by employing it in, or withholding it from, any particular action. And what is the will, but the faculty to do this? And is that faculty anything more in effect than a power; the power of the mind to determine its thought, to the producing, continuing, or stopping any action, as far as it depends on us? For can it be denied that whatever agent has a power to think on its own actions, and to prefer their doing or omission either to other, has that faculty called will? *Will*, then, is nothing but such a power. *Liberty*, on the other side, is the power a *man* has to do or forbear doing any particular action according as its doing or forbearance has the actual preference in the mind; which is the same thing as to say, according as he himself wills it.

16. *Powers belonging to Agents.* It is plain then that the will is nothing but one power or ability, and *freedom* another power or ability so that, to ask, whether the will has freedom, is to ask whether one power has another power, one ability another ability; a question at first sight too grossly absurd to make a dispute, or need an answer. For, who is it that sees not that powers belong only to agents, and are attributes only of substances, and not of powers themselves? So that this way of putting the question (viz. whether the will be free) is in effect to ask, whether the will be a substance, an agent, or at least to suppose it, since freedom can properly be attributed to nothing else. If freedom can with any propriety of speech be applied to power, it may be attributed to the power that is in a man to produce, or forbear producing, motion in parts of his body, by choice or preference; which is that which denominates him free, and is freedom itself. But if any one should ask, whether freedom were free, he would be suspected not to understand well what he said; and he would be thought to deserve Midas's ears,³ who, knowing that rich was a denomination for the possession of riches, should demand whether riches themselves were rich.

21. *But to the Agent or Man.* To return, then, to the inquiry about liberty, I think the question is not proper, *whether the will be free*, but *whether a man be free*. Thus, I think.

First, That so far as any one can, by the direction or choice of his mind, preferring the existence of any action to the non-existence of that action, and *vice versa*, make it to exist or not exist, so far he is free. For if I can, by a thought directing the motion of my finger, make it move when it was at rest, or *vice versa*, it is evident, that in respect of that I am free: and if I can, by a like thought of my mind, preferring one to the other, produce either words or silence, I am at liberty to speak or hold my peace: and as far as this power reaches, of acting or not acting, by the determination of his own thought preferring either, so far is a man free. For how can we think any one freer, than to have the power to do what he will? And so far as any one can, by preferring any action to its not being, or rest to any action, produce that action or rest, so far can he do what

he will. For such a preferring of action to its absence, is the willing of it: and we can scarce tell how to imagine any being freer, than *to be able to do what he wills*. So that in respect of actions within the reach of such a power in him, a man seems as free as it is possible for freedom to make him.

22. *In respect of willing, a Man is not free.* But the inquisitive mind of man, willing to shift off from himself, as far as he can, all thoughts of guilt, though it be by putting himself into a worse state than that of fatal necessity, is not content with this: freedom, unless it reaches further than this, will not serve the turn: and it passes for a good plea, that a man is not free at all, if he be not as *free to will* as he is to *act what he wills*. Concerning a man's liberty, there yet, therefore, is raised this further question, *Whether a man be free to will?* which I think is what is meant, when it is disputed whether the will be free. And as to that I imagine.

23. *How a man cannot be free to will.* Secondly, That willing, or volition, being an action, and freedom consisting in a power of acting or not acting, a man in respect of willing or the act of volition, when any action in his power is once proposed to his thoughts, as presently to be done, cannot be free. The reason whereof is very manifest. For, it being unavoidable that the action depending on his will should exist or not exist, and its existence or not existence following perfectly the determination and preference of his will, he cannot avoid willing the existence or non-existence of that action; it is absolutely necessary that he will the one or the other; i.e., prefer the one to the other: since one of them must necessarily follow; and that which does follow follows by the choice and determination of his mind; that is, by his willing it: for if he did not will it, it would not be. So that, in respect of the act of willing, a man in such a case is not free: liberty consisting in a power to act or not to act; which, in regard of volition, a man, upon such a proposal, has not. For it is unavoidably necessary to prefer the doing or forbearance of an action in a man's power, which is once so proposed to his thoughts; a man must necessarily will the one or the other of them; upon which preference or volition, the action or its forbearance certainly follows, and is truly voluntary. But the act of volition, or preferring one of the two, being that which he cannot avoid, a man, in respect of that act of willing, is under a necessity, and so cannot be free; unless necessity and freedom can consist together, and a man can be free and bound at once. Besides to make a man free after this manner, by making the action of willing to depend on his will, there must be another antecedent will, to determine the acts of this will, and another to determine that, and so *in infinitum*: for wherever one stops, the actions of the last will cannot be free. Nor is any being, as far I can comprehend beings above, capable of such a freedom of will, that it can forbear to will, i.e. to prefer the being or not being of anything in its power, which it has once considered as such.

24. *Liberty is freedom to execute what is willed.* This, then, is evident. That *a man is not at liberty to will, or not to will, anything in his power that he once considers of*: liberty consisting in a power to act or to forbear acting, and in that only. For a man that sits still is said yet to be at liberty; because he can walk if he wills it. A man that walks is at liberty also, not because he walks or moves; but because he can stand still if he wills it. *But if a man sitting still has not a power to remove himself, he is not at liberty*, so likewise a man falling down a precipice, though in motion, is not at liberty, because he cannot stop that motion if he would. This being so, it is plain that a man that is walking, to whom it is proposed to give off walking, is not at liberty, whether he will determine himself to walk, or give off walking or not: he must necessarily prefer one or the other of them; walking or not walking. And so it is in regard of all other actions in our power so proposed, which are the far greater number. For, considering the vast number of voluntary actions that succeed one another every moment that we are awake in the course of our lives, there are but few of them that are thought on or proposed to the will, till the time they are to be done; and in all such actions, as I have shown, the mind, in respect of willing, has not a power to act or not to act, wherein consists liberty. The mind, in that case, has not a power to forbear *willing*; it cannot avoid some determination concerning them, let the consideration be as short, the thought as quick as it will, it either leaves the man in the state he was before thinking, or changes it; continues the action, or puts an end to it. Whereby it is manifest, that *it* orders and directs one, in preference to, or with neglect of the other, and thereby either the continuation or change becomes *unavoidably* voluntary.

25. *The Will determined by something without it.* Since then it is plain that, in most cases, a man is not at liberty, whether he will nor no, (for, when an action in his power is proposed to his thoughts, he *cannot* forbear volition; he *must* determine one way or the other;) the next thing demanded is, — *Whether a man be at liberty to will which of the two he pleases, motion or rest?* This question carries the absurdity of it so manifestly in itself, that one might thereby sufficiently be convinced that liberty concerns not the will. For, to ask whether a man be at liberty to will either motion or rest, speaking or silence, which he pleases, is to ask whether a man can will what he wills, or be pleased with what he is pleased with? A question which, I think, needs no answer: and they who can make a question of it must suppose one will to determine the acts of another, and

another to determine that, and so on *in infinitum*.

26. *The ideas of liberty and volition must be defined.* To avoid these and the like absurdities, nothing can be of greater use than to establish in our minds determined ideas of the things under consideration. If the ideas of liberty and volition were well fixed in our understandings, and carried along with us in our minds, as they ought, through all the questions that are raised about them, I suppose a great part of the difficulties that perplex men's thoughts, and entangle their understandings, would be much easier resolved; and we should perceive where the confused signification of terms, or where the nature of the thing caused the obscurity.

27. *Freedom.* First, then, it is carefully to be remembered, That freedom consists in the dependence of the existence, or not existence of any *action*, upon our *volition* of it; and not in the dependence of any action, or its contrary, on our *preference*. A man standing on a cliff, is at liberty to leap twenty yards downwards into the sea, not because he has a power to do the contrary action, which is to leap twenty yards upwards, for that he cannot do; but he is therefore free, because he has a power to leap or not to leap. But if a greater force than his, either holds him fast, or tumbles him down, he is no longer free in that case; because the doing or forbearance of that particular action is no longer in his power. He that is a close prisoner in a room twenty feet square, being at the north side of his chamber, is at liberty to walk twenty feet southward, because he can walk or not walk it; but is not, at the same time, at liberty to do the contrary, i.e. to walk twenty feet northward.

In this, then, consists freedom, viz. in our being able to act or not to act, according as we shall choose or will.

28. *What Volition and action mean.* Secondly, we must remember, that *volition* or *willing* is an act of the mind directing its thought to the production of any action, and thereby exerting its power to produce it. To avoid multiplying of words, I would crave leave here, under the word *action*, to comprehend the forbearance too of any action proposed: sitting still, or holding one's peace, when walking or speaking are proposed, though mere forbearances, requiring as much the determination of the will, and being as often weighty in their consequences, as the contrary actions, may, on that consideration, well enough pass for actions too: but this I say, that I may not be mistaken, if (for brevity's sake) I speak thus.

29. *What determines the Will.* Thirdly, the will being nothing but a power in the mind to direct the operative faculties of a man to motion or rest, as far as they depend on such direction; to the question, What is it determines the will? the true and proper answer is, The mind. For that which determines the general power of directing, to this or that particular direction, is nothing but the agent itself exercising the power it has that particular way. If this answer satisfies not, it is plain the meaning of the question, What determines the will? is this, — What moves the mind, in every particular instance, to determine its general power of directing, to this or that particular motion or rest? And to this I answer, — *The motive for continuing in the same state or action, is only the present satisfaction in it; the motive to change is always some uneasiness:* nothing setting us upon the change of state, or upon any new action, but some uneasiness. This is the great motive that works on the mind to put it upon action, which for shortness' sake we will call determining of the will, which I shall more at large explain.

48. *The Power to suspend the Prosecution of any Desire makes way for Consideration.* There being in us a great many uneasinesses, always soliciting and ready to determine the will, it is natural, as I have said, that the greatest and most pressing should determine the will to the next action; and so it does for the most part, but not always. For, the mind having in most cases, as is evident in experience, a power to *suspend* the execution and satisfaction of any of its desires; and so all, one after another; is at liberty to consider the objects of them, examine them on all sides, and weigh them with others. In this lies the liberty man has; and from the not using of it right comes all that variety of mistakes, errors, and faults which we run into in the conduct of our lives, and our endeavours after happiness; whilst we precipitate the determination of our wills, and engage too soon, before due examination. To prevent this, we have a power to suspend the prosecution of this or that desire; as every one daily may experiment in himself. This seems to me the source of all liberty; in this seems to consist that which is (as I think improperly) called *free-will*. For, during this suspension of any desire, before the will be determined to action, and the action (which follows that determination) done, we have opportunity to examine, view, and judge of the good or evil of what we are going to do; and when, upon due examination, we have judged, we have done our duty, all that we can, or ought to do, in pursuit of our happiness; and it is not a fault, but a perfection of our nature, to desire, will, and act according to the last result of a fair examination.

73. *Recapitulation—Liberty of indifferency.* To conclude this inquiry into *human liberty*, which, as it stood

before, I myself from the beginning fearing, and a very judicious friend of mine, since the publication, suspecting to have some mistake in it, though he could not particularly show it me, I was put upon a stricter review of this chapter. Wherein lighting upon a very easy and scarce observable slip I had made, in putting one seemingly indifferent word for another that discovery opened to me this present view, which here, in this second edition, I submit to the learned world, and which, in short, is this: *Liberty* is a power to act or not to act, according as the mind directs. A power to direct the operative faculties to motion or rest in particular instances is that which we call the *will*. That which in the train of our voluntary actions determines the will to any change of operation is *some present uneasiness*, which is, or at least is always accompanied with that of *desire*. Desire is always moved by evil, to fly it: because a total freedom from pain always makes a necessary part of our happiness: but every good, nay, every greater good, does not constantly move desire, because it may not make, or may not be taken to make, any necessary part of our happiness. For all that we desire, is only to be happy. But, though this general desire of happiness operates constantly and invariably, yet the satisfaction of any particular desire *can be suspended* from determining the will to any subservient action, till we have maturely examined whether the particular apparent good which we then desire makes a part of our real happiness, or be consistent or inconsistent with it. The result of our judgment upon that examination is what ultimately determines the man; who could not be *free* if his will were determined by anything but his own desire, guided by his own judgment. I know that liberty, by some, is placed in an indifferency of the man; antecedent to the determination of his will. I wish they who lay so much stress on such an antecedent indifferency, as they call it, had told us plainly, whether this supposed indifferency be antecedent to the thought and judgment of the understanding, as well as to the decree of the will. For it is pretty hard to state it between them, i.e. immediately *after* the judgment of the understanding, and *before* the determination of the will: because the determination of the will immediately follows the judgment of the understanding: and to place liberty in an indifferency, antecedent to the thought and judgment of the understanding, seems to me to place liberty in a state of darkness, wherein we can neither see nor say anything of it; at least it places it in a subject incapable of it, no agent being allowed capable of liberty, but in consequence of thought and judgment. I am not nice about phrases, and therefore consent to say with those that love to speak so, that liberty is placed in indifferency; but it is an indifferency which remains after the judgment of the understanding, yea, even after the determination of the will: and that is an indifferency not of the *man*, (for after he has once judged which is best, viz. to do or forbear, he is no longer indifferent,) but an indifferency of *the operative powers of the man*, which remaining equally able to operate or to forbear operating after as before the decree of the will, are in a state, which, if one pleases, may be called indifferency; and as far as this indifferency reaches, a man is free, and no further: v.g. I have the ability to move my hand, or to let it rest; that operative power is indifferent to move or not to move my hand. I am then, in that respect perfectly free; my will determines that operative power to rest: I am yet free, because the indifferency of that my operative power to act, or not to act, still remains; the power of moving my hand is not at all impaired by the determination of my will, which at present orders rest; the indifferency of that power to act, or not to act, is just as it was before, as will appear, if the will puts it to the trial, by ordering the contrary. But if, during the rest of my hand, it be seized with a sudden palsy, the indifferency of that operative power is gone, and with it my liberty; I have no longer freedom in that respect, but am under a necessity of letting my hand rest. On the other side, if my hand be put into motion by a convulsion, the indifferency of that operative faculty is taken away by that motion; and my liberty in that case is lost, for I am under a necessity of having my hand move. I have added this, to show in what sort of indifferency liberty seems to me to consist, and not in any other, real or imaginary.

74. *Active and passive power, in motions and in thinking.* Before I close this chapter, it may perhaps be to our purpose, and help to give us clearer conceptions about *power*, if we make our thoughts take a little more exact survey of *action*. I have said above, that we have ideas but of two sorts of action, viz. motion and thinking. These, in truth, though called and counted actions, yet, if nearly considered, will not be found to be always perfectly so. For, if I mistake not, there are instances of both kinds, which, upon due consideration, will be found rather passions than actions; and consequently so far the effects barely of *passive powers* in those subjects, which yet on their accounts are thought agents. For, in these instances, the substance that hath motion or thought receives the impression, whereby it is put into that action, purely from without, and so acts merely by the capacity it has to receive such an impression from some external agent; and such a power is not properly an active power, but a mere passive capacity in the subject. Sometimes the substance or agent puts itself into action by its own power, and this is properly *active power*. Whatsoever modification a substance has, whereby it produces any effect, that is called action: v.g. a solid substance, by motion, operates on or alters the sensible ideas of another substance, and therefore this modification of motion we call action. But yet this

motion in that solid substance is, when rightly considered, but a passion, if it received it only from some external agent. So that the active power of motion is in no substance which cannot begin motion in itself or in another substance when at rest. So likewise in thinking, a power to receive ideas or thoughts from the operation of any external substance is called a power of thinking: but this is but a passive power, or capacity. But to be able to bring into view ideas out of sight at one's own choice, and to compare which of them one thinks fit, this is an active power. This reflection may be of some use to preserve us from mistakes about powers and actions, which grammar, and the common frame of languages, may be apt to lead us into. Since what is signified by verbs that grammarians call active, does not always signify action: v.g. this proposition: I *see* the moon, or a star, or I *feel* the heat of the sun, though expressed by a verb active, does not signify any action in me, whereby I operate on those substances, but only the reception of the ideas of light, roundness, and heat; wherein I am not active, but barely passive, and cannot, in that position of my eyes or body, avoid receiving them. But when I turn my eyes another way, or remove my body out of the sunbeams, I am properly active; because of my own choice, by a power within myself, I put myself into that motion. Such an action is the product of active power.

Chapter XXIII

OF OUR COMPLEX IDEAS OF SUBSTANCES

1. *Ideas of particular Substances, how made.* The mind being, as I have declared, furnished with a great number of the simple ideas, conveyed in by the senses as they are found in exterior things, or by reflection on its own operations, takes notice also that a certain number of these simple ideas go constantly together; which being presumed to belong to one thing, and words being suited to common apprehensions, and made use of for quick dispatch, are called, so united in one subject, by one name; which, by inadvertency, we are apt afterward to talk of and consider as one simple idea, which indeed is a complication of many ideas together: because, as I have said, not imaging how these simple ideas *can* subsist by themselves, we accustom ourselves to suppose some *substratum* wherein they do subsist, and from which they do result, which therefore we call *substance*.

2. *Our obscure Idea of Substance is general.* So that if any one will examine himself concerning his notion of pure substance in general, he will find he has no other idea of it at all, but only a supposition of he knows not what *support* of such qualities which are capable of producing simple ideas in us; which qualities are commonly called accidents. If any one should be asked, what is the subject wherein colour or weight inheres, he would have nothing to say, but the solid extended parts; and if he were demanded, what is it that solidity and extension adhere in, he would not be in a much better case than the Indian before mentioned who, saying that the world was supported by a great elephant, was asked what the elephant rested on; to which his answer was — a great tortoise: but being again pressed to know what gave support to the broad-backed tortoise, replied — *something, he knew not what*. And thus here, as in all other cases where we use words without having clear and distinct ideas, we talk like children: who, being questioned what such a thing is, which they know not, readily give this satisfactory answer, that it is *something*: which in truth signifies no more, when so used, either by children or men, but that they know not what; and that the thing they pretend to know, and talk of, is what they have no distinct idea of at all, and so are perfectly ignorant of it, and in the dark. The idea then we have, to which we give the *general* name substance, being nothing but the supposed, but unknown, support of those qualities we find existing, which we imagine cannot subsist *sine re substante*, without something to support them, we call that support *substantia*; which, according to the true import of the word, is, in plain English, standing under or upholding.

3. *Of the Sorts of Substances.* An obscure and relative idea of *substance in general* being thus made we come to have the ideas of *particular sorts of substances*, by collecting *such* combinations of simple ideas as are, by experience and observation of men's senses, taken notice of to exist together; and are therefore supposed to flow from the particular internal constitution, or unknown essence of that substance. Thus we come to have the ideas of a man, horse, gold, water, &c.; of which substances, whether any one has any other *clear* idea, further than of certain simple ideas coexistent together, I appeal to every one's own experience. It is the ordinary qualities observable in iron, or a diamond, put together, that make the true complex idea of those substances, which a smith or a jeweller commonly knows better than a philosopher; who, whatever *substantial forms* he may talk of, has no other idea of those substances, than what is framed by a collection of those simple ideas which are to be found in them: only we must take notice, that our complex ideas of substances, besides all those simple ideas they are made up of, have always the confused idea of something to which they belong, and in which they subsist: and therefore when we speak of any sort of substance, we say it is a thing having

such or such qualities; as body is a thing that is extended, figured, and capable of motion; spirit, a thing capable of thinking; and so hardness, friability, and power to draw iron, we say, are qualities to be found in a loadstone. These, and the like fashions of speaking, intimate that the substance is supposed always *something besides* the extension, figure, solidity, motion, thinking, or other observable ideas, though we know not what it is.

4. *No clear or distinct idea of Substance in general.* Hence, when we talk or think of any particular sort of corporeal substances, as horse, stone, &c., though the idea we have of either of them be but the complication or collection of those several simple ideas of sensible qualities, which we used to find united in the thing called horse or stone; yet, *because we cannot conceive how they should subsist alone, nor one in another*, we suppose them existing in and supported by some common subject; which support we denote by the name substance, though it be certain we have no clear or distinct idea of that thing we suppose a support.

5. *As clear an Idea of spiritual substance as of corporeal substance.* The same thing happens concerning the operations of the mind, viz. thinking, reasoning, fearing, &c., which we concluding not to subsist of themselves, nor apprehending how they can belong to body, or be produced by it, we are apt to think these the actions of some other *substance*, which we call *spirit*; whereby yet it is evident that, having no other idea or notion of matter, but something wherein those many sensible qualities which affect our senses do subsist; by supposing a substance wherein thinking, knowing, doubting, and a power of moving, &c., do subsist, we have as clear a notion of the substance of spirit, as we have of body; the one being supposed to be (without knowing what it is) the *substratum* to those simple ideas we have from without; and the other supposed (with a like ignorance of what it is) to be the *substratum* to those operations we experiment in ourselves within. It is plain then, that the idea of *corporeal substance* in matter is as remote from our conceptions and apprehensions, as that of *spiritual substance*, or spirit: and therefore, from our not having any notion of the substance of spirit, we can no more conclude its non-existence, than we can, for the same reason, deny the existence of body; it being as rational to affirm there is no body, because we have no clear and distinct idea of the substance of matter, as to say there is no spirit, because we have no clear and distinct idea of the substance of a spirit.

6. *Our ideas of particular Sorts of Substances.* Whatever therefore be the secret abstract nature of substance in general, all the ideas we have of particular distinct sorts of substances are nothing but several combinations of simple ideas, co-existing in such, though unknown, cause of their union, as makes the whole subsist of itself. It is by such combinations of simple ideas, and nothing else, that we represent particular sorts of substances to ourselves; such are the ideas we have of their several species in our minds; and such only do we, by their specific names, signify to others, v.g. man, horse, sun, water, iron: upon hearing which words, every one who understands the language, frames in his mind a combination of those several simple ideas which he has usually observed, or fancied to exist together under that denomination; all which he supposes to rest in and be, as it were, adherent to that unknown common subject, which inheres not in anything else. Though, in the meantime, it be manifest, and every one, upon inquiry into his own thoughts, will find, that he has no other idea of any substance, v.g. let it be gold, horse, iron, man, vitriol, bread, but what he has barely of those sensible qualities, which he supposes to inhere; with a supposition of such a *substratum* as gives, as it were, a support to those qualities or simple ideas, which he has observed to exist united together. Thus, the idea of the sun, — what is it but an aggregate of those several simple ideas, bright, hot, roundish, having a constant regular motion, at a certain distance from us, and perhaps some other: as he who thinks and discourses of the sun has been more or less accurate in observing those sensible qualities, ideas, or properties, which are in that thing which he calls the sun.

9. *Three sorts of Ideas make our complex ones of Corporeal Substances.* The ideas that make our complex ones of corporeal substances, are of these three sorts. First, the ideas of the primary qualities of things, which are discovered by our senses, and are in them even when we perceive them not; such are the bulk, figure, number, situation, and motion of the parts of bodies; which are really in them, whether we take notice of them or not. Secondly, the sensible secondary qualities, which, depending on these, are nothing but the powers those substances have to produce several ideas in us by our senses; which ideas are not in the things themselves, otherwise than as anything in its cause. Thirdly, the aptness we consider in any substance, to give or receive such alterations of primary qualities, as that the substance so altered should produce in us different ideas from what it did before; these are called active and passive powers: all which powers, as far as we have any notice or notion of them, terminate only in sensible simple ideas. For whatever alteration a loadstone has the power to make in the minute particles of iron, we should have no notion of any power it had at all to operate on iron, did not its sensible motion discover it: and I doubt not, but there are a thousand changes, that bodies we daily

handle have a power to cause in one another, which we never suspect, because they never appear in sensible effects.

10. *Powers thus make a great Part of our complex Ideas of particular Substances.* Powers therefore justly make a great part of our complex ideas of substances. He that will examine his complex idea of gold, will find several of its ideas that make it up to be only powers; as the power of being melted, but of not spending itself in the fire; of being dissolved in *aqua regia*, are ideas as necessary to make up our complex idea of gold, as its colour and weight: which, if duly considered, are also nothing but different powers. For, to speak truly, yellowness is not actually in gold, but is a power in gold to produce that idea in us by our eyes, when placed in a due light: and the heat, which we cannot leave out of our ideas of the sun, is no more really in the sun, than the white colour it introduced into wax. These are both equally powers in the sun, operating, by the motion and figure of its sensible parts, so on a man, as to make him have the idea of heat; and so on wax, as to make it capable to produce in a man the idea of white.

11. *The now secondary Qualities of Bodies would disappear, if we could discover the primary ones of their minute Parts.* Had we senses acute enough to discern the minute particles of bodies, and the real constitution on which their sensible qualities depend, I doubt not but they would produce quite different ideas in us: and that which is now the yellow colour of gold, would then disappear, and instead of it we should see an admirable texture of parts, of a certain size and figure. This microscopes plainly discover to us; for what to our naked eyes produces a certain colour, is, by thus augmenting the acuteness of our senses, discovered to be quite a different thing; and the thus altering, as it were, the proportion of the bulk of the minute parts of a coloured object to our usual sight, produces different ideas from what it did before. Thus, sand or pounded glass, which is opaque, and white to the naked eye, is pellucid in a microscope; and a hair seen in this way, loses its former colour, and is, in a great measure, pellucid, with a mixture of some bright sparkling colours, such as appear from the refraction of diamonds, and other pellucid bodies. Blood, to the naked eye, appears all red; but by a good microscope, wherein its lesser parts appear, shows only some few globules of red, swimming in a pellucid liquor, and how these red globules would appear, if glasses could be found that could yet magnify them a thousand or ten thousand times more, is uncertain.

14. *Our specific Ideas of Substances.* But to return to the matter in hand, — the ideas we have of substances, and the ways we come by them. I say, our *specific* ideas of substances are nothing else but *a collection of a certain number of simple ideas, considered as united in one thing*. These ideas of substances, though they are commonly simple apprehensions, and the names of them simple terms, yet in effect are complex and compounded. Thus the idea which an Englishman signifies by the name swan, is white colour, long neck, red beak, black legs, and whole feet, and all these of a certain size, with a power of swimming in the water, and making a certain kind of noise, and perhaps, to a man who has long observed this kind of birds, some other properties: which all terminate in sensible simple ideas, all united in one common subject.

15. *Our Ideas of spiritual Substances, as clear as of bodily Substances.* Besides the complex ideas we have of material sensible substances, of which I have last spoken, — by the simple ideas we have taken from those operations of our own minds, which we experiment daily in ourselves, as thinking, understanding, willing, knowing, and power of beginning motion, &c., co-existing in some substance, we are able to frame the *complex idea of an immaterial spirit*. And thus, by putting together the ideas of thinking, perceiving, liberty, and power of moving themselves and other things, we have as clear a perception and notion of immaterial substances as we have of material. For putting together the ideas of thinking and willing, or the power of moving or quieting corporeal motion, joined to substance, of which we have no distinct idea, we have the idea of an immaterial spirit; and by putting together the ideas of coherent solid parts, and a power of being moved, joined with substance, of which likewise we have no positive idea, we have the idea of matter. The one is as clear and distinct an idea as the other: the idea of thinking, and moving a body, being as clear and distinct ideas as the ideas of extension, solidity, and being moved. For our idea of substance is equally obscure, or none at all, in both: it is but a supposed I know not what, to support those ideas we call accidents. It is for want of reflection that we are apt to think that our senses show us nothing but material things. Every act of sensation, when duly considered, gives us an equal view of both parts of nature, the corporeal and spiritual. For whilst I know, by seeing or hearing, &c., that there is some corporeal being without me, the object of that sensation, I do more certainly know, that there is some spiritual being within me that sees and hears. This, I must be convinced, cannot be the action of bare insensible matter; nor ever could be, without an immaterial thinking being.

16. *No Idea of abstract Substance either in Body or Spirit.* By the complex idea of extended, figured, coloured, and all other sensible qualities, which is all that we know of it, we are as far from the idea of the substance of body, as if we knew nothing at all: nor after all the acquaintance and familiarity which we imagine we have with matter, and the many qualities men assure themselves they perceive and know in bodies, will it perhaps upon examination be found, that they have any more or clearer primary ideas belonging to body, than they have belonging to immaterial spirit.

17. *Cohesion of solid parts and Impulse, the primary ideas peculiar to Body.* The primary ideas we have *peculiar to body*, as contradistinguished to spirit, are the *cohesion of solid, and consequently separable, parts*, and a *power of communicating motion by impulse*. These, I think, are the original ideas proper and peculiar to body; for figure is but the consequence of finite extension.

18. *Thinking and Motivity.* The ideas we have belonging and *peculiar to spirit*, are *thinking*, and *will*, or a *power of putting body into motion by thought, and, which is consequent to it, liberty*. For, as body cannot but communicate its motion by impulse to another body, which it meets with at rest, so the mind can put bodies into motion, or forbear to do so, as it pleases. The ideas of *existence, duration, and mobility*, are common to them both.

37. *Recapitulation.* And thus we have seen what kind of ideas we have of *substances of all kinds*, wherein they consist, and how we came by them. From whence, I think, it is very evident,

First, That all our ideas of the several *sorts* of substances are nothing but collections of simple ideas: with a supposition of *something* to which they belong, and in which they subsist: though of this supposed something we have no clear distinct idea at all.

Secondly, That all the simple ideas, that thus united in one common *substratum*, make up our complex ideas of several *sorts* of substances, are no other but such as we have received from sensation or reflection. So that even in those which we think we are most intimately acquainted with, and that come nearest the comprehension of our most enlarged conceptions, we cannot go beyond those simple ideas. And even in those which seem most remote from all we have to do with, and do infinitely surpass anything we can perceive in ourselves by reflection; or discover by sensation in other things, we can attain to nothing but those simple ideas, which we originally received from sensation or reflection; as is evident in the complex ideas we have of angels, and particularly of God himself.

Thirdly, That most of the simple ideas that make up our complex ideas of substances, when truly considered, are only *powers*, however we are apt to take them for positive qualities; v.g. the greatest part of the ideas that make our complex idea of *gold* are yellowness, great weight, ductility, fusibility, and solubility in *aqua regia*, &c., all united together in an unknown *substratum*: all which ideas are nothing else but so many relations to other substances; and are not really in the gold, considered barely in itself, though they depend on those real and primary qualities of its internal constitution, whereby it has a fitness differently to operate, and be operated on by several other substances.

Chapter XXVII

OF IDENTITY AND DIVERSITY

1. *Wherein Identity consists.* Another occasion the mind often takes of comparing, is the very being of things, when, considering *anything as existing at any determined time and place*, we compare it with *itself existing at another time*, and thereon form the ideas of *identity* and *diversity*. When we see anything to be in any place in any instant of time, we are sure (be it what it will) that it is that very thing, and not another which at that same time exists in another place, how like and undistinguishable soever it may be in all other respects: and in this consists *identity*, when the ideas it is attributed to vary not at all from what they were that moment wherein we consider their former existence, and to which we compare the present. For never finding, nor conceiving it possible, that two things of the same kind should exist in the same place at the same time, we rightly conclude, that, whatever exists anywhere at any time, excludes all of the same kind, and is there itself alone. When therefore we demand whether anything be the *same* or no, it refers always to something that existed such a time in such a place, which it was certain, at that instant, was the same with itself, and no other. From whence it follows, that one thing cannot have two beginnings of existence, nor two things one beginning; it being impossible for two things of the same kind to be or exist in the same instant, in the very same place; or one and the same thing in different places. That, therefore, that had one beginning, is the same thing; and that which had a different beginning in time and place from that, is not the same, but divers. That which has made the difficulty about this relation has been the little care and attention used in having precise notions of the things to which it is attributed.

2. *Identity of Substances and of Modes.* We have the ideas but of three sorts of substances: 1. *God*. 2. *Finite intelligences*. 3. *Bodies*.

First, *God* is without beginning, eternal, unalterable, and everywhere, and therefore concerning his identity there can be no doubt.

Secondly, *Finite spirits* having had each its determinate time and place of beginning to exist, the relation to that time and place will always determine to each of them its identity, as long as it exists.

Thirdly, The same will hold of every *particle of matter*, to which no addition or subtraction of matter being made, it is the same. For, though these three sorts of substances, as we term them, do not exclude one another out of the same place, yet we cannot conceive but that they must necessarily each of them exclude any of the same kind out of the same place: or else the notions and names of identity and diversity would be in vain, and there could be no such distinctions of substances, or anything else one from another. For example: could two bodies be in the same place at the same time; then those two parcels of matter must be one and the same, take them great or little; nay, all bodies must be one and the same. For, by the same reason that two particles of matter may be in one place, all bodies may be in one place: which, when it can be supposed, takes away the distinction of identity and diversity of one and more, and renders it ridiculous. But it being a contradiction that two or more should be one, identity and diversity are relations and ways of comparing well founded, and of use to the understanding. All other things being but modes or relations ultimately terminated in substances, the identity and diversity of each particular existence of them too will be by the same way determined: only as to things whose existence is in succession, such as are the actions of finite beings, v.g. *motion* and *thought*, both which consist in a continued train of succession, concerning *their* diversity there can be no question: because each perishing the moment it begins, they cannot exist in different times, or in different places, as permanent beings can at different times exist in distant places; and therefore no motion or thought, considered as at different times, can be the same, each part thereof having a different beginning of existence.

3. *Principium Individuationis.* From what has been said, it is easy to discover what is so much inquired after, the *principium individuationis*; and that, it is plain, is existence itself; which determines a being of any sort to a particular time and place, incommunicable to two beings of the same kind. Thus, though it seems easier to conceive in simple substances or modes; yet, when reflected on, is not more difficult in compound ones, if care be taken to what it is applied: v.g. let us suppose an atom, i.e. a continued body under one immutable superficies, existing in a determined time and place; it is evident, that, considered in any instant of its existence, it is in that instant the same with itself. For, being at that instant what it is, and nothing else, it is the same, and so must continue as long as its existence is continued; for so long it will be the same, and no

other. In like manner, if two or more atoms be joined together into the same mass, every one of those atoms will be the same, by the foregoing rule: and whilst they exist united together, the mass, consisting of the same atoms, must be the same mass, or the same body, let the parts be ever so differently jumbled. But if one of these atoms be taken away, or one new one added, it is no longer the same mass or the same body. In the state of living creatures, their identity depends not on a mass of the same particles, but on something else. For in them the variation of great parcels of matter alters not the identity: an oak growing from a plant to a great tree, and then lopped, is still the same oak; and a colt grown up to a horse, sometimes fat, sometimes lean, is all the while the same horse: though, in both these cases, there may be a manifest change of the parts; so that truly they are not either of them the same masses of matter, though they be truly one of them the same oak, and the other the same horse. The reason whereof is, that, in these two cases — a *mass of matter* and a *living body* — identity is not applied to the same thing.

4. *Identity of Vegetables.* We must therefore consider wherein an oak differs from a mass of matter, and that seems to me to be in this, that the one is only the cohesion of particles of matter any how united, the other such a disposition of them as constitutes the parts of an oak; and such an organization of those parts as is fit to receive and distribute nourishment, so as to continue and frame the wood, bark, and leaves, &c., of an oak, in which consists the vegetable life. That being then one plant which has such an organization of parts in one coherent body, partaking of one common life, it continues to be the same plant as long as it partakes of the same life, though that life be communicated to new particles of matter vitally united to the living plant, in a like continued organization conformable to that sort of plants. For this organization, being at any one instant in any one collection of matter, is in that particular concrete distinguished from all other, and *is* that individual life, which existing constantly from that moment both forwards and backwards, in the same continuity of insensibly succeeding parts united to the living body of the plant, it has that identity which makes the same plant, and all the parts of it, parts of the same plant, during all the time that they exist united in that continued organization, which is fit to convey that common life to all the parts so united.

5. *Identity of Animals.* The case is not so much different in *brutes* but that any one may hence see what makes an animal and continues it the same. Something we have like this in machines, and may serve to illustrate it. For example, what is a watch? It is plain it is nothing but a fit organization or construction of parts to a certain end, which, when a sufficient force is added to it, it is capable to attain. If we would suppose this machine one continued body, all whose organized parts were repaired, increased, or diminished by a constant addition or separation of insensible parts, with one common life, we should have something very much like the body of an animal; with this difference, that, in an animal the fitness of the organization, and the motion wherein life consists, begin together, the motion coming from within; but in machines the force coming sensibly from without, is often away when the organ is in order, and well fitted to receive it.

6. *The Identity of Man.* This also shows wherein the identity of the same *man* consists; viz. in nothing but a participation of the same continued life, by constantly fleeting particles of matter, in succession vitally united to the same organized body. He that shall place the identity of man in anything else, but, like that of other animals, in one fitly organized body, taken in any one instant, and from thence continued, under one organization of life, in several successively fleeting particles of matter united to it, will find it hard to make an embryo, one of years, mad and sober, the *same* man, by any supposition, that will not make it possible for Seth, Ismael, Socrates, Pilate, St. Austin, and Caesar Borgia, to be the same man. For if the identity of *soul alone* makes the same *man*; and there be nothing in the nature of matter why the same individual spirit may not be united to different bodies, it will be possible that those men, living in distant ages, and of different tempers, may have been the same man: which way of speaking must be from a very strange use of the word man, applied to an idea out of which body and shape are excluded. And that way of speaking would agree yet worse with the notions of those philosophers who allow of transmigration, and are of opinion that the souls of men may, for their miscarriages, be detruded into the bodies of beasts, as fit habitations, with organs suited to the satisfaction of their brutal inclinations. But yet I think nobody, could he be sure that the *soul* of Heliogabalus were in one of his hogs, would yet say that hog were a *man* or *Heliogabalus*.

9. *Personal Identity.* This being premised, to find wherein personal identity consists, we must consider what *person* stands for; — which, I think, is a thinking intelligent being, that has reason and reflection, and can consider itself as itself, the same thinking thing, in different times and places; which it does only by that consciousness which is inseparable from thinking, and, as it seems to me, essential to it: it being impossible for any one to perceive without *perceiving* that he does perceive. When we see, hear, smell, taste, feel, meditate, or will anything, we know that we do so. Thus it is always as to our present sensations and perceptions: and by

this every one is to himself that which he calls *self*: — it not being considered, in this case, whether the same self be continued in the same or divers substances. For, since consciousness always accompanies thinking, and it is that which makes everyone to be what he calls self, and thereby distinguishes himself from all other thinking things, in this alone consists personal identity, i.e. the sameness of a rational being; and as far as this consciousness can be extended backwards to any past action or thought, so far reaches the identity of that person; it is the same self now it was then; and it is by the same self with this present one that now reflects on it, that that action was done.

10. *Consciousness makes personal Identity.* But it is further inquired, whether it be the same identical substance. This few would think they had reason to doubt of, if these perceptions, with their consciousness, always remained present in the mind, whereby the same thinking thing would be always consciously present, and, as would be thought, evidently the same to itself. But that which seems to make the difficulty is this, that this consciousness being interrupted always by forgetfulness, there being no moment of our lives wherein we have the whole train of all our past actions before our eyes in one view, but even the best memories losing the sight of one part whilst they are viewing another; and we sometimes, and that the greatest part of our lives, not reflecting on our past selves, being intent on our present thoughts, and in sound sleep having no thoughts at all, or at least none with that consciousness which remarks our waking thoughts, — I say, in all these cases, our consciousness being interrupted, and we losing the sight of our past selves, doubts are raised whether we are the same thinking thing, i.e., the same *substance* or no. Which, however reasonable or unreasonable, concerns not *personal* identity at all. The question being what makes the same person, and not whether it be the same identical substance, which always thinks in the same person, which, in this case, matters not at all: different substances, by the same consciousness (where they do partake in it) being united into one person, as well as different bodies by the same life are united into one animal, whose identity is preserved in that change of substances by the unity of one continued life. For, it being the same consciousness that makes a man be himself to himself, personal identity depends on that only, whether it be annexed solely to one individual substance, or can be continued in a succession of several substances. For as far as any intelligent being *can* repeat the idea of any past action with the same consciousness it had of it at first, and with the same consciousness it has of any present action; so far it is the same personal self. For it is by the consciousness it has of its present thoughts and actions, that it is *self to itself* now, and so will be the same self, as far as the same consciousness can extend to actions past or to come; and would be by distance of time, or change of substance, no more two persons, than a man be two men by wearing other clothes today than he did yesterday, with a long or a short sleep between: the same consciousness uniting those distant actions into the same person, whatever substances contributed to their production.

16. *Consciousness alone unites actions into the same Person.* But though the same immaterial substance or soul does not alone, wherever it be, and in whatsoever state, make the same man; yet it is plain, consciousness, as far as ever it can be extended— should it be to ages past—unites existences and actions very remote in time into the same *person*, as well as it does the existences and actions of the immediately preceding moment: so that whatever has the consciousness of present and past actions, is the same person to whom they both belong. Had I the same consciousness that I saw the ark and Noah's flood, as that I saw an overflowing of the Thames last winter, or as that I write now, I could no more doubt that I who write this now, that saw the Thames overflowed last winter, and that viewed the flood at the general deluge, was the same *self*; — place that self in what *substance* you please—than that I who write this am the same *myself* now while I write (whether I consist of all the same substance, material or immaterial, or no) that I was yesterday. For as to this point of being the same self, it matters not whether this present self be made up of the same or other substances—I being as much concerned, and as justly accountable for any action that was done a thousand years since, appropriated to me now by this self-consciousness, as I am for what I did the last moment.

17. *Self depends on Consciousness, not on Substance.* *Self* is that conscious thinking thing,— whatever substance made up of, (whether spiritual or material, simple or compounded, it matters not)—which is sensible or conscious of pleasure and pain, capable of happiness or misery, and so is concerned for itself, as far as that consciousness extends. Thus every one finds that, whilst comprehended under that consciousness, the little finger is as much a part of himself as what is most so. Upon separation of this little finger, should this consciousness go along with the little finger, and leave the rest of the body, it is evident the little finger would be the person, the same person; and self then would have nothing to do with the rest of the body. As in this case it is the consciousness that goes along with the substance, when one part is separate from another, which makes the same person, and constitutes this inseparable self: so it is in reference to substances remote in time. That with which the consciousness of this present thinking thing *can* join itself, makes the same person, and is

one self with it, and with nothing else; and so attributes to itself, and owns all the actions of that thing, as its own, as far as that consciousness reaches, and no further; as every one who reflects will perceive.

18. *Persons, not Substances, the Objects of Reward and Punishment.* In this personal identity is founded all the right and justice of reward and punishment; happiness and misery being that for which every one is concerned for *himself*, and not mattering what becomes of any *substance*, not joined to, or affected with that consciousness. For, as it is evident in the instance I gave but now, if the consciousness went along with the little finger when it was cut off, that would be the same self which was concerned for the whole body yesterday, as making part of itself, whose actions then it cannot but admit as its own now. Though, if the same body should still live, and immediately from the separation of the little finger have its own peculiar consciousness, where of the little finger knew nothing, it would not at all be concerned for it, as a part of itself, or could own any of its actions, or have any of them imputed to him.

20. *Absolute oblivion separates what is thus forgotten from the person, but not from the man.* But yet possibly it will still be objected, — Suppose I wholly lose the memory of some parts of my life, beyond a possibility of retrieving them, so that perhaps I shall never be conscious of them again; yet am I not the same person that did those actions, had those thoughts that I once was conscious of, though I have now forgot them? To which I answer, that we must here take notice what the word *I* is applied to; which, in this case, is the *man* only. And the same man being presumed to be the same person, I is easily here supposed to stand also for the same person. But if it be possible for the same man to have distinct incommunicable consciousness at different times, it is past doubt the same man would at different times make different persons; which, we see, is the sense of mankind in the solemnest declaration of their opinions, human laws not punishing the mad man for the sober man's actions, nor the sober man for what the mad man did, — thereby making them two persons: which is somewhat explained by our way of speaking in English when we say such an one is 'not himself,' or is 'beside himself'; in which phrases it is insinuated, as if those who now, or at least first used them, thought that self was changed; the self-same person was no longer in that man.

22. But is not a man drunk and sober the same person? Why else is he punished for the fact he commits when drunk, though he be never afterwards conscious of it? Just as much the same person as a man that walks, and does other things in his sleep, is the same person, and is answerable for any mischief he shall do in it. Human laws punish both, with a justice suitable to *their* way of knowledge;—because, in these cases, they cannot distinguish certainly what is real, what counterfeit: and so the ignorance in drunkenness or sleep is not admitted as a plea. For, though punishment be annexed to personality, and personality to consciousness, and the drunkard perhaps be not conscious of what he did, yet human judicatures justly punish him; because the fact is proved against him, but want of consciousness cannot be proved for him. But in the Great Day, wherein the secrets of all hearts shall be laid open, it may be reasonable to think, no one shall be made to answer for what he knows nothing of; but shall receive his doom, his conscience accusing or excusing him.

25. *Consciousness unites substances, material or spiritual, with the same personality.* I agree, the more probable opinion is, that this consciousness is annexed to, and the affection of, one individual immaterial substance.

But let men, according to their diverse hypotheses, resolve of that as they please. This every intelligent being, sensible of happiness or misery, must grant— that there is something that is *himself*, that he is concerned for, and would have happy; that this self has existed in a continued duration more than one instant, and therefore it is possible may exist, as it has done, months and years to come, without any certain bounds to be set to its duration; and may be the same self, by the same consciousness continued on for the future. And thus, by this consciousness he finds himself to be the same self which did such and such an action some years since, by which he comes to be happy or miserable now. In all which account of self, the same numerical *substance* is not considered as making the same self; but the same continued *consciousness*, in which several substances may have been united, and again separated from it, which, whilst they continued in a vital union with that wherein this consciousness then resided, made a part of that same self. Thus any part of our bodies, vitally united to that which is conscious in us, makes a part of ourselves: but upon separation from the vital union by which that consciousness is communicated, that which a moment since was part of ourselves, is now no more so than a part of another man's self is a part of me: and it is not impossible but in a little time may become a real part of another person. And so we have the same numerical substance become a part of two different persons; and the same person preserved under the change of various substances. Could we suppose any spirit wholly stripped of all its memory or consciousness of past actions, as we find our minds always are of a great part of ours, and sometimes of them all; the union or separation of such a spiritual substance would make no variation of personal identity, any more than that of any particle of matter does. Any substance vitally

united to the present thinking being is a part of that very same self which now is; anything united to it by a consciousness of former actions, makes also a part of the same self, which is the same both then and now.

BOOK III OF WORDS

Chapter II

OF THE SIGNIFICATION OF WORDS

1. *Words are sensible Signs, necessary for Communication of Ideas.* Man, though he have great variety of thoughts, and such from which others as well as himself might receive profit and delight; yet they are all within his own breast, invisible and hidden from others, nor can of themselves be made to appear. The comfort and advantage of society not being to be had without communication of thoughts, it was necessary that man should find out some external sensible signs, whereof those invisible ideas, which his thoughts are made up of, might be made known to others. For this purpose nothing was so fit, either for plenty or quickness, as those articulate sounds, which with so much ease and variety he found himself able to make. Thus we may conceive how *words*, which were by nature so well adapted to that purpose, came to be made use of by men as the signs of their ideas; not by any natural connexion that there is between particular articulate sounds and certain ideas, for then there would be but one language amongst all men; but by a voluntary imposition, whereby such a word is made arbitrarily the mark of such an idea. The use, then, of words, is to be sensible marks of ideas; and the ideas they stand for are their proper and immediate signification.

3. *Examples of this.* This is so necessary in the use of language, that in this respect the knowing and the ignorant, the learned and the unlearned, use the words they speak (with any meaning) all alike. They, in every man's mouth, stand for the ideas he has, and which he would express by them. A child having taken notice of nothing in the metal he hears called *gold*, but the bright shining yellow colour, he applies the word gold only to his own idea of that colour, and nothing else; and therefore calls the same colour in a peacock's tail gold. Another that hath better observed, adds to shining yellow great weight: and then the sound gold, when he uses it, stands for a complex idea of a shining yellow and a very weighty substance. Another adds to those qualities fusibility: and then the word gold signifies to him a body, bright, yellow, fusible, and very heavy. Another adds malleability. Each of these uses equally the word gold, when they have occasion to express the idea which they have applied it to: but it is evident that each can apply it only to his own idea; nor can be make it stand as a sign of such a complex idea as he has not.

Chapter III

OF GENERAL TERMS

1. *The greatest Part of Words are general terms.* All things that exist being particulars, it may perhaps be thought reasonable that words, which ought to be conformed to things, should be so too, — I mean in their signification: but yet we find quite the contrary. The far greatest part of the words that make all languages are general terms: which has not been the effect of neglect or chance, but of reason and necessity.

2. *That every particular Thing should have a Name for itself is impossible.* First, It is impossible that every particular thing should have a distinct peculiar name. For, the signification and use of words depending on that connexion which the mind makes between its ideas and the sounds it uses as signs of them, it is necessary, in the application of names to things, that the mind should have distinct ideas of the things, and retain also the particular name that belongs to every one, with its peculiar appropriation to that idea. But it is beyond the power of human capacity to frame and retain distinct ideas of all the particular things we meet with: every bird and beast men saw; every tree and plant that affected the senses, could not find a place in the most capacious understanding. If it be looked on as an instance of a prodigious memory, that some generals have been able to call every soldier in their army by his proper name, we may easily find a reason why men have never attempted to give names to each sheep in their flock, or crow that flies over their heads; much less to call every leaf of plants, or grain of sand that came in their way, by a peculiar name.

3. *And would be useless, if it were possible.* Secondly, If it were possible, it would yet be useless; because it would not serve to the chief end of language. Men would in vain heap up names of particular things, that would not serve them to communicate their thoughts. Men learn names, and use them in talk with others, only that they may be understood: which is then only done when, by use or consent, the sound I make by the organs of

speech, excites in another man's mind who hears it, the idea I apply it to in mine, when I speak it. This cannot be done by names applied to particular things; whereof I alone having the ideas in my mind, the names of them could not be significant or intelligible to another, who was not acquainted with all those very particular things which had fallen under my notice.

4. *A distinct name for every particular thing, not fitted for enlargement of knowledge.* Thirdly, But yet, granting this also feasible, (which I think is not,) yet a distinct name for every particular thing would not be of any great use for the improvement of knowledge: which, though founded in particular things, enlarges itself by general views; to which things reduced into sorts, under general names, are properly subservient. These, with the names belonging to them, come within some compass, and do not multiply every moment, beyond what either the mind can contain, or use requires. And therefore, in these, men have for the most part stopped: but yet not so as to hinder themselves from distinguishing particular things by appropriated names, where convenience demands it. And therefore in their own species, which they have most to do with, and wherein they have often occasion to mention particular persons, they make use of proper names; and there distinct individuals have distinct denominations.

5. *What things have proper Names and why.* Besides persons, countries also, cities, rivers, mountains, and other the like distinctions of place have usually found peculiar names, and that for the same reason; they being such as men have often an occasion to mark particularly, and, as it were, set before others in their discourses with them. And I doubt not but, if we had reason to mention particular horses as often as we have to mention particular men, we should have proper names for the one, as familiar as for the other, and Bucephalus would be a word as much in use as Alexander. And therefore we see that, amongst jockeys, horses have their proper names to be known and distinguished by, as commonly as their servants: because, amongst them, there is often occasion to mention this or that particular horse when he is out of sight.

6. *How general words are made.* The next thing to be considered is, — How general words come to be made. For, since all things that exist are only particulars, how come we by general terms; or where find we those general natures they are supposed to stand for? Words become general by being made the signs of general ideas: and ideas become general, by separating from them the circumstances of time and place, and any other ideas that may determine them to this or that particular existence. By this way of abstraction they are made capable of representing more individuals than one; each of which having in it a conformity to that abstract idea, is (as we call it) of that sort.

7. *Shown by the way we enlarge our complex ideas from infancy.* But, to deduce this a little more distinctly, it will not perhaps be amiss to trace our notions and names from their beginning, and observe by what degrees we proceed, and by what steps we enlarge our ideas from our first infancy. There is nothing more evident, than that the ideas of the persons children converse with (to instance in them alone) are like the persons themselves, only particular. The ideas of the nurse and the mother are well framed in their minds; and, like pictures of them there, represent only those individuals. The names they first gave to them are confined to these individuals; and the names of *nurse* and *mamma*, the child uses, determine themselves to those persons. Afterwards, when time and a larger acquaintance have made them observe that there are a great many other things in the world, that in some common agreements of shape, and several other qualities, resemble their father and mother, and those persons they have been used to, they frame an idea, which they find those many particulars do partake in; and to that they give, with others, the name man, for example. And thus they come to have a general name, and a general idea. Wherein they make nothing new; but only leave out of the complex idea they had of Peter and James, Mary and Jane, that which is peculiar to each, and retain only what is common to them all.

8. *And further enlarge our complex ideas, by still leaving out properties contained in them.* By the same way that they come by the general name and idea of *man*, they easily advance to more general names and notions. For, observing that several things that differ from their idea of man, and cannot therefore be comprehended under that name, have yet certain qualities wherein they agree with man, by retaining only those qualities, and uniting them into one idea, they have again another and more general idea; to which having given a name they make a term of a more comprehensive extension: which new idea is made, not by any new addition, but only as before, by leaving out the shape, and some other properties signified by the name man, and retaining only a body, with life, sense, and spontaneous motion, comprehended under the name *animal*.

9. *General natures are nothing but abstract and partial ideas of more complex ones.* That this is the way whereby

men first formed general ideas, and general names to them, I think is so evident, that there needs no other proof of it but the considering of a man's self, or others, and the ordinary proceedings of their minds in knowledge. And he that thinks *general natures* or *notions* are anything else but such abstract and partial ideas of more complex ones, taken at first from particular existences, will, I fear, be at a loss where to find them. For let any one effect, and then tell me, wherein does his idea of *man* differ from that of *Peter* and *Paul*, or his idea of *horse* from that of *Bucephalus*, but in the leaving out something that is peculiar to each individual, and retaining so much of those particular complex ideas of several particular existences as they are found to agree in? Of the complex ideas signified by the names *man* and *horse*, leaving out but those particulars wherein they differ, and retaining only those wherein they agree, and of those making a new distinct complex idea, and giving the name *animal* to it, one has a more general term, that comprehends with man several other creatures. Leave out of the idea of *animal*, sense and spontaneous motion, and the remaining complex idea, made up of the remaining simple ones of body, life, and nourishment, becomes a more general one, under the more comprehensive term, *vivens*. And, not to dwell longer upon this particular, so evident in itself; by the same way the mind proceeds to *body*, *substance*, and at last to *being*, *thing*, and such universal terms, which stand for any of our ideas whatsoever. To conclude: this whole mystery of genera and species, which make such a noise in the schools, and are with justice so little regarded out of them, is nothing else but *abstract ideas*, more or less comprehensive, with names annexed to them. In all which this is constant and unvariable, that every more general term stands for such an idea, and is but a part of any of those contained under it.

10. *Why the Genus is ordinarily made Use of in Definitions.* This may show us the reason why, in the defining of words, which is nothing but declaring their signification, we make use of the *genus*, or next general word that comprehends it. Which is not out of necessity, but only to save the labour of enumerating the several simple ideas which the next general word or *genus* stands for; or, perhaps, sometimes the shame of not being able to do it. But though defining by *genus* and *differentia* (I crave leave to use these terms of art, though originally Latin, since they most properly suit those notions they are applied to), I say, though defining by the *genus* be the shortest way, yet I think it may be doubted whether it be the best. This I am sure, it is not the only, and so not absolutely necessary. For, definition being nothing but making another understand by words what idea the term defined stands for, a definition is best made by enumerating those simple ideas that are combined in the signification of the term defined: and, if, instead of such an enumeration, men have accustomed themselves to use the next general term, it has not been out of necessity, or for greater clearness, but for quickness and dispatch sake. For I think that, to one who desired to know what idea the word *man* stood for; if it should be said, that man was a solid extended substance, having life, sense, spontaneous motion, and the faculty of reasoning, I doubt not but the meaning of the term man would be as well understood, and the idea it stands for be at least as clearly made known, as when it is defined to be a rational animal: which, by the several definitions of *animal*, *vivens*, and *corpus*, resolves itself into those enumerated ideas. I have, in explaining the term *man*, followed here the ordinary definition of the schools; which, though perhaps not the most exact, yet serves well enough to my present purpose. And one may, in this instance, see what gave occasion to the rule, that a definition must consist of *genus* and *differentia*; and it suffices to show us the little necessity there is of such a rule, or advantage in the strict observing of it. For, definitions, as has been said, being only the explaining of one word by several others, so that the meaning or idea it stands for may be certainly known; languages are not always so made according to the rules of logic, that every term can have its signification exactly and clearly expressed by two others. Experience sufficiently satisfies us to the contrary; or else those who have made this rule have done ill, that they have given us so few definitions conformable to it. But of definitions more in the next chapter.

11. *General and Universal are Creatures of the Understanding, and belong not to the Real Existence of things.* To return to general words: it is plain, by what has been said, that *general* and *universal* belong not to the real existence of things; but are the inventions and creatures of the understanding, made by it for its own use, and concern only signs, whether words or ideas. Words are general, as has been said, when used for signs of general ideas, and so are applicable indifferently to many particular things; and ideas are general when they are set up as the representatives of many particular things: but universality belongs not to things themselves, which are all of them particular in their existence, even those words and ideas which in their signification are general. When therefore we quit particulars, the generals that rest are only creatures of our own making; their general nature being nothing but the capacity they are put into, by the understanding, of signifying or representing many particulars. For the signification they have is nothing but a relation that, by the mind of man, is added to them.

12. *Abstract Ideas are the Essences of Genera and Species.* The next thing therefore to be considered is, What kind

of signification it is that general words have. For, as it is evident that they do not signify barely one particular thing; for then they would not be general terms, but proper names, so, on the other side, it is as evident they do not signify a plurality; for *man* and *men* would then signify the same; and the distinction of numbers (as the grammarians call them) would be superfluous and useless. That then which general words signify is a *sort* of things; and each of them does that, by being a sign of an abstract idea in the mind; to which idea, as things existing are found to agree, so they come to be ranked under that name, or, which is all one, be of that sort. Whereby it is evident that the *essences* of the sorts, or, if the Latin word pleases better, *species* of things, are nothing else but these abstract ideas. For the having the essence of any species, being that which makes anything to be of that species; and the conformity to the idea to which the name is annexed being that which gives a right to that name; the having the essence, and the having that conformity, must needs be the same thing: since to be of any species, and to have a right to the name of that species, is all one. As, for example, to be a *man*, or of the *species* man, and to have right to the *name* man, is the same thing, Again, to be a man, or of the species man, and have the *essence* of a man, is the same thing, Now, since nothing can be a man, or have a right to the name man, but what has a conformity to the abstract idea the name man stands for, nor anything be a man, or have a right to the species man, but what has the essence of that species; it follows, that the abstract idea for which the name stands, and the essence of the species, is one and the same. From whence it is easy to observe, that the essences of the sorts of things, and, consequently, the sorting of things, is the workmanship of the understanding that abstracts and makes those general ideas.

13. *They are the Workmanship of the Understanding, but have their Foundation in the Similitude of Things.* I would not here be thought to forget, much less to deny, that Nature, in the production of things, makes several of them alike: there is nothing more obvious, especially in the races of animals, and all things propagated by seed. But yet I think we may say, *the sorting of them under names is the workmanship of the understanding, taking occasion, from the similitude it observes amongst them, to make abstract general ideas*, and set them up in the mind, with names annexed to them, as patterns or forms, (for, in that sense, the word *form* has a very proper signification,) to which as particular things existing are found to agree, so they come to be of that species, have that denomination, or are put into that *classis*. For when we say this is a man, that a horse; this justice, that cruelty; this a watch, that a jack; what do we else but rank things under different specific names, as agreeing to those abstract ideas, of which we have made those names the signs? And what are the essences of those species set out and marked by names, but those abstract ideas in the mind; which are, as it were, the bonds between particular things that exist, and the names they are to be ranked under? And when general names have any connexion with particular beings, these abstract ideas are the medium that unites them: so that the essences of species, as distinguished and denominated by us, neither are nor can be anything but those precise abstract ideas we have in our minds. And therefore the supposed real essences of substances, if different from our abstract ideas, cannot be the essences of the species *we* rank things into. For two species may be one, as rationally as two different essences be the essence of one species: and I demand what are the alterations [which] may, or may not be made in a *horse* or *lead*, without making either of them to be of another species? In determining the species of things by *our* abstract ideas, this is easy to resolve, but if any one will regulate himself herein by supposed *real* essences, he will, I suppose, be at a loss: and he will never be able to know when anything precisely cease to be of the species of a *horse* or *lead*.

14. *Each distinct abstract Idea is a distinct Essence.* Nor will any one wonder that I say these essences, or abstract ideas (which are the measures of name, and the boundaries of species) are the workmanship of the understanding, who considers that at least the complex ones are often, in several men, different collections of simple ideas; and therefore that is *covetousness* to one man, which is not so to another. Nay, even in substances, where their abstract ideas seem to be taken from the things themselves, they are not constantly the same; no, not in that species which is most familiar to us, and with which we have the most intimate acquaintance: it having been more than once doubted, whether the *foetus* born of a woman were a *man*, even so far as that it hath been debated, whether it were or were not to be nourished and baptized: which could not be, if the abstract idea or essence to which the name man belonged were of nature's making; and were not the uncertain and various collection of simple ideas, which the understanding put together, and then, abstracting it, affixed a name to it. So that, in truth, every distinct abstract idea is a distinct essence; and the names that stand for such distinct ideas are the names of things essentially different. Thus a circle is as essentially different from an oval as a sheep from a goat; and rain is as essentially different from snow as water from earth: that abstract idea which is the essence of one being impossible to be communicated to the other. And thus any two abstract ideas, that in any part vary one from another, with two distinct names annexed to them, constitute two distinct sorts, or, if you please, *species*, as essentially different as any two of the most remote or opposite in the world.

15. *Several significations of the word Essence.* But since the essences of things are thought by some (and not without reason) to be wholly unknown, it may not be amiss to consider the several significations of the word *essence*.

First, Essence may be taken for the very being of anything, whereby it is what it is. And thus the real internal, but generally (in substances) unknown constitution of things, whereon their discoverable qualities depend, may be called their essence. This is the proper original signification of the word, as is evident from the formation of it; *essentia*, in its primary notation, signifying properly, being. And in this sense it is still used, when we speak of the essence of *particular* things, without giving them any name.

Secondly, The learning and disputes of the schools having been much busied about *genus* and *species*, the word *essence* has almost lost its primary signification: and, instead of the real constitution of things, has been almost wholly applied to the artificial constitution of *genus* and *species*. It is true, there is ordinarily supposed a real constitution of the sorts of things; and it is past doubt there must be some real constitution, on which any collection of simple ideas co-existing must depend. But, it being evident that things are ranked under names into sorts or species, only as they agree to certain abstract ideas, to which we have annexed those names, the essence of each *genus*, or sort, comes to be nothing but that abstract idea which the general, or sortal (if I may have leave so to call it from sort, as I do general from genus,) name stands for. And this we shall find to be that which the word essence imports in its most familiar use.

These two sorts of essences, I suppose, may not unfitly be termed, the one the *real*, the other *nominal essence*.

16. *Constant Connexion between the Name and nominal Essence.* Between the *nominal essence* and the *name* there is so near a connexion, that the name of any sort of things cannot be attributed to any particular being but what has this essence, whereby it answers that abstract idea whereof that name is the sign.

17. *Supposition, that Species are distinguished by their real Essences useless.* Concerning the *real essences* of corporeal substances (to mention these only) there are, if I mistake not, two opinions. The one is of those who, using the word essence for they know not what, suppose a certain number of those essences, according to which all natural things are made, and wherein they do exactly every one of them partake, and so become of this or that species. The other and more rational opinion is of those who look on all natural things to have a real, but unknown, constitution of their insensible parts; from which flow those sensible qualities which serve us to distinguish them one from another, according as we have occasion to rank them into sorts, under common denominations. The former of these opinions, which supposes these essences as a certain number of forms or moulds, wherein all natural things that exist are cast, and do equally partake, has, I imagine, very much perplexed the knowledge of natural things. The frequent productions of monsters, in all the species of animals, and of changelings, and other strange issues of human birth, carry with them difficulties, not possible to consist with this hypothesis; since it is as impossible that two things partaking exactly of the same real essence should have different properties, as that two figures partaking of the same real essence of a circle should have different properties. But were there no other reason against it, yet the supposition of essences that cannot be known; and the making of them, nevertheless, to be that which distinguishes the species of things, is so wholly useless and unserviceable to any part of our knowledge, that that alone were sufficient to make us lay it by, and content ourselves with such essences of the sorts or species of things as come within the reach of our knowledge: which, when seriously considered, will be found, as I have said, to be nothing else but, those *abstract* complex ideas to which we have annexed distinct general names.

18. *Real and nominal Essence, the same in simple Ideas and Modes, different in Substances.* Essences being thus distinguished into nominal and real, we may further observe, that, in the species of simple ideas and modes, they are always the same; but in substances always quite different. Thus, a figure including a space between three lines, is the real as well as nominal essence of a triangle; it being not only the abstract idea to which the general name is annexed, but the very *essentia* or being of the thing itself; that foundation from which all its properties flow, and to which they are all inseparably annexed. But it is far otherwise concerning that parcel of matter which makes the ring on my finger; wherein these two essences are apparently different. For, it is the real constitution of its insensible parts, on which depend all those properties of colour, weight, fusibility, fixedness, &c., which are to be found in it; which constitution we know not, and so, having no particular idea of, having no name that is the sign of it. But yet it is its colour, weight, fusibility, fixedness, &c., which makes it to be gold, or gives it a right to that name, which is therefore its nominal essence. Since nothing can be called gold but what has a conformity of qualities to that abstract complex idea to which that name is annexed. But this distinction of essences, belonging particularly to substances, we shall, when we come to consider their

names, have an occasion to treat of more fully.

19. *Essences ingenerable and incorruptible.* That such abstract ideas, with names to them, as we have been speaking of are essences, may further appear by what we are told concerning essences, viz. that they are all ingenerable and incorruptible. Which cannot be true of the real constitutions of things, which begin and perish with them. All things that exist, besides their Author, are all liable to change; especially those things we are acquainted with, and have ranked into bands under distinct names or ensigns. Thus, that which was grass to-day is to-morrow the flesh of a sheep; and, within a few days after, becomes part of a man: in all which and the like changes, it is evident their real essence — i.e. that constitution whereon the properties of these several things depended — is destroyed, and perishes with them. But essences being taken for ideas established in the mind, with names annexed to them, they are supposed to remain steadily the same, whatever mutations the particular substances are liable to. For, whatever becomes of *Alexander* and *Bucephalus*, the ideas to which *man* and *horse* are annexed, are supposed nevertheless to remain the same; and so the essences of those species are preserved whole and undestroyed, whatever changes happen to any or all of the individuals of those species. By this means the essence of a species rests safe and entire, without the existence of so much as one individual of that kind. For, were there now no circle existing anywhere in the world, (as perhaps that figure exists not anywhere exactly marked out,) yet the idea annexed to that name would not cease to be what it is; nor cease to be as a pattern to determine which of the particular figures we meet with have or have not a right to the *name* circle, and so to show which of them, by having that essence, was of that species. And though there neither were nor had been in nature such a beast as *unicorn*, or such a fish as a *mermaid*; yet, supposing those names to stand for complex abstract ideas that contained no inconsistency in them, the essence of a mermaid is as intelligible as that of a man; and the idea of an unicorn as certain, steady, and permanent as that of a horse. From what has been said, it is evident, that the doctrine of the immutability of essences proves them to be only abstract ideas; and is founded on the relation established between them and certain sounds as signs of them; and will always be true, as long as the same name can have the same signification.

20. *Recapitulation.* To conclude. This is that which in short I would say, viz. that all the great business of *genera* and *species*, and their *essences*, amounts to no more but this:—That men making abstract ideas, and settling them in their minds with names annexed to them, do thereby enable themselves to consider things, and discourse of them, as it were in bundles, for the easier and readier improvement and communication of their knowledge, which would advance but slowly were their words and thoughts confined only to particulars.

Chapter IV

OF SIMPLE IDEAS

5. *If all names were definable, it would be a Process in infinitum.* I will not here trouble myself to prove that all terms are not definable, from that progress *in infinitum*, which it will visibly lead us into, if we should allow that all names could be defined. For, if the terms of one definition were still to be defined by another, where at last should we stop? But I shall, from the nature of our ideas, and the signification of our words, show *why some names can, and others cannot be defined; and which they are.*

6. *What a Definition is.* I think it is agreed, that a *definition* is nothing else but *the showing the meaning of one word by several other not synonymous terms.* The meaning of words being only the ideas they are made to stand for by him that uses them, the meaning of any term is then showed, or the word is defined, when, by other words, the idea it is made the sign of, and annexed to, in the mind of the speaker, is as it were represented, or set before the view of another; and thus its signification ascertained. This is the only use and end of definitions; and therefore the only measure of what is, or is not a good definition.

7. *Simple Ideas, why undefinable.* This being premised, I say that the *names of simple ideas, and those only, are incapable of being defined.* The reason whereof is this, That the several terms of a definition, signifying several ideas, they can all together by no means represent an idea which has no composition at all: and therefore a definition, which is properly nothing but the showing the meaning of one word by several others not signifying each the same thing, can in the names of simple ideas have no place.

Chapter VI

OF THE NAMES OF SUBSTANCES

1. *The common Names of Substances stand for Sorts.* The common names of substances, as well as other general terms, stand for *sorts*: which is nothing else but the being made signs of such complex ideas wherein several particular substances do or might agree, by virtue of which they are capable of being comprehended in one common conception, and signified by one name. I say do or might agree: for though there be but one sun existing in the world, yet the idea of it being abstracted, so that more substances (if there were several) might each agree in it, it is as much a sort as if there were as many suns as there are stars. They want not their reasons who think there are, and that each fixed star would answer the idea the name sun stands for, to one who was placed in a due distance: which, by the way, may show us how much the sorts, or, if you please, *genera* and *species* of things (for those Latin terms signify to me no more than the English word sort) depend on such collections of ideas as men have made, and not on the real nature of things; since it is not impossible but that, in propriety of speech, that might be a sun to one which is a star to another.

2. *The Essence of each Sort of substance is our abstract Idea to which the name is annexed.* The measure and boundary of each sort or species, whereby it is constituted that particular sort, and distinguished from others, is that we call its *essence*, which is nothing but that abstract idea to which the name is annexed; so that everything contained in that idea is essential to that sort. This, though it be all the essence of natural substances that *we* know, or by which we distinguish them into sorts, yet I call it by a peculiar name, the *nominal essence*, to distinguish it from the real constitution of substances, upon which depends this nominal essence, and all the properties of that sort; which, therefore, as has been said, may be called the *real essence*: v.g. the nominal essence of gold is that complex idea the word gold stands for, let it be, for instance, a body yellow, of a certain weight, malleable, fusible, and fixed. But the real essence is the constitution of the insensible parts of that body, on which those qualities and all the other properties of gold depend. How far these two are different, though they are both called essence, is obvious at first sight to discover.

3. *The nominal and real Essence different.* For, though perhaps voluntary motion, with sense and reason, joined to a body of a certain shape, be the complex idea to which I and others annex the name *man*, and so be the nominal essence of the species so called: yet nobody will say that complex idea is the real essence and source of all those operations which are to be found in any individual of that sort. The foundation of all those qualities which are the ingredients of our complex idea, is something quite different: and had we such a knowledge of that constitution of man, from which his faculties of moving, sensation, and reasoning, and other powers flow, and on which his so regular shape depends, as it is possible angels have, and it is certain his Maker has, we should have a quite other idea of his essence than what now is contained in our definition of that species, be it what it will: and our idea of any individual man would be as far different from what it is now, as is his who knows all the springs and wheels and other contrivances within of the famous clock at Strasburg, from that which a gazing countryman has of it, who barely sees the motion of the hand, and hears the clock strike, and observes only some of the outward appearances.

4. *Nothing essential to Individuals.* That *essence*, in the ordinary use of the word, relates to sorts, and that it is considered in particular beings no further than as they are ranked into sorts, appears from hence: that, take but away the abstract ideas by which we sort individuals, and rank them under common names, and then the thought of anything essential to any of them instantly vanishes: we have no notion of the one without the other, which plainly shows their relation. It is necessary for me to be as I am; God and nature has made me so: but there is nothing I have is essential to me. An accident or disease may very much alter my colour or shape; a fever or fall may take away my reason or memory, or both; and an apoplexy leave neither sense, nor understanding, no, nor life. Other creatures of my shape may be made with more and better, or fewer and worse faculties than I have; and others may have reason and sense in a shape and body very different from mine. None of these are essential to the one or the other, or to any individual whatever, till the mind refers it to some sort of species of things; and then presently, according to the abstract idea of that sort, something is found essential. Let any one examine his own thoughts, and he will find that as soon as he supposes or speaks of essential, the consideration of some species, or the complex idea signified by some general name, comes into his mind; and it is in reference to that that this or that quality is said to be essential. So that if it be asked, whether it be essential to me or any other particular corporeal being, to have reason? I say, no; no more than it is essential to this white thing I write on to have words in it. But if that particular being be to be counted of the sort *man*, and to have the name *man* given it, then reason is essential to it; supposing reason to be a part of the complex idea the name man stands for: as it is essential to this thing I write on to contain words, if I will give it the name *treatise*, and rank it under that species. So that essential and not essential relate only to our abstract ideas, and the names annexed to them; which amounts to no more than this, that whatever particular thing has not in it those qualities which are contained in the abstract idea which any general term stands for,

cannot be ranked under that species, nor be called by that name; since that abstract idea is the very essence of that species.

5. *The only essences perceived by us in individual substances are those qualities which entitle them to receive their names.* Thus, if the idea of *body* with some people be bare extension or space, then solidity is not essential to body: if others make the idea to which they give the name *body* to be solidity and extension, then solidity is essential to body. That therefore, and that alone, is considered as essential, which makes a part of the complex idea the name of a sort stands for; without which no particular thing can be reckoned of that sort, nor be entitled to that name. Should there be found a parcel of matter that had all the other qualities that are in iron, but wanted obedience to the loadstone, and would neither be drawn by it nor receive direction from it, would any one question whether it wanted anything essential? It would be absurd to ask, Whether a thing really existing wanted anything essential to it. Or could it be demanded, Whether this made an essential or specific difference or no, since *we* have no other measure of essential or specific but our abstract ideas? And to talk of specific differences in *nature*, without reference to general ideas in names, is to talk unintelligibly. For I would ask for any one, What is sufficient to make an essential difference in nature between any two particular beings, without any regard had to some abstract idea, which is looked upon as the essence and standard of a species? All such patterns and standards being quite laid aside, particular beings, considered barely in themselves, will be found to have all their qualities equally essential; and everything in each individual will be essential to it; or, which is more, nothing at all. For, though it may be reasonable to ask, Whether obeying the magnet be essential to iron? yet I think it is very improper and insignificant to ask, whether it be essential to the particular parcel of matter I cut my pen with; without considering it under the name *iron*, or as being of a certain species. And if, as has been said, our abstract ideas, which have names annexed to them, are the boundaries of species, nothing can be essential but what is contained in those ideas.

6. *Even the real essences of individual substances imply potential sorts.* It is true, I have often mentioned a *real essence*, distinct in substances from those abstract ideas of them, which I call their nominal essence. By this real essence I mean, that real constitution of anything, which is the foundation of all those properties that are combined in, and are constantly found to co-exist with the nominal essence; that particular constitution which everything has within itself, without any relation to anything without it. But essence, even in this sense, *relates to a sort, and supposes a species*. For, being that real constitution on which the properties depend, it necessarily supposes a sort of things, properties belonging only to species, and not to individuals: v.g. supposing the nominal essence of gold to be a body of such a peculiar colour and weight, with malleability and fusibility, the real essence is that constitution of the parts of matter on which these qualities and their union depend; and is also the foundation of its solubility in *aqua regia* and other properties, accompanying that complex idea. Here are essences and properties, but all upon supposition of a sort or general abstract idea, which is considered as immutable; but there is no individual parcel of matter to which any of these qualities are so annexed as to be essential to it or inseparable from it. That which is essential belongs to it as a condition whereby it is of this or that sort: but take away the consideration of its being ranked under the name of some abstract idea, and then there is nothing necessary to it, nothing inseparable from it. Indeed, as to the real essences of substances, we only suppose their being, without precisely knowing what they are; but that which annexes them still to the species is the nominal essence, of which they are the supposed foundation and cause.

7. *The nominal Essence bounds the Species for us.* The next thing to be considered is, by which of those essences it is that substances are determined into sorts or species; and that, it is evident, is by the nominal essence. For it is that alone that the name, which is the mark of the sort, signifies. It is impossible, therefore, that anything should determine the sorts of things, which *we* rank under general names, but that idea which that name is designed as a mark for; which is that, as has been shown, which we call nominal essence. Why do we say this is a horse, and that a mule; this is an animal, that an herb? How comes any particular thing to be of this or that sort, but because it has that nominal essence; or, which is all one, agrees to that abstract idea, that name is annexed to? And I desire any one but to reflect on his own thoughts, when he fears or speaks any of those or other names of substances, to know what sort of essences they stand for.

8. *The nature of Species, as formed by us.* And that the species of things to us are nothing but the ranking them under distinct names, according to the complex ideas in us, and not according to precise, distinct, real essences in *them*, is plain from hence: — That we find many of the individuals that are ranked into one sort, called by one common name, and so received as being of one species, have yet qualities, depending on their real constitutions, as far different one from another as from others from which they are accounted to differ specifically. This, as it is easy to be observed by all who have to do with natural bodies, so chemists especially

are often, by sad experience, convinced of it, when they, sometimes in vain, seek for the same qualities in one parcel of sulphur, antimony, or vitriol, which they have found in others. For, though they are bodies of the same species, having the same nominal essence, under the same name, yet do they often, upon severe ways of examination, betray qualities so different one from another, as to frustrate the expectation and labour of very wary chemists. But if things were distinguished into species, according to their real essences, it would be as impossible to find different properties in any two individual substances of the same species, as it is to find different properties in two circles, or two equilateral triangles. That is properly the essence to *us*, which determines every particular to this or that *classis*; or, which is the same thing, to this or that general name: and what can that be else, but that abstract idea to which that name is annexed; and so has, in truth, a reference, not so much to the being of particular things, as to their general denominations?

9. *Not the real Essence, or texture of parts, which we know not.* Nor indeed can we rank and sort things, and consequently (which is the end of sorting) denominate them, by their real essences; because we know them not. Our faculties carry us no further towards the knowledge and distinction of substances, than a collection of *those sensible ideas which we observe in them*; which, however made with the greatest diligence and exactness we are capable of, yet is more remote from the true internal constitution from which those qualities flow, than, as I said, a countryman's idea is from the inward contrivance of that famous clock at Strasburg, whereof he only sees the outward figure and motions. There is not so contemptible a plant or animal, that does not confound the most enlarged understanding. Though the familiar use of things about us take off our wonder, yet it cures not our ignorance. When we come to examine the stones we tread on, or the iron we daily handle, we presently find we know not their make; and can give no reason of the different qualities we find in them. It is evident the internal constitution, whereon their properties depend, is unknown to us: for to go no further than the grossest and most obvious we can imagine amongst them, What is that texture of parts, that real essence, that makes lead and antimony fusible, wood and stones not? What makes lead and iron malleable, antimony and stones not? And yet how infinitely these come short of the fine contrivances and inconceivable real essences of plants or animals, every one knows. The workmanship of the all-wise and powerful God in the great fabric of the universe, and every part thereof, further exceeds the capacity and comprehension of the most inquisitive and intelligent man, than the best contrivance of the most ingenious man doth the conceptions of the most ignorant of rational creatures. Therefore we in vain pretend to range things into sorts, and dispose them into certain classes under names, by their real essences, that are so far from our discovery or comprehension. A blind man may as soon sort things by their colours, and he that has lost his smell as well distinguish a lily and a rose by their odours, as by those internal constitutions which he knows not. He that thinks he can distinguish sheep and goats by their real essences, that are unknown to him, may be pleased to try his skill in those species called *cassiowary* and *querechinchio*; and by their internal real essences determine the boundaries of those species, without knowing the complex idea of sensible qualities that each of those names stand for, in the countries where those animals are to be found.

13. *The Nominal Essence that of the Species, as conceived by us, proved from Water and Ice.* But to return to the species of corporeal substances. If I should ask any one whether ice and water were two distinct species of things, I doubt not but I should be answered in the affirmative: and it cannot be denied but he that says they are two distinct species is in the right. But if an Englishman bred in Jamaica, who perhaps had never seen nor heard of ice, coming into England in the winter, find the water he put in his basin at night in a great part frozen in the morning, and, not knowing any peculiar name it had, should call it hardened water; I ask whether this would be a new species to him, different from water? And I think it would be answered here, It would not be to him a new species, no more than congealed jelly, with it is cold, is a distinct species from the same jelly fluid and warm; or than liquid gold in the furnace is a distinct species from hard gold in the hands of a workman. And if this be so, it is plain that *our distinct species are nothing but distinct complex ideas, with distinct names annexed to them*. It is true every substance that exists has its peculiar constitution, whereon depend those sensible qualities and powers we observe in it; but the ranking of things into species (which is nothing but sorting them under several titles) is done by us according to the ideas that *we* have of them: which, though sufficient to distinguish them by names, so that we may be able to discourse of them when we have them not present before us; yet if we suppose it to be done by their real internal constitutions, and that things existing are distinguished by nature into species, by real essences, according as we distinguish them into species bynames, we shall be liable to great mistakes.

14. *Difficulties in the supposition of a certain number of real Essences.* To distinguish substantial being into species, according to the usual supposition, that there are certain precise essences of forms of things, whereby all the individuals existing are, by nature distinguished into species, these things are necessary: —

15. *A crude supposition.* First, To be assured that nature, in the production of things, always designs them to partake of certain regulated established essences, which are to be the models of all things to be produced. This, in that crude sense it is usually proposed, would need some better explication, before it can fully be assented to.

16. *Monstrous births.* Secondly, It would be necessary to know whether nature always attains that essence it designs in the production of things. The irregular and monstrous births, that in divers sorts of animals have been observed, will always give us reason to doubt of one or both of these.

17. *Are monsters really a distinct species?* Thirdly, It ought to be determined whether those we call monsters be really a distinct species, according to the scholastic notion of the word species; since it is certain that everything that exists has its particular constitution. And yet we find that some of these monstrous productions have few or none of those qualities which are supposed to result from, and accompany, the essence of that species from whence they derive their originals, and to which, by their descent, they seem to belong.

18. *Men can have no ideas of Real Essences.* Fourthly, The real essences of those things which we distinguish into species, and as so distinguished we name, ought to be known; i.e. we ought to have ideas of them. But since we are ignorant in these four points, the supposed real essences of things stand *us* not in stead for the distinguishing substances into species.

19. *Our Nominal Essences of Substances not perfect collections of the properties that flow from their Real Essences.* Fifthly, The only imaginable help in this case would be, that, having framed perfect complex ideas of the properties of things flowing from their different real essences, we should thereby distinguish them into species. But neither can this be done. For, being ignorant of the real essence itself, it is impossible to know all those properties that flow from it, and are so annexed to it, that any one of them being away, we may certainly conclude that that essence is not there, and so the thing is not of that species. We can never know what is the precise number of properties depending on the real essence of gold, any one of which failing, the real essence of gold, and consequently gold, would not be there, unless we knew the real essence of gold itself, and by that determined that species. By the word *gold* here, I must be understood to design a particular piece of matter; v.g. the last guinea that was coined. For, if it should stand here, in its ordinary signification, for that complex idea which I or any one else calls gold, i.e. for the nominal essence of gold, it would be jargon. So hard is it to show the various meaning and imperfection of words, when we have nothing else but words to do it by.

20. *Hence names independent of Real Essences.* By all which it is clear, that our distinguishing substances into species by names, is not at all founded on their real essences; nor can we pretend to range and determine them exactly into species, according to internal essential differences.

21. *But stand for such a collection of simple ideas as we have made the Name stand for.* But since, as has been remarked, we have need of *general* words, though we know not the real essences of things; all we can do is, to collect such a number of simple ideas as, by examination, we find to be united together in things existing, and thereof to make one complex idea. Which, though it be not the real essence of any substance that exists, is yet the specific essence to which our name belongs, and is convertible with it; by which we may at least try the truth of these nominal essences. For example: there be that say that the essence of body is *extension*; if it be so, we can never mistake in putting the essence of anything for the thing itself. Let us then in discourse put extension for body, and when we would say that body moves, let us say that extension moves, and see how ill it will look. He that should say that one extension by impulse moves another extension, would, by the bare expression, sufficiently show the absurdity of such a notion. The essence of anything in respect of us, is the whole complex idea comprehended and marked by that name; and in substances, besides the several distinct simple ideas that make them up, the confused one of substance, or of an unknown support and cause of their union, is always a part: and therefore the essence of body is not bare extension, but an extended solid thing; and so to say, an extended solid thing moves, or impels another, is all one, and as intelligible, as to say, *body* moves or impels. Likewise, to say that a rational animal is capable of conversation, is all one as to say a man; but no one will say that rationality is capable of conversation, because it makes not the whole essence to which we give the name man.

22. *Our Abstract Ideas are to us the Measures of the Species we make: instance in that of Man.* There are creatures in the world that have shapes like ours, but are hairy, and want language and reason. There are naturals amongst

us that have perfectly our shape, but want reason, and some of them language too. There are creatures, as it is said, (*sit fides penes authorem*, but there appears no contradiction that there should be such,) that, with language and reason and a shape in other things agreeing with ours, have hairy tails; others where the males have no beards, and others where the females have. If it be asked whether these be all *men* or no, all of human species? it is plain, the question refers only to the nominal essence: for those of them to whom the definition of the word man, or the complex idea signified by that name, agrees, are men, and the other not. But if the inquiry be made concerning the supposed real essence; and whether the internal constitution and frame of these several creatures be specifically different, it is wholly impossible for us to answer, no part of that going into our specific idea: only we have reason to think, that where the faculties or outward frame so much differs, the internal constitution is not exactly the same. But what difference in the real internal constitution makes a specific difference it is in vain to inquire; whilst our measures of species be, as they are, only our abstract ideas, which we know; and not that internal constitution, which makes no part of them. Shall the difference of hair only on the skin be a mark of a different internal specific constitution between a changeling and a drill, when they agree in shape, and want of reason and speech? And shall not the want of reason and speech be a sign to us of different real constitutions and species between a changeling and a reasonable man? And so of the rest, if we pretend that distinction of species or sorts is fixedly established by the real frame and secret constitutions of things.

25. *The specific Essences that are commonly made by Men.* But supposing that the *real* essences of substances were discoverable by those that would severely apply themselves to that inquiry, yet we could not reasonably think that the ranking of things under general names was regulated by those internal real constitutions, or anything else but their *obvious* appearances; since languages, in all countries, have been established long before sciences. So that they have not been philosophers or logicians, or such who have troubled themselves about forms and essences, that have made the general names that are in use amongst the several nations of men: but those more or less comprehensive terms have, for the most part, in all languages, received their birth and signification from ignorant and illiterate people, who sorted and denominated things by those sensible qualities they found in them; thereby to signify them, when absent, to others, whether they had an occasion to mention a sort or a particular thing.

26. *Therefore very various and uncertain in the ideas of different men.* Since then it is evident that we sort and name substances by their nominal and not by their real essences, the next thing to be considered is how, and by whom these essences come to be made. As to the latter, it is evident they are made by the mind, and not by nature: for were they Nature's workmanship, they could not be so various and different in several men as experience tells us they are. For if we will examine it, we shall not find the nominal essence of any one species of substances in all men the same: no, not of that which of all others we are the most intimately acquainted with. It could not possibly be that the abstract idea to which the name *man* is given should be different in several men, if it were of Nature's making; and that to one it should be *animal rationale*, and to another, *animal implume bipes latis unguibus*. He that annexes the name man to a complex idea, made up of sense and spontaneous motion, joined to a body of such a shape, has thereby one essence of the species man; and he that, upon further examination, adds rationality, has another essence of the species he calls man: by which means the same individual will be a true man to the one which is not so to the other. I think there is scarce any one will allow this upright figure, so well known, to be the essential difference of the species man; and yet how far men determine of the sorts of animals rather by their shape than descent, is very visible; since it has been more than once debated, whether several human foetuses should be preserved or received to baptism or no, only because of the difference of their outward configuration from the ordinary make of children, without knowing whether they were not as capable of reason as infants cast in another mould: some whereof, though of an approved shape, are never capable of as much appearance of reason all their lives as is to be found in an ape, or an elephant, and never give any signs of being acted by a rational soul. Whereby it is evident, that the outward figure, which only was found wanting, and not the faculty of reason, which nobody could know would be wanting in its due season, was made essential to the human species. The learned divine and lawyer must, on such occasions, renounce his sacred definition of *animal rationaie*, and substitute some other essence of the human species. Monsieur Menage⁴ furnishes us with an example worth the taking notice of on this occasion: 'When the abbot of Saint Martin,' says he, 'was born, he had so little of the figure of a man, that it bespoke him rather a monster. It was for some time under deliberation, whether he should be baptized or no. However, he was baptized, and declared a man provisionally till time should show what he would prove. Nature had moulded him so untowardly, that he was called all his life the Abbot Malotru; i.e. ill-shaped. He was of Caen.' (*Menagiana*, 278, 430.) This child, we see, was very near being excluded out of the species of

man, barely by his shape. He escaped very narrowly as he was; and it is certain, a figure a little more oddly turned had cast him, and he had been executed, as a thing not to be allowed to pass for man. And yet there can be no reason given why, if the lineaments of his face had been a little altered, a rational soul could not have been lodged in him; why a visage somewhat longer, or a nose flatter, or a wider mouth, could not have consisted, as well as the rest of his ill figure, with such a soul, such parts, as made him, disfigured as he was, capable to be a dignitary in the church.

27. *Nominal Essences of particular substances are undetermined by nature, and therefore various as men vary.* Wherein, then, would I gladly know, consist the precise and unmovable boundaries of that species? It is plain, if we examine, there is no such thing made by Nature, and established by her amongst men. The real essence of that or any other sort of substances, it is evident, we know not; and therefore are so undetermined in our nominal essences, which we make ourselves, that, if several men were to be asked concerning some oddly-shaped *foetus*, as soon as born, whether it were a *man* or no, it is past doubt one should meet with different answers. Which could not happen, if the nominal essences whereby we limit and distinguish the species of substances, were not made by man with some liberty; but were exactly copied from precise boundaries set by nature, whereby it distinguished all substances into certain species. Who would undertake to resolve what species that monster was of which is mentioned by Licetus (lib. i. c. 3),⁵ with a man's head and hog's body? Or those other which to the bodies of men had the heads of beasts, as dogs, horses, &c. If any of these creatures had lived, and could have spoke, it would have increased the difficulty. Had the upper part to the middle been of human shape, and all below swine, had it been murder to destroy it? Or must the bishop have been consulted, whether it were man enough to be admitted to the font or no? As I have been told it happened in France some years since, in somewhat a like case. So uncertain are the boundaries of species of animals to us, who have no other measures than the complex ideas of our own collecting; and so far are we from certainly knowing what a *man* is; though perhaps it will be judged great ignorance to make any doubt about it. And yet I think I may say, that the certain boundaries of that species are so far from being determined, and the precise number of simple ideas which make the nominal essence so far from being settled and perfectly known, that very material doubts may still arise about it. And I imagine none of the definitions of the word *man* which we yet have, nor descriptions of that sort of animal, are so perfect and exact as to satisfy a considerate inquisitive person; much less to obtain a general consent, and to be that which men would everywhere stick by, in the decision of cases, and determining of life and death, baptism or no baptism, in productions that might happen.

28. *But not so arbitrary as Mixed Modes.* But though these nominal essences of substances are made by the mind, they are not yet made so arbitrarily as those of mixed modes. To the making of any nominal essence, it is necessary, First, that the ideas whereof it consists have such a union as to make but one idea, how compounded soever. Secondly, that the particular ideas so united be exactly the same, neither more nor less. For if two abstract complex ideas differ either in number or sorts of their component parts, they make two different, and not one and the same essence. In the first of these, the mind, in making its complex ideas of substances, only follows nature; and puts none together which are not supposed to have a union in nature. Nobody joins the voice of a sheep with the shape of a horse; nor the colour of lead with the weight and fixedness of gold, to be the complex ideas of any real substances; unless he has a mind to fill his head with chimeras, and his discourse with unintelligible words. Men observing certain qualities always joined and existing together, therein copied nature; and of ideas so united made their complex ones of substances. For, though men may make what complex ideas they please, and give what names to them they will; yet, if they will be understood *when they speak of things really existing*, they must in some degree conform their ideas to the things they would speak of; or else men's language will be like that of Babel,⁶ and every man's words, being intelligible only to himself, would no longer serve to conversation and the ordinary affairs of life, if the ideas they stand for be not some way answering the common appearances and agreement of substances as they really exist.

29. *Our Nominal Essences of substances usually consist of a few obvious qualities observed in things.* Secondly, Though the mind of man, in making its complex ideas of substances, never puts any together that do not really, or are not supposed to, co-exist; and so it truly borrows that union from nature: yet the number it combines depends upon the various care, industry, or fancy of him that makes it. Men generally content themselves with some few sensible obvious qualities; and often, if not always, leave out others as material and as firmly united as those that they take. Of sensible substances there are two sorts: one of organized bodies, which are propagated by seed; and in these the *shape* is that which to us is the leading quality, and most

characteristical part, that determines the species. And therefore in vegetables and animals, an extended solid substance of such a certain figure usually serves the turn. For however some men seem to prize their definition of *animal rationale*, yet should there a creature be found that had language and reason, but partaked not of the usual shape of a man, I believe it would hardly pass for a man, how much soever it were *animal rationale*. And if Balaam's ass⁷ had all his life discoursed as rationally as he did once with his master, I doubt yet whether any one would have thought him worthy the name man, or allowed him to be of the same species with himself. As in vegetables and animals it is the shape, so in most other bodies, not propagated by seed, it is the *colour* we most fix on, and are most led by. Thus where we find the colour of gold, we are apt to imagine all the other qualities comprehended in our complex idea to be there also: and we commonly take these two obvious qualities, viz. shape and colour, for so presumptive ideas of several species, that in a good picture, we readily say, this is a lion, and that a rose; this is a gold, and that a silver goblet, only by the different figures and colours represented to the eye by the pencil.

30. *Yet, imperfect as they thus are, they serve for common converse.* But though this serves well enough for gross and confused conceptions, and inaccurate ways of talking and thinking; yet *men are far enough from having agreed on the precise number of simple ideas or qualities belonging to any sort of things, signified by its name.* Nor is it a wonder; since it requires much time, pains, and skill, strict inquiry, and long examination to find out what, and how many, those simple ideas are, which are constantly and inseparably united in nature, and are always to be found together in the same subject. Most men, wanting either time, inclination, or industry enough for this, even to some tolerable degree, content themselves with some few obvious and outward appearances of things, thereby readily to distinguish and sort them for the common affairs of life: and so, without further examination, give them names, or take up the names already in use. Which, though in common conversation they pass well enough for the signs of some few obvious qualities co-existing, are yet far enough from comprehending, in a settled signification, a precise number of simple ideas, much less all those which are united in nature. He that shall consider, after so much stir about genus and species, and such a deal of talk of specific differences, how few words we have yet settled definitions of, may with reason imagine, that those *forms* which there hath been so much noise made about are only chimeras, which give us no light into the specific natures of things. And he that shall consider how far the names of substances are from having significations wherein all who use them do agree, will have reason to conclude that, though the nominal essences of substances are all supposed to be copied from nature, yet they are all, or most of them, very imperfect. Since the composition of those complex ideas are, in several men, very different: and therefore that these boundaries of species are as men, and not as Nature, makes them, if at least there are in nature any such prefixed bounds. It is true that many particular substances are so made by Nature, that they have agreement and likeness one with another, and so afford a foundation of being ranked into sorts. But the sorting of things by us, or the making of determinate species, being in order to naming and comprehending them under general terms, I cannot see how it can be properly said, that Nature sets the boundaries of the species of things: or, if it be so, our boundaries of species are not exactly conformable to those in nature. For we, having need of general names for present use, stay not for a perfect discovery of all those qualities which would *best* show us their most material differences and agreements; but we ourselves divide them, by certain obvious appearances, into species, that we may the easier under general names communicate our thoughts about them. For, having no other knowledge of any substance but of the simple ideas that are united in it; and observing several particular things to agree with others in several of those simple ideas; we make that collection our specific idea, and give it a general name; that in recording our thoughts, and in our discourse with others, we may in one short word designate all the individuals that agree in that complex idea, without enumerating the simple ideas that make it up; and so not waste our time and breath in tedious descriptions: which we see they are fain to do who would discourse of any new sort of things they have not yet a name for.

31. *Essences of Species under the same Name very different in different minds.* But however these species of substances pass well enough in ordinary conversation, it is plain that this complex idea, wherein they observe several individuals to agree, is by different men made very differently; by some more, and others less accurately. In some, this complex idea contains a greater, and in others a smaller number of qualities; and so is apparently such as the mind makes it. The yellow shining colour makes gold to children; others add weight, malleableness, and fusibility; and others yet other qualities, which they find joined with that yellow colour, as constantly as its weight and fusibility. For in all these and the like qualities, one has as good a right to be put into the complex idea of that substance wherein they are all joined as another. And therefore different men, leaving out or putting in several simple ideas which others do not, according to their various examination, skill, or observation of that subject, have different essences of gold, which must make therefore be of their own

and not of nature's making.

32. *The more general our Ideas of Substances are, the more incomplete and partial they are.* If the number of simple ideas that make the nominal essence of the lowest species, or first sorting, of individuals, depends on the mind of man, variously collecting them, it is much more evident that they do so in the more comprehensive classes, which, by the masters of logic, are called *genera*. These are complex ideas designedly imperfect: and it is visible at first sight, that several of those qualities that are to be found in the things themselves are purposely left out of generical ideas. For, as the mind, to make general ideas comprehending several particulars, leaves out those of time and place, and such other, that make them incommunicable to more than one individual; so to make other yet more general ideas, that may comprehend different sorts, it leaves out those qualities that distinguish them, and puts into its new collection only such ideas as are common to several sorts. The same convenience that made men express several parcels of yellow matter coming from Guinea and Peru under one name, sets them also upon making of one name that may comprehend both gold and silver, and some other bodies of different sorts. This is done by leaving out those qualities, which are peculiar to each sort, and retaining a complex idea made up of those that are common to them all. To which the name *metal* being annexed, there is a genus constituted; the essence whereof being that abstract idea, containing only malleableness and fusibility, with certain degrees of weight and fixedness, wherein some bodies of several kinds agree, leaves out the colour and other qualities peculiar to gold and silver, and the other sorts comprehended under the name metal. Whereby it is plain that men follow not exactly the patterns set them by nature, when they make their general ideas of substances; since there is no body to be found which has barely malleableness and fusibility in it, without other qualities as inseparable as those. But men, in making their general ideas, seeking more the convenience of language, and quick dispatch by short and comprehensive signs, that the true and precise nature of things as they exist, have, in the framing their abstract ideas, chiefly pursued that end; which was to be furnished with store of general and variously comprehensive names. So that in this whole business of genera and species, the genus, or more comprehensive, is but a partial conception of what is in the species; and the species but a partial idea of what is to be found in each individual. If therefore any one will think that a man, and a horse, and an animal, and a plant, &c., are distinguished by real essences made by nature, he must think nature to be very liberal of these real essences, making one for body, another for an animal, and another for a horse; and all these essences liberally bestowed upon Bucephalus. But if we would rightly consider what is done in all these genera and species, or sorts, we should find that there is no new thing made, but only more or less comprehensive signs, whereby we may be enabled to express in a few syllables great numbers of particular things, as they agree in more or less general conceptions, which we have framed to that purpose. In all which we may observe, that the more general term is always the name of a less complex idea; and that each genus is but a partial conception of the species comprehended under it. So that if these abstract general ideas be thought to be complete, it can only be in respect of a certain established relation between them and certain names which are made use of to signify them; and not in respect of anything existing, as made by nature.

33. *This all accommodated to the end of Speech.* This is adjusted to the true end of speech, which is to be the easiest and shortest way of communicating our notions. For thus he that would discourse of things, as they agreed in the complex idea of extension and solidity, needed but use the word *body* to denote all such. He that to these would join others, signified by the words life, sense, and spontaneous motion, needed but use the word *animal* to signify all which partaked of those ideas, and he that had made a complex idea of a body, with life, sense, and motion, with the faculty of reasoning, and a certain shape joined to it, needed but use the short monosyllable *man*, to express all particulars that correspond to that complex idea. This is the proper business of genus and species: and this men do without any consideration of real essences, or substantial forms; which come not within the reach of our knowledge when we think of those things, nor within the signification of our words when we discourse with others.

34. *Instance in Cassowaries.* Were I to talk with any one of a sort of birds I lately saw in St. James's Park, about three or four feet high, with a covering of something between feathers and hair, of a dark brown colour, without wings, but in the place thereof two or three little branches coming down like sprigs of Spanish broom, long great legs, with feet only of three claws, and without a tail; I must make this description of it, and so may make others understand me. But when I am told that the name of it is *cassuaris*, I may then use that word to stand in discourse for all my complex idea mentioned in that description; though by that word, which is now become a specific name, I know no more of the real essence or constitution of that sort of animals than I did before; and knew probably as much of the nature of that species of birds before I learned the name, as many Englishmen do of swans or herons, which are specific names, very well known, of sorts of birds common in England.

35. *Men determine the Sorts of Substances, which may be sorted variously.* From what has been said, it is evident that *men* make sorts of things. For, it being different essences alone that make different species, it is plain that they who make those abstract ideas which are the nominal essences do thereby make the species, or sort. Should there be a body found, having all the other qualities of gold except malleableness, it would no doubt be made a question whether it were gold or not, i.e. whether it were of that species. This could be determined only by that abstract idea to which every one annexed the name gold: so that it would be true gold to him, and belong to that species, who included not malleableness in his nominal essence, signified by the sound gold; and on the other side it would not be true gold, or of that species, to him who included malleableness in his specific idea. And how, I pray, is it that makes these diverse species, even under one and the same name, but men that make two different abstract ideas, consisting not exactly of the same collection of qualities? Nor is it a mere supposition to imagine that a body may exist wherein the other obvious qualities of gold may be without malleableness; since it is certain that gold itself will be sometimes so eager, (as artists call it,) that it will as little endure the hammer as glass itself. What we have said of the putting in, or leaving out of malleableness, in the complex idea the name gold is by any one annexed to, may be said of its peculiar weight, fixedness, and several other the like qualities: for whatever is left out, or put in, it is still the complex idea to which that name is annexed that makes the species: and as any particular parcel of matter answers that idea, so the name of the sort belongs truly to it; and it is of that species. And thus anything is true gold, perfect metal. All which determination of the species, it is plain, depends on the understanding of man, making this or that complex idea.

36. *Nature makes the Similitudes of Substances.* This, then, in short, is the case: Nature makes many *particular things*, which do agree one with another in many sensible qualities, and probably too in their internal frame and constitution: but it is not this real essence that distinguishes them into species; it is men who, taking occasion from the qualities they find united in them, and wherein they observe often several individuals to agree, range them into sorts, in order to their naming, for the convenience of comprehensive signs; under which individuals, according to their conformity to this or that abstract idea, come to be ranked as under ensigns: so that this is of the blue, that the red regiment; this is a man, that a drill: and in this, I think, consists the whole business of genus and species.

BOOK IV

OF KNOWLEDGE AND PROBABILITY

Chapter I

OF KNOWLEDGE IN GENERAL

1. *Our Knowledge conversant about our Ideas only.* Since the mind, in all its thoughts and reasonings, hath no other immediate object but its own ideas, which it alone does or can contemplate, it is evident that our knowledge is only conversant about them.

2. *Knowledge is the Perception of the Agreement or Disagreement of two Ideas.* Knowledge then seems to me to be nothing but *the perception of the connexion of and agreement, or disagreement and repugnancy of any of our ideas.* In this alone it consists. Where this perception is, there is knowledge, and where it is not, there, though we may fancy, guess, or believe, yet we always come short of knowledge. For when we know that white is not black, what do we else but perceive, that these two ideas do not agree? When we possess ourselves with the utmost security of the demonstration, that the three angles of a triangle are equal to two right ones, what do we more but perceive, that equality to two right ones does necessarily agree to, and is inseparable from, the three angles of a triangle.

3. *This Agreement or Disagreement may be any of four sorts.* But to understand a little more distinctly wherein this agreement or disagreement consists, I think we may reduce it all to these four sorts:

I. *Identity, or diversity.*

II. *Relation.*

III. *Co-existence, or necessary connexion.*

IV. *Real existence.*

4. *First, Of Identity, or Diversity in ideas.* As to the first sort of agreement or disagreement, viz. *identity* or *diversity*. It is the first act of the mind, when it has any sentiments or ideas at all, to perceive its ideas; and so far as it perceives them, to know each what it is, and thereby also to perceive their difference, and that one is not another. This is so absolutely necessary, that without it there could be no knowledge, no reasoning, no imagination, no distinct thoughts at all. By this the mind clearly and infallibly perceives each idea to agree with itself, and to be what it is; and all distinct ideas to disagree, i.e. the one not to be the other: and this it does without pains, labour, or deduction; but at first view, by its natural power of perception and distinction. And though men of art have reduced this into those general rules, *What is, is*, and *It is impossible for the same thing to be and not to be*, for ready application in all cases, wherein there may be occasion to reflect on it: yet it is certain that the first exercise of this faculty is about particular ideas. A man infallibly knows, as soon as ever he has them in his mind, that the ideas he calls *white* and *round* are the very ideas they are; and that they are not other ideas which he calls *red* or *square*. Nor can any maxim or proposition in the world make him know it clearer or surer than he did before, and without any such general rule. This then is the first agreement or disagreement which the mind perceives in its ideas; which it always perceives at first sight: and if there ever happen any doubt about it, it will always be found to be about the names, and not the ideas themselves, whose identity and diversity will always be perceived, as soon and clearly as the ideas themselves are; nor can it possibly be otherwise.

5. *Secondly, Of abstract Relations between ideas.* The next sort of agreement or disagreement the mind perceives in any of its ideas may, I think, be called *relative*, and is nothing but the perception of the *relation* between any two ideas, of what kind soever, whether substances, modes, or any other. For, since all distinct ideas must eternally be known not to be the same, and so be universally and constantly denied one of another, there could be no room for any positive knowledge at all, if we could not perceive any relation between our ideas, and find out the agreement or disagreement they have one with another, in several ways the mind takes of comparing them.

6. *Thirdly, Of their necessary Co-existence in Substances.* The third sort of agreement or disagreement to be found in our ideas, which the perception of the mind is employed about, is *co-existence* or *non-co-existence* in the *same subject*; and this belongs particularly to substances. Thus when we pronounce concerning gold, that it is fixed, our knowledge of this truth amounts to no more but this, that fixedness, or a power to remain in the fire unconsumed, is an idea that always accompanies and is joined with that particular sort of yellowness, weight, fusibility, malleableness, and solubility in *aqua regia*, which make our complex idea signified by the word gold.

7. *Fourthly, Of real Existence agreeing to any idea.* The fourth and last sort is that of *actual real existence* agreeing to any idea.

Within these four sorts of agreement or disagreement is, I suppose, contained all the knowledge we have, or are capable of. For all the inquiries we can make concerning any of our ideas, all that we know or can affirm concerning any of them, is, That it is, or is not, the same with some other; that it does or does not always co-exist with some other idea in the same subject; that it has this or that relation with some other idea; or that it has a real existence without the mind. Thus, 'blue is not yellow,' is of identity. 'Two triangles upon equal bases between two parallels are equal,' is of relation. 'Iron is susceptible of magnetical impressions,' is of co-existence. 'God is,' is of real existence. Though identity and co-existence are truly nothing but relations, yet they are such peculiar ways of agreement or disagreement of our ideas, that they deserve well to be considered as distinct heads, and not under relation in general; since they are so different grounds of affirmation and negation, as will easily appear to any one, who will but reflect on what is said in several places of this *Essay*.

Chapter II

OF THE DEGREES OF OUR KNOWLEDGE

1. *Of the degrees, or differences in clearness, of our Knowledge: I. Intuitive.* All our knowledge consisting, as I have said, in the view the mind has of its own ideas, which is the utmost light and greatest certainty we, with our faculties, and in our way of knowledge, are capable of, it may not be amiss to consider a little the degrees of its evidence. The different clearness of our knowledge seems to me to lie in the different way of perception the mind has of the agreement or disagreement of any of its ideas. For if we will reflect on our own ways of thinking, we will find, that sometimes the mind perceives the agreement or disagreement of two ideas *immediately by themselves*, without the intervention of any other: and this I think we may call *intuitive knowledge*. For in this the mind is at no pains of proving or examining, but perceives the truth as the eye doth light, only by being directed towards it. Thus the mind perceives that *white* is not *black*, that a *circle* is not a *triangle*, that *three* are more than *two* and equal to *one and two*. Such kinds of truths the mind perceives at the first sight of the ideas together, by bare intuition; without the intervention of any other idea: and this kind of knowledge is the clearest and most certain that human frailty is capable of. This part of knowledge is irresistible, and, like bright sunshine, forces itself immediately to be perceived, as soon as ever the mind turns its view that way; and leaves no room for hesitation, doubt, or examination, but the mind is presently filled with the clear light of it. *It is on this intuition that depends all the certainty and evidence of all our knowledge*; which certainty every one finds to be so great, that he cannot imagine, and therefore not require a greater: for a man cannot conceive himself capable of a greater certainty than to know that any idea in his mind is such as he perceives it to be; and that two ideas, wherein he perceives a difference, are different and not precisely the same. He that demands a greater certainty than this, demands he knows not what, and shows only that he has a mind to be a sceptic, without being able to be so. Certainty depends so wholly on this intuition, that, in the next degree of knowledge which I call demonstrative, this intuition is necessary in all the connexions of the intermediate ideas, without which we cannot attain knowledge and certainty.

2. *II. Demonstrative.* The next degree of knowledge is, where the mind perceives the agreement or disagreement of any ideas, but not immediately. Though wherever the mind perceives the agreement or disagreement of any of its ideas, there be certain knowledge; yet it does not always happen, that the mind sees that agreement or disagreement, which there is between them, even where it is discoverable; and in that case remains in ignorance, and at most gets no further than a probable conjecture. The reason why the mind cannot always perceive presently the agreement or disagreement of two ideas, is, because those ideas, concerning whose agreement or disagreement the inquiry is made, cannot by the mind be so put together as to show it. In this case then, when the mind cannot so bring its ideas together as by their immediate comparison, and as it were juxtaposition or application one to another, to perceive their agreement or disagreement, it is fain, *by the intervention of other ideas* (one or more, as it happens) to discover the agreement or disagreement

which it searches; and this is that which we call *reasoning*. Thus, the mind being willing to know the agreement or disagreement in bigness between the three angles of a triangle and two right ones, cannot by an immediate view and comparing them do it: because the three angles of a triangle cannot be brought at once, and be compared with any other one, or two, angles; and so of this the mind has no immediate, no intuitive knowledge. In this case the mind is fain to find out some other angles, to which the three angles of a triangle have an equality; and, finding those equal to two right ones, comes to know their equality to two right ones.

7. *Each Step in Demonstrated knowledge must have Intuitive Evidence.* Now, in every step reason makes in demonstrative knowledge, there is an intuitive knowledge of that agreement or disagreement it seeks with the next intermediate idea which it uses as a proof: for if it were not so, that yet would need a proof; since without the perception of such agreement or disagreement, there is no knowledge produced: if it be perceived by itself, it is intuitive knowledge: if it cannot be perceived by itself, there is need of some intervening idea, as a common measure, to show their agreement or disagreement. By which it is plain, that every step in reasoning that produces knowledge, has intuitive certainty; which when the mind perceives, there is no more required but to remember it, to make the agreement or disagreement of the ideas concerning which we inquire visible and certain. So that to make anything a demonstration, it is necessary to perceive the immediate agreement of the intervening ideas, whereby the agreement or disagreement of the two ideas under examination (whereof the one is always the first, and the other the last in the account) is found. This intuitive perception of the agreement or disagreement of the intermediate ideas, in each step and progression of the demonstration, must also be carried exactly in the mind, and a man must be sure that no part is left out: which, because in long deductions, and the use of many proofs, the memory does not always so readily and exactly retain; therefore it comes to pass, that this is more imperfect than intuitive knowledge, and men embrace often falsehood for demonstrations.

14. *III. Sensitive Knowledge of the particular Existence of finite beings without us.* These two, viz. intuition and demonstration, are the degrees of our *knowledge*; whatever comes short of one of these, with what assurance soever embraced, is but *faith*, or *opinion*, but not knowledge, at least in all general truths. There is, indeed, another perception of the mind, employed about *the particular existence of finite beings without us*, which, going beyond bare probability, and yet not reaching perfectly to either of the foregoing degrees of certainty, passes under the name of *knowledge*. There can be nothing more certain than that the idea we receive from an external object is in our minds: this is intuitive knowledge. But whether there be anything more than barely that idea in our minds; whether we can thence certainly infer the existence of anything without us, which corresponds to that idea, is that whereof some men think there may be a question made; because men may have such ideas in their minds, when no such thing exists, no such object affects their senses. But yet here I think we are provided with an evidence that puts us past doubting. For I ask any one, Whether he be not invincibly conscious to himself of a different perception, when he looks on the sun by day, and thinks on it by night; when he actually tastes wormwood, or smells a rose, or only thinks on that savour or odour? We as plainly find the difference there is between any idea revived in our minds by our own memory, and actually coming into our minds by our senses, as we do between any two distinct ideas. If any one say, a dream may do the same thing, and all these ideas may be produced in us without any external objects; he may please to dream that I make him this answer:— 1. That it is no great matter, whether I remove his scruple or no: where all is but dream, reasoning and arguments are of no use, truth and knowledge nothing. 2. That I believe he will allow a very manifest difference between dreaming of being in the fire, and being actually in it. But yet if he be resolved to appear so sceptical as to maintain, that what I call being actually in the fire is nothing but a dream; and that we cannot thereby certainly know, that any such thing as fire actually exists without us: I answer, That we certainly finding that pleasure or pain follows upon the application of certain objects to us, whose existence we perceive, or dream that we perceive, by our senses; this certainty is as great as our happiness or misery, beyond which we have no concernment to know or to be. So that, I think, we may add to the two former sorts of knowledge this also, of the existence of particular external objects, by that perception and consciousness we have of the actual entrance of ideas from them, and allow these three degrees of knowledge, viz. *intuitive*, *demonstrative*, and *sensitive*: in each of which there are different degrees and ways of evidence and certainty.

Chapter III

OF THE EXTENT OF HUMAN KNOWLEDGE

1. *First, it extends no further than we have Ideas.* Knowledge, as has been said, lying in the perception of the

agreement or disagreement of any of our ideas, it follows from hence, That,

First, we can have knowledge no further than we have *ideas*.

2. *It extends no further than we can perceive their Agreement or Disagreement.* Secondly, That we can have no knowledge further than we can have *perception* of that agreement or disagreement. Which perception being: 1. Either by *intuition*, or the immediate comparing any two ideas; or, 2. By *reason*, examining the agreement or disagreement of two ideas, by the intervention of some others; or, 3. By *sensation*, perceiving the existence of particular things: hence it also follows:

3. *Intuitive Knowledge extends itself not to all the relations of all our Ideas.* Thirdly, That we cannot have an *intuitive knowledge* that shall extend itself to all our ideas, and all that we would know about them; because we cannot examine and perceive all the relations they have one to another, by juxta-position, or an immediate comparison one with another. Thus, having the ideas of an obtuse and an acute angled triangle, both drawn from equal bases, and between parallels, I can, by intuitive knowledge, perceive the one not to be the other, but cannot that way know whether they be equal or no; because their agreement or disagreement in equality can never be perceived by an immediate comparing them: the difference of figure makes their parts incapable of an exact immediate application; and therefore there is need of some intervening qualities to measure them by, which is demonstration, or rational knowledge.

4. *Nor does Demonstrative Knowledge.* Fourthly, It follows, also, from what is above observed, that our *rational knowledge* cannot reach to the whole extent of our ideas: because between two different ideas we would examine, we cannot always find such mediums as we can connect one to another with an intuitive knowledge in all the parts of the deduction; and wherever that fails, we come short of knowledge and demonstration.

5. *Sensitive Knowledge narrower than either.* Fifthly, *Sensitive knowledge* reaching no further than the existence of things actually present to our senses, is yet much narrower than either of the former.

6. *Our Knowledge, therefore, narrower than our Ideas.* Sixthly, From all which it is evident, that the *extent of our knowledge* comes not only short of the reality of things, but even of the extent of our own ideas. Though our knowledge be limited to our ideas, and cannot exceed them either in extent or perfection; and though these be very narrow bounds, in respect of the extent of All-being, and far short of what we may justly imagine to be in some even created understandings, not tied down to the dull and narrow information that is to be received from some few, and not very acute, ways of perception, such as are our senses; yet it would be well with us if our knowledge were but as large as our ideas, and there were not many doubts and inquiries *concerning the ideas we have*, whereof we are not, nor I believe ever shall be in this world resolved. Nevertheless, I do not question but that human knowledge, under the present circumstances of our beings and constitutions, maybe carried much further than it has hitherto been, if men would sincerely, and with freedom of mind, employ all that industry and labour of thought, in improving the means of discovering truth, which they do for the colouring or support of falsehood, to maintain a system, interest, or party they are once engaged in. But yet after all, I think I may, without injury to human perfection, be confident, that our knowledge would never reach to all we might desire to know concerning those ideas we have; nor be able to surmount all the difficulties, and resolve all the questions that might arise concerning any of them. We have the ideas of a *square*, a *circle*, and *equality*; and yet, perhaps, shall never be able to find a circle equal to a square, and certainly know that it is so. We have the ideas of *matter* and *thinking*, but possibly shall never be able to know whether any mere material being thinks or no; it being impossible for us, by the contemplation of our own ideas, without revelation, to discover whether Omnipotency has not given to some systems of matter, fitly disposed, a power to perceive and think, or else joined and fixed to matter, so disposed, a thinking immaterial substance: it being, in respect of our notions, not much more remote from our comprehension to conceive that GOD can, if he pleases, superadd to matter a *faculty of thinking*, than that he should superadd to it *another substance with a faculty of thinking*; since we know not wherein thinking consists, nor to what sort of substances the Almighty has been pleased to give that power, which cannot be in any created being, but merely by the good pleasure and bounty of the Creator. For I see no contradiction in it, that the first Eternal thinking Being, or Omnipotent Spirit, should, if he pleased, give to certain systems of created senseless matter, put together as he thinks fit, some degrees of sense, perception, and thought: though, as I think I have proved, lib iv. ch. 10, § 14, &c., it is no less than a contradiction to suppose matter (which is evidently in its own nature void of sense and thought) should be that Eternal first-thinking Being. What certainty of knowledge can any one have, that some perceptions, such as, v.g., pleasure and pain, should not be in some bodies themselves, after a certain manner modified and moved, as well as that they should be in an immaterial substance, upon the motion of

the parts of the body: Body, as far as we can conceive, being able only to strike and affect body, and motion, according to the utmost reach of our ideas, being able to produce nothing but motion; so that when we allow it to produce pleasure or pain, or the idea of a colour or sound, we are fain to quit our reason, go beyond our ideas, and attribute it wholly to the good pleasure of our Maker. For, since we must allow He has annexed effects to motion which we can no way conceive motion able to produce, what reason have we to conclude that He could not order them as well to be produced in a subject we cannot conceive capable of them, as well as in a subject we cannot conceive the motion of matter can any way operate upon?

But to return to the argument in hand: our knowledge, I say, is not only limited to the paucity and imperfections of the ideas we have, and which we employ it about, but even comes short of that too: but how far it reaches, let us now inquire.

7. *How far our Knowledge reaches.* The affirmations or negations we make concerning the ideas we have, may, as I have before intimated in general, be reduced to these four sorts, viz. identity, co-existence, relation, and real existence. I shall examine how far our knowledge extends in each of these:

8. *Firstly, Our Knowledge of Identity and Diversity in ideas extends as far as our Ideas themselves.* First, as to *identity* and *diversity*. In this way of agreement or disagreement of our ideas, our intuitive knowledge is as far extended as our ideas themselves: and there can be no idea in the mind, which it does not, presently, by an intuitive knowledge, perceive to be what it is, and to be different from any other.

9. *Secondly, Of their Co-existence, extends only a very little way.* As to the second sort, which is the agreement or disagreement of our ideas in *co-existence*, in this our knowledge is very short; though in this consists the greatest and most material part of our knowledge concerning substances. For our ideas of the species of substances being, as I have showed, nothing but certain collections of simple ideas united in one subject, and so co-existing together; v.g. our idea of flame is a body hot, luminous, and moving upward; of gold, a body heavy to a certain degree, yellow, malleable, and fusible: for these, or some such complex ideas as these, in men's minds, do these two names of the different substances, flame and gold, stand for. When we would know anything further concerning these, or any other sort of substances, what do we inquire, but what *other* qualities or powers these substances have or have not? Which is nothing else but to know what *other* simple ideas do, or do not co-exist with those that make up that complex idea?

10. *Because the Connexion between simple Ideas in substances is for the most part unknown.* This, how weighty and considerable a part soever of human science, is yet very narrow, and scarce any at all. The reason whereof is, that the simple ideas whereof our complex ideas of substances are made up are, for the most part, such as carry with them, in their own nature, no *visible necessary* connexion or inconsistency with any other simple ideas, whose co-existence with them we would inform ourselves about.

11. *Especially of the secondary Qualities of Bodies.* The ideas that our complex ones of substances are made up of, and about which our knowledge concerning substances is most employed, are those of their secondary qualities; which depending all (as has been shown) upon the primary qualities of their minute and insensible parts; or, if not upon them, upon something yet more remote from our comprehension; it is impossible we should know which have a *necessary* union or inconsistency one with another. For, not knowing the root they spring from, not knowing what size, figure, and texture of parts they are, on which depend, and from which result those qualities which make our complex idea of gold, it is impossible we should know what *other* qualities result from, or are incompatible with, the same constitution of the insensible parts of gold; and so consequently must always co-exist with that complex idea we have of it, or else are inconsistent with it.

12. *Because necessary Connexion between any secondary and the primary Qualities is undiscoverable by us.* Besides this ignorance of the primary qualities of the insensible parts of bodies, on which depend all their secondary qualities, there is yet another and more incurable part of ignorance, which sets us more remote from a certain knowledge of the co-existence or *inco-existence* (if I may so say) of different ideas in the same subject; and that is, that there is no discoverable connexion between any secondary quality and those primary qualities which it depends on.

13. *We have no perfect knowledge of their Primary Qualities.* That the size, figure, and motion of one body should cause a change in the size, figure, and motion of another body, is not beyond our conception; the separation of the parts of one body upon the intrusion of another; and the change from rest to motion upon impulse; these and the like seem to have *some connexion* one with another. And if we knew these primary

qualities of bodies, we might have reason to hope we might be able to know a great deal more of these operations of them one upon another: but our minds not being able to discover any connexion betwixt these primary qualities of bodies and the sensations that are produced in us by them, we can never be able to establish certain and undoubted rules of the *consequence* or *co-existence* of any secondary qualities, though we could discover the size, figure, or motion of those invisible parts which immediately produce them. We are so far from knowing *what* figure, size, or motion of parts produce a yellow colour, a sweet taste, or a sharp sound, that we can by no means conceive how *any* size, figure, or motion of any particles, can possibly produce in us the idea of any colour, taste, or sound whatsoever: there is no conceivable connexion between the one and the other.

14. *And seek in vain for certain and universal knowledge of unperceived qualities in substances.* In vain, therefore, shall we endeavour to discover by our ideas (the only true way of certain and universal knowledge) what other ideas are to be found constantly joined with that of *our* complex idea of any substance: since we neither know the real constitution of the minute parts on which their qualities do depend; nor, did we know them, could we discover any necessary connexion between them and any of the secondary qualities: which is necessary to be done before we can certainly know their necessary co-existence. So, that, let our complex idea of any species of substances be what it will, we can hardly, from the simple ideas contained in it, certainly determine the necessary co-existence of any other quality whatsoever. Our knowledge in all these inquiries reaches very little further than our experience. Indeed some few of the primary qualities have a necessary dependence and visible connexion one with another, as figure necessarily supposes extension; receiving or communicating motion by impulse, supposes solidity. But, though these, and perhaps some others of our ideas have: yet there are so few of them that have a visible connexion one with another, that we can by intuition or demonstration discover the co-existence of very few of the qualities that are to be found united in substances: and we are left only to the assistance of our senses to make known to us what qualities they contain. For of all the qualities that are co-existent in any subject, without this dependence and evident connexion of their ideas one with another, we cannot know certainly any two to co-exist, any further than experience, by our senses, informs us. Thus, though we see the yellow colour, and, upon trial, find the weight, malleableness, fusibility, and fixedness that are united in a piece of gold; yet, because no one of these ideas has any evident dependence or necessary connexion with the other, we cannot certainly know that where any four of these are, the fifth will be there also, how highly probable soever it may be; because the highest probability amounts not to certainty, without which there can be no true knowledge. For this co-existence can be no further known than it is perceived; and it cannot be perceived but either in particular subjects, by the observation of our senses, or, in general, by the necessary connexion of the ideas themselves.

18. *Thirdly, Of Relations between abstracted ideas it is not easy to say how far our knowledge extends.* As to the third sort of our knowledge, viz. the agreement or disagreement of any of our ideas in any other relation: this, as it is the largest field of our knowledge, so it is hard to determine how far it may extend: because the advances that are made in this part of knowledge, depending on our sagacity in finding intermediate ideas, that may show the relations and habitudes of ideas whose coexistence is not considered, it is a hard matter to tell when we are at an end of such discoveries; and when reason has all the helps it is capable of, for the finding of proofs, or examining the agreement or disagreement of remote ideas. They that are ignorant of Algebra cannot imagine the wonders in this kind are to be done by it: and what further improvements and helps advantageous to other parts of knowledge the sagacious mind of man may yet find out, it is not easy to determine. This at least I believe, that the *ideas of quantity* are not those alone that are capable of demonstration and knowledge; and that other, and perhaps more useful, parts of contemplation, would afford us certainty, if vices, passions, and domineering interest did not oppose or menace such endeavours.

21. *Fourthly, Of the three real Existences of which we have certain knowledge.* As to the fourth sort of our knowledge, viz. of the *real actual existence of things*, we have an intuitive knowledge of *our own existence*, and a demonstrative knowledge of the existence of a *God*: of the existence of *anything else*, we have no other but a sensitive knowledge; which extends not beyond the objects present to our senses.

Chapter IV

OF THE REALITY OF KNOWLEDGE

1. *Objection.* *'Knowledge placed in our Ideas may be all unreal or chimerical.'* I doubt not but my reader, by this time, may be apt to think that I have been all this while only building a castle in the air; and be ready to say to

me: —

‘To what purpose all this stir? Knowledge, say you, is only the perception of the agreement or disagreement of our own ideas: but who knows what those ideas may be? Is there anything so extravagant as the imaginations of men’s brains? Where is the head that has no chimeras in it? Or if there be a sober and a wise man, what difference will there be, by your rules, between his knowledge and that of the most extravagant fancy in the world? They both have their ideas, and perceive their agreement and disagreement one with another. If there be any difference between them, the advantage will be on the warm-headed man’s side, as having the more ideas, and the more lively. And so, by your rules, he will be the more knowing. If it be true, that all knowledge lies only in the perception of the agreement or disagreement of our own ideas, the visions of an enthusiast and the reasonings of a sober man will be equally certain. It is no matter how things are: so a man observe but the agreement of his own imaginations, and talk conformably, it is all truth, all certainty. Such castles in the air will be as strongholds of truth, as the demonstrations of Euclid. That an harpy is not a centaur is by this way as certain knowledge, and as much a truth, as that a square is not a circle.

‘But of what use is all this fine knowledge of *men’s own imaginations*, to a man that inquires after the reality of things? It matters not what men’s fancies are, it is the knowledge of things that is only to be prized: it is this alone gives a value to our reasonings, and preference to one man’s knowledge over another’s, that it is of things as they really are, and not of dreams and fancies.’

2. *Answer. Not so, where Ideas agree with Things.* To which I answer, That if our knowledge of our ideas terminate in them, and reach no further, where there is something further intended, our most serious thoughts will be of little more use than the reveries of a crazy brain; and the truths built thereon of no more weight than the discourses of a man who sees things clearly in a dream, and with great assurance utters them. But I hope, before I have done, to make it evident, that this way of certainty, by the knowledge of our own ideas, goes a little further than bare imagination: and I believe it will appear that all the certainty of general truths a man has lies in nothing else.

3. *But what shall be the criterion of this agreement?* It is evident the mind knows not things immediately, but only by the intervention of the ideas it has of them. Our knowledge, therefore, is real only so far as there is a *conformity* between our ideas and the reality of things. But what shall be here the criterion? How shall the mind, when it perceives nothing but its own ideas, know that they agree with things themselves? This, though it seems not to want difficulty, yet, I think, there be two sorts of ideas that we may be assured agree with things.

4. *As, First, All Simple Ideas are really conformed to Things.* The first are simple ideas, which since the mind, as has been showed, can by no means make to itself, must necessarily be the product of things operating on the mind, in a natural way, and producing therein those perceptions which by the Wisdom and Will of our Maker they are ordained and adapted to. From whence it follows, that simple ideas are not fictions of our fancies, but the natural and regular productions of things without us, really operating upon us; and so carry with them all the conformity which is intended; or which our state requires: for they represent to us things under those appearances which they are fitted to produce in us: whereby we are enabled to distinguish the sorts of particular substances, to discern the states they are in, and so to take them for our necessities, and apply them to our uses. Thus, the idea of whiteness, or bitterness, as it is in the mind, exactly answering that power which is in any body to produce it there, has all the real conformity it can or ought to have, with things without us. And this conformity between our simple ideas and the existence of things, is sufficient for real knowledge.

5. *Secondly, All Complex Ideas, except ideas of Substances, are their own archetypes.* Secondly, All our complex ideas, *except those of substances*, being archetypes of the mind’s own making, not intended to be the copies of anything, nor referred to the existence of anything, as to their originals, cannot want any conformity necessary to real knowledge. For that which is not designed to represent anything but itself, can never be capable of a wrong representation, nor mislead us from the true apprehension of anything, by its dislikeness to it: and such, excepting those of substances, are all our complex ideas. Which, as I have showed in another place, are combinations of ideas, which the mind, by its free choice, puts together, without considering any connexion they have in nature. And hence it is, that in all these sorts the ideas themselves are considered as the archetypes, and things no otherwise regarded, but as they are conformable to them. So that we cannot but be infallibly certain, that all the knowledge we attain concerning these ideas is real, and reaches things themselves. Because in all our thoughts, reasonings, and discourses of this kind, we intend things no further than as they are conformable to our ideas. So that in these we cannot miss of a certain and undoubted reality.

6. *Hence the reality of Mathematical Knowledge.* I doubt not but it will be easily granted, that the knowledge we have of mathematical truths is not only certain, but real knowledge; and not the bare empty vision of vain, insignificant chimeras of the brain: and yet, if we will consider, we shall find that it is only of our own ideas. The mathematician considers the truth and properties belonging to a rectangle or circle only as they are an idea in his own mind. For it is possible he never found either of them existing mathematically, i.e. precisely true, in his life. But yet the knowledge he has of any truths or properties belonging to a circle, or any other mathematical figure, are nevertheless true and certain, even of real things existing: because real things are no further concerned, nor intended to be meant by any such propositions, than as things really agree to those archetypes in his mind. Is it true of the *idea* of a triangle, that its three angles are equal to two right ones? It is true also of a triangle, wherever it *really exists*. Whatever other figure exists, that it is not exactly answerable to that idea of a triangle in his mind, is not at all concerned in that proposition. And therefore he is certain all his knowledge concerning such ideas is real knowledge: because, intending things no further than they agree with those his ideas, he is sure what he knows concerning those figures, when they have *barely an ideal existence* in his mind, will hold true of them also when they have a *real existence* in matter: his consideration being barely of those figures, which are the same wherever or however they exist.

7. *And of Moral.* And hence it follows that moral knowledge is as capable of real certainty as mathematics. For certainty being but the perception of the agreement or disagreement of our ideas, and demonstration nothing but the perception of such agreement, by the intervention of other ideas or mediums; our moral ideas, as well as mathematical, being archetypes themselves, and so adequate and complete ideas; all the agreement or disagreement which we shall find in them will produce real knowledge, as well as in mathematical figures.

11. *Thirdly, Our complex Ideas of Substances have their Archetypes without us; and here knowledge comes short.* Thirdly, There is another sort of complex ideas, which, being referred to archetypes without us, may differ from them, and so our knowledge about them may come short of being real. Such are our ideas of substances, which, consisting of a collection of simple ideas, supposed taken from the works of nature, may yet vary from them; by having more or different ideas united in them than are to be found united in the things themselves. From whence it comes to pass, that they may, and often do, fail of being exactly conformable to things themselves.

18. *Recapitulation.* Wherever we perceive the agreement or disagreement of any of our ideas, there is certain knowledge: and wherever we are sure those ideas agree with the reality of things, there is certain real knowledge. Of which agreement of our ideas with the reality of things, having here given the marks, I think, I have shown *wherein it is that certainty, real certainty, consists*. Which, whatever it was to others, was, I confess, to me heretofore, one of those desiderata which I found great want of.

Chapter VI

OF UNIVERSAL PROPOSITIONS: THEIR TRUTH AND CERTAINTY

1. *Treating of Words necessary to Knowledge.* Though the examining and judging of ideas by themselves, their names being quite laid aside, be the best and surest way to clear and distinct knowledge: yet, through the prevailing custom of using sounds for ideas, I think it is very seldom practised. Every one may observe how common it is for names to be made use of, instead of the ideas themselves, even when men think and reason within their own breasts; especially if the ideas be very complex, and made up of a great collection of simple ones. This makes the consideration of *words* and *propositions* so necessary a part of the Treatise of Knowledge, that it is very hard to speak intelligibly of the one, without explaining the other.

2. *General Truths hardly to be understood, but in verbal Propositions.* All the knowledge we have, being only of particular or general truths, it is evident that whatever may be done in the former of these, the latter, which is that which with reason is most sought after, can never be well made known, and is very seldom apprehended, but as conceived and expressed in words. It is not, therefore, out of our way, in the examination of our knowledge, to inquire into the truth and certainty of universal propositions.

3. *Certainty twofold—of Truth and of Knowledge.* But that we may not be misled in this case by that which is the danger everywhere, I mean by the doubtfulness of terms, it is fit to observe that certainty is twofold; *certainty of truth* and *certainty of knowledge*. Certainty of truth is, when words are so put together in propositions as exactly to express the agreement or disagreement of the ideas they stand for, as really it is. Certainty of knowledge is to perceive the agreement or disagreement of ideas, as expressed in any proposition.

This we usually call knowing, or being certain of the truth of any proposition.

4. *No Proposition can be certainly known to be true, where the real Essence of each Species mentioned is not known.* Now, because we cannot be certain of the truth of any general proposition, unless we know the precise bounds and extent of the species its terms stand for, it is necessary we should know the essence of each species, which is that which constitutes and bounds it.

This, in all simple ideas and modes, is not hard to do. For in these the real and nominal essence being the same, or, which is all one, the abstract idea which the general term stands for being the sole essence and boundary that is or can be supposed of the species, there can be no doubt how far the species extends, or what things are comprehended under each term; which, it is evident, are all that have an exact conformity with the idea it stands for, and no other.

But in substances, wherein a real essence, distinct from the nominal, is supposed to constitute, determine, and bound the species, the extent of the general word is very uncertain; because, not knowing this real essence, we cannot know what is, or what is not of that species; and, consequently, what may or may not with certainty be affirmed of it. And thus, speaking of a *man*, or *gold*, or any other species of natural substances, as supposed constituted by a precise and real essence which nature regularly imparts to every individual of that kind, whereby it is made to be of that species, we cannot be certain of the truth of any affirmation or negation made of it. For man or gold, taken in this sense, and used for species of things constituted by real essences, different from the complex idea in the mind of the speaker, stand for we know not what; and the extent of these species, with such boundaries, are so unknown and undetermined, that it is impossible with any certainty to affirm, that all men are rational, or that all gold is yellow. But where the nominal essence is kept to, as the boundary of each species, and men extend the application of any general term no further than to the particular things in which the complex idea it stands for is to be found, there they are in no danger to mistake the bounds of each species, nor can be in doubt, on this account, whether any proposition be true or not. I have chosen to explain this uncertainty of propositions in this scholastic way, and have made use of the terms of *essences*, and *species*, on purpose to show the absurdity and inconvenience there is to think of them as of any other sort of realities, than barely abstract ideas with names to them. To suppose that the species of things are anything but the sorting of them under general names, according as they agree to several abstract ideas of which we make those names the signs, is to confound truth, and introduce uncertainty into all general propositions that can be made about them. Though therefore these things might, to people not possessed with scholastic learning, be treated of in a better and clearer way; yet those wrong notions of essences or species having got root in most people's minds who have received any tincture from the learning which has prevailed in this part of the world, are to be discovered and removed, to make way for that use of words which should convey certainty with it.

5. *This more particularly concerns Substances.* The names of substances, then, whenever made to stand for species which are supposed to be constituted by real essences which we know not, are not capable to convey certainty to the understanding. Of the truth of general propositions made up of such terms we cannot be sure. The reason whereof is plain: for how can we be sure that this or that quality is in gold, when we know not what is or is not gold? Since in this way of speaking, nothing is gold but what partakes of an essence, which we, not knowing, cannot know where it is or is not, and so cannot be sure that any parcel of matter in the world is or is not in this sense gold; being incurably ignorant whether *it* has or has not that which makes anything to be called gold; i.e. that real essence of gold whereof we have no idea at all. This being as impossible for us to know as it is for a blind man to tell in what flower the colour of a pansy is or is not to be found, whilst he has no idea of the colour of a pansy at all. Or if we could (which is impossible) certainly know where a real essence, which we know not, is, v.g. in what parcels of matter the real essence of gold is, yet could we not be sure that this or that quality could with truth be affirmed of gold; since it is impossible for us to know that this or that quality or idea has a necessary connexion with a real essence of which we have no idea at all, whatever species that supposed real essence may be imagined to constitute.

6. *The Truth of few universal Propositions concerning Substances is to be known.* On the other side, the names of substances, when made use of as they should be, for the ideas men have in their minds, though they carry a clear and determinate signification with them, will not yet serve us to make many universal propositions of whose truth we can be certain. Not because in this use of them we are uncertain what things are signified by them, but because the complex ideas they stand for are such combinations of simple ones as carry not with them any discoverable connexion or repugnancy, but with a very few other ideas.

7. *Because necessary Co-existence of simple Ideas in Substances can in few Cases be known.* The complex ideas that our names of the species of substances properly stand for, are collections of such qualities as have been observed to co-exist in an unknown substratum, which we call substance; but what other qualities necessarily co-exist with such combinations, we cannot certainly know, unless we can discover their natural dependence; which, in their primary qualities, we can go but a very little way in; and in all their secondary qualities we can discover no connexion at all: for the reasons mentioned, chap. iii. Viz. I. Because we know not the real constitutions of substances, on which each secondary quality particularly depends. 2. Did we know that, it would serve us only for experimental (not universal) knowledge; and reach with certainty no further than that bare instance: because our understandings can discover no conceivable connexion between any secondary quality and any modification whatsoever of any of the primary ones. And therefore there are very few general propositions to be made concerning substances, which can carry with them undoubted certainty.

8. *Instances in Gold.* 'All gold is fixed,' is a proposition whose truth we cannot be certain of, how universally soever it be believed. For if, according to the useless imagination of the Schools, any one supposes the term gold to stand for a species of things set out by nature, by a real essence belonging to it, it is evident he knows not what particular substances are of that species; and so cannot with certainty affirm anything universally of gold. But if he makes gold stand for a species determined by its nominal essence, let the nominal essence, for example, be the complex idea of a body of a certain yellow colour, malleable, fusible, and heavier than any other known; — in this proper use of the word gold, there is no difficulty to know what is or is not gold. But yet no other quality can with certainty be universally affirmed or denied of gold, but what hath a *discoverable* connexion or inconsistency with that nominal essence. Fixedness, for example, having no necessary connexion that we can discover, with the colour, weight, or any other simple idea of our complex one, or with the whole combination together; it is impossible that we should certainly know the truth of this proposition, that all gold is fixed.

9. *No discoverable necessary connexion between nominal essence of gold and other simple ideas.* As there is no discoverable connexion between fixedness and the colour, weight, and other simple ideas of that nominal essence of gold; so, if we make our complex idea of gold, a body yellow, fusible, ductile, weighty, and fixed, we shall be at the same uncertainty concerning solubility in *aqua regia*, and for the same reason. Since we can never, from consideration of the ideas themselves, with certainty affirm or deny of a body whose complex idea is made up of yellow, very weighty, ductile, fusible, and fixed, that it is soluble in *aqua regia*: and so on of the rest of its qualities. I would gladly meet with one general affirmation concerning any quality of gold, that any one can certainly know is true. It will, no doubt, be presently objected, Is not this an universal proposition, *All gold is malleable*? To which I answer, It is a very certain proposition, if malleableness be a part of the complex idea the word gold stands for. But then here is nothing affirmed of gold, but that that sound stands for an idea in which malleableness is contained: and such a sort of truth and certainty as this it is, to say a centaur is four-footed. But if malleableness make not a part of the specific essence the name of gold stands for, it is plain, *all gold is malleable*, is not a certain proposition. Because, let the complex idea of gold be made up of whichever of its other qualities you please, malleableness will not appear to depend on that complex idea, nor follow from any simple one contained in it: the connexion that malleableness has (if it has any) with those other qualities being only by the intervention of the real constitution of its insensible parts; which, since we know not, it is impossible we should perceive that connexion, unless we could discover that which ties them together.

10. *As far as any such Co-existence can be known, so far Universal Propositions may be certain. But this will go but a little way.* The more, indeed, of these coexisting qualities we unite into one complex idea, under one name, the more precise and determinate we make the signification of that word; but never yet make it thereby more capable of universal certainty, *in respect of other qualities not contained in our complex idea*: since we perceive not their connexion or dependence on one another; being ignorant both of that real constitution in which they are all founded, and also how they flow from it. For the chief part of our knowledge concerning substances is not, as in other things, barely of the relation of two ideas that may exist separately; but is of the necessary connexion and co-existence of several distinct ideas in the same subject, or of their repugnancy so to coexist. Could we begin at the other end, and discover what it was wherein that colour consisted, what made a body lighter or heavier, what texture of parts made it malleable, fusible, and fixed, and fit to be dissolved in this sort of liquor, and not in another;—if, I say, we had such an idea as this of bodies, and could perceive therein all sensible qualities originally consist, and how they are produced; we might frame such abstract ideas of them as would furnish us with matter of more general knowledge, and enable us to make universal propositions, that should carry general truth and certainty with them. But whilst our complex ideas of the sorts of substances are so remote from that internal real constitution on which their sensible qualities depend, and are made up of

nothing but an imperfect collection of those apparent qualities our senses can discover, there can be few general propositions concerning substances of whose real truth we can be certainly assured; since there are but few simple ideas of whose real truth we can be certainly assured; since there are but few simple ideas of whose connexion and necessary co-existence we can have certain and undoubted knowledge. I imagine, amongst all the secondary qualities of substances, and the powers relating to them, there cannot any two be named, whose necessary co-existence, or repugnance to co-exist, can certainly be known; unless in those of the same sense, which necessarily exclude one another, as I have elsewhere showed. No one, I think, by the colour that is in any body, can certainly know what smell, taste, sound, or tangible qualities it has, nor what alterations it is capable to make or receive on or from other bodies. The same may be said of the sound or taste, &c. Our specific names of substances standing for any collections of such ideas, it is not to be wondered that we can with them make very few general propositions of undoubted real certainty. But yet so far as any complex idea of any sort of substances contains in it any simple idea, whose *necessary* coexistence with any other *may* be discovered, so far universal propositions may with certainty be made concerning it: v.g. could any one discover a necessary connexion between malleableness and the colour or weight of gold, or any other part of the complex idea signified by that name, he might make a certain universal proposition concerning gold in this respect; and the real truth of this proposition, that *all gold is malleable*, would be as certain as of this, *the three angles of all right-lined triangles are all equal to two right ones*.

Chapter IX

OF OUR THREEFOLD KNOWLEDGE OF EXISTENCE

1. *General Propositions that are certain concern not Existence.* Hitherto we have only considered the essences of things; which being only abstract ideas, and thereby removed in our thoughts from particular existence, (that being the proper operation of the mind, in abstraction, to consider an idea under no other existence but what it has in the understanding,) gives us no knowledge of real existence at all. Where, by the way, we may take notice, that universal propositions of whose truth or falsehood we can have certain knowledge concern not existence: and further, that all particular affirmations or negations that would not be certain if they were made general, are only concerning existence; they declaring only the accidental union or separation of ideas in things existing, which, in their abstract natures, have no known necessary union or repugnancy.

2. *A threefold Knowledge of Existence.* But, leaving the nature of propositions, and different ways of predication to be considered more at large in another place, let us proceed now to inquire concerning our knowledge of the *existence of things*, and how we come by it. I say, then, that we have the knowledge of *our own* existence by intuition; of the existence of *God* by demonstration; and of *other things* by sensation.

3. *Our Knowledge of our own Existence is Intuitive.* As for *our own existence*, we perceive it so plainly and so certainly, that it neither needs nor is capable of any proof. For nothing can be more evident to us than our own existence. I think, I reason, I feel pleasure and pain: can any of these be more evident to me than my own existence? If I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt of that. For if I know I feel pain, it is evident I have as certain perception of my own existence, as of the existence of the pain I feel: or if I know I doubt, I have as certain perception of the existence of the thing doubting, as of that thought which I *call doubt*. Experience then convinces us, that we have an *intuitive knowledge* of our own existence, and an internal infallible perception that we are. In every act of sensation, reasoning, or thinking, we are conscious to ourselves of our own being; and, in this matter, come not short of the highest degree of certainty.

Chapter X

OF OUR KNOWLEDGE OF THE EXISTENCE OF A GOD

1. *We are capable of knowing certainly that there is a God.* Though God has given us no innate ideas of himself; though he has stamped no original characters on our minds, wherein we may read his being; yet having furnished us with those faculties our minds are endowed with, he hath not left himself without witness: since we have sense, perception, and reason, and cannot want a clear proof of him, as long as we carry *ourselves* about us. Nor can we justly complain of our ignorance in this great point; since he has so plentifully provided us with the means to discover and know him; so far as is necessary to the end of our being, and the great concernment of our happiness. But, though this be the most obvious truth that reason discovers, and though its evidence be (if I mistake not) equal to mathematical certainty; yet it requires thought and attention; and

the mind must apply itself to a regular deduction of it from some part of our intuitive knowledge, or else we shall be as uncertain and ignorant of this as of other propositions, which are in themselves capable of clear demonstration. To show, therefore, that we are capable of *knowing*, i.e. *being certain* that there is a God, and *how we may come by* this certainty, I think we need go no further than *ourselves*, and that undoubted knowledge we have of our own existence.

2. *For Man knows that he himself exists.* I think it is beyond question, that man has a clear idea of his own being; he knows certainly he exists, and that he is something. He that can doubt whether he be anything or no, I speak not to; no more than I would argue with pure nothing, or endeavour to convince nonentity that it were something. If any one pretends to be so sceptical as to deny his own existence, (for really to doubt of it is manifestly impossible,) let him for me enjoy his beloved happiness of being nothing, until hunger or some other pain convince him of the contrary. This, then, I think I may take for a truth, which every one's certain knowledge assures him of, beyond the liberty of doubting, viz. that he is *something that actually exists*.

3. *He knows also that Nothing cannot produce a Being; therefore Something must have existed from Eternity.* In the next place, man knows, by an intuitive certainty, that bare *nothing can no more produce any real being, than it can be equal to two right angles*. If a man knows not that nonentity, or the absence of all being, cannot be equal to two right angles, it is impossible he should know any demonstration in Euclid. If, therefore, we know there is some real being, and that nonentity cannot produce any real being, it is an evident demonstration, that *from eternity there has been something*; since what was not from eternity had a beginning; and what had a beginning must be produced by something else.

4. *And that eternal Being must be most powerful.* Next, it is evident, that what had its being and beginning from another, must also have all that which is in and belongs to its being from another too. All the powers it has must be owing to and received from the same source. This eternal source, then, of all being must also be the source and original of all power; and so *this eternal Being must be also the most powerful*.

5. *And most knowing.* Again, a man finds in *himself* perception and knowledge. We have then got one step further; and we are certain now that there is not only some being, but some knowing, intelligent being in the world. There was a time, then, when there was no knowing being, and when knowledge began to be; or else there had been also *a knowing being from eternity*. If it be said, there was a time when no being had any knowledge, when that eternal being was void of all understanding; I reply, that then it was impossible there should ever have been any knowledge: it being as impossible that things wholly void of knowledge, and operating blindly, and without any perception, should produce a knowing being, as it is impossible that a triangle should make itself three angles bigger than two right ones. For it is as repugnant to the idea of senseless matter, that it should put into itself sense, perception, and knowledge, as it is repugnant to the idea of a triangle, that it should put into itself greater angles than two right ones.

6. *And therefore God.* Thus, from the consideration of ourselves, and what we infallibly find in our own constitutions, our reason leads us to the knowledge of this certain and evident truth, — *That there is an eternal, most powerful, and most knowing Being*; which whether any one will please to call God, it matters not. The thing is evident; and from this idea duly considered, will easily be deduced all those other attributes, which we ought to ascribe to this eternal Being. If, nevertheless, any one should be found to senselessly arrogant, as to suppose man alone knowing and wise, but yet the product of mere ignorance and chance; and that all the rest of the universe acted only by that blind haphazard; I shall leave with him that very rational and emphatical rebuke of Tully⁸ (1. ii. De Leg.), to be considered at his leisure: 'What can be more sillily arrogant and misbecoming, than for a man to think that he has a mind and understanding in him, but yet in all the universe beside there is no such thing? Or that those things, which with the utmost stretch of his reason he can scarce comprehend, should be moved and managed without any reason at all?' *Quid est enim venus, quam neminem esse oportere tam stulte arrogantem, ut in se mentem et rationem putet inesse, in caelo mundoque non putet? Aut ea quae vix summa ingenii ratione comprehendat, nulla ratione moveri putet?*

From what has been said, it is plain to me we have a more certain knowledge of the existence of a God, than of anything our senses have not immediately discovered to us. Nay, I presume I may say, that we more certainly know that there is a God, than that there is anything else without us. When I say we *know*, I mean there is such a knowledge within our reach which we cannot miss, if we will but apply our minds to that, as we do to several other inquiries.

Chapter XI

OF OUR KNOWLEDGE OF

THE EXISTENCE OF OTHER THINGS

1. *Knowledge of the existence of other Finite Beings is to be had only by actual Sensation.* The knowledge of our own being we have by intuition. The existence of a God, reason clearly makes known to us, as has been shown.

The knowledge of the existence of *any other thing* we can have only by *sensation*: for there being no necessary connexion of real existence with any *idea* a man hath in his memory; nor of any other existence but that of God with the existence of any particular man: no particular man can know the existence of any other being, but only when, by actual operating upon him, it makes itself perceived by him. For, the having the idea of anything in our mind, no more proves the existence of that thing, than the picture of a man evidences his being in the world, or the visions of a dream make thereby a true history.

2. *Instance: Whiteness of this Paper.* It is therefore the *actual receiving* of ideas from without that gives us notice of the existence of other things, and makes us know, that something doth exist at that time without us, which causes that idea in us; though perhaps we neither know nor consider how it does it. For it takes not from the certainty of our sense, and the ideas we receive by them, that we know not the manner wherein they are produced: v.g. whilst I write this, I have, by the paper affecting my eyes, that idea produced in my mind, which, whatever object causes, I call *white*; by which I know that that quality or accident (i.e. whose appearance before my eyes always causes that idea) doth really exist, and hath a being without me. And of this, the greatest assurance I can possibly have, and to which my faculties can attain, is the testimony of my eyes, which are the proper and sole judges of this thing; whose testimony I have reason to rely on as so certain, that I can no more doubt, whilst I write this, that I see white and black, and that something really exists that causes that sensation in me, than that I write or move my hand; which is a certainty as great as human nature is capable of, concerning the existence of anything, but a man's self alone, and of God.

3. *This notice by our Senses, though not so certain as Demonstration, yet may be called Knowledge, and proves the Existence of Things without us.* The notice we have by our senses of the existing of things without us, though it be not altogether so certain as our intuitive knowledge, or the deductions of our reason employed about the clear abstract ideas of our own minds; yet it is an assurance that deserves the name of *knowledge*. If we persuade ourselves that our faculties act and inform us right concerning the existence of those objects that affect them, it cannot pass for an ill-grounded confidence: for I think nobody can, in earnest, be so sceptical as to be uncertain of the existence of those things which he sees and feels. At least, he that can doubt so far, (whatever he may have with his own thoughts,) will never have any controversy with me; since he can never be sure I say anything contrary to his own opinion. As to myself, I think God has given me assurance enough of the existence of things without me: since, by their different application, I can produce in myself both pleasure and pain, which is one great concernment of my present state. This is certain: the confidence that our faculties do not herein deceive us, is the greatest assurance we are capable of concerning the existence of material beings. For we cannot act anything but by our faculties; nor talk of knowledge itself, but by the help of those faculties which are fitted to apprehend even what knowledge is.

But besides the assurance we have from our senses themselves, that they do not err in the information they give us of the existence of things without us, when they are affected by them, we are further confirmed in this assurance by other concurrent reasons: —

4. *Confirmed by concurrent reasons: — First, Because we cannot have ideas of Sensation but by the Inlet of the Senses.* I. It is plain those perceptions are produced in us by exterior causes affecting our senses: because those that want the *organs* of any sense, never can have the ideas belonging to that sense produced in their minds. This is too evident to be doubted: and therefore we cannot but be assured that they come in by the organs of that sense, and no other way. The organs themselves, it is plain, do not produce them: for then the eyes of a man in the dark would produce colours, and his nose smell roses in the winter: but we see nobody gets the relish of a pineapple, till he goes to the Indies, where it is, and tastes it.

5. *Secondly, Because we find that an Idea from actual Sensation, and another from Memory, are very distinct Perceptions.* II. Because sometimes I find that *I cannot avoid the having those ideas produced in my mind*. For though, when my eyes are shut, or windows fast, I can at pleasure recall to my mind the ideas of light, or the sun, which former sensations had lodged in my memory; so I can at pleasure lay by *that* idea, and take into my view that of the smell of a rose, or taste sugar. But, if I turn my eyes at noon towards the sun, I cannot avoid

the ideas which the light or sun then produces in me. So that there is a manifest difference between the ideas laid up in my memory, (over which, if they were there only, I should have constantly the same power to dispose of them, and lay them by at pleasure,) and those which force themselves upon me, and I cannot avoid having. And therefore it must needs be some exterior cause, and the brisk acting of some objects without me, whose efficacy I cannot resist, that produces those ideas in my mind, whether I will or no. Besides, there is nobody who doth not perceive the difference in himself between contemplating the sun, as he hath the idea of it in his memory, and actually looking upon it: of which two, his perception is so distinct, that few of his ideas are more distinguishable one from another. And therefore he hath certain knowledge that they are not *both* memory, or the actions of his mind, and fancies only within him; but that actual seeing hath a cause without.

6. *Thirdly, Because Pleasure or Pain, which accompanies actual Sensation, accompanies not the returning of those Ideas without the external Objects.* III. Add to this, that many of those ideas are *produced in us with pain*, which afterwards we remember without the least offence. Thus, the pain of heat or cold, when the idea of it is revived in our minds, gives us no disturbance; which, when felt, was very troublesome; and is again, when actually repeated: which is occasioned by the disorder the external object causes in our bodies when applied to them: and we remember the pains of hunger, thirst, or the headache, without any pain at all; which would either never disturb us, or else constantly do it, as often as we thought of it, were there nothing more but ideas floating in our minds, and appearances entertaining our fancies, without the real existence of things affecting us from abroad. The same may be said of *pleasure*, accompanying several actual sensations. And though mathematical demonstration depends not upon sense, yet the examining them by diagrams gives great credit to the evidence of our sight, and seems to give it a certainty approaching to that of demonstration itself. For, it would be very strange, that a man should allow it for an undeniable truth, that two angles of a figure, which he measures by lines and angles of a diagram, should be bigger one than the other, and yet doubt of the existence of those lines and angles, which by looking on he makes use of to measure that by.

7. *Fourthly, Because our Senses assist one another's Testimony of the Existence of outward Things, and enable us to predict.* IV. Our *senses* in many cases *bear witness to the truth of each other's report*, concerning the existence of sensible things without us. He that *sees* a fire, may, if he doubt whether it be anything more than a bare fancy, *feel* it too; and be convinced, by putting his hand in it. Which certainly could never be put into such exquisite pain by a bare idea or phantom, unless that the pain be a fancy too: which yet he cannot, when the burn is well, by raising the idea of it, bring upon himself again.

Thus I see, whilst I write this, I can change the appearance of the paper; and by designing the letters, tell *beforehand* what new idea it shall exhibit the very next moment, by barely drawing my pen over it: which will neither appear (let me fancy as much as I will) if my hands stand still; or though I move my pen, if my eyes be shut: nor, when those characters are once made on the paper, can I choose afterwards but see them as they are; that is, have the ideas of such letters as I have made. Whence it is manifest, that they are not barely the sport and play of my own imagination, when I find that the characters that were made at the pleasure of my own thoughts, do not obey them; nor yet cease to be, whenever I shall fancy it, but continue to affect my senses constantly and regularly, according to the figures I made them. To which if we will add, that the sight of those shall, from another man, draw such sounds as I beforehand design they shall stand for, there will be little reason left to doubt that those words I write do really exist without me, when they cause a long series of regular sounds to affect my ears, which could not be the effect of my imagination, nor could my memory retain them in that order.

8. *This Certainty is as great as our Condition needs.* But yet, if after all this any one will be so sceptical as to distrust his senses, and to affirm that all we see and hear, feel and taste, think and do, during our whole being, is but the series and deluding appearances of a long dream, whereof there is no reality; and therefore will question the existence of all things, or our knowledge of anything: I must desire him to consider, that, if all be a dream, then he doth but dream that he makes the question, and so it is not much matter that a waking man should answer him. But yet, if he pleases, he may dream that I make him this answer, That the certainty of things existing in *rerum natura* when we have the testimony of our senses for it is not only as great as our frame can attain to, but as our condition needs. For, our faculties being suited not to the full extent of being, nor to a perfect, clear, comprehensive knowledge of things free from all doubt and scruple; but to the preservation of us, in whom they are; and accommodated to the use of life: they serve to our purpose well enough, if they will but give us certain notice of those things, which are convenient or inconvenient to us. For he that sees a candle burning, and hath experimented the force of its flame by putting his finger in it, will little doubt that this is something existing without him, which does him harm, and puts him to great pain: which is

assurance enough, when no man requires greater certainty to govern his actions by than what is as certain as his actions themselves. And if our dreamer pleases to try whether the glowing heat of a glass furnace be barely a wandering imagination in a drowsy man's fancy, by putting his hand into it, he may perhaps be wakened into a certainty greater than he could wish, that it is something more than bare imagination. So that this evidence is as great as we can desire, being as certain to us as our pleasure or pain, i.e. happiness or misery; beyond which we have no concernment, either of knowing or being. Such an assurance of the existence of things without us is sufficient to direct us in the attaining the good and avoiding the evil which is caused by them, which is the important concernment we have of being made acquainted with them.

9. *But reaches no further than actual Sensation.* In fine, then, when our senses do actually convey into our understandings any idea, we cannot but be satisfied that there doth something *at that time* really exist without us, which doth affect our senses, and by them give notice of itself to our apprehensive faculties, and actually produce that idea which we then perceive: and we cannot so far distrust their testimony, as to doubt that such *collections* of simple ideas as we have observed by our senses to be united together, do really exist together. But this knowledge extends as far as the present testimony of our senses, employed about particular objects that do then affect them, and no further. For if I saw such a collection of simple ideas as is wont to be called *man*, existing together one minute since, and am now alone, I cannot be certain that the same man exists now, since there is no *necessary connexion* of his existence a minute since with his existence now: by a thousand ways he may cease to be, since I had the testimony of my senses for his existence. And if I cannot be certain that the man I saw last to-day is now in being, I can less be certain that he is so who hath been longer removed from my senses, and I have not seen since yesterday, or since the last year: and much less can I be certain of the existence of men that I never saw. And, therefore, though it be highly probable that millions of men do now exist, yet, whilst I am alone, writing this, I have not that certainty of it which we strictly call knowledge; though the great likelihood of it puts me past doubt, and it be reasonable for me to do several things upon the confidence that there are men (and men also of my acquaintance, with whom I have to do) now in the world: but this is but probability, not knowledge.

12. *The Existence of other finite Spirits not knowable, and rests on Faith.* What ideas we have of spirits, and how we come by them, I have already shown. But though we have those ideas in our minds, and know we have them there, the having the ideas of spirits does not make us know that any such things do exist without us, or that there are any finite spirits, or any other spiritual beings, but the Eternal God. We have ground from revelation, and several other reasons, to believe with assurance that there are such creatures: but our senses not being able to discover them, we want the means of knowing their particular existences. For we can no more know that there are finite spirits really existing, by the idea we have of such beings in our minds, than by the ideas any one has of fairies or centaurs, he can come to know that things answering those ideas do really exist.

And therefore concerning the existence of finite spirits, as well as several other things, we must content ourselves with the evidence of faith; but universal, certain propositions concerning this matter are beyond our reach. For however true it may be, v.g., that all the intelligent spirits that God ever created do still exist, yet it can never make a part of our certain knowledge. These and the like propositions we may assent to, as highly probable, but are not, I fear, in this state capable of knowing. We are not, then, to put others upon demonstrating, nor ourselves upon search of universal certainty in all those matters; wherein we are not capable of any other knowledge, but what our senses give us in this or that particular.

13. *Only particular Propositions concerning concrete Existences are knowable.* By which it appears that there are two sorts of propositions: — (1) There is one sort of propositions concerning the *existence* of anything answerable to such an idea: as having the idea of an elephant, phoenix, motion, or an angel, in my mind, the first and natural inquiry is, Whether such a thing does anywhere exist? And this knowledge is only of particulars. No existence of anything without us, but only of God, can certainly be known further than our senses inform us. (2) There is another sort of propositions, wherein is expressed the agreement or disagreement of *our abstract ideas*, and their dependence on one another. Such propositions may be universal and certain. So, having the idea of God and myself, of fear and obedience, I cannot but be sure that God is to be feared and obeyed by me: and this proposition will be certain, concerning man in general, if I have made an abstract idea of such a species, whereof I am one particular. But yet this proposition, how certain soever, that 'men ought to fear and obey God' proves not to me the *existence of men* in the world; but will be true of all such creatures, whenever they do exist: which certainty of such general propositions depends on the agreement or disagreement to be discovered in those abstract ideas.

14. *And all general Propositions that are known to be true concern abstract Ideas.* In the former case, our

knowledge is the consequence of the existence of things, producing ideas in our minds by our senses: in the latter, knowledge is the consequence of the ideas (be they what they will) that are in our minds, producing there general certain propositions. Many of these are called *aeternae veritates*, and all of them indeed are so; not from being written, all or any of them, in the minds of all men; or that they were any of them propositions in any one's mind, till he, having got the abstract ideas, joined or separated them by affirmation or negation. But wheresoever we can suppose such a creature as man is, endowed with such faculties, and thereby furnished with such ideas as we have, we must conclude, he must needs, when he applies his thoughts to the consideration of his ideas, know the truth of certain propositions that will arise from the agreement or disagreement which he will perceive in his own ideas. Such propositions are therefore called *eternal truths*, not because they are eternal propositions actually formed, and antecedent to the understanding that at any time makes them; nor because they are imprinted on the mind from any patterns that are anywhere out of the mind, and existed before: but because, being once made about abstract ideas, so as to be true, they will, whenever they can be supposed to be made again at any time, past or to come, by a mind having those ideas, always actually be true. For names being supposed to stand perpetually for the same ideas, and the same ideas having immutably the same habitudes one to another, propositions concerning any abstract ideas that are once true must needs be *eternal verities*.

-
1. [William Molineux (1656–1698), a Dubliner who was a Member of Parliament and who published a work on optics, entered into correspondence with Locke, and the two became close friends. The letter Locke refers to was sent in 1693, and the discussion of Molineux's problem was added to the *Essay* in its second edition (1694). — S.M.C.]
 2. [Descartes, for example.]
 3. [According to Greek mythology, King Midas argued that Apollo, the god of music, had lost a musical contest, and Apollo then punished Midas by turning his ears into those of an ass.]
 4. [Giles Menage (1613–1690) was a French philologist and critic.]
 5. [Fortunato Liceto (1577–1657) was an Italian physician. The reference is to his *De Monstrorum Causis* (Of the Causes of Monsters).]
 6. [The reference is to a biblical story related in the Book of Genesis, according to which, at a time when all people spoke the same language, they attempted to build a tower that reached to heaven, but they were prevented from doing so by God, who confounded their language so they could not understand one another.]
 7. [The reference is to a biblical story related in the Book of Numbers, according to which God gave the power of speech to the prophet Balaam's ass.]
 8. [Marcus Tullius Cicero (106–43 B.C.), the statesman and philosopher, was considered the greatest Roman orator. Locke's reference is to *De Legibus*, a political dialogue.]

George Berkeley

George Berkeley was born in Kilkenny, Ireland, in 1685. He studied at Trinity College, Dublin, where he received his B.A. in 1704 and his M.A. in 1707. Subsequently, he joined the faculty at Trinity, where he stayed until 1712. During this time at Trinity, Berkeley wrote his most important philosophical works, *An Essay Towards a New Theory of Vision* (1709), *A Treatise Concerning the Principles of Human Knowledge* (the *Principles*) (1710), and *Three Dialogues between Hylas and Philonous* (the *Dialogues*) (1713). In this period he also became an Anglican clergyman. For several years beginning in 1713, he lived in London, where he associated with the literati of the time. In 1721, the year he published *De Motu*, a book on the philosophy of physics, he returned to Trinity, where he remained until 1724. From 1724 until 1728 he promoted a plan to establish a college in Bermuda for sons of settlers and Native Americans. In 1728 he married Anne Forster and then sailed to Newport, Rhode Island, where he waited in vain until 1731 for the promised government subsidy for the college. The college was never established, and in 1731 he returned to London. During his stay in America, he wrote *Alciphron: or, the Minute Philosopher* (1734), a defense of Christianity. Around this time he also wrote *The Theory of Vision* (1733) and two books on the philosophy of mathematics, *The Analyst* (1734) and a *Defense of Free Thinking in Mathematics* (1735), and he published the third edition of the *Principles* (1734), which incorporates certain significant revisions. While in London, Berkeley was made bishop of Cloyne, a diocese in Ireland, where he lived from 1734 until 1752. In this period he produced an unusual work, *Siris: A Chain of Philosophical Reflections and Inquiries Concerning the Virtues of Tar-water, and Divers Other Subjects* (1744). In 1752 he moved his family to Oxford because his son George, one of his five children, was to study there, and in the next year, 1753, he died.

Berkeley is best known for his immaterialism, his view that there is no matter in the universe, and all that exists are minds (*spirits*) and their states. Matter, in his view, is by definition stuff external to any mind. Berkeley did not deny that there are objects such as books and trees, but he held that such physical objects exist only in minds, wholly constituted of ideas. A tree, for example, consists entirely of certain ideas in the mind of a perceiver—ideas of, for example, size, shape, weight, resistance, and color.

In both the *Principles* and the *Dialogues* the most prominent place is given to a series of arguments against the existence of matter. Berkeley's most basic antimaterialistic intuition is that, when we consider carefully what it means for a physical object to exist, we will see that it is just that its various qualities are perceived—its color is seen, its texture felt, its odor smelled, and its flavor tasted. For physical things, as Berkeley puts it, their *esse* is *percipi*; that is, for them *to be* is *to be perceived*. Beyond this basic consideration, Berkeley advances two types of argument against the existence of matter. In one sort, Berkeley contends that we would never come to know the existence of material objects. All we directly perceive are sensations, and indirectly, by means of inference from the sensations we directly perceive, we could never conclude that material objects exist, because we have no explanation of how material objects can cause sensations in immaterial minds.

The second sort of argument is devoted to the claim that matter cannot even be conceived by us. We cannot conceive of matter by forming an idea that resembles a material object, because ideas cannot resemble material objects—they can resemble only other ideas. But further, when I attempt to conceive of a material object by forming an idea of a physical object that is external to any mind, I do not succeed, because the physical object is nevertheless in *my* mind, the mind of the conceiver. Perhaps Berkeley's most important consideration against the existence of matter involves his attack on the supposed mind-independence of primary qualities. In the tradition of Galileo, Descartes, and Locke, we can form a conception of mind-independent physical things by forming an idea of entities possessing only primary qualities—for example, extension, size, shape, motion, location, and duration. By contrast, secondary qualities—such as color, taste, odor, and temperature—do not provide us with a conception of mind-independent physical things. This is partly because perception of secondary qualities varies with the state or nature of the perceptual organs. For example, a bowl of water can feel warmer or cooler depending on the initial temperature of the hand one is feeling the water with, and thus, temperature is perception- or mind-dependent. Berkeley argues that perception of primary qualities varies in the very same way and that consequently primary qualities are as mind-dependent as secondary qualities.

Berkeley's universe is a community of immaterial spirits. God is the greatest of the spirits, and he sends the other spirits sensations in an orderly way, giving rise to a physical world consisting wholly of sensations and governed by laws of nature. Despite the incredulity with which Berkeley's claims are often received, he

nevertheless argued that his views are commonsensical, and that those of the materialists are mere philosophers' inventions. Berkeley's legacy is a creative alternative to commonly held metaphysical views, offering resourceful and important challenges to the modern understanding of matter.

Important studies of Berkeley's views include Margaret Atherton, *Berkeley's Revolution in Vision* (Ithaca, N.Y.: Cornell University Press, 1990); A. A. Luce, *The Dialectic of Immaterialism: An Account of the Making of Berkeley's Principles* (London: Hodder and Stoughton, 1963); Keota Fields, *Berkeley: Ideas, Immaterialism, and Objective Presence* (Lanham, Md.: Lexington Books, 2011); Robert Muehlmann, *Berkeley's Ontology* (Indianapolis: Hackett Publishing Company, 1992); George Pitcher, *Berkeley* (London: Routledge & Kegan Paul, 1977); I. C. Tipton, *Berkeley: The Philosophy of Immaterialism* (London: Methuen, 1974); and Kenneth P. Winkler, *Berkeley: An Interpretation* (Oxford: Oxford University Press, 1989). Some of the best collections of critical essays are C. B. Martin and D. M. Armstrong, eds., *Locke and Berkeley: A Collection of Critical Essays* (Garden City, N.J.: Doubleday, 1968); Ernest Sosa, ed., *Essays on the Philosophy of George Berkeley* (Dordrecht: D. Reidel, 1987); Colin Turbayne, ed., *Berkeley: Critical and Interpretive Essays* (Minneapolis: University of Minnesota Press, 1987); and Margaret Atherton, ed., *The Empiricists: Locke, Berkeley, Hume* (Lanham, Md.: Rowman & Littlefield, 1998).

Derk Pereboom

*A Treatise Concerning the Principles of Human Knowledge**

The Preface

What I here make public has, after a long and scrupulous inquiry, seemed to me evidently true, and not unuseful to be known, particularly to those who are tainted with skepticism, or want a demonstration of the existence and immateriality of God, or the natural immortality of the soul. Whether it be so or no, I am content the reader should impartially examine. Since I do not think myself any farther concerned for the success of what I have written, than as it is agreeable to truth. But to the end this may not suffer, I make it my request that the reader suspend his judgment, till he has once, at least, read the whole through with that degree of attention and thought which the subject matter shall seem to deserve. For as there are some passages that, taken by themselves, are very liable (nor could it be remedied) to gross misinterpretation, and to be charged with most absurd consequences, which, nevertheless, upon an entire perusal will appear not to follow from them: so likewise, though the whole should be read over, yet, if this be done transiently, 'tis very probable my sense may be mistaken; but to a thinking reader, I flatter myself, it will be throughout clear and obvious. As for the characters of novelty and singularity, which some of the following notions may seem to bear, 'tis, I hope, needless to make any apology on that account. He must surely be either very weak, or very little acquainted with the sciences, who shall reject a truth, that is capable of demonstration, for no other reason but because it's newly known and contrary to the prejudices of mankind. Thus much I thought fit to premise, in order to prevent, if possible, the hasty censures of a sort of men, who are too apt to condemn an opinion before they rightly comprehend it.

Introduction

1. Philosophy being nothing else but the study of wisdom and truth, it may with reason be expected, that those who have spent most time and pains in it should enjoy a greater calm and serenity of mind, a greater clearness and evidence of knowledge, and be less disturbed with doubts and difficulties than other men. Yet so it is we see the illiterate bulk of mankind that walk the high-road of plain, common sense, and are governed by the dictates of nature, for the most part easy and undisturbed. To them nothing that's familiar appears unaccountable or difficult to comprehend. They complain not of any want of evidence in their senses, and are out of all danger of becoming *skeptics*. But no sooner do we depart from sense and instinct to follow the light of a superior principle, to reason, meditate, and reflect on the nature of things, but a thousand scruples spring up in our minds, concerning those things which before we seemed fully to comprehend. Prejudices and errors of sense do from all parts discover themselves to our view; and endeavoring to correct these by reason we are insensibly drawn into uncouth paradoxes, difficulties, and inconsistencies, which multiply and grow upon us as we advance in speculation; till at length, having wandered through many intricate mazes, we find ourselves just where we were, or, which is worse, sit down in a forlorn skepticism.

2. The cause of this is thought to be the obscurity of things, or the natural weakness and imperfection of our understandings. It is said the faculties we have are few, and those designed by nature for the support and comfort of life, and not to penetrate into the inward essence and constitution of things. Besides, the mind of man being finite, when it treats of things which partake of infinity, it is not to be wondered at, if it runs into absurdities and contradictions; out of which it is impossible it should ever extricate itself, it being of the nature of infinite not to be comprehended by that which is finite.

3. But perhaps we may be too partial to ourselves in placing the fault originally in our faculties, and not rather in the wrong use we make of them. It is a hard thing to suppose, that right deductions from true principles should ever end in consequences which cannot be maintained or made consistent. We should believe that God has dealt more bountifully with the sons of men, than to give them a strong desire for that knowledge, which he had placed quite out of their reach. This were not agreeable to the wonted, indulgent methods of providence, which, whatever appetites it may have implanted in the creatures, does usually furnish them with such means as, if rightly made use of, will not fail to satisfy them. Upon the whole, I am inclined to think that the far greater part, if not all, of those difficulties which have hitherto amused philosophers, and blocked up the way to knowledge, are entirely owing to ourselves. That we have first raised a dust, and then complain, we cannot see.

4. My purpose therefore is, to try if I can discover what those principles are, which have introduced all that doubtfulness and uncertainty, those absurdities and contradictions into the several sects of philosophy; insomuch that the wisest men have thought our ignorance incurable, conceiving it to arise from the natural dullness and limitation of our faculties. And surely it is a work well deserving our pains, to make a strict inquiry concerning the first principles of *human knowledge*, to sift and examine them on all sides: especially since there may be some grounds to suspect that those lets and difficulties, which stay and embarrass the mind in its search after truth, do not spring from any darkness and intricacy in the objects, or natural defect in the understanding, so much as from false principles which have been insisted on, and might have been avoided.

5. How difficult and discouraging soever this attempt may seem, when I consider how many great and extraordinary men have gone before me in the same designs: yet I am not without some hopes, upon the consideration that the largest views are not always the clearest, and that he who is short-sighted will be obliged to draw the object nearer, and may, perhaps, by a close and narrow survey discern that which had escaped far better eyes.

6. In order to prepare the mind of the reader for the easier conceiving what follows, it is proper to premise somewhat, by way of introduction, concerning the nature and abuse of language. But the unraveling this matter leads me in some measure to anticipate my design, by taking notice of what seems to have had a chief Part In rendering speculation intricate and perplexed, and to have occasioned innumerable errors and difficulties in almost all parts of knowledge. And that is the opinion that the mind has a power of framing *abstract ideas* or notions of things. He who is not a perfect stranger to the writings and disputes of philosophers, must needs acknowledge that no small part of them are spent about abstract ideas. These are in a more especial manner, thought to be the object of those sciences which go by the name of *logic* and *metaphysics*, and of all that which passes under the notion of the most abstracted and sublime learning, in all which one shall scarce find any question handled in such a manner, as does not suppose their existence in the

mind, and that it is well acquainted with them.

7. It is agreed on all hands, that the qualities or modes of things do never really exist each of them apart by itself, and separated from all others, but are mixed, as it were, and blended together, several in the same object. But we are told, the mind being able to consider each quality singly, or abstracted from those other qualities with which it is united, does by that means frame to itself abstract ideas. For example, there is perceived by sight an object extended, colored, and moved: this mixed or compound idea the mind resolving into its simple, constituent parts, and viewing each by itself, exclusive of the rest, does frame the abstract ideas of extension, color, and motion. Not that it is possible for color or motion to exist without extension: but only that the mind can frame to itself by *abstraction* the idea of color exclusive of extension, and of motion exclusive of both color and extension.

8. Again, the mind having observed that in the particular extensions perceived by sense, there is something common and alike in all, and some other things peculiar, as this or that figure or magnitude, which distinguish them one from another; it considers apart or singles out by itself that which is common, making thereof a most abstract idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude but is an idea entirely prescinded from all these. So likewise the mind by leaving out of the particular colors perceived by sense, that which distinguishes them one from another, and retaining that only which is common to all, makes an idea of color in abstract which is neither red, nor blue, nor white, nor any other determinate color. And in like manner by considering motion abstractedly not only from the body moved, but likewise from the figure it describes, and all particular directions and velocities, the abstract idea of motion is framed; which equally corresponds to all particular motions whatsoever that may be perceived by sense.

9. And as the mind frames to itself abstract ideas of qualities or modes, so does it, by the same precision or mental separation, attain abstract ideas of the more compounded beings, which include several coexistent qualities. For example, the mind having observed that *Peter, James, and John*, resemble each other, in certain common agreements of shape and other qualities, leaves out of the complex or compounded idea it has of *Peter, James, and any other particular man*, that which is peculiar to each, retaining only what is common to all; and so makes an abstract idea wherein all the particulars equally partake, abstracting entirely from and cutting off all those circumstances and differences, which might determine it to any particular existence. And after this manner it is said we come by the abstract idea of *man* or, if you please, humanity or human nature; wherein it is true there is included color, because there is no man but has some color, but then it can be neither white, nor black, nor any particular color; because there is no one particular color wherein all men partake. So likewise there is included stature, but then it is neither tall stature nor low stature, nor yet middle stature, but something abstracted from all these. And so of the rest. Moreover, there being a great variety of other creatures that partake in some parts, but not all, of the complex idea of *man*, the mind leaving out those parts which are peculiar to men, and retaining those only which are common to all the living creatures, frames the idea of *animal*, which abstracts not only from all particular men, but also all birds, beasts, fishes, and insects. The constituent parts of the abstract idea of animal are body, life, sense, and spontaneous motion. By *body* is meant, body without any particular shape or figure, there being no one shape or figure common to all animals, without covering, either of hair or feathers, or scales, etc. nor yet naked: hair, feathers, scales, and nakedness being the distinguishing properties of particular animals, and for that reason left out of the *abstract idea*. Upon the same account the spontaneous motion must be neither walking, nor flying, nor creeping, it is nevertheless a motion, but what that motion is, it is not easy to conceive.

10. Whether others have this wonderful faculty of *abstracting their ideas*, they best can tell: for myself I find indeed I have a faculty of imagining, or representing to myself the ideas of those particular things I have perceived and of variously compounding and dividing them. I can imagine a man with two heads or the upper parts of a man joined to the body of a horse. I can consider the hand, the eye, the nose, each by itself abstracted or separated from the rest of the body. But then whatever hand or eye I imagine, it must have some particular shape and color. Likewise the idea of man that I frame to myself, must be either of a white, or a black, or a tawny, a straight, or a crooked, a tall, or a low, or a middle-sized man. I cannot by any effort of thought conceive the abstract idea above described. And it is equally impossible for me to form the abstract idea of motion distinct from the body moving, and which is neither swift nor slow, curvilinear nor rectilinear; and the like may be said of all other abstract general ideas whatsoever. To be plain, I own myself able to abstract in one sense, as when I consider some particular parts or qualities separated from others, with which though they are united in some object, yet, it is possible they may really exist without them. But I deny that I can abstract one from another, or conceive separately, those qualities which it is impossible should exist so separated; or that I can frame a general notion by abstracting from particulars in the manner aforesaid. Which

two last are the proper acceptations of *abstraction*. And there are grounds to think most men will acknowledge themselves to be in my case. The generality of men which are simple and illiterate never pretend to *abstract notions*. It is said they are difficult and not to be attained without pains and study. We may therefore reasonably conclude that, if such there be, they are confined only to the learned.

11. I proceed to examine what can be alleged in defense of the doctrine of abstraction, and try if I can discover what it is that inclines the men of speculation to embrace an opinion, so remote from common sense as that seems to be. There has been a late deservedly esteemed philosopher, who, no doubt, has given it very much countenance by seeming to think the having abstract general ideas is what puts the widest difference in point of understanding betwixt man and beast.¹ “The having of general ideas (*says he*) is that which puts a perfect distinction betwixt man and brutes, and is an excellency which the faculties of brutes do by no means attain unto. For it is evident we observe no footsteps in them of making use of general signs for universal ideas; from which we have reason to imagine that they have not the faculty of *abstracting* or making general ideas, since they have no use of words or any other general signs. *And a little after*. Therefore, I think, we may suppose that it is in this that the species of brutes are discriminated from men, and ‘tis that proper difference wherein they are wholly separated, and which at last widens to so wide a distance. For if they have any ideas at all, and are not bare machines (as some would have them) we cannot deny them to have some reason. It seems as evident to me that they do some of them in certain instances reason as that they have sense, but it is only in particular ideas, just as they receive them from their senses. They are the best of them tied up within those narrow bounds, and have not (as I think) the faculty to enlarge them by any kind of *abstraction*.” *Essay on Hum. Underst.* B. 2. C. 11. Sect. 10 and 11. I readily agree with this learned author, that the faculties of brutes can by no means attain to *abstraction*. But then if this be made the distinguishing property of that sort of animals, I fear a great many of those that pass for men must be reckoned into their number. The reason that is here assigned why we have no grounds to think brutes have abstract general ideas, is that we observe in them no use of words or any other general signs; which is built on this supposition, to wit, that the making of use of words, implies the having general ideas. From which it follows, that men who use language are able to abstract or generalize their ideas. That this is the sense and arguing of the author will further appear by his answering the question he in another place puts. “Since all things that exist are only particulars, how come we by general terms? *His answer is*, Words become general by being made the signs of general ideas.” *Essay on Hum. Underst.* B. 3. C. 3. Sect. 6. But it seems that a word becomes general by being made the sign, not of an abstract general idea but, of several particular ideas, any one of which it indifferently suggests to the mind. For example, when it is said *the change of motion is proportional to the impressed force*, or that *whatever has extension is divisible*; these propositions are to be understood of motion and extension in general, and nevertheless it will not follow that they suggest to my thoughts an idea of motion without a body moved, or any determinate direction and velocity, or that I must conceive an abstract general idea of extension, which is neither line, surface nor solid, neither great nor small, black, white, nor red, nor of any other determinate color. It is only implied that whatever motion I consider, whether it be swift or slow, perpendicular, horizontal or oblique, or in whatever object, the axiom concerning it holds equally true. As does the other of every particular extension, it matters not whether line, surface or solid, whether of this or that magnitude or figure.

12. By observing how ideas become general, we may the better judge how words are made so. And here it is to be noted that I do not deny absolutely there are general ideas, but only that there are any *abstract general ideas*: for in the passages above quoted, wherein there is mention of general ideas, it is always supposed that they are formed by *abstraction*, after the manner set forth in Sect. 8 and 9. Now if we will annex a meaning to our words, and speak only of what we can conceive, I believe we shall acknowledge, that an idea, which considered in itself is particular, becomes general, by being made to represent or stand for all other particular ideas of the same sort. To make this plain by an example, suppose a geometrician is demonstrating the method, of cutting a line in two equal parts. He draws, for instance, a black line of an inch in length, this which in itself is a particular line is nevertheless with regard to its signification general, since as it is there used, it represents all particular lines whatsoever; so that what is demonstrated of it, is demonstrated of all lines, or, in other words, of a line in general. And as that particular line becomes general, by being made a sign, so the name *line* which is taken absolutely is particular, by being a sign is made general. And as the former owes its generality, not to its being the sign of an abstract or general line, but of all particular right lines that may possibly exist, so the latter must be thought to derive its generality from the same cause, namely, the various particular lines which it indifferently denotes.

13. To give the reader a yet clearer view of the nature of abstract ideas, and the uses they are thought necessary to, I shall add one more passage out of the *Essay on Human Understanding*, which is as follows. “*Abstract ideas* are not so obvious or easy to children or the yet unexercised mind as particular ones. If they

seem so to grown men, it is only because by constant and familiar use they are made so. For when we nicely reflect upon them, we shall find that general ideas are fictions and contrivances of the mind, that carry difficulty with them, and do not so easily offer themselves, as we are apt to imagine. For example, does it not require some pains and skill to form the general idea of a triangle (which is yet none of the most abstract comprehensive and difficult) for it must be neither oblique nor rectangle, neither equilateral, equicrural, nor scalenon, but *all and none* of these at once. In effect, it is something imperfect that cannot exist, an idea wherein some parts of several different and *inconsistent* ideas are put together. It is true the mind in this imperfect state has need of such ideas, and makes all the haste to them it can, for the conveniency of communication and enlargement of knowledge, to both which it is naturally very much inclined. But yet one has reason to suspect such ideas are marks of our imperfection. At least this is enough to show that the most abstract and general ideas are not those that the mind is first and most easily acquainted with, nor such as its earliest knowledge is conversant about. B. 4. C. 7. Sect. 9.² If any man has the faculty of framing in his mind such an idea of a triangle as is here described, it is in vain to pretend to dispute him out of it, nor would I go about it. All I desire is, that the reader would fully and certainly inform himself whether he has such an idea or no. And this, methinks, can be no hard task for anyone to perform. What more easy than for anyone to look a little into his own thoughts, and there try whether he has, or can attain to have, an idea that shall correspond with the description that is here given of the general idea of a triangle, which is, *neither oblique, nor rectangle, equilateral, equicrural, nor scalenon, but all and none of these at once?*

14. Much is here said of the difficulty that abstract ideas carry with them, and the pains and skill requisite to the forming them. And it is on all hands agreed that there is need of great toil and labor of the mind, to emancipate our thoughts from particular objects, and raise them to those sublime speculations that are conversant about abstract ideas. From all which the natural consequence should seem to be, that so difficult a thing as the forming abstract ideas was not necessary for *communication*, which is so easy and familiar to all sorts of men. But we are told, if they seem obvious and easy to grown men, *it is only because by constant and familiar use they are made so*. Now I would fain know at what time it is, men are employed in surmounting that difficulty, and furnishing themselves with those necessary helps for discourse. It cannot be when they are grown up, for then it seems they are not conscious of any such pains-taking; it remains therefore to be the business of their childhood. And surely, the great and multiplied labor of framing abstract notions, will be found a hard task for that tender age. It is not a hard thing to imagine, that a couple of children cannot prate together, of their sugar-plums and rattles and the rest of their little trinkets, till they have first tacked together numberless inconsistencies, and so framed in their minds *abstract general ideas*, and annexed them to every common name they make use of?

15. Nor do I think them a whit more needful for the *enlargement of knowledge* than for *communication*. It is I know a point much insisted on, that all knowledge and demonstration are about universal notions, to which I fully agree: but then it does not appear to me that those notions are formed by *abstraction* in the manner premised; *universality*, so far as I can comprehend, not consisting in the absolute, positive nature or conception of anything, but in the relation it bears to the particulars signified or represented by it: by virtue whereof it is that things, names, or notions, being in their own nature *particular*, are rendered *universal*. Thus when I demonstrate any proposition concerning triangles, it is to be supposed that I have in view the universal idea of a triangle; which ought not to be understood as if I could frame an idea of a triangle which was neither equilateral nor scalenon nor equicrural. But only that the particular triangle I consider, whether of this or that sort it matters not, does equally stand for and represent all rectilinear triangles whatsoever, and is in that sense *universal*. All which seems very plain and not to include any difficulty in it.

16. But here it will be demanded, how we can know any proposition to be true of all particular triangles, except we have first seen it demonstrated of the abstract idea of a triangle which equally agrees to all? For because a property may be demonstrated to agree to some one particular triangle, it will not thence follow that it equally belongs to any other triangle, which in all respects is not the same with it. For example, having demonstrated that the three angles of an isosceles rectangular triangle are equal to two right ones, I cannot therefore conclude this affection agrees to all other triangles, which have neither a right angle, nor two equal sides. It seems therefore that, to be certain this proposition is universally true, we must either make a particular demonstration for every particular triangle, which is impossible, or once for all demonstrate it of the *abstract idea of a triangle*, in which all the particulars do indifferently partake, and by which they are all equally represented. To which I answer, that though the idea I have in view whilst I make the demonstration, be, for instance, that of an isosceles rectangular triangle, whose sides are of a determinate length, I may nevertheless be certain it extends to all other rectilinear triangles, of what sort or bigness soever. And that, because neither the right angle, nor the equality, nor determinate length of the sides, are at all concerned in the

demonstration. It is true, the diagram I have in view includes all these particulars, but then there is not the least mention made of them in the proof of the proposition. It is not said, the three angles are equal to two right ones, because one of them is a right angle, or because the sides comprehending it are of the same length. Which sufficiently shows that the right angle might have been oblique, and the sides unequal, and for all that the demonstration have held good. And for this reason it is, that I conclude that to be true of any obliquangular or scalenon, which I had demonstrated of a particular right-angled, equicrural triangle; and not because I demonstrated the proposition of the abstract idea of a triangle. And here it must be acknowledged that a man may consider a figure merely as triangular, without attending to the particular qualities of the angles, or relations of the sides. So far he may abstract: but this will never prove, that he can frame an abstract general inconsistent idea of a triangle. In like manner we may consider *Peter* so far forth as man, or so far forth as animal, without framing the forementioned abstract idea, either of man or of animal, inasmuch as all that is perceived is not considered.

17. It were an endless, as well as a useless thing, to trace the *Schoolmen*, those great masters of abstraction, through all the manifold inextricable labyrinths of error and dispute, which their doctrine of abstract natures and notions seems to have led them into.³ What bickerings and controversies, and what a learned dust have been raised about those matters, and what mighty advantage has been from thence derived to mankind, are things at this day too clearly known to need being insisted on. And it had been well if the ill effects of that doctrine were confined to those only who make the most avowed profession of it. When men consider the great pains, industry and parts, that have for so many ages been laid out on the cultivation and advancement of the sciences, and that notwithstanding all this, the far greater part of them remain full of darkness and uncertainty, and disputes that are like never to have an end, and even those that are thought to be supported by the most clear and cogent demonstrations, contain in them paradoxes which are perfectly irreconcilable to the understandings of men, and that taking all together, a small portion of them does supply any real benefit to mankind, otherwise than by being an innocent diversion and amusement: I say, the consideration of all this is apt to throw them into a despondency, and perfect contempt of all study. But this may perhaps cease, upon a view of the false principles that have obtained in the worlds, amongst all which there is none, methinks, has a more wide influence over the thoughts of speculative men, than this of abstract general ideas.

18. I come now to consider the source of this prevailing notion, and that seems to me to be language. And surely nothing of less extent than reason itself could have been the source of an opinion so universally received. The truth of this appears as from other reasons, so also from the plain confession of the ablest patrons of abstract ideas, who acknowledge that they are made in order to naming; from which it is a clear consequence, that if there had been no such things as speech or universal signs, there never had been any thought of abstraction. See B. 3. C. 6. Sect. 39. and elsewhere of the *Essay on Human Understanding*. Let us therefore examine the manner wherein words have contributed to the origin of that mistake. First then, 'tis thought that every name has, or ought to have, one only precise and settled signification, which inclines men to think there are certain *abstract, determinate ideas*, which constitute the true and only immediate signification of each general name. And that it is by the mediation of these abstract ideas, that a general name comes to signify any particular thing. Whereas, in truth, there is no such thing as one precise and definite signification annexed to any general name, they all signifying indifferently a great number of particular ideas. All which does evidently follow from what has been already said, and will clearly appear to anyone by a little reflection. To this it will be objected, that every name that has a definition, is thereby restrained to one certain signification. For example, a *triangle* is defined to be a *plain surface comprehended by three right lines*; by which that name is limited to denote one certain idea and no other. To which I answer, that in the definition it is not said whether the surface be great or small, black or white, nor whether the sides are long or short, equal or unequal, nor with what angles they are inclined to each other; in all which there may be great variety, and consequently there is no one settled idea which limits the signification of the word *triangle*. 'Tis one thing for to keep a name constantly to the same definition, and another to make it stand everywhere for the same idea: the one is necessary, the other useless and impracticable.

19. But to give a farther account how words came to produce the doctrine of abstract ideas, it must be observed that it is a received opinion, that language has no other end but the communicating our ideas, and that every significant name stands for an idea. This being so, and it being withal certain, that names, which yet are not thought altogether insignificant, do not always mark out particular conceivable ideas, it is straightway concluded that they stand for abstract notions. That there are many names in use amongst speculative men, which do not always suggest to others determinate particular ideas, is what nobody will deny. And a little attention will discover, that it is not necessary (even in the strictest reasonings) significant names which stand for ideas should, every time they are used, excite in the understanding the ideas they are made to

stand for: in reading and discoursing, names being for the most part used as letters are in *algebra*, in which though a particular quantity be marked by each letter, yet to proceed right it is not requisite that in every step each letter suggest to your thoughts, that particular quantity it was appointed to stand for.

20. Besides, the communicating of ideas marked by words is not the chief and only end of language, as is commonly supposed. There are other ends, as the raising of some passion, the exciting to, or deterring from an action, the putting the mind in some particular disposition; to which the former is in many cases barely subservient, and sometimes entirely omitted, when these can be obtained without it, as I think does not infrequently happen in the familiar use of language. I entreat the reader to reflect with himself, and see if it does not often happen either in hearing or reading a discourse, that the passions of fear, love, hatred, admiration, disdain, and the like, arise immediately in his mind upon the perception of certain words, without any ideas coming between. At first, indeed, the words might have occasioned ideas that were fit to produce those emotions; but, if I mistake not, it will be found that when language is once grown familiar, the hearing of the sounds or sight of the characters is oft immediately attended with those passions, which at first were wont to be produced by the intervention of ideas, that are now quite omitted. May we not, for example, be affected with the promise of a *good thing*, though we have not an idea of what it is? Or is not the being threatened with danger sufficient to excite a dread, though we think not of any particular evil likely to befall us, nor yet frame to ourselves an idea of danger in abstract? If anyone shall join ever so little reflection of his own to what has been said, I believe it will evidently appear to him, that general names are often used in the propriety of language without the speaker's designing them for marks of ideas in his own, which he would have them raise in the mind of the hearer. Even proper names themselves do not seem always spoken, with a design to bring into our view the ideas of those individuals that are supposed to be marked by them. For example, when a Schoolman tells me *Aristotle has said it*, all I conceive he means by it, is to dispose me to embrace his opinion with the deference and submission which custom has annexed to that name. And this effect may be so instantly produced in the minds of those who are accustomed to resign their judgment to the authority of that philosopher, as it is impossible any idea either of his person, writings, or reputation should go before. Innumerable examples of this kind may be given, but why should I insist on those things, which everyone's experience will, I doubt not, plentifully suggest unto him?

21. We have, I think, shown the impossibility of *abstract ideas*. We have considered what has been said for them by their ablest patrons; and endeavored to show they are of no use for those ends, to which they are thought necessary. And lastly, we have traced them to the source from whence the flow, which appears to be language. It cannot be denied that words are of excellent use, in that by their means all that stock of knowledge which has been purchased by the joint labors of inquisitive men in all ages and nations, may be drawn into the view and made the possession of one single person. But at the same time it must be owned that most parts of knowledge have been strangely perplexed and darkened by the abuse of words, and general ways of speech wherein they are delivered. Since therefore words are so apt to impose on the understanding, whatever ideas I consider, I shall endeavor to take them bare and naked into my view, keeping out of my thoughts, so far as I am able, those names which long and constant use has so strictly united with them; from which I may expect to derive the following advantages.

22. First, I shall be sure to get clear of all controversies purely verbal; the springing up of which weeds in almost all the sciences has been a main hindrance to the growth of true and sound knowledge. Secondly, this seems to be a sure way to extricate myself out of that fine and subtle net of *abstract ideas*, which has so miserably perplexed and entangled the minds of men, and that with this peculiar circumstance, that by how much the finer and more curious was the wit of any man, by so much the deeper was he like to be ensnared, and faster held therein. Thirdly, so long as I confine my thoughts to my own ideas divested of words, I do not see how I can easily be mistaken. The objects I consider, I clearly and adequately know. I cannot be deceived in thinking I have an idea which I have not. It is not possible for me to imagine, that any of my own ideas are alike or unlike, that are not truly so. To discern the agreements or disagreements there are between my ideas, to see what ideas are included in any compound idea, and what not, there is nothing more requisite, than an attentive perception of what passes in my own understanding.

23. But the attainment of all these advantages does presuppose an entire deliverance from the deception of words, which I dare hardly promise myself; so difficult a thing it is to dissolve a union so early begun, and confirmed by so long a habit as that betwixt words and ideas. Which difficulty seems to have been very much increased by the doctrine of *abstraction*. For so long as men thought abstract ideas were annexed to their words, it does not seem strange that they should use words for ideas: it being found an impracticable thing to lay aside the word, and retain the abstract idea in the mind, which in itself was perfectly inconceivable. This seems to me the principal cause, why those men who have so emphatically recommended to others, the laying

aside all use of words in their meditations, and contemplating their bare ideas, have yet failed to perform it themselves.⁴ Of late many have been very sensible of the absurd opinions and insignificant disputes, which grow out of the abuse of words. And in order to remedy these evils they advise well, that we attend to the ideas signified, and draw off our attention from the words which signify them. But how good soever this advice may be, they have given others, it is plain they could not have a due regard to it themselves, so long as they thought the only immediate use of words was to signify ideas, and that the immediate signification of every general name was a *determinate, abstract idea*.

24. But these being known to be mistakes, a man may with greater ease prevent his being imposed on by words. He that knows he has no other than particular ideas, will not puzzle himself in vain to find out and conceive the abstract idea, annexed to any name. And he that knows names do not always stand for ideas, will spare himself the labor of looking for ideas, where there are none to be had. It were therefore to be wished that everyone would use his utmost endeavors, to obtain a clear view of the ideas he would consider, separating from them all that dress and encumbrance of words which so much contribute to blind the judgment and divide the attention. In vain do we extend our view into the heavens, and pry into the entrails of the earth, in vain do we consult the writings of learned men, and trace the dark footsteps of antiquity; we need only draw the curtain of words, to behold the fairest tree of knowledge, whose fruit is excellent, and within the reach of our hand.

25. Unless we take care to clear the first principles of knowledge, from the embarrass and delusion of words, we may make infinite reasonings upon them to no purpose; we may draw consequences from consequences, and be never the wiser. The farther we go, we shall only lose ourselves the more irrecoverably, and be the deeper entangled in difficulties and mistakes. Whoever therefore designs to read the following sheets, I entreat him to make my words the occasion of his own thinking, and endeavor to attain the same train of thoughts in reading, that I had in writing them. By this means it will be easy for him to discover the truth or falsity of what I say. He will be out of all danger of being deceived by my words, and I do not see how he can be led into an error by considering his own naked, undisguised ideas.

Of the Principles of Human Knowledge

1. It is evident to anyone who takes a survey of the objects of human knowledge, that they are either ideas actually imprinted on the senses, or else such as are perceived by attending to the passions and operations of the mind, or lastly ideas formed by help of memory and imagination, either compounding, dividing, or barely representing those originally perceived in the aforesaid ways. By sight I have the ideas of light and colors with their several degrees and variations. By touch I perceive, for example, hard and soft, heat and cold, motion and resistance, and of all these more and less either as to quantity or degree. Smelling furnishes me with odors; the palate with tastes, and hearing conveys sounds to the mind in all their variety of tone and composition. And as several of these are observed to accompany each other, they come to be marked by one name, and so to be reputed as one thing. Thus, for example, a certain color, taste, smell, figure and consistence having been observed to go together, are accounted one distinct thing, signified by the name *apple*. Other collections of ideas constitute a stone, a tree, a book, and the like sensible things; which, as they are pleasing or disagreeable, excite the passions of love, hatred, joy, grief, and so forth.

2. But besides all that endless variety of ideas or objects of knowledge, there is likewise something which knows or perceives them, and exercises divers operations, as willing, imagining, remembering about them. This perceiving, active being is what I call *mind, spirit, soul* or *myself*. By which words I do not denote any one of my ideas, but a thing entirely distinct from them, wherein they exist, or, which is the same thing, whereby they are perceived; for the existence of an idea consists in being perceived.

3. That neither our thoughts, nor passions, nor ideas formed by the imagination, exist without the mind, is what everybody will allow. And it seems no less evident that the various sensations or ideas imprinted on the sense, however blended or combined together (that is, whatever objects they compose) cannot exist otherwise than in a mind perceiving them. I think an intuitive knowledge may be obtained of this, by anyone that shall attend to what is meant by the term *exist* when applied to sensible things. The table I write on, I say, exists, that is, I see and feel it; and if I were out of my study I should say it existed, meaning thereby that if I was in my study I might perceive it, or that some other spirit actually does perceive it. There was an odor, that is, it was smelled; there was a sound, that is to say, it was heard; a color or figure, and it was perceived by sight or touch. This is all that I can understand by these and the like expressions. For as to what is said of the absolute existence of unthinking things without any relation to their being perceived, that seems perfectly unintelligible. Their *esse* is *percipi*, nor is it possible they should have any existence, out of the minds or thinking things which perceive them.⁵

4. It is indeed an opinion strangely prevailing amongst men, that houses, mountains, rivers, and in a word all sensible objects have an existence natural or real, distinct from their being perceived by the understanding. But with how great an assurance and acquiescence soever this principle may be entertained in the world; yet whoever shall find in his heart to call it in question, may, if I mistake not, perceive it to involve a manifest contradiction. For what are the forementioned objects but the things we perceive by sense, and what do we perceive besides our own ideas or sensations; and is it not plainly repugnant that any one of these or any combination of them should exist unperceived?

5. If we thoroughly examine this tenet, it will, perhaps, be found at bottom to depend on the doctrine of *abstract ideas*. For can there be a nicer strain of abstraction than to distinguish the existence of sensible objects from their being perceived, so as to conceive them existing unperceived? Light and colors, heat and cold, extension and figures, in a word the things we see and feel, what are they but so many sensations, notions, ideas or impressions on the sense; and is it possible to separate, even in thought, any of these from perception? For my part I might as easily divide a thing from itself. I may indeed divide in my thoughts or conceive apart from each other those things which, perhaps, I never perceived by sense so divided. Thus I imagine the trunk of a human body without the limbs, or conceive the smell of a rose without thinking on the rose itself. So far I will not deny I can abstract, if that may properly be called *abstraction*, which extends only to the conceiving separately such objects, as it is possible may really exist or be actually perceived asunder. But my conceiving or imagining power does not extend beyond the possibility of real existence or perception. Hence as it is impossible for me to see or feel anything without an actual sensation of that thing, so is it impossible for me to conceive in my thoughts any sensible thing or object distinct from the sensation or perception of it.

6. Some truths there are so near and obvious to the mind, that a man need only open his eyes to see them. Such I take this important one to be, to wit, that all the choir of heaven and furniture of the earth, in a word all those bodies which compose the mighty frame of the world, have not any subsistence without a mind, that

their being is to be perceived or known; that consequently so long as they are not actually perceived by me, or do not exist in my mind or that of any other created spirit, they must either have no existence at all, or else subsist in the mind of some eternal spirit: it being perfectly unintelligible and involving all the absurdity of abstraction, to attribute to any single part of them an existence independent of a spirit. To be convinced of which, the reader need only reflect and try to separate in his own thoughts the being of a sensible thing from its being perceived.

7. From what has been said, it follows, there is not any other substance than *spirit*, or that which perceives. But for the fuller proof of this point, let it be considered, the sensible qualities are color, figure, motion, smell, taste, and such like, that is, the ideas perceived by sense. Now for an idea to exist in an unperceiving thing, is a manifest contradiction; for to have an idea is all one as to perceive: that therefore wherein color, figure, and the like qualities exist, must perceive them; hence it is clear there can be no unthinking substance or *substratum* of those ideas.

8. But say you, though the ideas themselves do not exist without the mind, yet there may be things like them whereof they are copies or resemblances, which things exist without the mind, in an unthinking substance. I answer, an idea can be like nothing but an idea; a color or figure can be like nothing but another color or figure. If we look but ever so little into our thoughts, we shall find it impossible for us to conceive a likeness except only between our ideas. Again, I ask whether those supposed originals or external things, of which our ideas are the pictures or representations, be themselves perceivable or no? If they are, then they are ideas, and we have gained our point; but if you say they are not, I appeal to anyone whether it be sense, to assert a color is like something which is invisible; hard or soft, like something which is intangible; and so of the rest.

9. Some there are who make a distinction betwixt *primary* and *secondary* qualities: by the former, they mean extension, figure, motion, rest, solidity or impenetrability and number: by the latter they denote all other sensible qualities, as colors, sounds, tastes, and so forth.⁶ The ideas we have of these they acknowledge not to be the resemblances of anything existing without the mind or unperceived; but they will have our ideas of the primary qualities to be patterns or images of things which exist without the mind, in an unthinking substance which they call *matter*. By matter therefore we are to understand an inert, senseless substance, in which extension, figure, and motion, do actually subsist. But it is evident from what we have already shown, that extension, figure and motion are only ideas existing in the mind, and that an idea can be like nothing but another idea, and that consequently neither they nor their archetypes can exist in an unperceiving substance. Hence it is plain, that the very notion of what is called *matter* or *corporeal substance*, involves a contradiction in it.

10. They who assert that figure, motion, and the rest of the primary or original qualities do exist without the mind, in unthinking substances, do at the same time acknowledge that colors, sounds, heat, cold, and such like secondary qualities, do not, which they tell us are sensations existing in the mind alone, that depend on and are occasioned by the different size, texture and motion of the minute particles of matter. This they take for an undoubted truth, which they can demonstrate beyond all exception. Now if it be certain, that those original qualities are inseparably united with the other sensible qualities, and not, even in thought, capable of being abstracted from them, it plainly follows that they exist only in the mind. But I desire anyone to reflect and try, whether he can by any abstraction of thought, conceive the extension and motion of a body, without all other sensible qualities. For my own part, I see evidently that it is not in my power to frame an idea of a body extended and moved, but I must withal give it some color or other sensible quality which is acknowledged to exist only in the mind. In short, extension, figure, and motion, abstracted from all other qualities, are inconceivable. Where therefore the other sensible qualities are, there must these be also, to wit, in the mind and nowhere else.

11. Again, *great* and *small*, *swift* and *slow*, are allowed to exist nowhere without the mind, being entirely relative, and changing as the frame or position of the organs of sense varies. The extension therefore which exists without the mind, is neither great nor small, the motion neither swift nor slow, that is, they are nothing at all. But say you, they are extension in general, and motion in general: thus we see how much the tenet of extended, moveable substances existing without the mind, depends on that strange doctrine of *abstract ideas*. And here I cannot but remark, how nearly the vague and indeterminate description of matter or corporeal substance, which the modern philosophers are run into by their own principles, resembles that antiquated and so much ridiculed notion of *materia prima*, to be met with in *Aristotle* and his followers.⁷ Without extension solidity cannot be conceived; since therefore it has been shown that extension exists not in an unthinking substance, the same must also be true of solidity.

12. That number is entirely the creature of the mind, even though the other qualities be allowed to exist without, will be evident to whoever considers, that the same thing bears a different denomination of numbers, as the mind views it with different respects. Thus, the same extension is one or three or thirty six, according as the mind considers it with reference to a yard, a foot, or an inch. Number is so visibly relative, and dependent on men's understanding, that it is strange to think how anyone should give it an absolute existence without the mind. We say one book, one page, one line; all these are equally units, though some contain several of the others. And in each instance it is plain, the unit relates to some particular combination of ideas arbitrarily put together by the mind.

13. Unity I know some will have to be a simple or uncompounded idea, accompanying all other ideas into the mind.⁸ That I have any such idea answering the word *unity*, I do not find; and if I had, methinks I could not miss finding it; on the contrary it should be the most familiar to my understanding, since it is said to accompany all other ideas, and to be perceived by all the ways of sensation and reflection. To say no more, it is an *abstract idea*.

14. I shall farther add, that after the same manner, as modern philosophers prove certain sensible qualities to have no existence in matter, or without the mind, the same thing may be likewise proved of all other sensible qualities whatsoever. Thus, for instance, it is said that heat and cold are affections only of the mind, and not at all patterns of real beings, existing in the corporeal substances which excite them, for that the same body which appears cold to one hand, seems warm to another. Now why may we not as well argue that figure and extension are not patterns or resemblances of qualities existing in matter, because to the same eye at different stations, or eyes of a different texture at the same station, they appear various, and cannot therefore be the images of anything settled and determinate without the mind? Again, it is proved that sweetness is not really in the sapid thing, because the thing remaining unaltered the sweetness is changed into bitter, as in case of a fever or otherwise vitiated palate. It is not as reasonable to say, that motion is not without the mind, since if the succession of ideas in the mind become swifter, the motion, it is acknowledged, shall appear slower without any alteration in any external object.

15. In short, let anyone consider those arguments, which are thought manifestly to prove that colors and tastes exist only in the mind, and he shall find they may with equal force, be brought to prove the same thing of extension, figure, and motion. Though it must be confessed this method of arguing does not so much prove that there is no extension or color in an outward object, as that we do not know by sense which is the true extension or color of the object. But the arguments foregoing plainly show it to be impossible that any color or extension at all, or other sensible quality whatsoever, should exist in an unthinking subject without the mind, or in truth, that there should be any such thing as an outward object.

16. But let us examine a little the received opinion. It is said extension is a mode or accident of matter, and that matter is the *substratum* that supports it. Now I desire that you would explain what is meant by matter's *supporting* extension: say you, I have no idea of matter, and therefore cannot explain it. I answer, though you have no positive, yet if you have any meaning at all, you must at least have a relative idea of matter; though you know not what it is, yet you must be supposed to know what relation it bears to accidents, and what is meant by its supporting them. It is evident *support* cannot here be taken in its usual or literal sense, as when we say that pillars support a building: in what sense therefore must it be taken?

17. If we inquire into what the most accurate philosophers declare themselves to mean by *material substance*; we shall find them acknowledge, they have no other meaning annexed to those words, but the idea of being in general, together with the relative notion of its supporting accidents.⁹ The general idea of being appears to me the most abstract and incomprehensible of all other; and as for its supporting accidents, this, as we have just now observed, cannot be understood in the common sense of those words; it must therefore be taken in some other sense, but what that is they do not explain. So that when I consider the two parts or branches which make the signification of the words *material substance*, I am convinced there is no distinct meaning annexed to them. But why should we trouble ourselves any farther, in discussing this material *substratum* or support of figure and motion, and other sensible qualities? Does it not suppose they have an existence without the mind? And is not this a direct repugnancy, and altogether inconceivable?

18. But though it were possible that solid, figured, moveable substances may exist without the mind, corresponding to the ideas we have of bodies, yet how is it possible for us to know this? Either we must know it by sense, or by reason. As for our senses, by them we have the knowledge only of our sensations, ideas, or those things that are immediately perceived by sense, call them what you will: but they do not inform us that things exist without the mind, or unperceived, like to those which are perceived. This the materialists themselves acknowledge. It remains therefore that if we have any knowledge at all of external things, it must

be by reason, inferring their existence from what is immediately perceived by sense. But what reason can induce us to believe the existence of bodies without the mind, from what we perceive, since the very patrons of matter themselves do not pretend, there is any necessary connection betwixt them and our ideas? I say it is granted on all hands (and what happens in dreams, frenzies, and the like, puts it beyond dispute) that it is possible we might be affected with all the ideas we have now, though no bodies existed without, resembling them. Hence it is evident the supposition of external bodies is not necessary for the producing our ideas: since it is granted they are produced sometimes, and might possibly be produced always in the same order we see them in at present, without their concurrence.

19. But though we might possibly have all our sensations without them, yet perhaps it may be thought easier to conceive and explain the manner of their production, by supposing external bodies in their likeness rather than otherwise; and so it might be at least probable there are such things as bodies that excite their ideas in our minds. But neither can this be said; for though we give the materialists their external bodies, they by their own confession are never the nearer knowing how our ideas are produced: since they own themselves unable to comprehend in what manner body can act upon spirit, or how it is possible it should imprint any idea in the mind. Hence it is evident the production of ideas or sensations in our minds, can be no reason why we should suppose matter or corporeal substances, since that is acknowledged to remain equally inexplicable with, or without this supposition. If therefore it were possible for bodies to exist without the mind, yet to hold they do so, must needs be a very precarious opinion; since it is to suppose, without any reason at all, that God has created innumerable beings that are entirely useless, and serve to no manner of purpose.

20. In short, if there were external bodies, it is impossible we should ever come to know it; and if there were not, we might have the very same reasons to think there were that we have now. Suppose, what no one can deny possible, an intelligence, without the help of external bodies, to be affected with the same train of sensations or ideas that you are, imprinted in the same order and with like vividness in his mind. I ask whether that intelligence has not all the reason to believe the existence of corporeal substances, represented by his ideas, and exciting them in his mind, that you can possibly have for believing the same thing? Of this there can be no question; which one consideration is enough to make any reasonable person suspect the strength of whatever arguments he may think himself to have, for the existence of bodies without the mind.

21. Were it necessary to add any farther proof against the existence of matter, after what has been said, I could instance several of those errors and difficulties (not to mention impieties) which have sprung from that tenet. It has occasioned numberless controversies and disputes in philosophy, and not a few of far greater moment in religion. But I shall not enter into the detail of them in this place, as well because I think, arguments *a posteriori* are unnecessary for confirming what has been, if I mistake not, sufficiently demonstrated *a priori*, as because I shall hereafter find occasion to say somewhat of them.¹⁰

22. I am afraid I have given cause to think me needlessly prolix in handling this subject. For to what purpose is it to dilate on that which may be demonstrated with the utmost evidence in a line or two, to anyone that is capable of the least reflection? It is but looking into your own thoughts, and so trying whether you can conceive it possible for a sound, or figure, or motion, or color, to exist without the mind, or unperceived. This easy trial may make you see, that what you contend for, is a downright contradiction. Inasmuch that I am content to put the whole upon this issue; if you can but conceive it possible for one extended moveable substance, or in general, for any one idea or anything like an idea, to exist otherwise than in a mind perceiving it, I shall readily give up the cause: and as for all that *compages* of external bodies which you contend for, I shall grant you its existence, though you cannot either give me any reason why you believe it exists, or assign any use to it when it is supposed to exist. I say, the bare possibility of your opinion's being true, shall pass for an argument that it is so.

23. But say you, surely there is nothing easier than to imagine trees, for instance, in a park, or books existing in a closet, and nobody by to perceive them. I answer, you may so, there is no difficulty in it: but what is all this, I beseech you, more than framing in your mind certain ideas which you call *books* and *trees*, and at the same time omitting to frame the idea of anyone that may perceive them? But do not you yourself perceive or think of them all the while? This therefore is nothing to the purpose: it only shows you have the power of imagining or forming ideas in your mind; but it does not show that you can conceive it possible, the objects of your thought may exist without the mind: to make out this, it is necessary that you conceive them existing unconceived or unthought of, which is a manifest repugnancy. When we do our utmost to conceive the existence of external bodies, we are all the while only contemplating our own ideas. But the mind taking no notice of itself, is deluded to think it can and does conceive bodies existing unthought of or without the mind; though at the same time they are apprehended by or exist in itself. A little attention will discover to anyone the truth and evidence of what is here said, and make it unnecessary to insist on any other proofs against the

existence of material substance.

24. It is very obvious, upon the least inquiry into our own thoughts, to know whether it be possible for us to understand what is meant, by the *absolute existence of sensible objects in themselves, or without the mind*. To me it is evident those words mark out either a direct contradiction, or else nothing at all. And to convince others of this, I know no readier or fairer way, than to entreat they would calmly attend to their own thoughts: and if by this attention, the emptiness or repugnancy of those expressions does appear, surely nothing more is requisite for their conviction. It is on this therefore that I insist, to wit, that the absolute existence of unthinking things are words without a meaning, or which include a contradiction. This is what I repeat and inculcate, and earnestly recommend to the attentive thoughts of the reader.

25. All our ideas, sensations, or the things which we perceive, by whatsoever names they may be distinguished, are visibly inactive, there is nothing of power or agency included in them. So that one idea or object of thought cannot produce, or make any alteration in another. To be satisfied of the truth of this, there is nothing else requisite but a bare observation of our ideas. For since they and every part of them exist only in the mind, it follows that there is nothing in them but what is perceived. But whoever shall attend to his ideas, whether of sense or reflection, will not perceive in them any power or activity; there is therefore no such thing contained in them. A little attention will discover to us that the very being of an idea implies passiveness and inertness in it, insomuch that it is impossible for an idea to do anything, or, strictly speaking, to be the cause of anything: neither can it be the resemblance or pattern of any active being, as is evident from Sect. 8. Whence it plainly follows that extension, figure and motion, cannot be the cause of our sensations. To say therefore, that these are the effects of powers resulting from the configuration, number, motion, and size of corpuscles, must certainly be false.

26. We perceive a continual succession of ideas, some are anew excited, others are changed or totally disappear. There is therefore some cause of these ideas whereon they depend, and which produces and changes them. That this cause cannot be any quality or idea or combination of ideas, is clear from the preceding section. It must therefore be a substance; but it has been shown that there is no corporeal or material substance: it remains therefore that the cause of ideas is an incorporeal active substance or spirit.

27. A spirit is one simple, undivided, active being: as it perceives ideas, it is called the *understanding*, and as it produces or otherwise operates about them, it is called the *will*. Hence there can be no idea formed of a soul or spirit: for all ideas whatever, being passive and inert, *vide* Sect. 25, they cannot represent unto us, by way of image or likeness, that which acts. A little attention will make it plain to anyone, that to have an idea which shall be like that active principle of motion and change of ideas, is absolutely impossible. Such is the nature of *spirit* or that which acts, that it cannot be of itself perceived, but only by the effects which it produces. If any man shall doubt of the truth of what is here delivered, let him but reflect and try if he can frame the idea of any power or active being; and whether he has ideas of two principal powers, marked by the names *will* and *understanding*, distinct from each other as well as from a third idea of substance or being in general, with a relative notion of its supporting or being the subject of the aforesaid powers, which is signified by the name *soul* or *spirit*. This is what some hold; but so far as I can see, the words *will*, *soul*, *spirit*, do not stand for different ideas, or in truth, for any idea at all, but for something which is very different from ideas, and which being an agent cannot be like unto, or represented by, any idea whatsoever. Though it must be owned at the same time, that we have some notion of soul, spirit, and the operations of the mind, such as willing, loving, hating, inasmuch as we know or understand the meaning of those words.

28. I find I can excite ideas in my mind at pleasure, and vary and shift the scene as oft as I think fit. It is no more than willing, and straightaway this or that idea arises in my fancy: and by the same power it is obliterated, and makes way for another. This making and unmaking of ideas does very properly denominate the mind active. Thus much is certain, and grounded on experience: but when we talk of unthinking agents, or of exciting ideas exclusive of volition, we only amuse ourselves with words.

29. But whatever power I may have over my own thoughts, I find the ideas actually perceived by sense have not a like dependence on my will. When in broad daylight I open my eyes, it is not in my power to choose whether I shall see or no, or to determine what particular objects shall present themselves to my view; and so likewise as to the hearing and other senses, the ideas imprinted on them are not creatures of my will. There is therefore some other will or spirit that produces them.

30. The ideas of sense are more strong, lively, and distinct than those of the imagination; they have likewise a steadiness, order, and coherence, and are not excited at random, as those which are the effects of human will often are, but in a regular train or series, the admirable connection whereof sufficiently testifies the wisdom and benevolence of its author. Now the set rules or established methods, wherein the mind we depend on excites in us the ideas of sense, are called the *laws of nature*: and these we learn by experience,

which teaches us that such and such ideas are attended with such and such other ideas, in the ordinary course of things.

31. This gives us a sort of foresight, which enables us to regulate our actions for the benefit of life. And without this we should be eternally at a loss: we could not know how to act anything that might procure us the least pleasure, or remove the least pain of sense. That food nourishes, sleep refreshes, and fire warms us; that to sow in the seed-time is the way to reap in the harvest, and, in general, that to obtain such or such ends, such or such means are conducive, all this we know, not by discovering any necessary connection between our ideas, but only by the observations of the settled laws of nature, without which we should be all in uncertainty and confusion, and a grown man no more know how to manage himself in the affairs of life, than an infant just born.

32. And yet this consistent uniform working, which so evidently displays the goodness and wisdom of that governing spirit whose will constitutes the laws of nature, is so far from leading our thoughts to him, that it rather sends them awandering after second causes. For when we perceive certain ideas of sense constantly followed by other ideas, and we know this is not of our own doing, we forthwith attribute power and agency to the ideas themselves, and make one the cause of another, than which nothing can be more absurd and unintelligible. Thus, for example, having observed that when we perceive by sight a certain round luminous figure, we at the same time perceive by touch the idea or sensation called *heat*, we do from thence conclude the sun to be the cause of heat. And in like manner perceiving the motion and collision of bodies to be attended with sound, we are inclined to think the latter an effect of the former.

33. The ideas imprinted on the senses by the Author of Nature are called *real things*: and those excited in the imagination being less regular, vivid and constant, are more properly termed *ideas*, or *images of things*, which they copy and represent. But then our sensations, be they never so vivid and distinct, are nevertheless *ideas*, that is, they exist in the mind, or are perceived by it, as truly as the ideas of its own framing. The ideas of sense are allowed to have more reality in them, that is, to be more strong, orderly, and coherent than the creatures of the mind; but this is no argument that they exist without the mind. They are also less dependent on the spirit, or thinking substance which perceives them, in that they are excited by the will of another and more powerful spirit: yet still they are *ideas*, and certainly no *idea*, whether faint or strong, can exist otherwise than in a mind perceiving it.

34. Before we proceed any farther, it is necessary to spend some time in answering objections which may probably be made against the principles hitherto laid down. In doing of which, if I seem too prolix to those of quick apprehensions, I hope it may be pardoned, since all men do not equally apprehend things of this nature; and I am willing to be understood by everyone. First then, it will be objected that by the foregoing principles, all that is real and substantial in nature is banished out of the world: and instead thereof a chimerical scheme of ideas takes place. All things that exist, exist only in the mind, that is, they are purely notional. What therefore becomes of the sun, moon, and stars? What must we think of houses, rivers, mountains, trees, stones; nay, even of our own bodies? Are all these but so many chimeras and illusions on the fancy? To all which, and whatever else of the same sort may be objected, I answer, that by the principles premised, we are not deprived of any one thing in nature. Whatever we see, feel, hear, or any wise conceive or understand, remains as secure as ever, and is as real as ever. There is a *rerum natura*, and the distinction between realities and chimeras retains its full force. This is evident from Sect. 29, 30, and 33, where we have shown what is meant by *real things* in opposition to *chimeras*, or ideas of our own framing; but then they both equally exist in the mind, and in that sense are alike *ideas*.

35. I do not argue against the existence of any one thing that we can apprehend, either by sense or reflection. That the things I see with mine eyes and touch with my hands do exist, really exist, I make not the least question. The only thing whose existence we deny, is that which philosophers call matter or corporeal substance. And in doing of this, there is no damage done to the rest of mankind, who, I dare say, will never miss it. The atheist indeed will want the color of an empty name to support his impiety; and the philosophers may possibly find, they have lost a great handle for trifling and disputation.

36. If any man thinks this detracts from the existence or reality of things, he is very far from understanding what has been premised in the plainest terms I could think of. Take here an abstract of what has been said. There are spiritual substances, minds, or human souls, which will or excite ideas in themselves at pleasure: but these are faint, weak, and unsteady in respect of others they perceive by sense, which being impressed upon them according to certain rules or laws of nature, speak themselves the effects of a mind more powerful and wise than human spirits. These latter are said to have more *reality* in them than the former: by which is meant that they are more affecting, orderly, and distinct, and that they are not fictions of the mind perceiving them. And in this sense, the sun that I see by day is the real sun, and that which I imagine by night is the idea of the

former. In the sense here given of *reality*, it is evident that every vegetable, star, mineral, and in general each part of the mundane system, is as much a *real being* by our principles as by any other. Whether others mean anything by the term *reality* different from what I do, I entreat them to look into their own thoughts and see.

37. It will be urged that thus much at least is true, to wit, that we take away all corporeal substances. To this my answer is, that if the word *substance* be taken in the vulgar sense, for a combination of sensible qualities, such as extension, solidity, weight, and the like; this we cannot be accused of taking away. But if it be taken in a philosophic sense, for the support of accidents or qualities without the mind: then indeed I acknowledge that we take it away, if one may be said to take away that which never had any existence, not even in the imagination.

38. But, say you, it sounds very harsh to say we eat and drink ideas, and are clothed with ideas. I acknowledge it does so, the word *idea* not being used in common discourse to signify the several combinations of sensible qualities, which are called *things*: and it is certain that any expression which varies from the familiar use of language, will seem harsh and ridiculous. But this does not concern the truth of the proposition, which in other words is no more than to say, we are fed and clothed with those things which we perceive immediately by our senses. The hardness or softness, the color, taste, warmth, figure, and such like qualities, which combined together constitute the several sorts of victuals and apparel, have been shown to exist only in the mind that perceives them; and this is all that is meant by calling them *ideas*; which word, if it was as ordinarily used as *thing*, would sound no harsher nor more ridiculous than it. I am not for disputing about the propriety, but the truth of the expression. If therefore you agree with me that we eat and drink, and are clad with the immediate objects of sense which cannot exist unperceived or without the mind: I shall readily grant it is more proper or conformable to custom, that they should be called things rather than ideas.

39. If it be demanded why I make use of the word *idea*, and do not rather in compliance with custom call them things. I answer, I do it for two reasons: first, because the term *thing*, in contradistinction to *idea*, is generally supposed to denote somewhat existing without the mind: secondly, because *thing* has a more comprehensive signification than *idea*, including spirits or thinking things as well as ideas. Since therefore the objects of sense exist only in the mind, and are withal thoughtless and inactive, I chose to mark them by the word *idea*, which implies those properties.

40. But say what we can, someone perhaps may be apt to reply, he will still believe his senses, and never suffer any arguments, how plausible soever, to prevail over the certainty of them. Be it so, assert the evidence of sense as high as you please, we are willing to do the same. That what I see, hear and feel does exist, that is to say, is perceived by me, I no more doubt than I do of my own being. But I do not see how the testimony of sense can be alleged, as a proof for the existence of anything, which is not perceived by sense. We are not for having any man turn *skeptic*, and disbelieve his senses; on the contrary we give them all the stress and assurance imaginable; nor are there any principles more opposite to skepticism, than those we have laid down, as shall be hereafter clearly shown.

41. Secondly, it will be objected that there is a great difference betwixt real fire, for instance, and the idea of fire, betwixt dreaming or imagining oneself burnt, and actually being so: this and the like may be urged in opposition to our tenets. To all which the answer is evident from what has been already said, and I shall only add in this place, that if real fire be very different from the idea of fire, so also is the real pain that it occasions, very different from the idea of the same pain: and yet nobody will pretend that real pain either is, or can possibly be, in an unperceiving thing or without the mind, any more than its idea.

42. Thirdly, it will be objected that we see things actually without or at a distance from us, and which consequently do not exist in the mind, it being absurd that those things which are seen at the distance of several miles, should be as near to us as our own thoughts. In answer to this, I desire it may be considered, that in a dream we do oft perceive things as existing at a great distance off, and yet for all that, those things are acknowledged to have their existence only in the mind.

43. But for the fuller clearing of this point, it may be worthwhile to consider, how it is that we perceive distance and things placed at a distance by sight. For that we should in truth see external space, and bodies actually existing in it, some nearer, others farther off, seems to carry with it some opposition to what has been said, of their existing nowhere without the mind. The consideration of this difficulty it was, that gave birth to my *Essay towards a New Theory of Vision*, which was published not long since. Wherein it is shown that *distance* or outness is neither immediately of itself perceived by sight, nor yet apprehended or judged of by lines and angles, or anything that has a necessary connection with it: but that it is only suggested to our thoughts, by certain visible ideas and sensations attending vision, which in their own nature have no manner of similitude or relation, either with distance, or things placed at a distance. But by a connection taught us by experience, they come to signify and suggest them to us, after the same manner that words of any language

suggest the ideas they are made to stand for. Insomuch that a man born blind, and afterwards made to see, would not, at first sight, think the things he saw, to be without his mind, or at any distance from him. See Sect. 41 of the fore-mentioned treatise.

44. The ideas of sight and touch make two species, entirely distinct and heterogeneous. The former are marks and prognostics of the latter. That the proper objects of sight neither exist without the mind, nor are the images of external things, was shown even in that treatise. Though throughout the same, the contrary be supposed true of tangible objects: not that to suppose that vulgar error, was necessary for establishing the notion therein laid down; but because it was beside my purpose to examine and refute it in a discourse concerning *vision*. So that in strict truth the ideas of sight, when we apprehend by them distance and things placed at a distance, do not suggest or mark out to us things actually existing at a distance, but only admonish us what ideas of touch will be imprinted in our minds at such and such distances of time, and in consequence of such or such actions. It is, I say, evident from what has been said in the foregoing parts of this treatise, and in Sect. 147, and elsewhere of the essay concerning vision, that visible ideas are the language whereby the governing spirit, on whom we depend, informs us what tangible ideas he is about to imprint upon us, in case we excite this or that motion in our own bodies. But for a fuller information in this point, I refer to the essay itself.

45. Fourthly, it will be objected that from the foregoing principles it follows, things are every moment annihilated and created anew. The objects of sense exist only when they are perceived: the trees therefore are in the garden, or the chairs in the parlor, no longer than while there is somebody by to perceive them. Upon shutting my eyes all the furniture in the room is reduced to nothing, and barely upon opening them it is again created. In answer to all which, I refer the reader to what has been said in Sect. 3, 4, etc. and desire he will consider whether he means anything by the actual existence of an idea, distinct from its being perceived. For my part, after the nicest inquiry I could make, I am not able to discover that anything else is meant by those words. And I once more entreat the reader to sound his own thoughts, and not suffer himself to be imposed on by words. If he can conceive it possible either for his ideas or their archetypes to exist without being perceived, then I give up the cause: but if he cannot, he will acknowledge it is unreasonable for him to stand up in defense of he knows not what, and pretend to charge on me as an absurdity, the not assenting to those propositions which at bottom have no meaning in them.

46. It will not be amiss to observe, how far the received principles of philosophy are themselves chargeable with those pretended absurdities. It is thought strangely absurd that upon closing my eyelids, all the visible objects round me should be reduced to nothing; and yet is not this what philosophers commonly acknowledge, when they agree on all hands, that light and colors, which alone are the proper and immediate objects of sight, are mere sensations that exist no longer than they are perceived? Again, it may to some perhaps seem very incredible, that things should be every moment creating, yet this very notion is commonly taught in the Schools. For the *Schoolmen*, though they acknowledge the existence of matter, and that the whole mundane fabric is framed out of it, are nevertheless of opinion that it cannot subsist without the divine conservation, which by them is expounded to be a continual creation.

47. Farther, a little thought will discover to us, that though we allow the existence of matter or corporeal substance, yet it will unavoidably follow from the principles which are now generally admitted, that the particular bodies of what kind soever, do none of them exist whilst they are not perceived. For it is evident from Sect. 11 and the following sections, that the matter philosophers contend for, is an incomprehensible somewhat which has none of those particular qualities, whereby the bodies falling under our senses are distinguished one from another. But to make this more plain, it must be remarked, that the infinite divisibility of matter is now universally allowed, at least by the most approved and considerable philosophers, who on the received principles demonstrate it beyond all exception. Hence it follows, that there is an infinite number of parts in each particle of matter, which are not perceived by sense. The reason therefore, that any particular body seems to be of a finite magnitude, or exhibits only a finite number of parts to sense, is, not because it contains no more, since in itself it contains an infinite number of parts, but because the sense is not acute enough to discern them. In proportion therefore as the sense is rendered more acute, it perceives a greater number of parts in the object, that is, the object appears greater, and its figure varies, those parts in its extremities which were before unperceivable, appearing now to bound it in very different lines and angles from those perceived by an obtuser sense. And at length, after various changes of size and shape, when the sense becomes infinitely acute, the body shall seem infinite. During all which there is no alteration in the body, but only in the sense. Each body therefore considered in itself, is infinitely extended, and consequently void of all shape or figure. From which it follows, that though we should grant the existence of matter to be ever so certain, yet it is withal as certain, the materialists themselves are by their own principles forced to

acknowledge, that neither the particular bodies perceived by sense, nor anything like them exists without the mind. Matter, I say, and each particle thereof is according to them infinite and shapeless, and it is the mind that frames all that variety of bodies which compose the visible world, any one whereof does not exist longer than it is perceived.

48. If we consider it, the objection proposed in Sect. 45 will not be found reasonably charged on the principles we have premised, so as in truth to make any objection at all against our notions. For though we hold indeed the objects of sense to be nothing else but ideas which cannot exist unperceived; yet we may not hence conclude they have no existence except only while they are perceived by us, since there may be some other spirit that perceives them, though we do not. Wherever bodies are said to have no existence without the mind, I would not be understood to mean this or that particular mind, but all minds whatsoever. It does not therefore follow from the foregoing principles, that bodies are annihilated and created every moment, or exist not at all during the intervals between our perception of them.

49. Fifthly, it may perhaps be objected, that if extension and figure exist only in the mind, it follows that the mind is extended and figured; since extension is a mode or attribute, which (to speak with the Schools) is predicated of the subject in which it exists. I answer, those qualities are in the mind only as they are perceived by it, that is, not by way of *mode* or *attribute*, but only by way of *idea*; and it no more follows, that the soul or mind is extended because extension exists in it alone, than it does that it is red or blue, because those colors are on all hands acknowledged to exist in it, and nowhere else. As to what philosophers say of subject and mode, that seems very groundless and unintelligible. For instance, in this proposition, a die is hard, extended and square, they will have it that the word *die* denotes a subject or substance, distinct from the hardness, extension and figure, which are predicated of it, and in which they exist. This I cannot comprehend: to me a die seems to be nothing distinct from those things which are termed its modes or accidents. And to say a die is hard, extended and square, is not to attribute those qualities to a subject distinct from and supporting them, but only an explication of the meaning of the word *die*.

50. Sixthly, you will say there have been a great many things explained by matter and motion: take away these, and you destroy the whole corpuscular philosophy, and undermine those mechanical principles which have been applied with so much success to account for the *phenomena*. In short, whatever advances have been made, either by ancient or modern philosophers, in the study of nature, do all proceed on the supposition, that corporeal substance or matter does really exist. To this I answer, that there is not any one *phenomenon* explained on that supposition, which may not as well be explained without it, as might easily be made appear by an induction of particulars. To explain the *phenomena*, is all one as to show, why upon such and such occasions we are affected with such and such ideas. But how matter should operate on a spirit, or produce any idea in it, is what no philosopher will pretend to explain. It is therefore evident, there can be no use of matter in natural philosophy. Besides, they who attempt to account for things, do it not by corporeal substance, but by figure, motion, and other qualities, which are in truth no more than mere ideas, and therefore cannot be the cause of anything, as has been already shown. See Sect. 25.

51. Seventhly, it will upon this be demanded whether it does not seem absurd to take away natural causes, and ascribe everything to the immediate operation of spirits? We must no longer say upon these principles that fire heats, or water cools, but that a spirit heats, and so forth. Would not a man be deservedly laughed at, who should talk after this manner? I answer, he would so; in such things we ought to *think with the learned, and speak with the vulgar*. They who to demonstration are convinced of the truth of the *Copernican* system, do nevertheless say the sun rises, the sun sets, or comes to the meridian: and if they affected a contrary style in common talk, it would without doubt appear very ridiculous. A little reflection on what is here said will make it manifest, that the common use of language would receive no manner of alteration or disturbance from the admission of our tenets.

52. In the ordinary affairs of life, any phrases may be retained, so long as they excite in us proper sentiments, or dispositions to act in such a manner as is necessary for our well-being, how false soever they may be, if taken in a strict and speculative sense. Nay this is unavoidable, since propriety being regulated by custom, language is suited to the received opinions, which are not always the truest. Hence it is impossible, even in the most rigid philosophic reasonings, so far to alter the bent and genius of the tongue we speak, as never to give a handle for cavillers to pretend difficulties and inconsistencies. But a fair and ingenuous reader will collect the sense, from the scope and tenor and connection of a discourse, making allowances for those inaccurate modes of speech, which use has made inevitable.

53. As to the opinion that there are no corporeal causes, this has been heretofore maintained by some of the Schoolmen, as it is of late by others among the modern philosophers, who though they allow matter to exist, yet will have God alone to be the immediate efficient cause of all things.¹¹ These men saw, that amongst

all the objects of sense, there was none which had any power or activity included in it, and that by consequence this was likewise true of whatever bodies they supposed to exist without the mind, like unto the immediate objects of sense. But then, that they should suppose an innumerable multitude of created beings, which they acknowledge are not capable of producing any one effect in nature, and which therefore are made to no manner of purpose, since God might have done everything as well without them; this I say, though we should allow it possible, must yet be a very unaccountable and extravagant supposition.

54. In the eighth place, the universal concurrent assent of mankind may be thought by some, an invincible argument in behalf of matter, or the existence of external things. Must we suppose the whole world to be mistaken? And if so, what cause can be assigned of so widespread and predominant an error? I answer, first, that upon a narrow inquiry, it will not perhaps be found, so many as is imagined do really believe the existence of matter or things without the mind. Strictly speaking, to believe that which involves a contradiction, or has no meaning in it, is impossible: and whether the foregoing expressions are not of that sort, I refer it to the impartial examination of the reader. In one sense indeed, men may be said to believe that matter exists, that is, they act as if the immediate cause of their sensations, which affects them every moment and is so nearly present to them, were some senseless unthinking being. But that they should clearly apprehend any meaning marked by those words, and form thereof a settled speculative opinion, is what I am not able to conceive. This is not the only instance wherein men impose upon themselves, by imagining they believe those propositions they have often heard, though at bottom they have no meaning in them.

55. But secondly, though we should grant a notion to be ever so universally and steadfastly adhered to, yet this is but a weak argument of its truth, to whoever considers what a vast number of prejudices and false opinions are everywhere embraced with the utmost tenaciousness, by the unreflecting (which are the far greater) part of mankind. There was a time when the *antipodes* and motion of the earth were looked upon as monstrous absurdities, even by men of learning: and if it be considered what a small proportion they bear to the rest of mankind, we shall find that at this day, those notions have gained but a very inconsiderable footing in the world.

56. But it is demanded, that we assign a cause of this prejudice, and account for its obtaining in the world. To this I answer, that men knowing they perceived several ideas, whereof they themselves were not the authors, as not being excited from within, nor depending on the operation of their wills, this made them maintain, those ideas or objects of perception had an existence independent of, and without the mind, without ever dreaming that a contradiction was involved in those words. But philosophers having plainly seen, that the immediate objects of perception do not exist without the mind, they in some degree corrected the mistake of the vulgar, but at the same time run into another which seems no less absurd, to wit, that there are certain objects really existing without the mind, or having a subsistence distinct from being perceived, of which our ideas are only images or resemblances, imprinted by those objects on the mind. And this notion of the philosophers owes its origin to the same cause with the former, namely, their being conscious that they were not the authors of their own sensations, which they evidently knew were imprinted from without, and which therefore must have some cause, distinct from the minds on which they are imprinted.

57. But why they should suppose the ideas of sense to be excited in us by things in their likeness, and not rather have recourse to *spirit* which alone can act, may be accounted for, first, because they were not aware of the repugnancy there is, as well in supposing things like unto our ideas existing without, as in attributing to them power or activity. Secondly, because the supreme spirit which excites those ideas in our minds, is not marked out and limited to our view by any particular finite collection of sensible ideas, as human agents are by their size, complexion, limbs, and motions. And thirdly, because his operations are regular and uniform. Whenever the course of nature is interrupted by a miracle, men are ready to own the presence of a superior agent. But when we see things go on in the ordinary course, they do not excite in us any reflection; their order and concatenation, though it be an argument of the greatest wisdom, power, and goodness in their creator, is yet so constant and familiar to us, that we do not think them the immediate effects of a *free spirit*: especially since inconstancy and mutability in acting, though it be an imperfection, is looked on as a mark of *freedom*.

58. Tenthly, it will be objected, that the notions we advance, are inconsistent with several sound truths in philosophy and mathematics. For example, the motion of the earth is now universally admitted by astronomers, as a truth grounded on the clearest and most convincing reasons; but on the foregoing principles, there can be no such thing. For motion being only an idea, it follows that if it be not perceived, it exists not; but the motion of the earth is not perceived by sense. I answer, that tenet, if rightly understood, will be found to agree with the principles we have premised: for the question, whether the earth moves or no, amounts in reality to no more than this, to wit, whether we have reason to conclude from what has been observed by astronomers, that if we were placed in such and such circumstances, and such or such a position and distance,

both from the earth and sun, we should perceive the former to move among the choir of the planets, and appearing in all respects like one of them: and this, by the established rules of nature, which we have no reason to mistrust, is reasonably collected from the phenomena.

59. We may, from the experience we have had of the train and succession of ideas in our minds, often make, I will not say uncertain conjectures, but sure and well-grounded predictions, concerning the ideas we shall be affected with, pursuant to a great train of actions, and be enabled to pass a right judgment of what would have appeared to us, in case we were placed in circumstances very different from those we are in at present. Herein consists the knowledge of nature, which may preserve its use and certainty very consistently with what has been said. It will be easy to apply this to whatever objections of the like sort may be drawn from the magnitude of the stars, or any other discoveries in astronomy or nature.

60. In the eleventh place, it will be demanded to what purpose serves that curious organization of plants, and the admirable mechanism in the parts of animals; might not vegetables grow, and shoot forth leaves and blossoms, and animals perform all their motions, as well without as with all that variety of internal parts so elegantly contrived and put together, which being ideas have nothing powerful or operative in them, nor have any necessary connection with the effects ascribed to them? If it be a spirit that immediately produces every effect by a *fiat*, or act of his will, we must think all that is fine and artificial in the works, whether of man or nature, to be made in vain. By this doctrine, though an artist has made the spring and wheels, and every movement of a watch, and adjusted them in such a manner as he knew would produce the motions he designed; yet he must think all this done to no purpose, and that it is an intelligence which directs the index, and points to the hour of the day. If so, why may not the intelligence do it, without his being at the pains of making the movements, and putting them together? Why does not an empty case serve as well as another? And how comes it to pass, that whenever there is any fault in the going of a watch, there is some corresponding disorder to be found in the movements, which being mended by a skillful hand, all is right again? The like may be said of all the clockwork of nature, great part whereof is so wonderfully fine and subtle, as scarce to be discerned by the best microscope. In short, it will be asked, how upon our principles any tolerable account can be given, or any final cause assigned of an innumerable multitude of bodies and machines framed with the most exquisite art, which in the common philosophy have very apposite uses assigned them, and serve to explain abundance of phenomena.

61. To all which I answer, first, that though there were some difficulties relating to the administration of providence, and the uses by it assigned to the several parts of nature, which I could not solve by the foregoing principles, yet this objection could be of small weight against the truth and certainty of those things which may be proved *a priori*, with the utmost evidence. Secondly, but neither are the received principles free from the like difficulties; for it may still be demanded, to what end God should take those roundabout methods of effecting things by instruments and machines, which no one can deny might have been effected by the mere command of his will, without all that *apparatus*: nay, if we narrowly consider it, we shall find the objection may be retorted with greater force on those who hold the existence of those machines without the mind; for it has been made evident, that solidity, bulk, figure, motion and the like, have no *activity* or *efficacy* in them, so as to be capable of producing any one effect in nature. See Sect. 25. Whoever therefore supposes them to exist (allowing the supposition possible) when they are not perceived, does it manifestly to no purpose; since the only use that is assigned to them, as they exist unperceived, is that they produce those perceivable effects, which in truth cannot be ascribed to anything but spirit.

62. But to come nearer the difficulty, it must be observed, that though the fabrication of all those parts and organs be not absolutely necessary to the producing any effect, yet it is necessary to the producing of things in a constant, regular way, according to the laws of nature. There are certain general laws that run through the whole chain of natural effects: these are learned by the observation and study of nature, and are by men applied as well to the framing artificial things for the use and ornament of life, as to the explaining the various *phenomena*: which explication consists only in showing the conformity any particular phenomenon has to the general laws of nature, or, which is the same thing, in discovering the *uniformity* there is in the production of natural effects; as will be evident to whoever shall attend to the several instances, wherein philosophers pretend to account for appearances. That there is a great and conspicuous use in these regular constant methods of working observed by the Supreme Agent, has been shown in Sect. 31. And it is no less visible, that a particular size, figure, motion and disposition of parts are necessary, though not absolutely to the producing any effect, yet to the producing it according to the standing mechanical laws of nature. Thus, for instance, it cannot be denied that God, or the intelligence which sustains and rules the ordinary course of things might, if he were minded to produce a miracle, cause all the motions on the dial-plate of a watch, though nobody had ever made the movements, and put them in it: but yet if he will act agreeably to the rules

of mechanism, by him for wise ends established and maintained in the creation, it is necessary that those actions of the watchmaker, whereby he makes the movements and rightly adjusts them, precede the production of the aforesaid motions; as also that any disorder in them be attended with the perception of some corresponding disorder in the movements, which being once corrected all is right again.

63. It may indeed on some occasions be necessary, that the Author of Nature display his overruling power in producing some appearance out of the ordinary series of things. Such exceptions from the general rules of nature are proper to surprise and awe men into an acknowledgment of the Divine Being: but then they are to be used but seldom, otherwise there is a plain reason why they should fail of that effect. Besides, God seems to choose the convincing our reason of his attributes by the works of nature, which discover so much harmony and contrivance in their make, and are such plain indications of wisdom and beneficence in their author, rather than to astonish us into a belief of his being by anomalous and surprising events.

64. To set this matter in a yet clearer light, I shall observe that what has been objected in Sect. 60 amounts in reality to no more than this: ideas are not anyhow and at random produced, there being a certain order and connection between them, like to that of cause and effect: there are also several combinations of them, made in a very regular and artificial manner, which seem like so many instruments in the hand of nature, that being hid as it were behind the scenes, have a secret operation in producing those appearances which are seen on the theater of the world, being themselves discernible only to the curious eye of the philosopher. But since one idea cannot be the cause of another, to what purpose is that connection? And since those instruments, being barely *inefficacious perceptions* in the mind, are not subservient to the production of natural effects; it is demanded why they are made, or, in other words, what reason can be assigned why God should make us, upon a close inspection into his works, behold so great variety of ideas, so artfully laid together, and so much according to rule; it not being credible, that he would be at the expense (if one may so speak) of all that art and regularity to no purpose?

65. To all which my answer is, first, that the connection of ideas does not imply the relation of *cause* and *effect*, but only a mark or *sign* with the things *signified*. The fire which I see is not the cause of the pain I suffer upon my approaching it, but the mark that forewarns me of it. In like manner, the noise that I hear is not the effect of this or that motion or collision of the ambient bodies, but the sign thereof. Secondly, the reason why ideas are formed into machines, that is, artificial and regular combinations, is the same with that for combining letters into words. That a few original ideas may be made to signify a great number of effects and actions, it is necessary they be variously combined together: and to the end their use be permanent and universal, these combinations must be made by *rule*, and with *wise contrivance*. By this means abundance of information is conveyed unto us, concerning what we are to expect from such and such actions, and what methods are proper to be taken, for the exciting such and such ideas: which in effect is all that I conceive to be distinctly meant, when it is said that by discerning the figure, texture, and mechanism of the inward parts of bodies, whether natural or artificial, we may attain to know the several uses and properties depending thereon, or the nature of the thing.

66. Hence it is evident, that those things which under the notion of a cause cooperating or concurring to the production of effects, are altogether inexplicable, and run us into great absurdities, may be very naturally explained, and have a proper and obvious use assigned them, when they are considered only as marks or signs for our information. And it is the searching after, and endeavoring to understand those signs instituted by the Author of Nature, that ought to be the employment of the natural philosopher, and not the pretending to explain things by corporeal causes; which doctrine seems to have too much estranged the minds of men from that active principle, that supreme and wise spirit, *in whom we live, move, and have our being*.¹²

67. In the twelfth place, it may perhaps be objected, that though it be clear from what has been said, that there can be no such thing as an inert, senseless, extended, solid, figured, moveable substance, existing without the mind, such as philosophers describe matter: yet if any man shall leave out of his idea of *matter*, the positive ideas of extension, figure, solidity and motion, and say that he means only by that word, an inert senseless substance, that exists without the mind, or unperceived, which is the occasion of our ideas, or at the presence whereof God is pleased to excite ideas in us: it does not appear, but that matter taken in this sense may possibly exist. In answer to which I say, first, that it seems no less absurd to suppose a substance without accidents, than it is to suppose accidents without a substance. But secondly, though we should grant this unknown substance may possibly exist, yet where can it be supposed to be? That it exists not in the mind is agreed, and that it exists not in place is no less certain; since all extension exists only in the mind, as has been already proved. It remains therefore that it exists nowhere at all.

68. Let us examine a little the description that is here given us of *matter*. It neither acts, nor perceives, nor is perceived: for this is all that is meant by saying it is an inert, senseless, unknown substance; which is a

definition entirely made up of negatives, excepting only the relative notion of its standing under or supporting; but then it must be observed, that it *supports* nothing at all; and how nearly this comes to the description of a *non-entity*, I desire may be considered. But, say you, it is the *unknown occasion*, at the presence of which, ideas are excited in us by the will of God. Now I would fain know how anything can be present to us, which is neither perceivable by sense nor reflection, nor capable of producing any idea in our minds, not is it at all extended, nor has any form, nor exists in any place. The words *to be present*, when thus applied, must needs be taken in some abstract and strange meaning, and which I am not able to comprehend.

69. Again, let us examine what is meant by *occasion*: so far as I can gather from the common use of language, that word signifies, either the agent which produces any effect, or else something that is observed to accompany, or go before it, in the ordinary course of things. But when it is applied to matter as above described, it can be taken in neither of those senses. For matter is said to be passive and inert, and so cannot be an agent or efficient cause. It is also unperceivable, as being devoid of all sensible qualities, and so cannot be the occasion of our perceptions in the latter sense: as when the burning my finger is said to be the occasion of the pain that attends it. What therefore can be meant by calling matter an *occasion*? This term is either used in no sense at all, or else in some sense very distant from its received signification.

70. You will perhaps say that matter, though it be not perceived by us, is nevertheless perceived by God, to whom it is the occasion of exciting ideas in our minds. For, say you, since we observe our sensations to be imprinted in an orderly and constant manner, it is but reasonable to suppose there are certain constant and regular occasions of their being produced. That is to say, that there are certain permanent and distinct parcels of matter, corresponding to our ideas, which, though they do not excite them in our minds, or any ways immediately affect us, as being altogether passive and unperceivable to us, they are nevertheless to God, by whom they are perceived, as it were so many occasions to remind him when and what ideas to imprint on our minds: that so things may go on in a constant uniform manner.

71. In answer to this I observe, that as the notion of matter is here stated, the question is no longer concerning the existence of a thing distinct from *spirit* and *idea*, from perceiving and being perceived: but whether there are not certain ideas, of I know not what sort, in the mind of God, which are so many marks or notes that direct him how to produce sensations in our minds, in a constant and regular method: much after the same manner as a musician is directed by the notes of music to produce that harmonious train and composition of sound, which is called a *tune*; though they who hear the music do not perceive the notes, and may be entirely ignorant of them. But this notion of matter seems too extravagant to deserve a confutation. Besides, it is in effect no objection against what we have advanced, to wit, that there is no senseless, unperceived *substance*.

72. If we follow the light of reason, we shall, from the constant uniform method of our sensations, collect the goodness and wisdom of the *spirit* who excites them in our minds. But this is all that I can see reasonably concluded from thence. To me, I say, it is evident that the being of a *spirit infinitely wise, good, and powerful* is abundantly sufficient to explain all the appearances of nature. But as for *inert senseless matter*, nothing that I perceive has any the least connection with it, or leads to the thoughts of it. And I would fain see anyone explain any the meanest *phenomenon* in nature by it, or show any manner of reason, though in the lowest rank of probability, that he can have for its existence; or even make any tolerable sense or meaning of that supposition. For as to its being an occasion, we have, I think, evidently shown that with regard to us it is no occasion: it remains therefore that it must be, if at all, the occasion to God of exciting ideas in us; and what this amounts to, we have just now seen.

73. It is worthwhile to reflect a little on the motives which induced men to suppose the existence of material substance; that so having observed the gradual ceasing, and expiration of those motives or reasons, we may proportionably withdraw the assent that was grounded on them. First therefore, it was thought that color, figure, motion, and the rest of the sensible qualities or accidents, did really exist without the mind; and for this reason, it seemed needful to suppose some unthinking *substratum* or *substance* wherein they did exist, since they could not be conceived to exist by themselves. Afterwards, in process of time, men being convinced that colors, sounds, and the rest of the sensible secondary qualities had no existence without the mind, they stripped this *substratum* or material substance of those qualities, leaving only the primary ones, figure, motion, and such like, which they still conceived to exist without the mind, and consequently to stand in need of a material support. But it having been shown, that none, even of these, can possibly exist otherwise than in a spirit or mind which perceives them, it follows that we have no longer any reason to suppose the being of *matter*. Nay, that it is utterly impossible there should be any such thing, so long as that word is taken to denote an *unthinking substratum* of qualities or accidents, wherein they exist without the mind.

74. But though it be allowed by the *materialists* themselves, that matter was thought of only for the sake of

supporting accidents; and the reason entirely ceasing, one might expect the mind should naturally, and without any reluctance at all, quit the belief of what was solely grounded thereon. Yet the prejudice is riveted so deeply in our thoughts, that we can scarce tell how to part with it, and are therefore inclined, since the *thing* itself is indefensible, at least to retain the *name*; which we apply to I know not what abstracted and indefinite notions of *being*, or *occasion*, though without any show of reason, at least so far as I can see. For what is there on our part, or what do we perceive amongst all the ideas, sensations, notions, which are imprinted on our minds, either by sense or reflection, from whence may be inferred the existence of an inert, thoughtless, unperceived occasion? And on the other hand, on the part of an *all-sufficient spirit*, what can there be that should make us believe, or even suspect, he is *directed* by an inert occasion to excite ideas in our minds?

75. It is a very extraordinary instance of the force of prejudice, and much to be lamented, that the mind of man retains so great a fondness against all the evidence of reason, for a stupid thoughtless *somewhat*, by the interposition whereof it would, as it were, screen itself from the providence of God, and remove him farther off from the affairs of the world. But though we do the utmost we can, to secure the belief of *matter*, though when reason forsakes us, we endeavor to support our opinion on the bare possibility of the thing, and though we indulge ourselves in the full scope of an imagination not regulated by reason, to make out that poor *possibility*, yet the upshot of all is, that there are certain *unknown ideas* in the mind of God; for this, if anything, is all that I conceive to be meant by *occasion* with regard to God. And this, at the bottom, is no longer contending for the *thing*, but for the *name*.

76. Whether therefore there are such ideas in the mind of God, and whether they may be called by the name *matter*, I shall not dispute. But if you stick to the notion of an unthinking substance, or support of extension, motion, and other sensible qualities, then to me it is most evidently impossible there should be any such thing. Since it is a plain repugnancy, that those qualities should exist in or be supported by an unperceiving substance.

77. But say you, though it be granted that there is no thoughtless support of extension, and the other qualities or accidents which we perceive; yet there may, perhaps, be some inert unperceiving substance, or *substratum* of some other qualities, as incomprehensible to us as colors are to a man born blind, because we have not a sense adapted to them. But if we had a new sense, we should possibly no more doubt of their existence, than a blind man made to see does of the existence of light and colors. I answer, first, if what you mean by the word *matter* be only the unknown support of unknown qualities, it is no matter whether there is such a thing or no, since it no way concerns us: and I do not see the advantage there is in disputing about we know not *what*, and we know not *why*.

78. But secondly, if we had a new sense, it could only furnish us with new ideas or sensations: and then we should have the same reason against their existing in an unperceiving substance, that has been already offered with relation to figure, motion, color, and the like. Qualities, as has been shown, are nothing else but *sensations* or *ideas*, which exist only in a *mind* perceiving them; and this is true not only of the ideas we are acquainted with at present, but likewise of all possible ideas whatsoever.

79. But you will insist, what if I have no reason to believe the existence of matter, what if I cannot assign any use to it, or explain anything by it, or even conceive what is meant by that word? Yet still it is no contradiction to say that matter exists, and that this matter is *in general* a *substance*, or *occasion of ideas*; though, indeed, to go about to unfold the meaning, or adhere to any particular explication of those words, may be attended with great difficulties. I answer, when words are used without a meaning, you may put them together as you please, without danger of running into a contradiction. You may say, for example, that *twice two* is equal to *seven*, so long as you declare you do not take the words of that proposition in their usual acceptation, but for marks of you know not what. And by the same reason you may say, there is an inert thoughtless substance without accidents, which is the occasion of our ideas. And we shall understand just as much by one proposition, as the other.

80. In the last place, you will say, what if we give up the cause of material substance, and assert, that matter is an unknown *somewhat*, neither substance nor accident, spirit nor idea, inert, thoughtless, indivisible, immoveable, unextended, existing in no place? For, say you, whatever may be urged against *substance* or *occasion*, or any other positive or relative notion of matter, has no place at all, so long as the *negative* definition of matter is adhered to. I answer, you may, if so it shall seem good, use the word *matter* in the same sense, that other men use *nothing*, and so make those terms convertible in your style. For after all, this is what appears to me to be the result of that definition, the parts whereof when I consider with attention, either collectively, or separate from each other, I do not find that there is any kind of effect or impression made on my mind, different from what is excited by the term *nothing*.

81. You will reply perhaps, that in the foresaid definition is included, what does sufficiently distinguish it from nothing, the positive abstract idea of *quiddity*, *entity*, or *existence*. I own indeed, that those who pretend to the faculty of framing abstract general ideas, so talk as if they had such an idea, which is, say they, the most abstract and general notion of all, that is to me the most incomprehensible of all others. That there are a great variety of spirits of different orders and capacities, whose faculties, both in number and extent, are far exceeding those the author of my being has bestowed on me, I see no reason to deny. And for me to pretend to determine by my own few, stinted, narrow inlets of perception, what ideas the inexhaustible power of the Supreme Spirit may imprint upon them, were certainly the utmost folly and presumption. Since there may be, for ought that I know, innumerable sorts of ideas or sensations, as different from one another, and from all that I have perceived, as colors are from sounds. But how ready soever I may be, to acknowledge the scantiness of my comprehension, with regard to the endless variety of spirits and ideas, that might possibly exist, yet for anyone to pretend to a notion of entity or existence, *abstracted* from *spirit* and *idea*, from perceiving and being perceived, is, I suspect, a downright repugnancy and trifling with words. It remains that we consider the objections, which may possibly be made on the part of religion.

82. Some there are who think, that though the arguments for the real existence of bodies, which are drawn from reason, be allowed not to amount to demonstration, yet the Holy Scriptures are so clear in the point, as will sufficiently convince every good Christian, that bodies do really exist, and are something more than mere ideas; there being in Holy Write innumerable facts related, which evidently suppose the reality of timber, and stone, mountains, and rivers, and cities, and human bodies. To which I answer, that no sort of writings whatever, sacred or profane, which use those and the like words in the vulgar acceptation, or so as to have a meaning in them, are in danger of having their truth called in question by our doctrine. That all those things do really exist, that there are bodies, even corporeal substances, when taken in the vulgar sense, has been shown to be agreeable to our principles: and the difference betwixt *things* and *ideas*, *realities* and *chimeras*, has been distinctly explained.¹³ And I do not think, that either what philosophers call *matter*, or the existence of objects without the mind, is anywhere mentioned in Scripture.

83. Again, whether there be, or be not external things, it is agreed on all hands, that the proper use of words, is the marking our conceptions, or things only as they are known and perceived by us; whence it plainly follows, that in the tenets we have laid down, there is nothing inconsistent with the right use and significancy of *language*, and that discourse of what kind soever, so far as it is intelligible, remains undisturbed. But all this seems so manifest, from what has been set forth in the premises, that it is needless to insist any farther on it.

84. But it will be urged, that miracles do, at least, lose much of their stress and import by our principles. What must we think of *Moses's* rod, was it not *really* turned into a serpent, or was there only a change of *ideas* in the minds of the spectators? And can it be supposed, that our Savior did no more at the marriage-feast in *Cana*, than impose on the sight, and smell, and taste of the guests, so as to create in them the appearance or idea only of wine? The same may be said of all other miracles: which, in consequence of the foregoing principles, must be looked upon only as so many cheats, or illusions of fancy. To this I reply, that the rod was changed into a real serpent, and the water into real wine. That this does not, in the least, contradict what I have elsewhere said, will be evident from Sect. 34, and 35. But this business of *real* and *imaginary* has been already so plainly and fully explained, and so often referred to, and the difficulties about it are so easily answered from what has gone before, that it were an affront to the reader's understanding, to resume the explication of it in this place. I shall only observe, that if at table all who were present should see, and smell, and taste, and drink wine, and find the effects of it, with me there could be no doubt of its reality. So that, at bottom, the scruple concerning real miracles has no place at all on ours, but only on the received principles, and consequently makes rather *for*, than *against* what has been said.

85. Having done with the objections, which I endeavored to propose in the clearest light, and gave them all the force and weight I could, we proceed in the next place to take a view of our tenets in their consequences. Some of these appear at first sight, as that several difficult and obscure questions, on which abundance of speculation has been thrown away, are entirely banished from philosophy. Whether corporeal substance can think? Whether matter be infinitely divisible? And how it operates on spirit? These and the like inquiries have given infinite amusement to philosophers in all ages. But depending on the existence of *matter*, they have no longer any place on our principles. Many other advantages there are, as well with regard to *religion* as the *sciences*, which it is easy for anyone to deduce from what has been premised. But this will appear more plainly in the sequel.

86. From the principles we have laid down, it follows, human knowledge may naturally be reduced to two heads, that of *ideas*, and that of *spirits*. Of each of these I shall treat in order. And first as to ideas or unthinking things, our knowledge of these has been very much obscured and confounded, and we have been

led into very dangerous errors, by supposing a twofold existence of the objects of sense, the one *intelligible*, or in the mind, the other *real* and without the mind: whereby unthinking things are thought to have a natural subsistence of their own, distinct from being perceived by spirits. This which, if I mistake not, has been shown to be a most groundless and absurd notion, is the very root of *skepticism*; for so long as men thought that real things subsisted without the mind, and that their knowledge was only so far forth *real* as it was conformable to *real things*, it follows, that they could not be certain that they had any real knowledge at all. For how can it be known, that the things which are perceived, are conformable to those which are not perceived, or exist without the mind?

87. Color, figure, motion, extension and the like, considered only as so many *sensations* in the mind, are perfectly known, there being nothing in them which is not perceived. But if they are looked on as notes or images, referred to *things* or *archetypes* existing without the mind, then are we involved all in *skepticism*. We see only the appearances, and not the real qualities of things. What may be the extension, figure, or motion of anything really and absolutely, or in itself, it is impossible for us to know, but only the proportion or the relation they bear to our senses. Things remaining the same, our ideas vary, and which of them, or even whether any of them at all represent the true quality really existing in the thing, it is out of our reach to determine. So that, for ought we know, all we see, hear, and feel, may be only phantom and vain chimera, and not at all agree with the real things, existing in *rerum natura*. All this skepticism follows, from our supposing a difference between *things* and *ideas*, and that the former have a subsistence without the mind, or unperceived. It were easy to dilate on this subject, and show how the arguments urged by *skeptics* in all ages, depend on the supposition of external objects.

88. So long as we attribute a real existence to unthinking things, distinct from their being perceived, it is not only impossible for us to know with evidence the nature of any real unthinking being, but even that it exists. Hence it is, that we see philosophers distrust their senses, and doubt of the existence of heaven and earth, of everything they see or feel, even of their own bodies. And after all their labor and struggle of thought, they are forced to own, we cannot attain to any self-evident or demonstrative knowledge of the existence of sensible things. But all this doubtfulness, which so bewilders and confounds the mind, and makes *philosophy* ridiculous in the eyes of the world, vanishes, if we annex a meaning to our words, and do not amuse ourselves with the terms *absolute*, *external*, *exist*, and such like, signifying we know not what. I can as well doubt of my own being, as of the being of those things which I actually perceive by sense: it being a manifest contradiction, that any sensible object should be immediately perceived by sight or touch, and at the same time have no existence in nature, since the very existence of an unthinking being consists in *being perceived*.

89. Nothing seems of more importance, towards erecting a firm system of sound and real knowledge, which may be proof against the assaults of *skepticism*, than to lay the beginning in a distinct explication of what is meant by *thing*, *reality*, *existence*: for in vain shall we dispute concerning the real existence of things, or pretend to any knowledge thereof, so long as we have not fixed the meaning of those words. *Thing* or *being* is the most general name of all, it comprehends under it two kinds entirely distinct and heterogeneous, and which have nothing common but the name, to wit, *spirits* and *ideas*. The former are *active*, *indivisible substances*: the latter are *inert*, *fleeting*, *dependent beings*, which subsist not by themselves, but are supported by, or exist in minds or spiritual substances. We comprehend our own existence by inward feeling or reflection, and that of other spirits by reason. We may be said to have some knowledge or notion of our own minds, of spirits and active beings, whereof in a strict sense we have not ideas. In like manner we know and have a notion of relations between things or ideas, which relations are distinct from the ideas or things related, inasmuch as the latter may be perceived by us without our perceiving the former. To me it seems that ideas, spirits and relations are all in their respective kinds, the object of human knowledge and subject of discourse: and that the term *idea* would be improperly extended to signify everything we know or have any notion of.

90. Ideas imprinted on the senses are real things, or do really exist; this we do not deny, but we deny they can subsist without the minds which perceive them, or that they are resemblances of any archetypes existing without the mind: since the very being of a sensation or idea consists in being perceived, and an idea can be like nothing but an idea. Again, the things perceived by sense may be termed *external*, with regard to their origin, in that they are not generated from within, by the mind itself, but imprinted by a spirit distinct from that which perceives them. Sensible objects may likewise be said to be without the mind, in another sense, namely when they exist in some other mind. Thus when I shut my eyes, the things I saw may still exist, but it must be in another mind.

91. It were a mistake to think, that what is here said derogates in the least from the reality of things. It is acknowledged on the received principles, that extension, motion, and in a word all sensible qualities, have need of a support, as not being able to subsist by themselves. But the objects perceived by sense, are allowed to

be nothing but combinations of those qualities, and consequently cannot subsist by themselves. Thus far it is agreed on all hands. So that in denying the things perceived by sense, an existence independent of a substance, or support wherein they may exist, we detract nothing from the received opinion of their *reality*, and are guilty of no innovation in that respect. All the difference is, that according to us the unthinking beings perceived by sense, have no existence distinct from being perceived, and cannot therefore exist in any other substance, than those unextended, indivisible substances, or *spirits*, which act, and think, and perceive them: whereas philosophers vulgarly hold, that the sensible qualities exist in an inert, extended, unperceiving substance, which they call *matter*, to which they attribute a natural subsistence, exterior to all thinking beings, or distinct from being perceived by any mind whatsoever, even the eternal mind of the Creator, wherein they suppose only ideas of the corporeal substances created by him: if indeed they allow them to be at all created.

92. For as we have shown the doctrine of matter or corporeal substance, to have been the main pillar and support of *skepticism*, so likewise upon the same foundation have been raised all the impious schemes of *atheism* and irreligion. Nay so great a difficulty has it been thought, to conceive matter produced out of nothing, that the most celebrated among the ancient philosophers, even of these who maintained the being of a God, have thought matter to be uncreated and coeternal with him. How great a friend material substance has been to *atheists* in all ages, were needless to relate. All their monstrous systems have so visible and necessary a dependence on it, that when this cornerstone is once removed, the whole fabric cannot choose but fall to the ground; insomuch that it is no longer worthwhile, to bestow a particular consideration on the absurdities of every wretched sect of *atheists*.

93. That impious and profane persons should readily fall in with those systems which favor their inclinations, by deriding immaterial substance, and supposing the soul to be divisible and subject to corruption as the body; which exclude all freedom, intelligence, and design from the formation of things, and instead thereof make a self-existent, stupid, unthinking substance the root and origin of all beings. That they should hearken to those who deny a providence, or inspection of a superior mind over the affairs of the world, attributing the whole series of events either to blind chance or fatal necessity, arising from the impulse of one body on another. All this is very natural. And on the other hand, when men of better principles observe the enemies of religion lay so great a stress on *unthinking matter*, and all of them use so much industry and artifice to reduce everything to it; methinks they should rejoice to see them deprived of their grand support, and driven from that only fortress, without which your *Epicureans*, *Hobbists*, and the like, have not even the shadow of a pretense, but become the most cheap and easy triumph in the world.¹⁴

94. The existence of matter, or bodies unperceived, has not only been the main support of *atheists* and *fatalists*, but on the same principle does *idolatry* likewise in all its various forms depend. Did men but consider that the sun, moon, and stars, and every other object of the senses, are only so many sensations in their minds, which have no other existence but barely being perceived, doubtless they would never fall down, and worship their own *ideas*; but rather address their homage to that Eternal Invisible Mind which produces and sustains all things.

95. The same absurd principle, by mingling itself with the articles of our faith, has occasioned no small difficulties to Christians. For example, about the *resurrection*, how many scruples and objections have been raised by *Socinians* and others?¹⁵ But do not the most plausible of them depend on the supposition, that a body is denominated the *same*, with regard not to the form or that which is perceived by sense, but the material substance which remains the same under several forms? Take away this *material substance*, about the identity whereof all the dispute is, and mean by *body* what every plain ordinary person means by that word, to wit, that which is immediately seen and felt, which is only a combination of sensible qualities, or ideas: and then their most unanswerable objections come to nothing.

96. Matter being once expelled out of nature, drags with it so many skeptical and impious notions, such an incredible number of disputes and puzzling questions, which have been thorns in the sides of divines, as well as philosophers, and made so much fruitless work for mankind; that if the arguments we have produced against it, are not found equal to demonstration (as to me they evidently seem) yet I am sure all friends to knowledge, peace, and religion, have reason to wish they were.

97. Beside the external existence of the objects of perception, another great source of errors and difficulties, with regard to ideal knowledge, is the doctrine of *abstract ideas*, such as it has been set forth in the Introduction. The plainest things in the world, those we are most intimately acquainted with, and perfectly know, when they are considered in an abstract way, appear strangely difficult and incomprehensible. Time, place, and motion, taken in particular or concrete, are what everybody knows; but having passed through the hands of a metaphysician, they become too abstract and fine, to be apprehended by men of ordinary sense. Bid

your servant meet you at such a *time*, in such a *place*, and he shall never stay to deliberate on the meaning of those words: in conceiving that particular time and place, or the motion by which he is to get thither, he finds not the least difficulty. But if *time* be taken, exclusive of all those particular actions and ideas that diversify the day, merely for the continuation of existence, or duration in abstract, then it will perhaps gravel even a philosopher to comprehend it.

98. Whenever I attempt to frame a simple idea of *time*, abstracted from the succession of ideas in my mind, which flows uniformly, and is participated by all beings, I am lost and embrangled in inextricable difficulties. I have no notion of it at all, only I hear others say, it is infinitely divisible, and speak of it in such a manner as leads me to entertain odd thoughts of my existence: since that doctrine lays one under an absolute necessity of thinking, either that he passes away innumerable ages without a thought, or else that he is annihilated every moment of his life: both which seem equally absurd. Time therefore being nothing, abstracted from the succession of ideas in our minds, it follows that the duration of any finite spirit must be estimated by the number of ideas or actions succeeding each other in that same spirit or mind. Hence it is a plain consequence that the soul always thinks: and in truth whoever shall go about to divide in his thoughts, or abstract the *existence* of a spirit from its *cogitation*, will, I believe, find it no easy task.

99. So likewise, when we attempt to abstract extension and motion from all other qualities, and consider them by themselves, we presently lose sight of them, and run into great extravagancies. All which depend on a twofold abstraction: first, it is supposed that extension, for example, may be abstracted from all other sensible qualities; and secondly, that the entity of extension may be abstracted from its being perceived. But whoever shall reflect, and take care to understand what he says, will, if I mistake not, acknowledge that all sensible qualities are alike *sensations*, and alike *real*; that where the extension is, there is the color too, to wit, in his mind, and that their archetypes can exist only in some other *mind*: and that the objects of sense are nothing but those sensations combined, blended, or (if one may so speak) concreted together: none of all which can be supposed to exist unperceived.

100. What it is for a man to be happy, or an object good, everyone may think he knows. But to frame an abstract idea of *happiness*, prescinded from all particular pleasure, or of *goodness*, from everything that is good, this is what few can pretend to. So likewise, a man may be just and virtuous, without having precise ideas of *justice* and *virtue*. The opinion that those and the like words stand for general notions abstracted from all particular persons and actions, seems to have rendered morality difficult, and the study thereof of less use to mankind. And in effect, the doctrine of *abstraction* has not a little contributed towards spoiling the most useful parts of knowledge.

101. The two great provinces of speculative science, conversant about ideas received from sense and their relations, are *natural philosophy* and *mathematics*; with regard to each of these I shall make some observations. And first, I shall say somewhat of natural philosophy. On this subject it is, that the *skeptics* triumph: all that stock of arguments they produce to depreciate our faculties, and make mankind appear ignorant and low, are drawn principally from this head, to wit, that we are under an invincible blindness as to the *true* and *real* nature of things. This they exaggerate, and love to enlarge on. We are miserably bantered, say they, by our senses, and amused only with the outside and show of things. The real essence, the internal qualities, and constitution of every the meanest object, is hid from our view; something there is in every drop of water, every grain of sand, which it is beyond the power of human understanding to fathom or comprehend. But it is evident from what has been shown, that all this complaint is groundless, and that we are influenced by false principles to that degree as to mistrust our senses, and think we know nothing of those things which we perfectly comprehend.

102. One great inducement to our pronouncing ourselves ignorant of the nature of things, is the current opinion that everything includes within itself the cause of its properties: or that there is in each object an inward essence, which is the source whence its discernible qualities flow, and whereon they depend. Some have pretended to account for appearances by occult qualities, but of late they are mostly resolved into mechanical causes, to wit, the figure, motion, weight, and such like qualities of insensible particles: whereas in truth, there is no other agent or efficient cause than *spirit*, it being evident that motion, as well as all other *ideas*, is perfectly inert. See Sect. 25. Hence, to endeavor to explain the production of colors or sounds, by figure, motion, magnitude and the like, must needs be labor in vain. And accordingly, we see the attempts of that kind are not at all satisfactory. Which may be said, in general, of those instances, wherein one idea or quality is assigned for the cause of another. I need not say, how many *hypotheses* and speculations are left out, and how much the study of nature is abridged by this doctrine.

103. The great mechanical principle now in vogue is *attraction*. That a stone falls to the earth, or the sea swells towards the moon, may to some appear sufficiently explained thereby. But how are we enlightened by

being told this is done by attraction? Is it that that word signifies the manner of the tendency, and that it is by the mutual drawing of bodies, instead of their being impelled or protruded towards each other? But nothing is determined of the manner of action, and it may as truly (for ought we know) be termed *impulse* or *protrusion* as *attraction*. Again, the parts of steel we see cohere firmly together, and this also is accounted for by attraction; but in this, as in the other instances, I do not perceive that anything is signified besides the effect itself; for as to the manner of the action whereby it is produced, or the cause which produces it, these are not so much as aimed at.

104. Indeed, if we take a view of the several *phenomena*, and compare them together, we may observe some likeness and conformity between them. For example, in the falling of a stone to the ground, in the rising of the sea towards the moon, in cohesion and crystallization, there is something alike, namely a union or mutual approach of bodies. So that any one of these or the like *phenomena*, may not seem strange or surprising to a man who has nicely observed and compared the effects of nature. For that only is thought so which is uncommon, or a thing by itself, and out of the ordinary course of our observation. That bodies should tend towards the center of the earth, is not thought strange, because it is what we perceive every moment of our lives. But that they should have a like gravitation towards the center of the moon, may seem odd and unaccountable to most men, because it is discerned only in the tides. But a philosopher, whose thoughts take in a larger compass of nature, having observed a certain similitude of appearances, as well in the heavens as the earth, that argue innumerable bodies to have a mutual tendency towards each other, which he denotes by the general name *attraction*, whatever can be reduced to that, he thinks justly accounted for. Thus he explains the tides by the attraction of the terraqueous globe towards the moon, which to him does not appear odd or anomalous, but only a particular example of a general rule or law of nature.

105. If therefore we consider the difference there is betwixt natural philosophers and other men, with regard to their knowledge of the *phenomena*, we shall find it consists, not in an exacter knowledge of the efficient cause that produces them, for that can be no other than the *will of a spirit*, but only in a greater largeness of comprehension, whereby analogies, harmonies, and agreements are discovered in the works of nature, and the particular effects explained, that is, reduced to general rules, see Sect. 62, which rules grounded on the analogy, and uniformness observed in the production of natural effects, are most agreeable, and sought after by the mind; for that they extend our prospect beyond what is present, and near to us, and enable us to make very probable conjectures, touching things that may have happened at very great distances of time and place, as well as to predict things to come; which sort of endeavor towards omniscience, is much affected by the mind.

106. But we should proceed warily in such things: for we are apt to lay too great a stress on analogies, and to the prejudice of truth, humor that eagerness of the mind, whereby it is carried to extend its knowledge into general theorems. For example, gravitation, or mutual attraction, because it appears in many instances, some are straightaway for pronouncing *universal*; and that to *attract, and be attracted by every other body, is an essential quality inherent in all bodies whatsoever*. Whereas it appears the fixed stars have no such tendency towards each other: and so far is that gravitation, from being *essential* to bodies, that, in some instances a quite contrary principle seems to show itself: as in the perpendicular growth of plants, and the elasticity of the air. There is nothing necessary or essential in the case, but it depends entirely on the will of the *governing spirit*, who causes certain bodies to cleave together, or tend towards each other, according to various laws, whilst he keeps others at a fixed distance; and to some he gives a quite contrary tendency to fly asunder, just as he sees convenient.

107. After what has been premised, I think we may lay down the following conclusions. First, it is plain philosophers amuse themselves in vain, when they inquire for any natural efficient cause, distinct from a *mind* or *spirit*. Secondly, considering the whole creation is the workmanship of a *wise and good agent*, it should seem to become philosophers, to employ their thoughts (contrary to what some hold) about the final causes of things: and I must confess, I see no reason, why pointing out the various ends, to which natural things are adapted, and for which they were originally with unspeakable wisdom contrived, should not be thought one good way of accounting for them, and altogether worthy a philosopher.¹⁶ Thirdly, from what has been premised no reason can be drawn, why the history of nature should not still be studied, and observations and experiments made, which, that they are of use to mankind, and enable us to draw any general conclusions, is not the result of any immutable habitudes, or relations between things themselves, but only of God's goodness and kindness to men in the administration of the world. See Sect. 30 and 31. Fourthly, by a diligent observation of the *phenomena* within our view, we may discover the general laws of nature, and from them deduce the other *phenomena*, I do not say *demonstrate*; for all deductions of that kind depend on a supposition that the Author of Nature always operates uniformly, and in a constant observance of those rules we take for principles: which we cannot evidently know.

108. Those men who frame general rules from the *phenomena*, and afterwards derive the *phenomena* from those rules, seem to consider signs rather than causes. A man may well understand natural signs without knowing their analogy, or being able to say by what rule a thing is so or so. And as it is very possible to write improperly, through too strict an observance of general grammar-rules: so in arguing from general rules of nature, it is not impossible we may extend the analogy too far, and by that means run into mistakes.

109. As in reading other books, a wise man will choose to fix his thoughts on the sense and apply it to use, rather than lay them out in grammatical remarks on the language; so in perusing the volume of nature, it seems beneath the dignity of the mind to affect an exactness in reducing each particular *phenomenon* to general rules, or showing how it follows from them. We should propose to ourselves nobler views, such as to recreate and exalt the mind, with a prospect of the beauty, order, extent, and variety of natural things: hence, by proper inferences, to enlarge our notions of the grandeur, wisdom, and beneficence of the Creator: and lastly, to make the several parts of the creation so far as in us lies, subservient to the ends they were designed for, God's glory, and the sustentation and comfort of our selves and fellow-creatures.

110. The best key for the aforesaid analogy, or natural science, will be easily acknowledged to be a certain celebrated treatise of *mechanics*: in the entrance of which justly admired treatise, time, space and motion, are distinguished into *absolute* and *relative*, *true* and *apparent*, *mathematical* and *vulgar*: which distinction, as it is at large explained by the author, does suppose those quantities to have an existence without the mind: and that they are ordinarily conceived with relation to sensible things, to which nevertheless in their own nature, they bear no relation at all.¹⁷

111. As for *time*, as it is there taken in an absolute or abstracted sense, for the duration or perseverance of the existence of things, I have nothing more to add concerning it, after what has been already said on that subject, Sect. 97 and 98. For the rest, this celebrated author holds there is an *absolute space*, which, being unperceivable to sense, remains in itself similar and immoveable: and relative space to be the measure thereof, which being moveable, and defined by its situation in respect of sensible bodies, is vulgarly taken for immoveable space. *Place* he defines to be that part of space which is occupied by any body. And according as the space is absolute or relative, so also is the place. *Absolute motion* is said to be the translation of a body from absolute place to absolute place, as relative motion is from one relative place to another. And because the parts of absolute space, do not fall under our senses, instead of them we are obliged to use their sensible measures: and so define both place and motion with respect to bodies, which we regard as immoveable. But it is said, in philosophical matters we must abstract from our senses, since it may be, that none of those bodies which seem to be quiescent, are truly so: and the same thing which is moved relatively, may be really at rest. As likewise one and the same body may be in relative rest and motion, or even moved with contrary relative motions at the same time, according as its place is variously defined. All which ambiguity is to be found in the apparent motions, but not at all in the true or absolute, which should therefore be alone regarded in philosophy. And the true, we are told, are distinguished from the apparent or relative motions by the following properties. First, in true or absolute motion, all parts which preserve the same position with respect to the whole, partake of the motions of the whole. Secondly, the place being moved, that which is placed therein is also moved: so that a body moving in a place which is in motion, does participate the motion of its place. Thirdly, true motion is never generated or changed, otherwise than by force impressed on the body itself. Fourthly, true motion is always changed by force impressed on the body moved. Fifthly, in circular motion barely relative, there is no centrifugal force, which nevertheless in that which is true or absolute, is proportional to the quantity of motion.

112. But notwithstanding what has been said, it does not appear to me, that there can be any motion other than *relative*: so that to conceive motion, there must be at least conceived two bodies, whereof the distance or position in regard to each other is varied. Hence if there was one only body in being, it could not possibly be moved. This seems evident, in that the idea I have of motion does necessarily include relation.

113. But though in every motion it be necessary to conceive more bodies than one, yet it may be that one only is moved, namely that on which the force causing the change of distance is impressed, or in other words, that to which the action is applied. For however some may define relative motion, so as to term that body *moved*, which changes its distance from some other body, whether the force or action causing that change were applied to it, or no: yet as relative motion is that which is perceived by sense, and regarded in the ordinary affairs of life, it should seem that every man of common sense knows what it is, as well as the best philosopher: now I ask anyone, whether in his sense of motion as he walks along the streets, the stones he passes over may be said to *move*, because they change distance with his feet? To me it seems, that though motion includes a relation of one thing to another, yet it is not necessary that each term of relation be denominated from it. As a man may think of somewhat which does not think, so a body may be moved to or

from another body, which is not therefore itself in motion.

114. As the place happens to be variously defined, the motion which is related to it varies. A man in a ship may be said to be quiescent, with relation to the sides of the vessel, and yet move with relation to the land. Or he may move eastward in respect of the one, and westward in respect of the other. In the common affairs of life, men never go beyond the earth to define the place of any body: and what is quiescent in respect of that, is accounted *absolutely* to be so. But philosophers who have a greater extent of thought, and juster notions of the system of things, discover even the earth itself to be moved. In order therefore to fix their notions, they seem to conceive the corporeal world as finite, and the utmost unmoved walls or shell thereof to be the place, whereby they estimate true motions. If we sound our own conceptions, I believe we may find all the absolute motion we can frame an idea of, to be at bottom no other than relative motion thus defined. For as has been already observed, absolute motion exclusive of all external relation is incomprehensible: and to this kind of relative motion, all the abovementioned properties, causes, and effects ascribed to absolute motion, will, if I mistake not, be found to agree. As to what is said of the centrifugal force, that it does not at all belong to circular relative motion: I do not see how this follows from the experiment which is brought to prove it. See *Philosophiae Naturalis Principia Mathematica, in Schol. Def. VIII.* For the water in the vessel, at that time wherein it is said to have the greatest relative circular motion, has, I think, no motion at all: as is plain from the foregoing section.

115. For to denominate a body *moved*, it is requisite, first, that it change its distance or situation with regard to some other body: and secondly, that the force or action occasioning that change be applied to it. If either of these be wanting, I do not think that agreeably to the sense of mankind, or the propriety of language, a body can be said to be in motion. I grant indeed, that it is possible for us to think a body, which we see change its distance from some other, to be moved, though it have no force applied to it (in which sense there may be apparent motion), but then it is, because the force causing the change of distance, is imagined by us to be applied or impressed on that body thought to move. Which indeed shows we are capable of mistaking a thing to be in motion which is not, and that is all.

116. From what has been said, it follows that the philosophic consideration of motion does not imply the being of an *absolute space*, distinct from that which is perceived by sense, and related to bodies: which that it cannot exist without the mind, is clear upon the same principles, that demonstrate the like of all other objects of sense. And perhaps, if we inquire narrowly, we shall find we cannot even frame an idea of *pure space*, exclusive of all body. This I must confess seems impossible, as being a most abstract idea. When I excite a motion in some part of my body, if it be free or without resistance, I say there is *space*: but if I find a resistance, then I say there is *body*: and in proportion as the resistance to motion is lesser or greater, I say the *space* is more or less *pure*. So that when I speak of pure or empty space, it is not to be supposed, that the word *space* stands for an idea distinct from, or conceivable without body and motion. Though indeed we are apt to think every noun substantive stands for a distinct idea, that may be separated from all others: which has occasioned infinite mistakes. When therefore supposing all the world to be annihilated besides my own body, I say there still remains *pure space*: thereby nothing else is meant, but only that I conceive it possible, for the limbs of my body to be moved on all sides without the least resistance: but if that too were annihilated, then there could be no motion, and consequently no space. Some perhaps may think the sense of seeing does furnish them with the idea of pure space; but it is plain from what we have elsewhere shown, that the ideas of space and distance are not obtained by that sense. See the *Essay concerning Vision*.

117. What is here laid down, seems to put an end to all those disputes and difficulties, which have sprung up amongst the learned concerning the nature of *pure space*. But the chief advantage arising from it, is, that we are freed from that dangerous *dilemma*, to which several who have employed their thoughts on this subject, imagine themselves reduced, to wit, of thinking either that real space is God, or else that there is something besides God which is eternal, uncreated, infinite, indivisible, immutable. Both which may justly be thought pernicious and absurd notions. It is certain that not a few divines, as well as philosophers of great note, have, from the difficulty they found in conceiving either limits or annihilation of space, concluded it must be *divine*. And some of late have set themselves particularly to show, that the incommunicable attributes of God agree to it. Which doctrine, how unworthy soever it may seem of the divine nature, yet I do not see how we can get clear of it, so long as we adhere to the received opinions.

118. Hitherto of natural philosophy: we come now to make some inquiry concerning that other great branch of speculative knowledge, to wit, *mathematics*. These, how celebrated soever they may be, for their clearness and certainty of demonstration, which is hardly anywhere else to be found, cannot nevertheless be supposed altogether free from mistakes; if in their principles there lurks some secret error, which is common to the professors of those sciences with the rest of mankind. Mathematicians, though they deduce their

theorems from a great height of evidence, yet their first principles are limited by the consideration of quantity: and they do not ascend into any inquiry concerning those transcendental maxims, which influence all the particular sciences, each part whereof, mathematics not excepted, does consequently participate of the errors involved in them. That the principles laid down by mathematicians are true, and their way of deduction from those principles clear and incontestable, we do not deny. But we hold, there may be certain erroneous maxims of greater extent than the object of mathematics, and for that reason not expressly mentioned, though tacitly supposed throughout the whole progress of that science; and that the ill effects of those secret unexamined errors are diffused through all the branches thereof. To be plain, we suspect the mathematicians are, as well as other men, concerned in the errors arising from the doctrine of abstract general ideas, and the existence of objects without the mind.

119. *Arithmetic* has been thought to have for its object abstract ideas of *number*. Of which to understand the properties and mutual habitudes is supposed no mean part of speculative knowledge. The opinion of the pure and intellectual nature of numbers in abstract, has made them in esteem with those philosophers, who seem to have affected an uncommon fineness and elevation of thought. It has set a price on the most trifling numerical speculations which in practice are of no use, but serve only for amusement: and has therefore so far infected the minds of some, that they have dreamt of mighty *mysteries* involved in numbers, and attempted the explication of natural things by them. But if we inquire into our own thoughts, and consider what has been premised, we may perhaps entertain a low opinion of those high flights and abstractions, and look on all inquiries about numbers, only as so many *difficiles nugae*, so far as they are not subservient to practice, and promote the benefit of life.

120. Unity in abstract we have before considered in Sect. 13, from which and what has been said in the Introduction, it plainly follows there is not any such idea. But number being defined a *collection of units*, we may conclude that, if there be no such thing as unity or unit in abstract, there are no ideas of number in abstract denoted by the numeral names and figures. The theories therefore in arithmetic, if they are abstracted from the names and figures, as likewise from all use and practice, as well as from the particular things numbered, can be supposed to have nothing at all for their object. Hence we may see, how entirely the science of numbers is subordinate to practice, and how jejune and trifling it becomes, when considered as a matter of mere speculation.

121. However since there may be some, who, deluded by the specious show of discovering abstracted verities, waste their time in arithmetical theorems and problems, which have not any use: it will not be amiss, if we more fully consider, and expose the vanity of that pretense; and this will plainly appear, by taking a view of arithmetic in its infancy, and observing what it was that originally put men on the study of that science, and to what scope they directed it. It is natural to think that at first, men, for ease of memory and help of computation, made use of counters, or in writing of single strokes, points or the like, each whereof was made to signify a unit, that is, some one thing of whatever kind they had occasion to reckon. Afterwards they found out the more compendious ways, of making one character stand in place of several strokes, or points. And lastly, the notation of the *Arabians* or *Indians* came into use, wherein by the repetition of a few characters or figures, and varying the signification of each figure according to the place it obtains, all numbers may be most aptly expressed: which seems to have been done in imitation of language, so that an exact analogy is observed betwixt the notation by figures, and names, the nine simple figures answering the nine first numeral names, and place in the former corresponding to denominations in the latter. And agreeably to those conditions of the simple and local value of figures, were contrived methods of finding from the given figures or marks of the parts, what figures and how placed, are proper to denote the whole or *vice versa*. And having found the sought figures, the same rule or analogy being observed throughout, it is easy to read them into words; and so the number becomes perfectly known. For then the number of any particular things is said to be known, when we know the name or figures (with their due arrangement) that according to the standing analogy belong to them. For these signs being known, we can by the operations of arithmetic, know the signs of any part of the particular sums signified by them; and thus computing in signs (because of the connection established betwixt them and the distinct multitudes of things, whereof one is taken for a unit), we may be able rightly to sum up, divide, and proportion the things themselves that we intend to number.

122. In *arithmetic* therefore we regard not the *things* but the *signs*, which nevertheless are not regarded for their own sake, but because they direct us how to act with relation to things, and dispose rightly of them. Now agreeably to what we have before observed, of words in general (Sect. 19, *Introd.*) it happens here likewise, that abstract ideas are thought to be signified by numeral names or characters, while they do not suggest ideas of particular things to our minds. I shall not at present enter into a more particular dissertation on this subject; but only observe that it is evident from what has been said, those things which pass for abstract truths and

theorems concerning numbers, are, in reality, conversant about no object distinct from particular numerable things, except only names and characters; which originally came to be considered, on no other account but their being *signs*, or capable to represent aptly, whatever particular things men had need to compute. Whence it follows, that to study them for their own sake would be just as wise, and to as good purpose, as if a man, neglecting the true use or original intention and subserviency of language, should spend his time in impertinent criticisms upon words, or reasonings and controversies purely verbal.

123. From numbers we proceed to speak of *extension*, which considered as relative, is the object of geometry. The *infinite* divisibility of *finite* extension, though it is not expressly laid down, either as an axiom or theorem in the elements of that science, yet is throughout the same everywhere supposed, and thought to have so inseparable and essential a connection with the principles and demonstrations in geometry, that mathematics never admit it into doubt, or make the least question of it. And as this notion is the source from whence do spring all those amusing geometrical paradoxes, which have such a direct repugnancy to the plain common sense of mankind, and are admitted with so much reluctance into a mind not yet debauched by learning: so is it the principal occasion of all that nice and extreme subtlety, which renders the study of *mathematics* so difficult and tedious. Hence if we can make it appear, that no finite extension contains innumerable parts, or is infinitely divisible, it follows that we shall at once clear the science of geometry from a great number of difficulties and contradictions, which have ever been esteemed a reproach to human reason, and withal make the attainment thereof a business of much less time and pains, than it hitherto has been.

124. Every particular finite extension, which may possibly be the object of our thought, is an *idea* existing only in the mind, and consequently each part thereof must be perceived. If therefore I cannot perceive innumerable parts in any finite extension that I consider, it is certain they are not contained in it: but it is evident, that I cannot distinguish innumerable parts in any particular line, surface, or solid, which I either perceive by sense, or figure to myself in my mind: wherefore I conclude they are not contained in it. Nothing can be plainer to me, than that the extensions I have in view are no other than my own ideas, and it is no less plain, that I cannot resolved any one of my ideas into an infinite number of other ideas, that is, that they are not infinitely divisible. If by *finite extension* be meant something distinct from a finite idea, I declare I do not know what that is, and so cannot affirm or deny anything of it. But if the terms *extension*, *parts*, and the like, are taken in any sense conceivable, that is, for ideas; then to say a finite quantity or extension consists of parts infinite in number, is so manifest a contradiction, that everyone at first sight acknowledges it to be so. And it is impossible it should ever gain the assent of any reasonable creature, who is not brought to it by gentle and slow degrees, as a converted gentile to the belief of *transubstantiation*.¹⁸ Ancient and rooted prejudices do often pass into principles: and those propositions which once obtain the force and credit of a *principle*, are not only themselves, but likewise whatever is deducible from them, thought privileged from all examination. And there is no absurdity so gross, which by this means the mind of man may not be prepared to swallow.

125. He whose understanding is prepossessed with the doctrine of abstract general ideas, may be persuaded, that (whatever be thought of the ideas of sense), extension in *abstract* is infinitely divisible. And one who thinks the objects of sense exist without the mind, will perhaps in virtue thereof be brought to admit, that a line but an inch long may contain innumerable parts really existing, though too small to be discerned. These errors are grafted as well in the minds of *geometricians*, as of other men, and have a like influence on their reasonings; and it were no difficult thing, to show how the arguments from geometry made use of to support the infinite divisibility of extension, are bottomed on them. At present we shall only observe in general, whence it is that the mathematicians are all so fond and tenacious of this doctrine.

126. It has been observed in another place, that the theorems and demonstrations in geometry are conversant about universal ideas. Sect 15, *Introd.* Where it is explained in what sense this ought to be understood, to wit, that the particular lines and figures included in the diagram, are supposed to stand for innumerable others of different sizes: or in other words, the geometer considers them abstracting from their magnitude: which does not imply that he forms an abstract idea, but only that he cares not what the particular magnitude is, whether great or small, but looks on that as a thing indifferent to the demonstration: hence it follows, that a line in the scheme, but an inch long, must be spoken of, as though it contained ten thousand parts, since it is regarded not in itself, but as it is universal; and it is universal only in its signification, whereby it represents innumerable lines greater than itself, in which may be distinguished ten thousand parts or more, though there may not be above an inch in it. After this manner the properties of the lines signified are (by a very usual figure) transferred to the sign, and thence through mistake thought to appertain to it considered in its own nature.

127. Because there is no number of parts so great, but it is possible there may be a line containing more, the inch-line is said to contain parts more than any assignable number; which is true, not of the inch taken

absolutely, but only for the things signified by it. But men not retaining that distinction in their thoughts, slide into a belief that the small particular line described on paper contains in itself parts innumerable. There is no such thing as the ten-thousandth part of an *inch*; but there is of a *mile* or *diameter of the earth*, which may be signified by that inch. When therefore I delineate a triangle on paper, and take one side not above an inch, for example, in length to be the *radius*: this I consider as divided into ten thousand or a hundred thousand parts, or more. For though the ten-thousandth part of that line considered in itself, is nothing at all, and consequently may be neglected without any error or inconveniency; yet these described lines being only marks standing for greater quantities, whereof it may be the ten-thousandth part is very considerable, it follows, that to prevent notable errors in practice, the *radius* must be taken of ten thousand parts, or more.

128. From what has been said the reason is plain why, to the end any theorem may become universal in its use, it is necessary we speak of the lines described on paper, as though they contained parts which really they do not. In doing of which, if we examine the matter thoroughly, we shall perhaps discover that we cannot conceive an inch itself as consisting of, or being divisible into a thousand parts, but only some other line which is far greater than an inch, and represented by it. And that when we say a line is *infinitely divisible*, we must mean a line which is *infinitely great*. What we have here observed seems to be the chief cause, why to suppose the infinite divisibility of finite extension has been thought necessary in geometry.

129. The several absurdities and contradictions which flowed from this false principle might, one would think, have been esteemed so many demonstrations against it. But by I know not what *logic*, it is held that proofs *a posteriori* are not to be admitted against propositions relating to infinity. As though it were not impossible even for an infinite mind to reconcile contradictions. Or as if anything absurd and repugnant could have a necessary connection with truth, or flow from it. But whoever considers the weakness of this pretense, will think it was contrived on purpose to humor the laziness of the mind, which had rather acquiesce in an indolent skepticism, than be at the pains to go through with a severe examination of those principles it has ever embraced for true.

130. Of late the speculations about infinities have run so high, and grown to such strange notions, as have occasioned no small scruples and disputes among the geometers of the present age. Some there are of great note, who not content with holding that finite lines may be divided into an infinite number of parts, do yet farther maintain, that each of those infinitesimals is itself subdivisible into an infinity of other parts, or infinitesimals of a second order, and so on *ad infinitum*. These, I say, assert there are infinitesimals of infinitesimals, without ever coming to an end. So that according to them an inch does not barely contain an infinite number of parts, but an infinity of an infinity of an infinity *ad infinitum* of parts. Others there be who hold all orders of infinitesimals below the first to be nothing at all, thinking it with good reason absurd, to imagine there is any positive quantity or part of extension, which though multiplied infinitely, can ever equal the smallest given extension. And yet on the other hand it seems no less absurd, to think the square, cube, or other power of a positive real root, should itself be nothing at all; which they who hold infinitesimals of the first order, denying all of the subsequent orders, are obliged to maintain.

131. Have we not therefore reason to conclude, that they are *both* in the wrong, and that there is in effect no such thing as parts infinitely small, or an infinite number of parts contained in any finite quantity? But you will say, that if this doctrine obtains, it will follow the very foundations of geometry are destroyed: and those great men who have raised that science to so astonishing a height, have been all the while building a castle in the air. To this it may be replied, that whatever is useful in geometry and promotes the benefit of human life, does still remain firm and unshaken on our principles. That science considered as practical, will rather receive advantage than any prejudice from what has been said. But to set this in a due light, may be the subject of a distinct inquiry. For the rest, though it should follow that some of the more intricate and subtle parts of *speculative mathematics* may be pared off without any prejudice to truth; yet I do not see what damage will be thence derived to mankind. On the contrary, it were highly to be wished, that men of great abilities and obstinate application would draw off their thoughts from those amusements, and employ them in the study of such things as lie nearer the concerns of life, or have a more direct influence on the manners.

132. If it be said that several theorems undoubtedly true, are discovered by methods in which infinitesimals are made use of, which could never have been, if their existence included a contradiction in it. I answer, that upon a thorough examination it will not be found, that in any instance it is necessary to make use of or conceive infinitesimal parts of finite lines, or even quantities less than the *minimum sensible*: nay, it will be evident this is never done, it being impossible.¹⁹

133. By what we have premised, it is plain that very numerous and important errors have taken their rise from those false principles, which were impugned in the foregoing parts of this treatise. And the opposites of those erroneous tenets at the same time appear to be most fruitful principles, from whence do flow

innumerable consequences highly advantageous to true philosophy as well as to religion. Particularly, *matter* or *the absolute existence of corporeal objects*, has been shown to be that wherein the most avowed and pernicious enemies of all knowledge, whether human or divine, have ever placed their chief strength and confidence. And surely, if by distinguishing the real existence of unthinking things from their being perceived, and allowing them a subsistence of their own out of the minds of spirits, no one thing is explained in nature; but on the contrary a great many inexplicable difficulties arise: if the supposition of matter is barely precarious, as not being grounded on so much as one single reason: if its consequences cannot endure the light of examination and free inquiry, but screen themselves under the dark and general pretense of *infinities being incomprehensible*: if withal the removal of this *matter* be not attended with the least evil consequence, if it be not even missed in the world, but everything as well, nay much easier conceived without it: if lastly, both *skeptics* and *atheists* are forever silenced upon supposing only spirits and ideas, and this scheme of things is perfectly agreeable both to *reason* and *religion*: methinks we may expect it should be admitted and firmly embraced, though it were proposed only as a *hypothesis*, and the existence of matter had been allowed possible, which yet I think we have evidently demonstrated that it is not.

134. True it is, that in consequence of the foregoing principles, several disputes and speculations, which are esteemed no mean parts of learning, are rejected as useless. But how great a prejudice soever against our notions, this may give to those who have already been deeply engaged, and made large advances in studies of that nature: yet by others, we hope it will not be thought any just ground of dislike to the principles and tenets herein laid down, that they abridge the labor of study, and make human sciences more clear, compendious, and attainable, than they were before.

135. Having dispatched what we intended to say concerning the knowledge of *ideas*, the method we proposed leads us, in the next place, to treat of *spirits*: with regard to which, perhaps human knowledge is not so deficient as is vulgarly imagined. The great reason that is assigned for our being thought ignorant of the nature of spirits, is, our not having an idea of it. But surely it ought not to be looked on as a defect in a human understanding, that it does not perceive the idea of *spirit*, if it is manifestly impossible there should be any such *idea*. And this, if I mistake not, has been demonstrated in Sect. 27: to which I shall here add that a spirit has been shown to be the only substance or support, wherein the unthinking beings or ideas can exist: but that this *substance* which supports or perceives ideas should itself be an *idea* or like an *idea*, is evidently absurd.

136. It will perhaps be said, that we want a sense (as some have imagined) proper to know substances withal, which if we had, we might know our own soul, as we do a triangle. To this I answer, that in case we had a new sense bestowed upon us, we could only receive thereby some new sensations or ideas of sense. But I believe nobody will say, that what he means by the terms *soul* and *substance*, is only some particular sort of idea or sensation. We may therefore infer, that all things duly considered, it is not more reasonable to think our faculties defective, in that they do not furnish us with an idea of spirit or active thinking substance, than it would be if we should blame them for not being able to comprehend a *round square*.

137. From the opinion that spirits are to be known after the manner of an idea or sensation, have risen many absurd and heterodox tenets, and much skepticism about the nature of the soul. It is even probable, that this opinion may have produced a doubt in some, whether they had any soul at all distinct from their body, since upon inquiry they could not find they had an idea of it. That an *idea* which is inactive, and the existence whereof consists in being perceived, should be the image or likeness of an agent subsisting by itself, seems to need no other refutation, than barely attending to what is meant by those words. But perhaps you will say, that though an *idea* cannot resemble a *spirit*, in its thinking, acting, or subsisting by itself, yet it may in some other respects: and it is not necessary that an idea or image be in all respects like the original.

138. I answer, if it does not in those mentioned, it is impossible it should represent it in any other thing. Do but leave out the power of willing, thinking, and perceiving ideas, and there remains nothing else wherein the idea can be like a spirit. For by the word *spirit* we mean only that which thinks, wills, and perceives; this, and this alone, constitutes the signification of that term. If therefore it is impossible that any degree of those powers should be represented in an idea, it is evident there can be no idea of a spirit.

139. But it will be objected, that if there is no idea signified by the terms *soul*, *spirit*, and *substance*, they are wholly insignificant, or have no meaning in them. I answer, those words do mean or signify a real thing, which is neither an idea nor like an idea, but that which perceives ideas, and wills, and reasons about them. What I am myself, that which I denote by the term I, is the same with what is meant by *soul* or *spiritual substance*. If it be said that this is only quarrelling at a word, and that since the immediate significations of other names are by common consent called *ideas*, no reason can be assigned, why that which is signified by the name *spirit* or *soul* may not partake in the same appellation. I answer, all the unthinking objects of the mind agree, in that they are entirely passive, and their existence consists only in being perceived: whereas a soul or

spirit is an active being, whose existence consists not in being perceived, but in perceiving ideas and thinking. It is therefore necessary, in order to prevent equivocation and confounding natures perfectly disagreeing and unlike, that we distinguish between *spirit* and *idea*. See Sect. 27.

140. In a large sense indeed, we may be said to have an idea, or rather a notion of *spirit*, that is, we understand the meaning of the word, otherwise we could not affirm or deny anything of it. Moreover, as we conceive the ideas that are in the minds of other spirits by means of our own, which we suppose to be resemblances of them: so we know other spirits by means of our own soul, which in that sense is the image or idea of them, it having a like respect to other spirits, that blueness or heat by me perceived has to those ideas perceived by another.

141. It must not be supposed, that they who assert the natural immortality of the soul are of opinion, that it is absolutely incapable of annihilation even by the infinite power of the Creator who first gave it being: but only that it is not liable to be broken or dissolved by the ordinary laws of nature or motion. They indeed, who hold the soul of man to be only a thin vital flame, or system of animal spirits, make it perishing and corruptible as the body, since there is nothing more easily dissipated than such a being, which it is naturally impossible should survive the ruin of the tabernacle, wherein it is enclosed. And this notion has been greedily embraced and cherished by the worst part of mankind, as the most effectual antidote against all impressions of virtue and religion. But it has been made evident, that bodies of what frame or texture soever, are barely passive ideas in the mind, which is more distant and heterogeneous from them, than light is from darkness. We have shown that the soul is indivisible, incorporeal, unextended, and it is consequently incorruptible. Nothing can be plainer, than that the motions, changes, decays, and dissolutions which we hourly see befall natural bodies (and which is what we mean by the *course of nature*) cannot possibly affect an active, simple, uncompounded substance: such a being therefore is indissoluble by the force of nature, that is to say, *the soul of man is naturally immortal*.

142. After what has been said, it is I suppose plain, that our souls are not to be known in the same manner as senseless inactive objects, or by way of *idea*. *Spirits* and *ideas* are things so wholly different, that when we say, *they exist, they are known*, or the like, these words must not be thought to signify anything common to both natures. There is nothing alike or common in them: and to expect that by any multiplication or enlargement of our faculties, we may be enabled to know a spirit as we do a triangle, seems as absurd as if we should hope to *see a sound*. This is inculcated because I imagine it may be of moment towards clearing several important questions, and preventing some very dangerous errors concerning the nature of the soul. (We may not I think strictly be said to have an idea of an active being, or of an action, although we may be said to have a notion of them. I have some knowledge or notion of my mind, and its acts about ideas, inasmuch as I know or understand what is meant by those words. What I know, that I have some notion of, I will not say, that the terms *idea* and *notion* may not be used convertibly, if the world will have it so. But yet it conduces to clearness and propriety, that we distinguish things very different by different names. It is also to be remarked, that all relations including an act of the mind, we cannot so properly be said to have an idea, but rather a notion of the relations or habitudes between things. But if in the modern way the word *idea* is extended to spirits, and relations and acts; this is after all an affair of verbal concern.)

143. It will not be amiss to add, that the doctrine of *abstract ideas* has had no small share in rendering those sciences intricate and obscure, which are particularly conversant about spiritual things. Men have imagined they could frame abstract notions of the powers and acts of the mind, and consider them prescinded, as well from the mind or spirit itself, as from their respective objects and effects. Hence a great number of dark and ambiguous terms presumed to stand for abstract notions, have been introduced into metaphysics and morality, and from these have grown infinite distractions and disputes amongst the learned.

144. But nothing seems more to have contributed towards engaging men in controversies and mistakes, with regard to the nature and operations of the mind, than the being used to speak of those things, in terms borrowed from sensible ideas. For example, the will is termed the *motion* of the soul: this infuses a belief, that the mind of man is as a ball in motion, impelled and determined by the objects of sense, as necessarily as that is by the stroke of a racket.²⁰ Hence arise endless scruples and errors of dangerous consequence in morality. All which I doubt not may be cleared, and truth appear plain, uniform, and consistent, could but philosophers be prevailed on to retire into themselves, and attentively consider their own meaning.

145. From what has been said, it is plain that we cannot know the existence of other spirits, otherwise than by their operations, or the ideas by them excited in us. I perceive several motions, changes, and combinations of ideas, that inform me there are certain particular agents like myself, which accompany them, and concur in their production. Hence the knowledge I have of other spirits is not immediate, as is the knowledge of my ideas: but depending on the intervention of ideas, by me referred to agents or spirits distinct from myself, as

effects or concomitant signs.

146. But though there be some things which convince us, human agents are concerned in producing them; yet it is evident to everyone, that those things which are called the works of nature, that is, the far greater part of the ideas or sensations perceived by us, are not produced by, or dependent on the wills of men. There is therefore some other spirit that causes them, since it is repugnant that they should subsist by themselves. See Sect. 29. But if we attentively consider the constant regularity, order, and concatenation of natural things, the surprising magnificence, beauty, and perfection of the larger, and the exquisite contrivance of the smaller parts of the creation, together with the exact harmony and correspondence of the whole, but above all, the never enough admired laws of pain and pleasure, and the instincts or natural inclinations, appetites, and passions of animals; I say if we consider all these things, and at the same time attend to the meaning and import of the attributes, one, eternal, infinitely wise, good, and perfect, we shall clearly perceive that they belong to the aforesaid spirit, *who works all in all, and by whom all things consist*.²¹

147. Hence it is evident, that God is known as certainly and immediately as any other mind or spirit whatsoever, distinct from ourselves. We may even assert, that the existence of God is far more evidently perceived than the existence of men; because the effects of nature are infinitely more numerous and considerable, than those ascribed to human agents. There is not any one mark that denotes a man, or effect produced by him, which does not more strongly evince the being of that spirit who is the *Author of Nature*. For it is evident that in affecting other persons, the will of man has no other object, than barely the motion of the limbs of his body; but that such a motion should be attended by, or excite any idea in the mind of another, depends wholly on the will of the Creator. He alone it is who *upholding all things by the word of his power*, maintains that intercourse between spirits, whereby they are able to perceive the existence of each other.²² And yet this pure and clear light which enlightens everyone, is itself invisible.

148. It seems to be a general pretense of the unthinking herd, that they cannot see God. Could we but see him, say they, as we see a man, we should believe that he is, and believing obey his commands. But alas we need only open our eyes to see the sovereign lord of all things with a more full and clear view, than we do any one of our fellow-creatures. Not that I imagine we see God (as some will have it) by a direct and immediate view, or see corporeal things, not by themselves, but by seeing that which represents them in the essence of God, which doctrine is I must confess to me incomprehensible.²³ But I shall explain my meaning. A human spirit or person is not perceived by sense, as not being an idea; when therefore we see the color, size, figure, and motions of a man, we perceive only certain sensations or ideas excited in our own minds: and these being exhibited to our view in sundry distinct collections, serve to mark out unto us the existence of finite and created spirits like ourselves. Hence it is plain, we do not see a man, if by *man* is meant that which lives, moves, perceives, and thinks as we do: but only such a certain collection of ideas, as directs us to think there is a distinct principle of thought and motion like to ourselves, accompanying and represented by it. And after the same manner we see God; all the difference is, that whereas some one finite and narrow assemblage of ideas denotes a particular human mind, whithersoever we direct our view, we do at all times and in all places perceive manifest tokens of the Divinity: everything we see, hear, feel, or any wise perceive by sense, being a sign or effect of the power of God; as is our perception of those very motions, which are produced by men.

149. It is therefore plain, that nothing can be more evident to anyone that is capable of the least reflection, than the existence of God, or a spirit who is intimately present to our minds, producing in them all that variety of ideas or sensations, which continually affect us, on whom we have an absolute and entire dependence, in short, *in whom we live, and move, and have our being*.²⁴ That the discovery of this great truth which lies so near and obvious to the mind, should be attained to by the reason of so very few, is a sad instance of the stupidity and inattention of men, who, though they are surrounded with such clear manifestations of the Deity, are yet so little affected by them, that they seem as it were blinded with excess of light.

150. But you will say, has nature no share in the production of natural things, and must they be all ascribed to the immediate and sole operation of God? I answer, if by *nature* is meant only the visible *series* of effects, or sensations imprinted on our minds according to certain fixed and general laws: then it is plain, that nature taken in this sense cannot produce anything at all. But if by *nature* is meant some being distinct from God, as well as from the laws of nature, and things perceived by sense, I must confess that word is to me an empty sound, without any intelligible meaning annexed to it. Nature in this acceptation is a vain *chimera* introduced by those heathens, who had not just notions of the omnipresence and infinite perfection of God. But it is more unaccountable, that it should be received among *Christians* professing belief in the Holy Scriptures, which constantly ascribe those effects to the immediate hand of God, that heathen philosophers are wont to impute to *nature*. *The Lord, he causeth the vapors to ascend; he maketh lightnings with rain; he bringeth forth the*

wind out of his treasures, Jerem. Chap. 10 ver. 13. *He turneth the shadow of death into the morning, and maketh the day dark with night*, Amos Chap. 5. ver. 8. *He visiteth the earth, and maketh it soft with showers: he blesseth the springing thereof, and crowneth the year with his goodness; so that the pastures are clothed with flocks, and the valleys are covered over with corn.* See Psalm 65. But notwithstanding that this is the constant language of Scripture; yet we have I know not what aversion from believing, that God concerns himself so nearly in our affairs. Fain would we suppose him at a great distance off, and substitute some blind unthinking deputy in his stead, though (if we may believe Saint Paul) *he be not far from every one of us.*²⁵

151. It will I doubt not be objected, that the slow and gradual methods observed in the production of natural things, do not seem to have for their cause the immediate hand of an *almighty agent*. Besides, monsters, untimely births, fruits blasted in the blossom, rains falling in desert places, miseries incident to human life, are so many arguments that the whole frame of nature is not immediately actuated and superintended by a spirit of infinite wisdom and goodness. But the answer to this objection is in a good measure plain from Sect. 62, it being visible, that the aforesaid methods of nature are absolutely necessary, in order to working by the most simple and general rules, and after a steady and consistent manner; which argues both the *wisdom* and *goodness* of God. Such is the artificial contrivance of this mighty machine of nature, that whilst its motions and various phenomena strike on our senses, the hand which actuates the whole is itself unperceivable to men of flesh and blood. *Verily* (says the prophet) *thou art a God that hidest thyself*; Isaiah Chap. 45 ver. 15. But though God conceal himself from the eyes of the *sensual* and *lazy*, who will not be at the least expense of thought; yet to an unbiased and attentive mind, nothing can be more plainly legible, than the intimate presence of an *all-wise spirit*, who fashions, regulates, and sustains the whole system of being. It is clear from what we have elsewhere observed, that the operating according to general and stated laws, is so necessary for our guidance in the affairs of life, and letting us into the secret of nature, that without it, all reach and compass of thought, all human sagacity and design could serve to no manner of purpose: it were even impossible there should be any such faculties or powers in the mind. See Sect. 31. Which one consideration abundantly out-balances whatever particular inconveniences may thence arise.

152. We should further consider, that the very blemishes and defects of nature are not without their use, in that they make an agreeable sort of variety, and augment the beauty of the rest of the creation, as shades in a picture serve to set off the brighter and more enlightened parts. We would likewise do well to examine, whether our taxing the waste of seeds and embryos, and accidental destruction of plants and animals, before they come to full maturity, as an imprudence in the Author of Nature, be not the effect of prejudice contracted by our familiarity with impotent and saving mortals. In *man* indeed a thrifty management of those things, which he cannot procure without much pains and industry, may be esteemed *wisdom*. But we must not imagine, that the inexplicably fine machines of an animal or vegetable, costs the great Creator any more pains or trouble in its production than a pebble does: nothing being more evident, than that an omnipotent spirit can indifferently produce everything by a mere *fiat* or act of his will. Hence it is plain, that the splendid profusion of natural things should not be interpreted, weakness or prodigality in the agent who produces them, but rather be looked on as an argument of the riches of his power.

153. As for the mixture of pain or uneasiness which is in the world, pursuant to the general laws of nature, and the actions of finite imperfect spirits: this, in the state we are in at present, is indispensably necessary to our well-being. But our prospects are too narrow: we take, for instance, the idea of some one particular pain into our thoughts, and account it *evil*; whereas if we enlarge our view, so as to comprehend the various ends, connections, and dependencies of things, on what occasions and in what proportions we are affected with pain and pleasure, the nature of human freedom, and the design with which we are put into the world; we shall be forced to acknowledge that those particular things, which considered in themselves appear to be *evil*, have the nature of *good*, when considered as linked with the whole system of beings.

154. From what has been said it will be manifest to any considering person, that it is merely for want of attention and comprehensiveness of mind, that there are any favorers of *atheism* or the *Manichean heresy* to be found.²⁶ Little and unreflecting souls may indeed burlesque the works of providence, the beauty and order whereof they have not capacity, or will not be at the pains to comprehend. But those who are masters of any justness and extent of thought, and are withal used to reflect, can never sufficiently admire the divine traces of wisdom and goodness that shine throughout the economy of nature. But what truth is there which shines so strongly on the mind, that by an aversion of thought, a willful shutting of the eyes, we may not escape seeing it? Is it therefore to be wondered at, if the generality of men, who are ever intent on business or pleasure, and little used to fix or open the eye of their mind, should not have all that conviction and evidence of the being of God, which might be expected in reasonable creatures?

155. We should rather wonder, that men can be found so stupid as to neglect, than that neglecting they

should be unconvinced of such an evident and momentous truth. And yet it is to be feared that too many of parts and leisure, who live in Christian countries, are merely through a supine and dreadful negligence sunk into a sort of *atheism*. Since it is downright impossible, that a soul pierced and enlightened with a thorough sense of the omnipresence, holiness, and justice of that *Almighty Spirit*, should persist in a remorseless violation of his laws. We ought therefore earnestly to meditate and dwell on those important points; that so we may attain conviction without all scruple, *that the eyes of the Lord are in every place beholding the evil and the good; that he is with us and keepeth us in all places whither we go, and giveth us bread to eat, and raiment to put on; that he is present and conscious to our innermost thoughts; and that we have a most absolute and immediate dependence on him.*²⁷ A clear view of which great truths cannot choose but fill our hearts with an awful circumspection and holy fear, which is the strongest incentive to *virtue*, and the best guard against *vice*.

156. For after all, what deserves the first place in our studies, is the consideration of God, and our *duty*, which to promote, as it was the main drift and design of my labors, so shall I esteem them altogether useless and ineffectual, if by what I have said I cannot inspire my readers with a pious sense of the presence of God: and having shown the falseness or vanity of those barren speculations, which make the chief employment of learned men, the better dispose them to reverence and embrace the salutary truths of the Gospel, which to know and to practice is the highest perfection of human nature.

*Reprinted from Berkeley, *A Treatise Concerning the Principles of Human Knowledge*, edited by Kenneth Winkler (Indianapolis: Hackett Publishing Co., 1982), by permission of the publisher.

1. [The philosopher is John Locke (1632–1704), whose *An Essay concerning Human Understanding* was first published in 1690. — K.W.]
2. [The emphasis on “all and none” and “inconsistent” is Berkeley’s.]
3. [“Schoolmen” refers to the philosophers and theologians who taught in the medieval universities (the “Schools”) and to later figures who philosophized in their style. They were also known as “Scholastics.” Berkeley does not refer to any of the Schoolmen by name in the *Principles*, but in *Alciphron* IV he briefly discusses St. Thomas Aquinas (c. 1224–1274) and Francisco Suarez (1548–1617). Berkeley’s opinion of the Schoolmen is typical of its time: he thinks their “bickerings and controversies” are over-subtle and useless (a view expressed in the present section), and that they too often defer to the authority of Aristotle.]
4. [No doubt Berkeley is thinking of Locke, who often advises his readers to lay aside words and attend to ideas. See for example *Essay* IV iv 17 and IV iii 30.]
5. [esse, to be; *percipi*, to be perceived.]
6. [Locke makes the distinction at *Essay* II viii 9–26.]
7. [Aristotle calls the wood of a casket its *matter*. He thinks the various kinds of matter can be arranged in a hierarchy: wood, for example, is matter for a casket, while earth (one of the four basic elements) is matter for wood. *Materia prima*, or prime matter, is a totally indeterminate substratum, the most basic item in the hierarchy. Berkeley follows a long tradition when he attributes belief in prime matter to Aristotle, but it is a tradition many scholars now dispute.]
8. [Locke makes these observations about unity at *Essay* II xvi 1.]
9. [Berkeley is probably referring to Locke’s remarks on “pure substance in general” at *Essay* II xxiii 2.]
10. [*a posteriori*, from what comes after; *a priori*, from what comes before. These are among the first appearances of these expressions in English. Berkeley does not use the expressions as philosophers do today. According to Berkeley, an *a posteriori* argument against a belief attacks the belief through its effects or consequences, which in the case of matter include skepticism, atheism, and various difficulties in physics and mathematics. An *a priori* argument attacks the belief directly. Berkeley’s promise to present the *a posteriori* case against matter is fulfilled in sections 85–96 and 101–34.]
11. [One of the “modern philosophers” is Nicolas Malebranche (1638–1715). See his *The Search after Truth*, Book 6, Part 2, chapter 3.]
12. [Acts 17:28.]
13. Sect. 29, 30, 33, 36, etc.
14. [Epicurus and Thomas Hobbes both maintain that the universe is nothing but matter in motion. Epicurus acknowledges the existence of gods, but he believes they have no interest in the world. Hobbes writes as if he believes in God, and even offers a proof of God’s existence, but he has always been suspected of atheism, in part because his metaphysics commits him to the view that God, if he exists, is a material thing.]
15. [The Socinians were followers of Fausto Sozzini (Latinized “Socinus,” 1539–1604), and forerunners of the Unitarians. Though they denied the divinity of Christ, their leading catechism affirms the resurrection. In Berkeley’s day the word “Socinian” was often applied to anyone who challenged Christian orthodoxy, and this probably explains Berkeley’s use of it here.]
16. [Among the philosophers who deny either the existence of final causes or the propriety of inquiry into them are René Descartes in *The Principles of Philosophy*, Part I, xxviii, and Baruch Spinoza in the Appendix to Part I of his *Ethics*.]
17. [The treatise is *Mathematical Principles of Natural Philosophy*, published by Isaac Newton (1642–1727) in 1687. Berkeley refers to it under its

Latin title in section 114.]

18. [Transubstantiation is the conversion of the substance of the bread and wine of the Eucharist into the substance of the body and blood of Christ.]

19. [The *minimum sensible* is the smallest quantity capable of being sensed, a “sensible point.”]

20. [Berkeley is apparently thinking of Hobbes.]

21. [*who works all in all*, 1 Corinthians 12:6; *by whom all things consist*, Colossians 1:17.]

22. [*upholding all things by ... his power*, Hebrews 1:3.]

23. [Malebranche believes that “we see all things in God.” See *The Search after Truth*, Book 3, Part 2, chapter 6. Berkeley explains how he differs from Malebranche in *Three Dialogues* 2.]

24. [Acts 17:28.]

25. [Acts 17:27.]

26. [The Manicheans (followers of Mani, c. 216–276) believed that the world is governed by two competing principles, one good, the other evil.]

*Three Dialogues between Hylas and Philonous, in Opposition to Skeptics and Atheists**

THE FIRST DIALOGUE

PHILONOUS: Good morning, Hylas; I did not expect to find you up so early.

HYLAS: It is indeed something unusual, but my thoughts were so taken up with a subject I was discoursing of last night that, finding I could not sleep, I resolved to rise and take a turn in the garden.

P: It happened well to let you see what innocent and agreeable pleasures you lose every morning. Can there be a pleasanter time of the day, or a more delightful season of the year? That purple sky, those wild but sweet notes of birds, the fragrant bloom upon the trees and flowers, the gentle influence of the rising sun, these and a thousand nameless beauties of nature inspire the soul with secret transports; its faculties too being at this time fresh and lively are fit for these meditations, which the solitude of a garden and tranquillity of the morning naturally dispose us to. But I am afraid I interrupt your thoughts, for you seemed very intent on something.

H: It is true, I was, and shall be obliged to you if you will permit me to go on in the same vein; not that I would by any means deprive myself of your company, for my thoughts always flow more easily in conversation with a friend than when I am alone, but my request is that you would allow me to impart my reflections to you.

P: With all my heart, it is what I should have requested myself, if you had not prevented me.

H: I was considering the odd fate of those men who have in all ages, through an affectation of being distinguished from the vulgar — or some unaccountable turn of thought— pretended either to believe nothing at all or to believe the most extravagant things in the world. This, however, might be borne, if their paradoxes and skepticism did not draw after them some consequences of general disadvantage to mankind. But the mischief lies here, that when men of less leisure see them who are supposed to have spent their whole time in the pursuits of knowledge, professing an entire ignorance of all things or advancing such notions as are repugnant to plain and commonly received principles, they will be tempted to entertain suspicions concerning the most important truths, which they had up to now held sacred and unquestionable.

P: I entirely agree with you as to the ill tendency of the affected doubts of some philosophers and fantastic conceits of others. I am even so far gone of late in this way of thinking that I have discarded several of the sublime notions I had got in their schools for vulgar opinions. And I give it you on my word, since this revolt from metaphysical notions to the plain dictates of nature and common sense, I find my understanding strangely enlightened so that I can now easily comprehend a great many things which before were all mystery and riddle.

H: I am glad to find there was nothing in the accounts I heard of you.

P: Pray, what were those?

H: You were represented in last night's conversation as one who maintained the most extravagant opinion that ever entered into the mind of man, namely, that there is no such thing as *material substance* in the world.

P: That there is no such thing as what philosophers call *material substance*, I am seriously persuaded, but if I were made to see anything absurd or skeptical in this, I should then have the same reason to renounce this, that I imagine I have now to reject the contrary opinion.

H: What! Can anything be more fantastic, more repugnant to common sense, or a more manifest piece of skepticism, than to believe there is no such thing as *matter*?

P: Softly, good Hylas. What if it should prove that you, who hold there is, are by virtue of that opinion a

greater skeptic and maintain more paradoxes and repugnancies to common sense than I who believe no such thing?

H: You may as soon persuade me the part is greater than the whole, as that, in order to avoid absurdity and skepticism, I should ever be obliged to give up my opinion in this point.

P: Well then, are you content to admit that opinion for true which upon examination shall appear most agreeable to common sense and remote from skepticism?

H: With all my heart. Since you are for raising disputes about the plainest things in nature, I am content for once to hear what you have to say.

P: Pray, Hylas, what do you mean by a *skeptic*?

H: I mean what all men mean, one that doubts of everything.

P: He then who entertains no doubt concerning some particular point, with regard to that point, cannot be thought a *skeptic*.

H: I agree with you.

P: Whether doubting consists in embracing the affirmative or negative side of a question?

H: In neither; for whoever understands English cannot but know that *doubting* signifies a suspense between both.

P: He then who denies any point can no more be said to doubt of it than he who affirms it with the same degree of assurance.

H: True.

P: And, consequently, in this case his denial is no more to be esteemed *skeptical* than the other.

H: I acknowledge it.

P: How does it come to pass then, Hylas, that you pronounce me a *skeptic*, because I deny what you affirm, namely, the existence of matter? Since, for all you can tell, I am as peremptory in my denial as you in your affirmation.

H: Hold on, Philonous, I have been a little out in my definition, but every false step a man makes in discourse is not to be insisted on. I said, indeed, that a *skeptic* was one who doubted of everything, but I should have added: or who denies the reality and truth of things.

P: What things? Do you mean the principles and theorems of sciences? But these you know are universal intellectual notions and consequently independent of matter; the denial of this therefore does not imply denying them.

H: I grant it. But are there no other things? What do you think of distrusting the senses, of denying the real existence of sensible things, or pretending to know nothing of them? Is not this sufficient to call a man a *skeptic*?

P: Shall we therefore examine which of us it is that denies the reality of sensible things or professes the greatest ignorance of them, since, if I take you rightly, he is to be esteemed the greatest *skeptic*?

H: That is what I desire.

P: What do you mean by sensible things?

H: Those things which are perceived by the senses. Can you imagine that I mean anything else?

P: Pardon me, Hylas, if I am desirous clearly to apprehend your notions, since this may much shorten our inquiry. Allow me then to ask you this further question. Are those things only perceived by the senses which are perceived immediately? Or may those things properly be said to be *sensible* which are perceived mediately or not without the intervention of others?

H: I do not sufficiently understand you.

P: In reading a book, what I immediately perceive are the letters, but mediately, or by means of these, are suggested to my mind the notions of God, virtue, truth, etc. Now that the letters are truly sensible things, or perceived by sense, there is no doubt; but I would like to know whether you take the things suggested by them to be so too.

H: No, certainly, it would be absurd to think *God* or *virtue* sensible things, though they may be signified and suggested to the mind by sensible marks with which they have an arbitrary connection.

P: It seems then, that by *sensible things* you mean those only which can be perceived immediately by sense.

H: Right.

P: Does it not follow from this that though I see one part of the sky red, and another blue, and that my reason does then evidently conclude there must be some cause of that diversity of colors, yet that cause cannot be said to be a sensible thing or perceived by the sense of seeing?

H: It does.

P: In like manner, though I hear a variety of sounds, yet I cannot be said to hear the causes of those sounds.

H: You cannot.

P: And when by my touch I perceive a thing to be hot and heavy, I cannot say with any truth or propriety that I feel the cause of its heat or weight.

H: To prevent any more questions of this kind, I tell you once and for all that by *sensible things* I mean those only which are perceived by sense and that in truth the senses perceive nothing which they do not perceive immediately, for they make no inferences. The deducing therefore of causes or occasions from effects and appearances, which alone are perceived by sense, entirely relates to reason.

P: This point then is agreed between us — that *sensible things are those only which are immediately perceived by sense*. You will further inform me whether we immediately perceive by sight anything besides light, and colors, and figures; or by hearing anything but sounds; by the palate, anything besides tastes; by the smell, besides odors; or by the touch, more than tangible qualities.

H: We do not.

P: It seems, therefore, that if you take away all sensible qualities, there remains nothing sensible.

H: I grant it.

P: Sensible things therefore are nothing else but so many sensible qualities or combinations of sensible qualities.

H: Nothing else.

P: Heat then is a sensible thing.

H: Certainly.

P: Does the reality of sensible things consist in being perceived? Or, is it something distinct from their being perceived and that bears no relation to the mind?

H: To *exist* is one thing and to be *perceived* is another.

P: I speak with regard to sensible things only; and of these I ask whether by their real existence you mean a subsistence exterior to the mind and distinct from their being perceived?

H: I mean a real absolute being, distinct from and without any relation to their being perceived.

P: Heat, therefore, if it is allowed a real being, must exist without the mind.

H: It must.

P: Tell me, Hylas, is this real existence equally compatible to all degrees of heat which we perceive, or is there any reason why we should attribute it to some and deny it others? And if there is, pray let me know that reason.

H: Whatever degree of heat we perceive by sense, we may be sure the same exists in the object that occasions it.

P: What! The greatest as well as the least?

H: I tell you, the reason is plainly the same in respect of both: They are both perceived by sense; no, the greater degree of heat is more sensibly perceived and, consequently, if there is any difference, we are more certain of its real existence than we can be of the reality of a lesser degree.

P: But is not the most vehement and intense degree of heat a very great pain?

H: No one can deny it.

P: And is any unperceiving thing capable of pain or pleasure?

H: No certainly.

P: Is your material substance a senseless being or a being endowed with sense and perception?

H: It is senseless without doubt.

P: It cannot therefore be the subject of pain.

H: By no means.

P: Nor consequently of the greatest heat perceived by sense, since you acknowledge this to be no small pain.

H: I grant it.

P: What shall we say then of your external object; is it a material substance or not?

H: It is a material substance with the sensible qualities inhering in it.

P: How then can a great heat exist in it, since you admit it cannot in a material substance? I desire you would clear this point.

H: Hold on, Philonous, I fear I was wrong in yielding intense heat to be a pain. It should seem rather that pain is something distinct from heat and the consequence or effect of it.

P: Upon putting your hand near the fire, do you perceive one simple uniform sensation or two distinct sensations?

H: But one simple sensation.

P: Is not the heat immediately perceived?

H: It is.

P: And the pain?

H: True.

P: Seeing therefore they are both immediately perceived at the same time and the fire affects you only with one simple or uncompounded idea, it follows that this same simple idea is both the intense heat immediately perceived and the pain, and, consequently, that the intense heat immediately perceived is nothing distinct from a particular sort of pain.

H: It seems so.

P: Again, try in your thoughts, Hylas, if you can conceive a vehement sensation to be without pain or pleasure.

H: I cannot.

P: Or can you frame to yourself an idea of sensible pain or pleasure in general, abstracted from every particular idea of heat, cold, tastes, smells, etc.?

H: I do not find that I can.

P: Does it not therefore follow that sensible pain is nothing distinct from those sensations or ideas in an intense degree?

H: It is undeniable, and, to speak the truth, I begin to suspect a very great heat cannot exist but in a mind perceiving it.

P: What! Are you then in that *skeptical* state of suspense between affirming and denying?

H: I think I may be positive in the point. A very violent and painful heat cannot exist without the mind.

P: It does not, therefore, according to you, have any real being.

H: I admit it.

P: Is it therefore certain that there is no body in nature really hot?

H: I have not denied there is any real heat in bodies. I only say there is no such thing as an intense real heat.

P: But did you not say before that all degrees of heat were equally real or, if there was any difference, that the greater would be more undoubtedly real than the lesser?

H: True, but it was because I did not then consider the ground there is for distinguishing between them which I now plainly see. And it is this: Because intense heat is nothing else but a particular kind of painful sensation and pain cannot exist but in a perceiving being, it follows that no intense heat can really exist in an unperceiving corporeal substance. But this is no reason why we should deny heat in an inferior degree to exist in such a substance.

P: But how shall we be able to discern those degrees of heat which exist only in the mind, from those which exist without it?

H: That is no difficult matter. You know the least pain cannot exist unperceived; therefore, whatever degree of heat is a pain exists only in the mind. But as for all other degrees of heat nothing obliges us to think the same of them.

P: I think you granted before that no unperceiving being was capable of pleasure any more than of pain.

H: I did.

P: And is not warmth, or a more gentle degree of heat than what causes uneasiness, a pleasure?

H: What then?

P: Consequently, it cannot exist without the mind in any unperceiving substance or body.

H: So it seems.

P: Since, therefore, those degrees of heat that are not painful as well as those that are can exist only in a thinking substance, may we not conclude that external bodies are absolutely incapable of any degree of heat whatsoever?

H: On second thought, I do not think it so evident that warmth is a pleasure as that a great degree of heat is a pain.

P: I do not pretend that warmth is as great a pleasure as heat is a pain. But if you grant it to be even a small pleasure, it serves to make good my conclusion.

H: I could rather call it an *indolence*. It seems to be nothing more than a privation of both pain and pleasure. And that such a quality or state as this may agree to an unthinking substance, I hope you will not deny.

P: If you are resolved to maintain that warmth, or a gentle degree of heat, is no pleasure, I do not know how to convince you otherwise than by appealing to your own sense. But what do you think of cold?

H: The same that I do of heat. An intense degree of cold is a pain, for to feel a very great cold is to perceive a great uneasiness; it cannot, therefore, exist without the mind, but a lesser degree of cold may as well as a lesser degree of heat.

P: Those bodies, therefore, upon whose application to our own we perceive a moderate degree of heat, must be concluded to have a moderate degree of heat or warmth in them; and those, upon whose application we feel a like degree of cold, must be thought to have cold in them.

H: They must.

P: Can any doctrine be true that necessarily leads a man into an absurdity?

H: Without doubt it cannot.

P: Is it not an absurdity to think that the same thing should be at the same time both cold and warm?

H: It is.

P: Suppose now one of your hands hot, and the other cold, and that they are both at once put into the same vessel of water in an intermediate state; will not the water seem cold to one hand and warm to the other?

H: It will.

P: Ought we not therefore by your principles conclude: It is really both cold and warm at the same time, that is, according to your own concession, believe an absurdity?

H: I confess it seems so.

P: Consequently, the principles themselves are false, since you have granted that no true principle leads to an absurdity.

H: But, after all, can anything be more absurd than to say *there is no heat in the fire*?

P: To make the point still clearer, tell me whether in two cases exactly alike we ought not make the same judgment?

H: We ought.

P: When a pin pricks your finger, does it not rend and divide the fibers of your flesh?

H: It does.

P: And when a coal burns your finger, does it do so any more?

H: It does not.

P: Since, therefore, you neither judge the sensation itself occasioned by the pin, nor anything like it to be

in the pin, you should not, conformably to what you have now granted, judge the sensation occasioned by the fire, or anything like it, to be in the fire.

H: Well, since it must be so, I am content to yield this point and acknowledge that heat and cold are only sensations existing in our minds, but there still remain qualities enough to secure the reality of external things.

P: But what will you say, Hylas, if it shall appear that the case is the same with regard to all other sensible qualities and that they can no more be supposed to exist without the mind than heat and cold?

H: Then indeed you will have done something to the purpose, but that is what I despair of seeing proved.

P: Let us examine them in order. What think you of tastes — do they exist without the mind or not?

H: Can any man in his senses doubt whether sugar is sweet or wormwood bitter?

P: Inform me, Hylas. Is a sweet taste a particular kind of pleasure or pleasant sensation, or is it not?

H: It is.

P: And is not bitterness some kind of uneasiness or pain?

H: I grant it.

P: If therefore sugar and wormwood are unthinking corporeal substances existing without the mind, how can sweetness and bitterness, that is, pleasure and pain, agree to them?

H: Hold on, Philonous, I now see what deluded me all this time. You asked whether heat and cold, sweetness and bitterness, were not particular sorts of pleasure and pain—to which I answered simply that they were. Whereas I should have distinguished thus: Those qualities, as perceived by us, are pleasures or pains, but not as existing in the external objects. We must not, therefore, conclude absolutely that there is no heat in the fire or sweetness in the sugar, but only that heat or sweetness, as perceived by us, is not in the fire or sugar. What do you say to this?

P: I say it is nothing to the purpose. Our discourse proceeded altogether concerning sensible things, which you defined to be the things we *immediately perceive by our senses*. Therefore, whatever other qualities you speak of as distinct from these, I know nothing of them, nor do they at all belong to the point in dispute. You may indeed pretend to have discovered certain qualities which you do not perceive and assert those insensible qualities exist in fire and sugar. But what use can be made of this to your present purpose, I am at a loss to conceive. Tell me then once more—do you acknowledge that heat and cold, sweetness and bitterness (meaning those qualities which are perceived by the senses), do not exist without the mind?

H: I see it is to no purpose to hold out, so I give up the cause as to those mentioned qualities. Though I profess it sounds odd to say that sugar is not sweet.

P: But for your further satisfaction, take this along with you: That which at other times seems sweet shall to a distempered palate appear bitter. And nothing can be plainer than that various persons perceive different tastes in the same food, since that which one man delights in, another abhors. And how could this be, if the taste was something really inherent in the food?

H: I acknowledge I do not know how.

P: In the next place, odors are to be considered. And with regard to these, I would gladly know whether what has been said of tastes does not exactly agree to them? Are they not so many pleasing or displeasing sensations?

H: They are.

P: Can you then conceive it possible that they should exist in an unperceiving thing?

H: I cannot.

P: Or can you imagine that filth and garbage affect those brute animals that feed on them out of choice with the same smells which we perceive in them?

H: By no means.

P: May we not therefore conclude of smells, as of the other aforementioned qualities, that they cannot exist in any but a perceiving substance or mind?

H: I think so.

P: Then as to sounds, what must we think of them — are they accidents really inherent in external bodies or not?

H: That they do not inhere in the sonorous bodies is plain from this: because a bell struck in the exhausted receiver of an air pump sends forth no sound. The air, therefore, must be thought the subject of

sound.

P: What reason is there for that, Hylas?

H: Because, when any motion is raised in the air, we perceive a greater or lesser sound in proportion to the air's motion, but without some motion in the air we never hear any sound at all.

P: And granting that we never hear a sound but when some motion is produced in the air, yet I do not see how you can infer from this that the sound itself is in the air.

H: It is this very motion in the external air that produces in the mind the sensation of *sound*. For striking on the drum of the ear, it causes a vibration, which, being communicated to the brain by the auditory nerves, then affects the soul with the sensation called sound.

P: What! Is sound then a sensation?

H: I tell you, as perceived by us, it is a particular sensation in the mind.

P: And can any sensation exist without the mind?

H: No, certainly.

P: How then can sound, being a sensation, exist in the air if by the air you mean a senseless substance existing without the mind.

H: You must distinguish, Philonous, between sound as it is perceived by us and as it is in itself, or (which is the same thing) between the sound we immediately perceive and that which exists without us. The former indeed is a particular kind of sensation, but the latter is merely a vibrational or undulatory motion in the air.

P: I thought I had already obviated that distinction by the answer I gave when you were applying it in a like case before. But, to say no more of that, are you sure then that sound is really nothing but motion?

H: I am.

P: Whatever therefore agrees to real sound may with truth be attributed to motion.

H: It may.

P: It is then good sense to speak of *motion*, as of a thing that is *loud*, *sweet*, *acute*, or *grave*.

H: I see you are resolved not to understand me. Is it not evident those accidents or modes belong only to sensible sound, or *sound* in the common meaning of the word, but not to *sound* in the real and philosophic sense, which, as I just now told you, is nothing but a certain motion of the air?

P: It seems then there are two sorts of sound, the one vulgar, or that which is heard, the other philosophical and real.

H: Even so.

P: And the latter consists in motion.

H: I told you so before.

P: Tell me, Hylas, to which of the senses, do you think, the idea of motion belongs—to the hearing?

H: No, certainly, but to the sight and touch.

P: It should follow then, that according to you, real sounds may possibly be *seen* or *felt*, but never *heard*.

H: Look, Philonous, you may if you please make a jest of my opinion, but that will not alter the truth of things. I admit, indeed, the inferences you draw me into sound something odd, but common language, you know, is framed by and for the use of the vulgar. We must not therefore wonder if expressions adapted to exact philosophic notions seem uncouth and out of the way.

P: Is it come to that? I assure you, I imagine myself to have gained no small point, since you make so light of departing from common phrases and opinions, it being a main part of our inquiry to examine whose notions are widest of the common road and most repugnant to the general sense of the world. But can you think it no more than a philosophical paradox to say that *real sounds are never heard* and that the idea of them is obtained by some other sense. And is there nothing in this contrary to nature and the truth of things?

H: To deal ingenuously, I do not like it. And after the concessions already made, I granted as well that sounds too have no real being without the mind.

P: And I hope you will make no difficulty to acknowledge the same of colors.

H: Pardon me, the case of colors is very different. Can anything be plainer than that we see them on the objects?

P: The objects you speak of are, I suppose, corporeal substances existing without the mind.

H: They are.

P: And have true and real colors inhering in them?

H: Each visible object has that color which we see in it.

P: How! Is there anything visible but what we perceive by sight?

H: There is not.

P: And do we perceive anything by sense which we do not perceive immediately?

H: How often must I be obliged to repeat the same thing? I tell you, we do not.

P: Have patience, good Hylas, and tell me once more whether there is anything immediately perceived by the senses except sensible qualities. I know you asserted there was not, but I would now be informed whether you still persist in the same opinion.

H: I do.

P: Pray, is your corporeal substance either a sensible quality or made up of sensible qualities?

H: What a question that is! Who ever thought it was?

P: My reason for asking was because in saying *each visible object has that color which we see in it*, you make visible objects be corporeal substances, which implies either that corporeal substances are sensible qualities or else that there is something besides sensible qualities perceived by sight; but as this point was formerly agreed between us and is still maintained by you, it is a clear consequence that your corporeal substance is nothing distinct from sensible qualities.

H: You may draw as many absurd consequences as you please and endeavor to perplex the plainest things, but you shall never persuade me out of my senses. I clearly understand my own meaning.

P: I wish you would make me understand it too. But since you are unwilling to have your notion of corporeal substance examined, I shall urge that point no further. Only be pleased to let me know whether the same colors which we see exist in external bodies or some other.

H: The very same.

P: What! Are then the beautiful red and purple we see on yonder clouds really in them? Or do you imagine they have in themselves any other form than that of a dark mist or vapor?

H: I must admit, Philonous, those colors are not really in the clouds as they seem to be at this distance. They are only apparent colors.

P: *Apparent* call you them? How shall we distinguish these apparent colors from real?

H: Very easily. Those are to be thought apparent which, appearing only at a distance, vanish upon a nearer approach.

P: And those, I suppose, are to be thought real which are discovered by the most near and exact survey.

H: Right.

P: Is the nearest and most exact survey made by the help of a microscope or by the naked eye?

H: By a microscope, doubtless.

P: But a microscope often discovers colors in an object different from those perceived by the unassisted sight. And in case we had microscopes magnifying to any assigned degree, it is certain that no object whatsoever viewed through them would appear in the same color which it exhibits to the naked eye.

H: And what will you conclude from all this? You cannot argue that there are really and naturally no colors on objects because they may be altered or made to vanish by artificial managements.

P: I think it may evidently be concluded from your own concessions that all the colors we see with our naked eyes are only apparent as those on the clouds, since they vanish upon a more close and accurate inspection, which is afforded us by a microscope. Then as to what you say by way of prevention, I ask you whether the real and natural state of an object is better discovered by a very sharp and piercing sight or by one which is less sharp.

H: By the former without doubt.

P: Is it not plain from *Dioptrics* that microscopes make the sight more penetrating and represent objects as they would appear to the eye, in case it were naturally endowed with a most exquisite sharpness?

H: It is.

P: Consequently, the microscopic representation is to be thought that which best sets forth the real

nature of the thing or what it is in itself. The colors therefore perceived by it are more genuine and real than those perceived otherwise.

H: I confess there is something in what you say.

P: Besides, it is not only possible but manifest that there actually are animals whose eyes are by nature framed to perceive those things which by reason of their minuteness escape our sight. What do you think of those inconceivably small animals perceived by glasses? Must we suppose they are all stark blind? Or, in case they see, can it be imagined their sight does not have the same use in preserving their bodies from injuries which appears in that of all other animals? And if it does, is it not evident they must see particles less than their own bodies, which will present them with a far different view in each object from that which strikes our senses? Even our own eyes do not always represent objects to us after the same manner. With *jaundice*, everyone knows that all things seem yellow. Is it not therefore highly probable that those animals in whose eyes we discern a very different texture from that of ours and whose bodies abound with different humors, do not see the same colors in every object that we do? From all of which, should it not seem to follow that all colors are equally apparent and that none of those which we perceive are really inherent in any outward object?

H: It should.

P: The point will be past all doubt if you consider that in case colors were real properties or affections inherent in external bodies, they could admit of no alteration without some change made in the very bodies themselves. But is it not evident from what has been said that upon the use of microscopes, upon a change happening in the humors of the eye, or a variation of distance, without any manner of real alteration in the thing itself, the colors of any object are either changed or totally disappear? No, all other circumstances remaining the same, change but the situation of some objects and they shall present different colors to the eye. The same thing happens upon viewing an object in various degrees of light. And what is more known than that the same bodies appear differently colored by candlelight from what they do in the open day? Add to these the experiment of a prism which, separating the heterogeneous rays of light, alters the color of any object and will cause the whitest to appear of a deep blue or red to the naked eye. And now tell me whether you are still of the opinion that every body has its true, real color inhering in it; and if you think it has, I would gladly know further from you what certain distance and position of the object, what peculiar texture and formation of the eye, what degree or kind of light is necessary for ascertaining that true color and distinguishing it from apparent ones.

H: I admit myself entirely satisfied that they are all equally apparent and that there is no such thing as color really inhering in external bodies, but that it is altogether in the light. And what confirms me in this opinion is that, in proportion to the light, colors are still more or less vivid, and if there is no light, then there are no colors perceived. Besides, allowing there are colors on external objects, yet how is it possible for us to perceive them? For no external body affects the mind unless it acts first on our organs of sense. But the only action of bodies is motion, and motion cannot be communicated otherwise than by impulse. A distant object, therefore, cannot act on the eye, nor consequently make itself or its properties perceivable to the soul. From this it plainly follows that it is immediately some contiguous substance which, operating on the eye, occasions a perception of colors — and such is light.

P: How! Is light then a substance?

H: I tell you, Philonous, external light is nothing but a thin fluid substance whose minute particles, being agitated with a brisk motion and in various manners reflected from the different surfaces of outward objects to the eyes, communicate different motions to the optic nerves, which being propagated to the brain, cause various impressions in it; and these are attended with the sensations of red, blue, yellow, etc.

P: It seems, then, the light does no more than shake the optic nerves.

H: Nothing else.

P: And, consequent to each particular motion of the nerves, the mind is affected with a sensation, which is some particular color.

H: Right.

P: And these sensations have no existence without the mind.

H: They do not.

P: How then do you affirm that colors are in the light, since by light you understand a corporeal substance external to the mind?

H: Light and colors, as immediately perceived by us, I grant cannot exist without the mind. But in

themselves they are only the motions and configurations of certain insensible particles of matter.

P: Colors then, in the vulgar sense, or taken for the immediate objects of sight, cannot agree to any but a perceiving substance.

H: That is what I say.

P: Well then, since you give up the point as to those sensible qualities which are alone thought colors by all mankind besides, you may hold what you please with regard to those invisible ones of the philosophers. It is not my business to dispute about them; only I would advise you to envision yourself, whether, considering the inquiry we are upon, it would be prudent for you to affirm: *The red and blue which we see are not real colors, but certain unknown motions and figures which no man ever did or can see are truly so.* Are not these shocking notions, and are not they subject to as many ridiculous inferences as those you were obliged to renounce before in the case of sounds?

H: I frankly admit, Philonous, that it is in vain to stand out any longer. Colors, sounds, tastes, in a word, all those termed *secondary qualities*, have certainly no existence without the mind. But by this acknowledgment I must not be supposed to derogate anything from the reality of matter or external objects, seeing it is no more than several philosophers maintain who nevertheless are the furthest imaginable from denying matter. For the clearer understanding of this you must know sensible qualities are by philosophers divided into *primary* and *secondary*.¹ The former are extension, figure, solidity, gravity, motion, and rest. And these they hold exist really in bodies. The latter are those above enumerated or, briefly, all sensible qualities besides the primary, which they assert are only so many sensations or ideas existing nowhere but in the mind. But all this, I do not doubt, you are already apprised of. For my part, I have been a long time sensible there was such an opinion current among philosophers, but was never thoroughly convinced of its truth until now.

P: You are still then of the opinion that extension and figures are inherent in external unthinking substances.

H: I am.

P: But what if the same arguments which are brought against secondary qualities will hold proof against these also?

H: Why then I shall be obliged to think they too exist only in the mind.

P: Is it your opinion that the very figure and extension which you perceive by sense exist in the outward object or material substance?

H: It is.

P: Have all other animals as good grounds to think the same of the figure and extension which they see and feel?

H: Without doubt, if they have any thought at all.

P: Answer me, Hylas. Do you think the senses were bestowed upon all animals for their preservation and well being in life? Or were they given to men alone for this end?

H: I make no question but they have the same use in all other animals.

P: If so, is it not necessary they should be enabled by them to perceive their own limbs and those bodies which are capable of harming them?

H: Certainly.

P: A mite therefore must be supposed to see his own foot, and things equal or even less than it, as bodies of some considerable dimension, though at the same time they appear to you scarce discernible or at best as so many visible points.

H: I cannot deny it.

P: And to creatures less than the mite they will seem yet larger.

H: They will.

P: To the extent that what you can hardly discern will to another extremely minute animal appear as some huge mountain.

H: All this I grant.

P: Can one and the same thing be at the same time in itself of different dimensions?

H: That would be absurd to imagine.

P: But from what you have laid down it follows that both the extension perceived by you and that

perceived by the mite itself, as likewise all those perceived by lesser animals, are each of them the true extension of the mite's foot — that is to say, by your own principles you are led into an absurdity.

H: There seems to be some difficulty in the point.

P: Again, have you not acknowledged that no real inherent property of any object can be changed without some change in the thing itself?

H: I have.

P: But as we approach to or recede from an object, the visible extension varies, being at one distance ten or a hundred times greater than at another. Does it not therefore follow from this, likewise, that it is not really inherent in the object?

H: I admit I am at a loss what to think.

P: Your judgment will soon be determined if you will venture to think as freely concerning this quality as you have done concerning the rest. Was it not admitted as a good argument that neither heat nor cold was in the water because it seemed warm to one hand and cold to the other?

H: It was.

P: Is it not the very same reasoning to conclude there is no extension or figure in an object because to one eye it shall seem little, smooth, and round, when at the same time it appears to the other, great, uneven, and angular?

H: The very same. But does this latter fact ever happen?

P: You may at any time make the experiment by looking with one eye bare and with the other through a microscope.

H: I do not know how to maintain it, and yet I am loath to give up *extension*; I see so many odd consequences following upon such a concession.

P: Odd, you say? After the concessions already made, I hope you will stick at nothing for its oddness. But on the other hand should it not seem very odd if the general reasoning which includes all other sensible qualities did not also include extension? If it is allowed that no idea nor anything like an idea can exist in an unperceiving substance, then surely it follows that no figure or mode of extension, which we can either perceive or imagine or have any idea of, can be really inherent in matter—not to mention the peculiar difficulty there must be in conceiving a material substance, prior to and distinct from extension, to be the *substratum* of extension. Whatever the sensible quality is, figure, or sound, or color, it seems equally impossible it should subsist in that which does not perceive it.

H: I give up the point for the present, reserving still a right to retract my opinion, in case I shall hereafter discover any false step in my progress to it.

P: That is a right you cannot be denied. Figures and extension being dispatched, we proceed next to *motion*. Can a real motion in any external body be at the same time both very swift and very slow?

H: It cannot.

P: Is not the motion of a body swift in a reciprocal proportion to the time it takes up in describing any given space? Thus a body that describes a mile in an hour moves three times faster than it would in case it described only a mile in three hours.

H: I agree with you.

P: And is not time measured by the succession of ideas in our minds?

H: It is.

P: And is it not possible ideas should succeed one another twice as fast in your mind as they do in mine or in that of some spirit of another kind?

H: I admit it.

P: Consequently, the same body may to another seem to perform its motion over any space in half the time that it does to you. And the same reasoning will hold as to any other proportion — that is to say, according to your principles (since the motions perceived are both really in the object) it is possible one and the same body shall be really moved the same way at once, both very swift and very slow. How is this consistent either with common sense or with what you just now granted?

H: I have nothing to say to it.

P: Then as for *solidity*, either you do not mean any sensible quality by that word, and so it is beside our

inquiry, or if you do, it must be either hardness or resistance. But both the one and the other are plainly relative to our senses, it being evident that what seems hard to one animal may appear soft to another who has greater force and firmness of limbs. Nor is it less plain that the resistance I feel is not in the body.

H: I admit the very sensation of resistance, which is all you immediately perceive, is not in the *body*, but the cause of that sensation is.

P: But the causes of our sensations are not things immediately perceived, and, therefore, not sensible. This point I thought had been already determined.

H: I admit it was, but you will pardon me if I seem a little embarrassed; I do not know how to quit my old notions.

P: To help you out, do but consider that if extension is once acknowledged to have no existence without the mind, the same must necessarily be granted of motion, solidity, and gravity, since they all evidently suppose extension. It is therefore superfluous to inquire particularly concerning each of them. In denying extension, you have denied them all to have any real existence.

H: I wonder, Philonous, if what you say is true, why those philosophers who deny the secondary qualities any real existence should yet attribute it to the primary. If there is no difference between them, how can this be accounted for?

P: It is not my business to account for every opinion of the philosophers. But among other reasons which may be assigned for this, it seems probable that pleasure and pain being annexed to the former rather than the latter may be one. Heat and cold, tastes and smells, have something more vividly pleasing or disagreeable than the ideas of extension, figure, and motion affect us with. And it being too visibly absurd to hold that pain or pleasure can be in an unperceiving substance, men are more easily weaned from believing the external existence of the secondary than the primary qualities. You will be satisfied there is something in this if you recollect the difference you made between an intense and more moderate degree of heat, allowing the one a real existence, while you denied it to the other. But after all, there is no rational ground for that distinction, for surely an indifferent sensation is as truly *a sensation* as one more pleasing or painful, and consequently should not any more than they be supposed to exist in an unthinking subject.

H: It has just come into my head, Philonous, that I have somewhere heard of a distinction between absolute and sensible extension. Now though it is acknowledged that great and small, consisting merely in the relation which other extended beings have to the parts of our own bodies, do not really inhere in the substances themselves, yet nothing obliges us to hold the same with regard to *absolute extension*, which is something abstracted from *great* and *small*, from this or that particular magnitude or figure. So likewise as to motion, *swift* and *slow* are altogether relative to the succession of ideas in our own minds. But it does not follow, because those modifications of motion do not exist without the mind, that absolute motion abstracted from them therefore does not.

P: Pray what is it that distinguishes one motion or one part of extension from another? Is it not something sensible, as some degree of swiftness or slowness, some certain magnitude or figure peculiar to each?

H: I think so.

P: These qualities, therefore, stripped of all sensible properties, are without all specific and numerical differences, as the schools call them.

H: They are.

P: That is to say, they are extension in general and motion in general.

H: Let it be so.

P: But it is a universally received maxim that *everything which exists is particular*. How then can motion in general or extension in general exist in any corporeal substance?

H: I will take time to solve your difficulty.

P: But I think the point may be speedily decided. Without doubt you can tell whether you are able to frame this or that idea. Now I am content to put our dispute on this issue. If you can frame in your thoughts a distinct abstract idea of motion or extension, divested of all those sensible modes as swift and slow, great and small, round and square, and the like, which are acknowledged to exist only in the mind, I will then yield the point you contend for. But if you cannot, it will be unreasonable on your side to insist any longer upon what you have no notion of.

H: To confess ingenuously, I cannot.

P: Can you even separate the ideas of extension and motion from the ideas of all those qualities which they who make the distinction term *secondary*?

H: What! Is it not an easy matter to consider extension and motion by themselves, abstracted from all other sensible qualities? Pray how do the mathematicians treat of them?

P: I acknowledge, Hylas, it is not difficult to form general propositions and reasonings about those qualities without mentioning any other and in this sense to consider or treat of them abstractly. But how does it follow that because I can pronounce the word *motion* by itself, I can form the idea of it in my mind exclusive of body? Or because theorems maybe made of extension and figures without any mention of *great* or *small*, or any other sensible mode or quality, that therefore it is possible such an abstract idea of extension without any particular size or figure, or sensible quality, should be distinctly formed and apprehended by the mind? Mathematicians treat of quantity without regarding what other sensible qualities it is attended with, as being altogether indifferent to their demonstrations. But when, laying aside the words, they contemplate the bare ideas, I believe you will find they are not the pure abstracted ideas of extension.

H: But what do you say to *pure intellect*? May not abstracted ideas be framed by that faculty?

P: Since I cannot frame abstract ideas at all, it is plain I cannot frame them by the help of *pure intellect*, whatever faculty you understand by those words. Besides, not to inquire into the nature of pure intellect and its spiritual objects, as *virtue*, *reason*, *God*, or the like — this much seems manifest — that sensible things are only to be perceived by sense or represented by the imagination. Figures, therefore, and extension, being originally perceived by sense, do not belong to pure intellect. But for your further satisfaction, try if you can frame the idea of any figure abstracted from all particularities of size or even from other sensible qualities.

H: Let me think a little — I do not find that I can.

P: And can you think it possible that what implies a repugnance in its conception should really exist in nature?

H: By no means.

P: Since, therefore, it is impossible even for the mind to disunite the ideas of extension and motion from all other sensible qualities, does it not follow that where the one exists, there necessarily the other exists likewise?

H: It should seem so.

P: Consequently, the very same arguments which you admitted as conclusive against the secondary qualities are without any further application of force against the primary too. Besides, if you will trust your senses, is it not plain all sensible qualities coexist or appear to them as being in the same place? Do they ever represent a motion, or figure, as being divested of all other visible and tangible qualities?

H: You need say no more on this head. I am free to admit, if there is no secret error or oversight in our proceedings up to now, that all sensible qualities are alike to be denied existence without the mind. But my fear is that I have been too liberal in my former concessions or overlooked some fallacy or other. In short, I did not take time to think.

P: For that matter, Hylas, you may take what time you please in reviewing the progress of our inquiry. You are at liberty to recover any slips you might have made or offer whatever you have omitted, which makes for your first opinion.

H: One great oversight I take to be this: that I did not sufficiently distinguish the *object* from the *sensation*. Now though this latter may not exist without the mind, yet it will not follow from this that the former cannot.

P: What object do you mean? The object of the senses?

H: The same.

P: It is then immediately perceived?

H: Right.

P: Make me understand the difference between what is immediately perceived and a sensation.

H: The sensation I take to be an act of the mind perceiving, besides which there is something perceived, and this I call the *object*. For example, there is red and yellow on that tulip. But then the act of perceiving those colors is in me only, and not in the tulip.

P: What tulip do you speak of? Is it that which you see?

H: The same.

P: And what do you see besides color, figure, and extension?

H: Nothing.

P: What you would say then is that the red and yellow are coexistent with the extension; is it not?

H: That is not all. I would say they have a real existence without the mind in some unthinking substance.

P: That the colors are really in the tulip, which I see, is manifest. Neither can it be denied that this tulip may exist independent of your mind or mine; but that any immediate object of the senses, that is, any idea or combination of ideas, should exist in an unthinking substance or exterior to all minds, is in itself an evident contradiction. Nor can I imagine how this follows from what you said just now, namely, that the red and yellow were on the tulip *you saw*, since you do not pretend to see that unthinking substance.

H: You have an artful way, Philonous, of diverting our inquiry from the subject.

P: I see you have no mind to be pressed that way. To return then to your distinction between *sensation* and *object*; if I take you right, you distinguish in every perception two things, the one an action of the mind, the other not.

H: True.

P: And this action cannot exist in or belong to any unthinking thing, but whatever besides is implied in a perception, may.

H: That is my meaning.

P: So that if there was a perception without any act of the mind, it was possible such a perception should exist in an unthinking substance.

H: I grant it. But it is impossible there should be such a perception.

P: When is the mind said to be active?

H: When it produces, puts an end to, or changes anything.

P: Can the mind produce, discontinue, or change anything but by an act of the will?

H: It cannot.

P: The mind therefore is to be accounted active in its perceptions, insofar as volition is included in them.

H: It is.

P: In plucking this flower I am active, because I do it by the motion of my hand, which was consequent upon my volition — so likewise in applying it to my nose. But is either of these smelling?

H: No.

P: I act too in drawing the air through my nose, because my breathing so rather than otherwise is the effect of my volition. But neither can this be called *smelling*, for if it were, I should smell every time I breathed in that manner.

H: True.

P: Smelling then is somewhat consequent to all this.

H: It is.

P: But I do not find my will concerned any further. Whatever more there is, as that I perceive such a particular smell or any smell at all, this is independent of my will and I am altogether passive in this. Do you find it otherwise with you, Hylas?

H: No, the very same.

P: Then as to seeing, is it not in your power to open your eyes or keep them shut, to turn them this or that way?

H: Without doubt.

P: But does it in like manner depend on your will that, in looking on this flower, you perceive *white* rather than any other color? Or directing your open eyes towards that part of the heaven beyond, can you avoid seeing the sun? Or is light or darkness the effect of your volition?

H: No, certainly.

P: You are then in these respects altogether passive.

H: I am.

P: Tell me now, whether *seeing* consists in perceiving light and colors or in opening and turning the eyes?

H: Without doubt, in the former.

P: Since, therefore, you are in the very perception of light and colors altogether passive, what has become of that action you were speaking of as an ingredient in every sensation? And does it not follow from your own concessions that the perception of light and colors, including no action in it, may exist in an unperceiving substance? And is this not a plain contradiction?

H: I do not know what to think of it.

P: Besides, since you distinguish the *active* and *passive* in every perception, you must do it in that of pain. But how is it possible that pain — let it be as little active as you please — should exist in an unperceiving substance? In short, do but consider the point and then confess ingenuously whether light and colors, tastes, sounds, etc., are not all equally passions or sensations in the soul. You may indeed call them *external objects* and give them in words what subsistence you please. But examine your own thoughts and then tell me whether it is not as I say?

H: I acknowledge, Philonous, that upon a fair observation of what passes in my mind, I can discover nothing else but that I am a thinking being, affected with variety of sensations; neither is it possible to conceive how a sensation should exist in an unperceiving substance. But then, on the other hand, when I look on sensible things in a different view, considering them as so many modes and qualities, I find it necessary to suppose a material *substratum*, without which they cannot be conceived to exist.

P: *Material substratum* call you it? Pray, by which of your senses did you become acquainted with that being?

H: It is not itself sensible, its modes and qualities only being perceived by the senses.

P: I presume, then, it was by reflection and reason you obtained the idea of it.

H: I do not pretend to any proper positive idea of it. However, I conclude it exists, because qualities cannot be conceived to exist without a support.

P: It seems then you have only a relative notion of it, or that you conceive it not otherwise than by conceiving the relation it bears to sensible qualities.

H: Right.

P: Be pleased, therefore, to let me know in what that relation consists.

H: Is it not sufficiently expressed in the term *substratum* or *substance*?

P: If so, the word *substratum* should import that it is spread under the sensible qualities or accidents.

H: True.

P: And consequently under extension.

H: I admit it.

P: It is therefore somewhat in its own nature entirely distinct from extension.

H: I tell you extension is only a mode, and matter is something that supports modes. And is it not evident the thing supported is different from the thing supporting?

P: So that something distinct from and exclusive of extension is supposed to be the *substratum* of extension.

H: Just so.

P: Answer me, Hylas. Can a thing be spread without extension? Or is not the idea of extension necessarily included in *spreading*?

H: It is.

P: Whatever, therefore, you suppose spread under anything must have in itself an extension distinct from the extension of that thing under which it is spread.

H: It must.

P: Consequently, every corporeal substance being the *substratum* of extension must have in itself another extension by which it is qualified to be a *substratum*, and so on to infinity. And I ask whether this is not absurd in itself and repugnant to what you granted just now, namely, that the *substratum* was something distinct from and exclusive of extension.

H: Yes, but, Philonous, you take me wrong. I do not mean that matter is *spread* in a gross literal sense under extension. The word *substratum* is used only to express in general the same thing with *substance*.

P: Well then, let us examine the relation implied in the term *substance*. Is it not that it stands under accidents?

H: The very same.

P: But that one thing may stand under or support another, must it not be extended?

H: It must.

P: Is not therefore this supposition liable to the same absurdity with the former?

H: You still take things in a strict literal sense; that is not fair, Philonous.

P: I am not for imposing any sense on your words; you are at liberty to explain them as you please. Only I beseech you, make me understand something by them. You tell me matter supports or stands under accidents. How? Is it as your legs support your body?

H: No; that is the literal sense.

P: Pray let me know any sense, literal or not literal, that you understand it in. How long must I wait for an answer, Hylas?

H: I declare I do not know what to say. I once thought I understood well enough what was meant by matter's supporting accidents. But now the more I think on it, the less can I comprehend it; in short, I find that I know nothing of it.

P: It seems then you have no idea at all, neither relative nor positive, of matter; you know neither what it is in itself nor what relation it bears to accidents.

H: I acknowledge it.

P: And yet you asserted that you could not conceive how qualities or accidents should really exist without conceiving at the same time a material support of them.

H: I did.

P: That is to say, when you conceive the real existence of qualities, you do in addition conceive something which you cannot conceive.

H: It was wrong, I admit. But still I fear there is some fallacy or other. Pray what do you think of this? It has just come into my head that the ground of all our mistake lies in your treating of each quality by itself. Now, I grant that each quality cannot singly subsist without the mind. Color cannot exist without extension, neither can figure without some other sensible quality. But as the several qualities united or blended together form entire sensible things, nothing hinders why such things may not be supposed to exist without the mind.

P: Either, Hylas, you are jesting or have a very bad memory. Though indeed we went through all the qualities by name one after another, yet my arguments, or rather your concessions, nowhere tended to prove that the secondary qualities did not subsist each alone by itself, but that they were not *at all* without the mind. Indeed in treating of figure and motion, we concluded they could not exist without the mind because it was impossible even in thought to separate them from all secondary qualities so as to conceive them existing by themselves. But then this was not the only argument made use of upon that occasion. But (to pass by all that has been said up to now, and reckon it for nothing, if you will have it so) I am content to put the whole upon this issue. If you can conceive it possible for any mixture or combination of qualities or any sensible object whatever to exist without the mind, then I will grant it actually to be so.

H: If it comes to that, the point will soon be decided. What is more easy than to conceive a tree or house existing by itself, independent of, and unperceived by any mind whatsoever? I do at this present time conceive them existing after that manner.

P: What are you saying, Hylas — can you see a thing which is at the same time unseen?

H: No, that would be a contradiction.

P: Is it not as great a contradiction to talk of *conceiving* a thing which is *unconceived*?

H: It is.

P: The tree or house, therefore, which you think of is conceived by you.

H: How should it be otherwise?

P: And what is conceived is surely in the mind.

H: Without question, that which is conceived is in the mind.

P: How then did you come to say you conceived a house or tree existing independent and out of all minds whatsoever?

H: That was, I admit, an oversight; but stay, let me consider what led me into it. It is a pleasant mistake enough. As I was thinking of a tree in a solitary place where no one was present to see it, I thought that was to conceive a tree as existing unperceived or unthought of, not considering that I myself conceived it all the while. But now I plainly see that all I can do is to frame ideas in my own mind. I may indeed conceive in my own thoughts the idea of a tree, or a house, or a mountain, but that is all. And this is far from proving that I can conceive them *existing out of the minds of all spirits*.

P: You acknowledge then that you cannot possibly conceive how any one corporeal sensible thing should exist otherwise than in a mind.

H: I do.

P: And yet you will earnestly contend for the truth of that which you cannot so much as conceive.

H: I profess I do not know what to think, but still some scruples remain with me. Is it not certain I see things at a distance? Do we not perceive the stars and moon, for example, to be a great way off? Is this not, I say, manifest to the senses?

P: Do you not in a dream too perceive those or the like objects?

H: I do.

P: And do they not then have the same appearance of being distant?

H: They have.

P: But you do not then conclude the apparitions in a dream to be without the mind?

H: By no means.

P: You ought not therefore conclude that sensible objects are without the mind from their appearance or manner in which they are perceived.

H: I acknowledge it. But does not my sense deceive me in those cases?

P: By no means. Of the idea or thing which you immediately perceive, neither sense nor reason informs you that it actually exists without the mind. By sense you only know that you are affected with such certain sensations of light and colors, etc. And these you will not say are without the mind.

H: True, but besides all that, do you not think the sight suggests something of *outness* or *distance*?

P: Upon approaching a distant object, do the visible size and figure change perpetually or do they appear the same at all distances?

H: They are in a continual change.

P: Sight, therefore, does not suggest or in any way inform you that the visible object you immediately perceive exists at a distance or will be perceived when you advance further onward, there being a continued series of visible objects succeeding each other during the whole time of your approach.

H: It does not; but still I know, upon seeing an object, what object I shall perceive after having passed over a certain distance — no matter whether it be exactly the same or no — there is still something of distance suggested in the case.

P: Good Hylas, do but reflect a little on the point and then tell me whether there is any more in it than this: From the ideas you actually perceive by sight, you have by experience learned to collect what other ideas you will (according to the standing order of nature) be affected with, after such a certain succession of time and motion.

H: Upon the whole, I take it to be nothing else.

P: Now is it not plain that if we suppose a man born blind was suddenly made to see, he could at first have no experience of what may be suggested by sight.

H: It is.

P: He would not then, according to you, have any notion of distance annexed to the things he saw; but would take them for a new set of sensations existing only in his mind.

H: It is undeniable.

P: But to make it still more plain: is not *distance* a line turned endwise to the eye?

H: It is.

P: And can a line so situated be perceived by sight?

H: It cannot.

P: Does it not therefore follow that distance is not properly and immediately perceived by sight?

H: It should seem so.

P: Again, is it your opinion that colors are at a distance?

H: It must be acknowledged they are only in the mind.

P: But do not colors appear to the eye as coexisting in the same place with extension and figures?

H: They do.

P: How can you then conclude from sight that figures exist without, when you acknowledge colors do not, the sensible appearance being the very same with regard to both?

H: I do not know what to answer.

P: But allowing that distance was truly and immediately perceived by the mind, yet it would not then follow it existed out of the mind. For whatever is immediately perceived is an idea; and can any idea exist out of the mind?

H: To suppose that would be absurd, but inform me, Philonous, can we perceive or know nothing besides our ideas?

P: As for the rational deducing of causes from effects, that is besides our inquiry. And by the senses you can best tell whether you perceive anything which is not immediately perceived. And I ask you whether the things immediately perceived are other than your own sensations or ideas? You have indeed more than once, in the course of this conversation, declared yourself on those points; but you seem, by this last question, to have departed from what you then thought.

H: To speak the truth, Philonous, I think there are two kinds of objects, the one perceived immediately, which are likewise called ideas, the other are real things or external objects perceived by the mediation of ideas, which are their images and representations. Now I admit ideas do not exist without the mind, but the latter sort of object does. I am sorry I did not think of this distinction sooner; it would probably have cut short your discourse.

P: Are those external objects perceived by sense or by some other faculty?

H: They are perceived by sense.

P: How! Is there anything perceived by sense which is not immediately perceived?

H: Yes, Philonous, in some sort there is. For example, when I look on a picture or statue of Julius Caesar, I may be said, after a manner, to perceive him (though not immediately) by my senses.

P: It seems then you will have our ideas, which alone are immediately perceived, to be pictures of external things, and that these also are perceived by sense inasmuch as they have a conformity or resemblance to our ideas.

H: That is my meaning.

P: And in the same way that Julius Caesar, in himself invisible, is nevertheless perceived by sight; real things, in themselves imperceptible, are perceived by sense.

H: In the very same.

P: Tell me, Hylas, when you behold the picture of Julius Caesar, do you see with your eyes any more than some colors and figures, with a certain symmetry and composition of the whole?

H: Nothing else.

P: And would not a man who had never known anything of Julius Caesar see as much?

H: He would.

P: Consequently, he has his sight and the use of it in as perfect a degree as you.

H: I agree with you.

P: From where does it come then that your thoughts are directed to the Roman emperor and his are not? This cannot proceed from the sensations or ideas of sense by you then perceived, since you acknowledge you have no advantage over him in that respect. It should seem therefore to proceed from reason and memory, should it not?

H: It should.

P: Consequently, it will not follow from that instance that anything is perceived by sense which is not immediately perceived. Though I grant we may in one meaning be said to perceive sensible things mediately

by sense, that is, when, from a frequently perceived connection, the immediate perception of ideas by one sense suggests to the mind others perhaps belonging to another sense which are accustomed to be connected with them. For instance, when I hear a coach drive along the streets, immediately I perceive only the sound; but, from the experience I have had that such a sound is connected with a coach, I am said to hear the coach. It is nevertheless evident that, in truth and strictness, nothing can be *heard* but *sound*, and the coach is not then properly perceived by sense, but suggested from experience. So likewise when we are said to see a red-hot bar of iron, the solidity and heat of the iron are not the objects of sight, but suggested to the imagination by the color and figure, which are properly perceived by that sense. In short, those things alone are actually and strictly perceived by any sense which would have been perceived in case that same sense had then been first conferred on us. As for other things, it is plain they are only suggested to the mind by experience grounded on former perceptions. But to return to your comparison of Caesar's picture, it is plain, if you keep to that, you must hold that the real things or archetypes of our ideas are not perceived by sense, but by some internal faculty of the soul as reason or memory. I would therefore gladly know what arguments you can draw from reason for the existence of what you call *real things* or *material objects*, or whether you remember to have seen them formerly as they are in themselves, or if you have heard or read of anyone who did.

H: I see, Philonous, you are disposed to raillery, but that will never convince me.

P: My aim is only to learn from you the way to come at the knowledge of *material beings*. Whatever we perceive is perceived either immediately or mediately, by sense, or by reason and reflection. But as you have excluded sense, pray show me what reason you have to believe their existence, or what *medium* you can possibly make use of to prove it, either to mine or your own understanding.

H: To deal ingenuously, Philonous, now that I consider the point, I do not find I can give you any good reason for it. But this much seems pretty plain — that it is at least possible such things may really exist, and as long as there is no absurdity in supposing them, I am resolved to believe as I did, until you bring good reasons to the contrary.

P: What! Has it come to this that you only believe the existence of material objects and that your belief is founded barely on the possibility of its being true? Then you will have me bring reasons against it, though another would think it reasonable the proof should lie on him who holds the affirmative. And after all, this very point which you are now resolved to maintain without any reason is, in effect, what you have more than once during this discourse seen good reason to give up. But to pass over all this — if I understand you rightly, you say our ideas do not exist without the mind, but that they are copies, images, or representations of certain originals that do.

H: You take me right.

P: They are then like external things.

H: They are.

P: Have those things a stable and permanent nature independent of our senses, or are they in a perpetual change upon our producing any motions in our bodies, suspending, exerting, or altering our faculties or organs of sense?

H: Real things, it is plain, have a fixed and real nature, which remains the same, notwithstanding any change in our senses or in the posture and motion of our bodies, which indeed may affect the ideas in our minds, but it would be absurd to think they had the same effect on things existing without the mind.

P: How then is it possible that things perpetually fleeting and variable as our ideas should be copies or images of anything fixed and constant? Or, in other words, since all sensible qualities, as size, figure, color, etc., that is, our ideas, are continually changing upon every alteration in the distance, medium, or instruments of sensation, how can any determinate material objects be properly represented or painted forth by several distinct things, each of which is so different from and unlike the rest? Or if you say it resembles some one only of our ideas, how shall we be able to distinguish the true copy from all the false ones?

H: I profess, Philonous, I am at a loss. I do not know what to say to this.

P: But neither is this all. Which are material objects in themselves—perceptible or imperceptible?

H: Properly and immediately nothing can be perceived but ideas. All material things, therefore, are in themselves insensible and to be perceived only by their ideas.

P: Ideas then are sensible, and their archetypes or originals insensible.

H: Right.

P: But how can that which is sensible be like that which is insensible? Can a real thing in itself *invisible*

be like a *color*, or a real thing which is not *audible* be like a *sound*? In a word, can anything be like a sensation or idea but another sensation or idea?

H: I must admit, I think not.

P: Is it possible there should be any doubt in the point? Do you not perfectly know your own ideas?

H: I know them perfectly, since what I do not perceive or know can be no part of my idea.

P: Consider, therefore, and examine them, and then tell me if there is anything in them which can exist without the mind or if you can conceive anything like them existing without the mind.

H: Upon inquiry, I find it is impossible for me to conceive or understand how anything but an idea can be like an idea. And it is most evident that *no idea can exist without the mind*.

P: You are, therefore, by your principles forced to deny the reality of sensible things, since you made it to consist in an absolute existence exterior to the mind. That is to say, you are a downright *skeptic*. So I have gained my point, which was to show your principles led to skepticism.

H: For the present I am, if not entirely convinced, at least silenced.

P: I would gladly know what more you would require in order to have a perfect conviction. Have you not had the liberty of explaining yourself all manner of ways? Were any little slips in discourse laid hold and insisted on? Or were you not allowed to retract or reinforce anything you had offered, as best served your purpose? Has not everything you could say been heard and examined with all the fairness imaginable? In a word, have you not in every point been convinced out of your own mouth? And if you can at present discover any flaw in any of your former concessions, or think of any remaining subterfuge, any new distinction, color, or comment whatsoever, why do you not produce it?

H: A little patience, Philonous. I am at present so amazed to see myself ensnared, and as it were imprisoned in the labyrinths you have drawn me into, that on the sudden it cannot be expected I should find my way out. You must give me time to look about me and recollect myself.

P: Listen, is not this the college bell?

H: It rings for prayers.

P: We will go in then if you please, and meet here again tomorrow morning. In the meantime you may employ your thoughts on this morning's discourse, and try if you can find any fallacy in it, or invent any new means to extricate yourself.

H: Agreed.

THE SECOND DIALOGUE

HYLAS: I beg your pardon, Philonous, for not meeting you sooner. All this morning my head was so filled with our late conversation that I had not leisure to think of the time of the day, or indeed of anything else.

PHILONOUS: I am glad you were so intent upon it, in hopes if there were any mistakes in your concessions or fallacies in my reasonings from them, you will now discover them to me.

H: I assure you, I have done nothing ever since I saw you but search after mistakes and fallacies — and, with that view, have minutely examined the whole series of yesterday's discourse — but all in vain, for the notions it led me into, upon review, appear still more clear and evident, and the more I consider them, the more irresistibly do they force my assent.

P: And is this not, you think, a sign that they are genuine, that they proceed from nature and are conformable to right reason? Truth and beauty are in this alike, that the strictest survey sets them both off to advantage. While the false luster of error and disguise cannot endure being reviewed or too nearly inspected.

H: I admit there is a great deal in what you say. Nor can anyone be more entirely satisfied of the truth of those odd consequences so long as I have in view the reasonings that lead to them. But when these are out of my thoughts, there seems, on the other hand, something so satisfactory, so natural and intelligible in the modern way of explaining things that I profess I do not know how to reject it.

P: I do not know what way you mean.

H: I mean the way of accounting for our sensations or ideas.

P: How is that?

H: It is supposed the soul makes her residence in some part of the brain from which the nerves take their rise and are thus extended to all parts of the body, and that outward objects, by the different impressions they make on the organs of sense, communicate certain vibrational motions to the nerves, and these being filled with spirits, propagate them to the brain or seat of the soul, which, according to the various impressions or traces thereby made in the brain, is variously affected with ideas.

P: And do you call this an explication of the manner whereby we are affected with ideas?

H: Why not, Philonous? Have you anything to object against it?

P: I would first know whether I rightly understand your hypothesis. You make certain traces in the brain to be the causes or occasions of our ideas. Pray tell me whether by the *brain* you mean any sensible thing?

H: What else do you think I could mean?

P: Sensible things are all immediately perceivable; and those things which are immediately perceivable are ideas; and these exist only in the mind. This much you have, if I am not mistaken, long since agreed to.

H: I do not deny it.

P: The brain therefore you speak of, being a sensible thing, exists only in the mind. Now, I would gladly know whether you think it reasonable to suppose that one idea or thing existing in the mind occasions all other ideas. And if you think so, pray how do you account for the origin of that primary idea or brain itself?

H: I do not explain the origin of our ideas by that brain which is perceivable to sense, this being itself only a combination of sensible ideas, but by another which I imagine.

P: But are not things imagined as truly *in the mind* as things perceived?

H: I must confess they are.

P: It comes, therefore, to the same thing, and you have been all this while accounting for ideas by certain motions or impressions in the brain, that is, by some alterations in an idea—whether sensible or imaginable, it does not matter.

H: I begin to suspect my hypothesis.

P: Beside spirits, all that we know or conceive are our own ideas. When, therefore, you say all ideas are occasioned by impressions in the brain, do you conceive this brain or not? If you do, then you talk of ideas imprinted in an idea causing that same idea, which is absurd. If you do not conceive it, you talk unintelligibly instead of forming a reasonable hypothesis.

H: I now clearly see it was a mere dream. There is nothing in it.

P: You need not be much concerned at it; for, after all, this way of explaining things, as you called it,

could never have satisfied any reasonable man. What connection is there between a motion in the nerves and the sensations of sound or color in the mind? Or how is it possible these should be the effect of that?

H: But I could never think it had so little in it as now it seems to have.

P: Well then, are you at length satisfied that no sensible things have a real existence, and that you are in truth a thoroughgoing *skeptic*?

H: It is too plain to be denied.

P: Look! Are not the fields covered with a delightful greenery? Is there not something in the woods and groves, in the rivers and clear springs, that soothes, that delights, that transports the soul? At the prospect of the wide and deep ocean, or some huge mountain whose top is lost in the clouds, or of an old gloomy forest, are not our minds filled with a pleasing horror? Even in rocks and deserts, is there not an agreeable wildness? How sincere a pleasure is it to behold the natural beauties of the earth! To preserve and renew our relish for them, is not the veil of night alternately drawn over her face, and does she not change her dress with the seasons? How aptly are the elements disposed! What variety and use in the meanest production of nature! What delicacy, what beauty, what contrivance in animal and vegetable bodies! How exquisitely are all things suited as well to their particular ends as to constitute opposite parts of the whole! And while they mutually aid and support, do they not also set off and illustrate each other! Raise now your thoughts from this ball of earth to all those glorious luminaries that adorn the high arch of heaven. The motion and situation of the planets, are they not admirable for use and order? Were those (miscalled *erratic*) globes ever known to stray in their repeated journeys through the pathless void? Do they not measure areas round the sun ever proportioned to the times? So fixed, so immutable, are the laws by which the unseen Author of nature actuates the universe. How vivid and radiant is the luster of the fixed stars! How magnificent and rich that negligent profusion with which they appear to be scattered throughout the whole azure vault! Yet if you take the telescope, it brings into your sight a new host of stars that escape the naked eye. Here they seem contiguous and minute, but to a nearer view immense orbs of light at various distances, far sunk in the abyss of space. Now you must call imagination to your aid. The feeble narrow sense cannot ascertain innumerable worlds revolving round the central fires, and in those worlds the energy of an all-perfect mind displayed in endless forms. But neither sense nor imagination is big enough to comprehend the boundless extent with all its glittering furniture. Though the laboring mind exerts and strains each power to its utmost reach, there still stands out ungrasped an immeasurable surplus. Yet all the vast bodies that compose this mighty frame, however distant and remote, are by some secret mechanism, some divine art and force, linked in a mutual dependence and intercourse with each other, even with this earth, which was almost slipped from my thoughts and lost in the crowd of worlds. Is not the whole system immense, beautiful, glorious beyond expression and beyond thought? What treatment then do those philosophers deserve who would deprive these noble and delightful scenes of all reality? How should those principles be entertained that lead us to think all the visible beauty of the creation a false imaginary glare? To be plain, can you expect this skepticism of yours will not be thought extravagantly absurd by all men of sense?

H: Other men may think as they please, but for your part you have nothing to reproach me with. My comfort is you are as much a skeptic as I am.

P: There, Hylas, I must beg leave to differ from you.

H: What! Have you all along agreed to the premises, and do you now deny the conclusion and leave me to maintain these paradoxes which you led me into by myself? This surely is not fair.

P: I deny that I agreed with you in those notions that led to skepticism. You indeed said the reality of sensible things consisted in an *absolute existence* out of the minds of spirits or distinct from their being perceived. And, pursuant to this notion of reality, you are obliged to deny sensible things any real existence, that is, according to your own definition, you profess yourself a *skeptic*. But I neither said nor thought the reality of sensible things was to be defined after that manner. To me it is evident, for the reasons you allow of, that sensible things cannot exist otherwise than in a mind or spirit. From this I conclude, not that they have no real existence, but that, seeing they do not depend on my thought, and have an existence distinct from being perceived by me, *there must be some other mind in which they exist*. As sure, therefore, as the sensible world really exists, so sure is there an infinite, omnipresent Spirit who contains and supports it.

H: What! This is no more than I and all Christians hold — no, and all others too who believe there is a God and that he knows and comprehends all things.

P: Yes, but here lies the difference. Men commonly believe that all things are known or perceived by God because they believe the being of a God, whereas I, on the other side, immediately and necessarily conclude the being of a God because all sensible things must be perceived by him.

H: But so long as we all believe the same thing, what matter is it how we come by that belief?

P: But neither do we agree in the same opinion. For philosophers, though they acknowledge all corporeal beings to be perceived by God, yet they attribute to them an absolute subsistence distinct from their being perceived by any mind whatever, which I do not. Besides, is there no difference between saying *there is a God, therefore he perceives all things*, and saying *sensible things do really exist — and if they really exist, they are necessarily perceived by an infinite mind — therefore there is an infinite mind, or God?* This furnishes you with a direct and immediate demonstration, from a most evident principle, of the *being of a God*. Theologians and philosophers had proved beyond all controversy, from the beauty and usefulness of the several parts of the creation, that it was the workmanship of God. But that—setting aside all help of astronomy and natural philosophy, all contemplation of the contrivance, order, and adjustment of things — an infinite mind should be necessarily inferred from the bare existence of the sensible world is an advantage peculiar to them only who have made this easy reflection: that the sensible world is that which we perceive by our several senses; and that nothing is perceived by the senses besides ideas; and that no idea or archetype of an idea can exist otherwise than in a mind. You may now, without any laborious search into the sciences, without any subtlety of reason or tedious length of discourse, oppose and baffle the most strenuous advocate for atheism. Those miserable refuges, whether in an eternal succession of unthinking causes and effects or in a fortuitous concourse of atoms — those wild imaginations of Vanini,² Hobbes, and Spinoza, in a word, the whole system of atheism — is it not entirely overthrown by this single reflection on the repugnance included in supposing the whole or any part, even the most rude and shapeless, of the visible world to exist without a mind? Let anyone of those abettors of impiety but look into his own thoughts and there try if he can conceive how so much as a rock, a desert, a chaos, or confused jumble of atoms, how anything at all, either sensible or imaginable, can exist independent of a mind, and he need go no further to be convinced of his folly. Can anything be fairer than to put a dispute on such an issue and leave it to a man himself to see if he can conceive, even in thought, what he holds to be true in fact, and to allow it a real existence from a notion?

H: It cannot be denied, there is something highly serviceable to religion in what you advance. But do you not think it looks very like a notion entertained by some eminent moderns,³ of *seeing all things in God*?

P: I would gladly know that opinion; pray explain it to me.

H: They conceive that the soul, being immaterial, is incapable of being united with material things so as to perceive them in themselves, but that she perceives them by her union with the substance of God, which, being spiritual, is therefore purely intelligible or capable of being the immediate object of a spirit's thought. Besides, the divine essence contains in it perfections correspondent to each created being, and which are, for that reason, proper to exhibit or represent them to the mind.

P: I do not understand how our ideas, which are things altogether passive and inert, can be the essence or any part (or like any part) of the essence or substance of God, who is an impassive, indivisible, purely active being. Many more difficulties and objections occur at first view against this hypothesis, but I shall only add that it is liable to all the absurdities of the common hypotheses in making a created world exist otherwise than in the mind of a spirit. Besides all which, it has this peculiar to itself that it makes that material world serve to no purpose. And if it passes for a good argument against other hypotheses in the sciences that they suppose nature or the Divine Wisdom to make something in vain or do by tedious round-about methods what might have been performed in a much more easy and compendious way, what shall we think of that hypothesis which supposes the whole world made in vain?

H: But what do you say, are not you too of the opinion that we see all things in God? If I am not mistaken, what you advance comes near it.

P: Few men think, yet all will have opinions. Hence men's opinions are superficial and confused. It is nothing strange that tenets which in themselves are ever so different should nevertheless be confounded with each other by those who do not consider them attentively. I shall not therefore be surprised if some men imagine that I run into the enthusiasm of Malebranche, though in truth I am very remote from it. He builds on the most abstract general ideas, which I entirely disclaim. He asserts an absolute external world, which I deny. He maintains that we are deceived by our senses and do not know the real natures or the true forms and figures of extended beings — to all of which I hold the direct contrary. So that, upon the whole, there are no principles more fundamentally opposite than his and mine. It must be admitted I entirely agree with what the Holy Scripture says that “in God we live, and move, and have our being.”⁴ But that we see things in his essence, after the manner above set forth, I am far from believing. Take here in brief my meaning. It is evident that the things I perceive are my own ideas and that no idea can exist unless it be in a mind. Nor is it less plain that these ideas, or things perceived by me, either themselves or their archetypes, exist independently of my

mind, since I do not know myself to be their author, it being out of my power to determine at pleasure what particular ideas I shall be affected with upon opening my eyes or ears. They must therefore exist in some other mind, whose will it is they should be exhibited to me. The things, I say, immediately perceived, are ideas or sensations, call them which you will. But how can any idea or sensation exist in, or be produced by, anything but a mind or spirit? This indeed is inconceivable, and to assert that which is inconceivable is to talk nonsense, is it not?

H: Without doubt.

P: But, on the other hand, it is very conceivable that they should exist in and be produced by a spirit, since this is no more than I daily experience in myself—inasmuch as I perceive numberless ideas and, by an act of my will, can form a great variety of them and raise them up in my imagination, though it must be confessed, these creatures of the fancy are not altogether so distinct, so strong, vivid, and permanent, as those perceived by my senses, which latter are called *real things*. From all which I conclude *there is a mind which affects me every moment with all the sensible impressions I perceive*. And from the variety, order, and manner of these, I conclude the author of them to be *wise, powerful, and good beyond comprehension*. Mark it well: I do not say I see things by perceiving that which represents them in the intelligible substance of God. This I do not understand; but I say the things perceived by me are known by the understanding and produced by the will of an infinite Spirit. And is not all this most plain and evident? Is there any more in it than what a little observation of our own minds, and that which passes in them, not only enables us to conceive but also obliges us to acknowledge?

H: I think I understand you very clearly and admit the proof you give of a Deity seems no less evident than it is surprising. But allowing that God is the supreme and universal cause of all things, yet may not there be still a third nature besides spirits and ideas? May we not admit a subordinate and limited cause of our ideas? In a word, may there not for all that be *matter*?

P: How often must I inculcate the same thing? You allow the things immediately perceived by sense to exist nowhere without the mind, but there is nothing perceived by sense which is not perceived immediately. Therefore, there is nothing sensible that exists without the mind. The matter, therefore, which you still insist on is something intelligible, I suppose, something that may be discovered by reason and not by sense.

H: You are in the right.

P: Pray let me know what reasoning your belief of matter is grounded on, and what this matter is in your present sense of it.

H: I find myself affected with various ideas of which I know I am not the cause; neither are they the cause of themselves or of one another, or capable of subsisting by themselves, as being altogether inactive, fleeting, dependent beings. They have therefore some cause distinct from me and them, of which I pretend to know no more than that it is *the cause of my ideas*. And this thing, whatever it is, I call matter.

P: Tell me, Hylas, has everyone a liberty to change the current proper signification annexed to a common name in any language? For example, suppose a traveler should tell you that in a certain country men might pass unhurt through the fire, and, upon explaining himself, you found he meant by the word *fire* that which others call *water*, or if he should assert there are trees which walk upon two legs, meaning men by the term *trees*. Would you think this reasonable?

H: No, I should think it very absurd. Common custom is the standard of propriety in language. And for any man to affect speaking improperly is to pervert the use of speech and can never serve to a better purpose than to protract and multiply disputes where there is no difference in opinion.

P: And does not *matter*, in the common current meaning of the word, signify an extended, solid, moveable, unthinking, inactive substance?

H: It does.

P: And has it not been made evident that no such substance can possibly exist? And though it should be allowed to exist, yet how can that which is *inactive* be a *cause* or that which is *unthinking* be a *cause of thought*? You may, indeed, if you please, annex to the word *matter* a contrary meaning to what is vulgarly received, and tell me you understand by it an unextended, thinking, active being, which is the cause of our ideas. But what else is this than to play with words and run into that very fault you just now condemned with so much reason? I do by no means find fault with your reasoning, in that you collect a cause from the *phenomena*, but I deny that the cause deducible by reason can properly be termed matter.

H: There is indeed something in what you say. But I am afraid you do not thoroughly comprehend my meaning. I would by no means be thought to deny that God, or an infinite spirit, is the supreme cause of all

things. All I contend for is that subordinate to the supreme agent there is a cause of a limited and inferior nature, which concurs in the production of our ideas, not by any act of will or spiritual efficiency, but by that kind of action which belongs to matter, namely *motion*.

P: I find you are at every turn relapsing into your old exploded conceit of a moveable and consequently an extended substance existing without the mind. What! Have you already forgot you were convinced, or are you willing I should repeat what has been said on that head? In truth this is not fair dealing in you still to suppose the being of that which you have so often acknowledged to have no being. But not to insist further on what has been so largely handled, I ask whether all your ideas are not perfectly passive and inert, including nothing of action in them?

H: They are.

P: And are sensible qualities anything else but ideas?

H: How often have I acknowledged that they are not?

P: But is not motion a sensible quality?

H: It is.

P: Consequently, it is no action.

H: I agree with you. And indeed it is very plain that when I stir my finger, it remains passive, but my will which produced the motion is active.

P: Now I desire to know, in the first place, whether motion being allowed to be no action, you can conceive any action besides volition; and, in the second place, whether to say something and conceive nothing is not to talk nonsense; and, lastly, whether having considered the premises, you do not perceive that to suppose any efficient or active cause of our ideas other than *spirit* is highly absurd and unreasonable?

H: I give up the point entirely. But though matter may not be a cause, yet what hinders its being an *instrument* subservient to the supreme agent in the production of our ideas?

P: An instrument, you say; pray what may be the figure, springs, wheels, and motions of that instrument?

H: Those I pretend to determine nothing of, both the substance and its qualities being entirely unknown to me.

P: What? You are then of the opinion, it is made up of unknown parts, that it has unknown motions, and an unknown shape.

H: I do not believe it has any figure or motion at all, being already convinced that no sensible qualities can exist in an unperceiving substance.

P: But what notion is it possible to frame of an instrument void of all sensible qualities, even extension itself?

H: I do not pretend to have any notion of it.

P: And what reason do you have to think this unknown, this inconceivable somewhat does exist? Is it that you imagine God cannot act as well without it or that you find by experience the use of some such thing when you form ideas in your own mind?

H: You are always teasing me for reasons of my belief. Pray what reasons do you have not to believe it?

P: It is to me a sufficient reason not to believe the existence of anything if I see no reason for believing it. But, not to insist on reasons for believing, you will not so much as let me know what it is you would have me believe, since you say you have no manner of notion of it. After all, let me entreat you to consider whether it is like a philosopher, or even like a man of common sense, to pretend to believe you do not know what and you do not know why.

H: Hold on, Philonous. When I tell you matter is an *instrument*, I do not mean altogether nothing. It is true, I do not know the particular kind of instrument, but, however, I have some notion of *instrument in general*, which I apply to it.

P: But what if it should prove that there is something, even in the most general notion of *instrument*, as taken in a distinct sense from *cause*, which makes the use of it inconsistent with the divine attributes?

H: Make that appear and I shall give up the point.

P: What do you mean by the general nature or notion of *instrument*?

H: That which is common to all particular instruments composes the general notion.

P: Is it not common to all instruments that they are applied to the doing those things only which cannot

be performed by the mere act of our wills? Thus, for instance, I never use an instrument to move my finger because it is done by a volition. But I should use one if I were to remove part of a rock or tear up a tree by the roots. Are you of the same mind? Or can you show any example where an instrument is made use of in producing an effect immediately depending on the will of the agent?

H: I admit I cannot.

P: How, therefore, can you suppose that an all-perfect Spirit, on whose will all things have an absolute and immediate dependence, should need an instrument in his operations or, not needing it, make use of it? Thus it seems to me that you are obliged to admit the use of a lifeless inactive instrument to be incompatible with the infinite perfection of God — that is, by your own confession to give up the point.

H: It does not readily occur what I can answer you.

P: But I think you should be ready to admit the truth when it has been fairly proved to you. We, indeed, who are beings of finite powers, are forced to make use of instruments. And the use of an instrument shows the agent to be limited by rules of another's prescription and that he cannot obtain his end, but in such a way and by such conditions. From this it seems a clear consequence that the supreme unlimited agent uses no tool or instrument at all. The will of an omnipotent Spirit is no sooner exerted than executed, without the application of means, which, if they are employed by inferior agents, it is not upon account of any real efficacy that is in them or necessary aptitude to produce any effect, but merely in compliance with the laws of nature or those conditions prescribed to them by the first cause, who is himself above all limitation or prescription whatsoever.

H: I will no longer maintain that matter is an instrument. However, I would not be understood to give up its existence either, since, notwithstanding what has been said, it may still be an *occasion*.

P: How many shapes is your matter to take? Or how often must it be proved not to exist before you are content to part with it? But to say no more of this (though by all the laws of disputation I may justly blame you for so frequently changing the signification of the principal term) I would gladly know what you mean by affirming that matter is an occasion, having already denied it to be a cause. And when you have shown in what sense you understand *occasion*, pray, in the next place, be pleased to show me what reason induces you to believe there is such an occasion of our ideas.

H: As to the first point: By *occasion* I mean an inactive, unthinking being, at the presence of which God excites ideas in our minds.

P: And what may be the nature of that inactive, unthinking being?

H: I know nothing of its nature.

P: Proceed then to the second point and assign some reason why we should allow an existence to this inactive, unthinking, unknown thing.

H: When we see ideas produced in our minds after an orderly and constant manner, it is natural to think they have some fixed and regular occasions at the presence of which they are excited.

P: You acknowledge then God alone to be the cause of our ideas and that he causes them at the presence of those occasions.

H: That is my opinion.

P: Those things which you say are present to God, without doubt he perceives.

H: Certainly. Otherwise they could not be to him an occasion of acting.

P: Not to insist now on your making sense of this hypothesis or answering all the puzzling questions and difficulties it is liable to: I only ask whether the order and regularity observable in the series of our ideas, or the course of nature, are not sufficiently accounted for by the wisdom and power of God, and whether it does not derogate from those attributes to suppose he is influenced, directed, or put in mind, when and how he is to act, by any unthinking substance. And, lastly, whether in case I granted all you contend for, it would make anything to your purpose, it not being easy to conceive how the external or absolute existence of an unthinking substance, distinct from its being perceived, can be inferred from my allowing that there are certain things perceived by the mind of God which are to him the occasion of producing ideas in us.

H: I am perfectly at a loss what to think, this notion of *occasion* seeming now altogether as groundless as the rest.

P: Do you not at length perceive that in all these different meanings of *matter*, you have been only supposing you do not know what, for no manner of reason, and to no kind of use?

H: I freely admit myself less fond of my notions since they have been so accurately examined. But still, I think I have some confused perception that there is such a thing as *matter*.

P: Either you perceive the being of matter immediately or mediately. If immediately, pray inform me by which of the senses you perceive it. If mediately, let me know by what reasoning it is inferred from those things which you perceive immediately. So much for the perception. Then for the matter itself, I ask whether it is object, *substratum*, cause, instrument, or occasion? You have already pleaded for each of these, shifting your notions and making matter to appear sometimes in one shape, then in another. And what you have offered has been disapproved and rejected by yourself. If you have anything new to advance, I would gladly hear it.

H: I think I have already offered all I had to say on those heads. I am at a loss what more to urge.

P: And yet you are loath to part with your old prejudice. But to make you quit it more easily, I desire that, besides what has been suggested up to now, you will further consider whether, upon the supposition that matter exists, you can possibly conceive how you should be affected by it? Or, supposing it did not exist, whether it is not evident you might for all that be affected with the same ideas you now are, and consequently have the very same reasons to believe its existence that you now can have?

H: I acknowledge it is possible we might perceive all things just as we do now, though there was no matter in the world; neither can I conceive, if there is matter, how it should produce any idea in our minds. And I do further grant you have entirely satisfied me that it is impossible there should be such a thing as matter in any of the foregoing senses. But still I cannot help supposing that there is *matter* in some sense or other. What that is I do not indeed pretend to determine.

P: I do not expect you should define exactly the nature of that unknown being. Only be pleased to tell me whether it is a substance, and if so, whether you can suppose a substance without accidents, or in case you suppose it to have accidents or qualities, I desire you will let me know what those qualities are, at least what is meant by matter's supporting them.

H: We have already argued on those points. I have no more to say to them. But to prevent any further questions, let me tell you, I at present understand by *matter* neither substance nor accident, thinking nor extended being, neither cause, instrument, nor occasion, but something entirely unknown, distinct from all these.

P: It seems then you include in your present notion of matter nothing but the general abstract of idea of *entity*.

H: Nothing else, save only that I superadd to this general idea the negation of all those particular things, qualities, or ideas that I perceive, imagine, or in any way apprehend.

P: Pray where do you suppose this unknown matter to exist?

H: Oh Philonous! Now you think you have entangled me; for if I say it exists in place, then you will infer that it exists in the mind, since it is agreed that place or extension exists only in the mind, but I am not ashamed to admit my ignorance. I do not know where it exists; only I am sure it does not exist in place. There is a negative answer for you and you must expect no other to all the questions you put for the future about matter.

P: Since you will not tell me where it exists, be pleased to inform me after what manner you suppose it to exist or what you mean by its existence.

H: It neither thinks nor acts, neither perceives, nor is perceived.

P: But what is there positive in your abstracted notion of its existence?

H: Upon a nice observation, I do not find I have any positive notion or meaning at all. I tell you again I am not ashamed to admit my ignorance. I do not know what is meant by its *existence* or how it exists.

P: Continue, good Hylas, to act the same ingenuous part and tell me sincerely whether you can frame a distinct idea of entity in general, prescinded from and exclusive of all thinking and corporeal beings, all particular things whatsoever.

H: Hold on, let me think a little — I profess, Philonous, I do not find that I can. At first glance I thought I had some dilute and airy notion of pure entity in abstract, but upon closer attention it has quite vanished out of sight. The more I think on it, the more am I confirmed in my prudent resolution of giving none but negative answers and not pretending to the least degree of any positive knowledge or conception of matter, its *where*, its *how*, its *entity*, or anything belonging to it.

P: When, therefore, you speak of the existence of matter, you do not have any notion in your mind.

H: None at all.

P: Pray tell me if the case does not stand thus: At first, from a belief in material substance, you would have it that the immediate objects existed without the mind; then, that they are archetypes; then causes; next instruments; then occasions; lastly, *something in general*, which being interpreted proves *nothing*. So matter comes to nothing. What do you think, Hylas? Is not this a fair summary of your whole proceeding?

H: Be that as it will, yet I still insist upon it that our not being able to conceive a thing is no argument against its existence.

P: That from a cause, effect, operation, sign, or other circumstance, there may reasonably be inferred the existence of a thing not immediately perceived, and that it would be absurd for any man to argue against the existence of that thing from his having no direct and positive notion of it, I freely admit. But where there is nothing of all this; where neither reason nor revelation induces us to believe the existence of a thing; where we have not even a relative notion of it; where an abstraction is made from perceiving and being perceived, from spirit and idea; lastly, where there is not so much as the most inadequate or faint idea pretended to, I will not, indeed, then conclude against the reality of any notion or existence of anything, but my inference shall be that you mean nothing at all, that you imply words to no manner of purpose, without any design or signification whatsoever. And I leave it to you to consider how mere jargon should be treated.

H: To deal frankly with you, Philonous, your arguments seem in themselves unanswerable, but they do not have so great an effect on me as to produce that entire conviction, that hearty acquiescence which attends demonstration. I find myself still relapsing into an obscure surmise of I do not know what— *matter*.

P: But are you not sensible, Hylas, that two things must concur to take away all scruple and work a plenary assent in the mind? Let a visible object be set in never so clear a light, yet, if there is any imperfection in the sight, or if the eye is not directed towards it, it will not be distinctly seen. And though a demonstration be never so well grounded and fairly proposed, yet, if there is in addition a stain of prejudice or a wrong bias on the understanding, can it be expected on a sudden to perceive clearly and adhere firmly to the truth? No, there is need of time and pains; the attention must be awakened and detained by a frequent repetition of the same thing placed often in the same, often in different lights. I have said it already, and find I must still repeat and inculcate, that it is an unaccountable license you take in pretending to maintain you do not know what, you do not know for what reason, you do not know to what purpose. Can this be paralleled in any art or science, any sect or profession of men? Or is there anything so barefacedly groundless and unreasonable to be met with even in the lowest of common conversation? But perhaps you will still say, matter may exist, though at the same time you neither know what is meant by *matter*, nor by its *existence*. This indeed is surprising, and the more so because it is altogether voluntary, you not being led to it by any one reason; for I challenge you to show me that thing in nature which needs matter to explain or account for it.

H: The reality of things cannot be maintained without supposing the existence of matter. And is not this, you think, a good reason why I should be earnest in its defense?

P: The reality of things! What things, sensible or intelligible?

H: Sensible things.

P: My glove, for example?

H: That or any other thing perceived by the senses.

P: But to fix on some particular thing, is it not a sufficient evidence to me of the existence of this *glove* that I see it, and feel it, and wear it? Or if this will not do, how is it possible I should be assured of the reality of this thing, which I actually see in this place, by supposing that some unknown thing, which I never did or can see, exists after an unknown manner, in an unknown place, or in no place at all? How can the supposed reality of that which is intangible be a proof that anything tangible really exists? Or of that which is invisible, that any visible thing, or in general of anything which is imperceptible, that a perceptible exists? Do but explain this and I shall think nothing too hard for you.

H: Upon the whole, I am content to admit the existence of matter is highly improbable; but the direct and absolute impossibility of it does not appear to me.

P: But granting matter to be possible, yet, upon that account merely, it can have no more claim to existence than a golden mountain or a centaur.

H: I acknowledge it, but still you do not deny it is possible; and that which is possible, for all you know, may actually exist.

P: I deny it to be possible, and have, if I am not mistaken, evidently proved from your own concessions

that it is not. In the common meaning of the word *matter*, is there any more implied than an extended, solid, figured, moveable substance, existing without the mind? And have not you acknowledged over and over that you have seen evident reason for denying the possibility of such a substance?

H: True, but that is only one sense of the term *matter*.

P: But is it not the only proper genuine received sense? And if matter in such a sense is proved impossible, may it not be thought with good grounds absolutely impossible? How else could anything be proved impossible? Or indeed how could there be any proof at all one way or the other to a man who takes the liberty to unsettle and change the common signification of words?

H: I thought philosophers might be allowed to speak more accurately than the vulgar and were not always confined to the common meaning of a term.

P: But this now mentioned is the common received sense among philosophers themselves. But not to insist on that, have you not been allowed to take matter in what sense you pleased? And have you not used this privilege in the utmost extent, sometimes entirely changing, at others leaving out or putting into the definition of it whatever for the present best served your design, contrary to all the known rules of reason and logic? And has not this shifting, unfair method of yours spun out our dispute to an unnecessary length, matter having been particularly examined and by your own confession refuted in each of those senses? And can any more be required to prove the absolute impossibility of a thing than the proving it impossible in every particular sense that either you or anyone else understands it in?

H: But I am not so thoroughly satisfied that you have proved the impossibility of matter in the last most obscure, abstracted, and indefinite sense.

P: When is a thing shown to be impossible?

H: When a repugnance is demonstrated between the ideas comprehended in its definition.

P: But where there are no ideas, there no repugnance can be demonstrated between ideas.

H: I agree with you.

P: Now, in that which you call the obscure, indefinite sense of the word matter, it is plain, by your own confession, there was included no idea at all, no sense except an unknown sense, which is the same thing as none. You are not, therefore, to expect I should prove a repugnance between ideas where there are no ideas, or the impossibility of matter taken in an *unknown* sense — that is, no sense at all. My business was only to show you meant *nothing*, and this you were brought to admit. So that in all your various senses, you have been shown either to mean nothing at all or, if anything, an absurdity. And if this is not sufficient to prove the impossibility of a thing, I desire you will let me know what is.

H: I acknowledge you have proved that matter is impossible; nor do I see what more can be said in defense of it. But, at the same time that I give up this, I suspect all my other notions. For surely none could be more seemingly evident than this once was, and yet it now seems as false and absurd as ever it did true before. But I think we have discussed the point sufficiently for the present. The remaining part of the day I would willingly spend in running over in my thoughts the several heads of this morning's conversation, and tomorrow shall be glad to meet you here again about the same time.

P: I will not fail to attend you.

THE THIRD DIALOGUE

PHILONOUS: Tell me, Hylas, what are the fruits of yesterday's meditation? Has it confirmed you in the same mind you were in at parting? Or have you since seen cause to change your opinion?

HYLAS: Truly my opinion is that all our opinions are alike vain and uncertain. What we approve today, we condemn tomorrow. We keep a stir about knowledge and spend our lives in the pursuit of it, when, alas, we know nothing all the while; nor do I think it possible for us ever to know anything in this life. Our faculties are too narrow and too few. Nature certainly never intended us for speculation.

P: What! You say we can know nothing, Hylas?

H: There is not that single thing in the world of which we can know the real nature, or what it is in itself.

P: Will you tell me I do not really know what fire or water is?

H: You may indeed know that fire appears hot and water fluid, but this is no more than knowing what sensations are produced in your own mind, upon the application of fire and water to your organs of sense. Their internal constitution, their true and real nature, you are utterly in the dark as to *that*.

P: Do I not know this to be a real stone that I stand on and that which I see before my eyes to be a real tree?

H: *Know?* No, it is impossible you or any man alive should know it. All you know is that you have such a certain idea or appearance in your own mind. But what is this to the real tree or stone? I tell you that color, figure, and hardness, which you perceive, are not the real natures of those things or in the least like them. The same may be said of all other real things or corporeal substances which compose the world. They have, none of them, anything in themselves like those sensible qualities perceived by us. We should not, therefore, pretend to affirm or know anything of them as they are in their own nature.

P: But surely, Hylas, I can distinguish gold, for example, from iron, and how could this be, if I knew not what either truly was?

H: Believe me, Philonous, you can only distinguish between your own ideas. That yellowness, that weight, and other sensible qualities, do you think they are really in the gold? They are only relative to the senses and have no absolute existence in nature. And in pretending to distinguish the species of real things by the appearances in your mind, you may perhaps act as wisely as he who should conclude two men were of a different species because their clothes were not of the same color.

P: It seems, then, we are altogether put off with the appearances of things, and those false ones too. The very meat I eat and the cloth I wear have nothing in them like what I see and feel.

H: Even so.

P: But is it not strange the whole world should be thus imposed on and so foolish as to believe their senses? And yet I do not know how it is, but men eat, and drink, and sleep, and perform all the offices of life as comfortably and conveniently as if they really knew the things they are conversant about.

H: They do so, but you know ordinary practice does not require a nicety of speculative knowledge. Hence the vulgar retain their mistakes, and for all that make a shift to bustle through the affairs of life. But philosophers know better things.

P: You mean, they know that they *know nothing*.

H: That is the very top and perfection of human knowledge.

P: But are you all this while in earnest, Hylas; and are you seriously persuaded that you know nothing real in the world? Suppose you are going to write, would you not call for pen, ink, and paper, like another man; and do you not know what it is you call for?

H: How often must I tell you that I do not know the real nature of any one thing in the universe? I may, indeed, upon occasion, make use of pen, ink, and paper. But what any one of them is in its own true nature, I declare positively I do not know. And the same is true with regard to every other corporeal thing. And, what is more, we are not only ignorant of the true and real nature of things, but even of their existence. It cannot be denied that we perceive such certain appearances or ideas; but it cannot be concluded from this that bodies really exist. No, now I think on it, I must, agreeably to my former concessions, further declare that it is impossible any real corporeal thing should exist in nature.

P: You amaze me. Was anything ever more wild and extravagant than the notions you now maintain, and

is it not evident you are led into all these extravagances by the belief of *material substance*? This makes you dream of those unknown natures in everything. It is this which occasions your distinguishing between the reality and sensible appearances of things. It is to this you are indebted for being ignorant of what everybody else knows perfectly well. Nor is this all: you are not only ignorant of the true nature of everything, but you do not know whether anything really exists or whether there are any true natures at all. For as much as you attribute to your material beings an absolute or external existence, in which you suppose their reality consists, and as you are forced, in the end, to acknowledge such an existence means either a direct repugnance or nothing at all, it follows that you are obliged to pull down your own hypothesis of material substance and positively to deny the real existence of any part of the universe. And so you are plunged into the deepest and most deplorable *skepticism* that ever man was. Tell me, Hylas, is it not as I say?

H: I agree with you. *Material substance* was no more than an hypothesis, and a false and groundless one too. I will no longer spend my breath in defense of it. But whatever hypothesis you advance, or whatever scheme of things you introduce in its stead, I do not doubt it will appear every whit as false; let me but be allowed to question you upon it. That is, allow me to serve you in your own kind and I warrant it shall conduct you through as many perplexities and contradictions to the very same state of skepticism that I myself am in at present.

P: I assure you, Hylas, I do not pretend to frame any hypothesis at all. I am of a vulgar cast, simple enough to believe my senses and leave things as I find them. To be plain, it is my opinion that the real things are those very things I see and feel and perceive by my senses. These I know, and, finding they answer all the necessities and purposes of life, have no reason to be solicitous about any other unknown beings. A piece of sensible bread, for instance, would stay my stomach better than ten thousand times as much of that insensible, unintelligible, real bread you speak of. It is likewise my opinion that colors and other sensible qualities are in the objects. I cannot for my life help thinking that snow is white and fire hot. You indeed, who by *snow* and *fire* mean certain external, unperceived, unperceiving substances, are in the right to deny whiteness or heat to be affections inherent in them. But I, who understand by those words the things I see and feel, am obliged to think like other folks. And as I am no skeptic with regard to the nature of things, so neither am I as to their existence. That a thing should be really perceived by my senses and at the same time not really exist is to me a plain contradiction, since I cannot prescind or abstract, even in thought, the existence of a sensible thing from its being perceived. Wood, stones, fire, water, flesh, iron, and the like things, which I name and discourse of, are things that I know. And I should not have known them but that I perceived them by my senses; and things perceived by the senses are immediately perceived; and things immediately perceived are ideas; and ideas cannot exist without the mind; their existence, therefore, consists in being perceived; when, therefore, they are actually perceived, there can be no doubt of their existence. Away then with all that skepticism, all those ridiculous philosophical doubts. What a jest is it for a philosopher to question the existence of sensible things until he has it proved to him from the veracity of God or to pretend our knowledge in this point falls short of intuition or demonstration! I might as well doubt of my own being as of the being of those things I actually see and feel.

H: Not so fast, Philonous; you say you cannot conceive how sensible things should exist without the mind. Do you not?

P: I do.

H: Supposing you were annihilated, cannot you conceive it possible that things perceivable by sense may still exist?

P: I can; but then it must be in another mind. When I deny sensible things an existence out of the mind, I do not mean my mind in particular, but all minds. Now it is plain they have an existence exterior to my mind, since I find them by experience to be independent of it. There is, therefore, some other mind in which they exist during the intervals between the times of my perceiving them, as likewise they did before my birth and would do after my supposed annihilation. And as the same is true with regard to all other finite created spirits, it necessarily follows there is an *omnipresent, eternal Mind* which knows and comprehends all things, and exhibits them to our view in such a manner and according to such rules as he himself has ordained and are by us termed the *laws of nature*.

H: Answer me, Philonous. Are all our ideas perfectly inert beings? Or do they have any agency included in them?

P: They are altogether passive and inert.

H: And is not God an agent, a being purely active?

P: I acknowledge it.

H: No idea, therefore, can be like or represent the nature of God.

P: It cannot.

H: Since, therefore, you have no idea of the mind of God, how can you conceive it possible that things should exist in his mind? Or, if you can conceive the mind of God without having an idea of it, why may I not be allowed to conceive the existence of matter, notwithstanding that I have no idea of it?

P: As to your first question, I admit I have properly no idea, either of God or any other spirit; for these, being active, cannot be represented by things perfectly inert as our ideas are. I do nevertheless know that I, who am a spirit or thinking substance, exist as certainly as I know my ideas exist. Further, I know what I mean by the terms *I* and *myself*; and I know this immediately, or intuitively, though I do not perceive it as I perceive a triangle, a color, or a sound. The mind, spirit, or soul, is that indivisible, unextended thing, which thinks, acts, and perceives. I say *indivisible*, because unextended, and *unextended*, because extended, figured, moveable things are ideas; and that which perceives ideas, which thinks and wills, is plainly itself no idea, nor like an idea. Ideas are things inactive and perceived, and spirits a sort of beings altogether different from them. I do not therefore say my soul is an idea or like an idea. However, taking the word *idea* in a large sense, my soul may be said to furnish me with an idea, that is, an image or likeness of God, though indeed extremely inadequate. For all the notion I have of God is obtained by reflecting on my own soul, heightening its powers and removing its imperfections. I have, therefore, though not an inactive idea, yet in myself some sort of an active thinking image of the Deity. And though I do not perceive him by sense, yet I have a notion of him or know him by reflection and reasoning. My own mind and my own ideas I have an immediate knowledge of, and, by the help of these, do mediately apprehend the possibility of the existence of other spirits and ideas. Further, from my own being and from the dependency I find in myself and my ideas, I do by an act of reason necessarily infer the existence of a God and of all created things in the mind of God. So much for your first question. For the second, I suppose by this time you can answer it yourself. For you neither perceive matter objectively, as you do an inactive being or idea, nor know it, as you do yourself, by a reflective act — neither do you mediately apprehend it by similitude of the one or the other, nor yet collect it by reasoning from that which you know immediately—all of which makes the case of *matter* widely different from that of the *Deity*.

H: You say your own soul supplies you with some sort of an idea or image of God. But at the same time you acknowledge you have, properly speaking, no idea of your own soul. You even affirm that spirits are a sort of beings altogether different from ideas, consequently, that no idea can be like a spirit. We have, therefore, no idea of any spirit. You admit nevertheless that there is spiritual substance, although you have no idea of it, while you deny there can be such a thing as material substance, because you have no notion or idea of it. Is this fair dealing? To act consistently, you must either admit matter or reject spirit. What do you say to this?

P: I say, in the first place, that I do not deny the existence of material substance merely because I have no notion of it, but because the notion of it is inconsistent or, in other words, because it is repugnant that there should be a notion of it. Many things, for all I know, may exist, of which neither I nor any other man has or can have any idea or notion whatsoever. But then those things must be possible; that is, nothing inconsistent must be included in their definition. I say, secondly, that, although we believe things to exist which we do not perceive, yet we may not believe that any particular thing exists without some reason for such belief, but I have no reason for believing the existence of matter. I have no immediate intuition of this; neither can I mediately from my sensations, ideas, notions, actions, or passions infer an unthinking, unperceiving, inactive substance, either by probable deduction or necessary consequence, whereas the being of myself, that is, my own soul, mind, or thinking principle, I evidently know by reflection. You will forgive me if I repeat the same things in answer to the same objections. In the very notion or definition of material substance, there is included a manifest repugnance and inconsistency. But this cannot be said of the notion of spirit. That ideas should exist in what does not perceive, or be produced by what does not act, is repugnant. But it is no repugnance to say that a perceiving thing should be the subject of ideas or an active thing the cause of them. It is granted we have neither an immediate evidence nor a demonstrative knowledge of the existence of other finite spirits, but it will not then follow that such spirits are on a foot with material substances, if to suppose the one is inconsistent and it is not inconsistent to suppose the other; if the one can be inferred by no argument, and there is a probability for the other; if we see signs and effects indicating distinct finite agents like ourselves, and see no sign or symptom whatever that leads to a rational belief of matter. I say, lastly, that I have a notion of spirit, though I do not have, strictly speaking, an idea of it. I do not perceive it as an idea or by means of an idea, but know it by reflection.

H: Notwithstanding all you have said, it seems to me that, according to your own way of thinking, and in consequence of your own principles, it should follow that you are only a system of floating ideas without any substance to support them. Words are not to be used without a meaning. And as there is no more meaning in

spiritual substance than in material substance, the one is to be exploded as well as the other.

P: How often must I repeat that I know or am conscious of my own being and that I myself am not my ideas, but something else, a thinking, active principle that perceives, knows, wills, and operates about ideas? I know that I, one and the same self, perceive both colors and sounds; that a color cannot perceive a sound nor a sound a color; that I am therefore one individual principle, distinct from color and sound, and, for the same reason, from all other sensible things and inert ideas. But I am not in like manner conscious of either the existence or the essence of matter. On the contrary, I know that nothing inconsistent can exist and that the existence of matter implies an inconsistency. Further, I know what I mean when I affirm that there is a spiritual substance or support of ideas, that is, that a spirit knows and perceives ideas. But I do not know what is meant when it is said that an unperceiving substance has inherent in it and supports either ideas or the archetypes of ideas. There is, therefore, upon the whole no parity of case between spirit and matter.

H: I admit myself satisfied in this point. But do you in earnest think the real existence of sensible things consists in their being actually perceived? If so, how does it come that all mankind distinguishes between them? Ask the first man you meet, and he shall tell you, *to be perceived* is one thing and *to exist* is another.

P: I am content, Hylas, to appeal to the common sense of the world for the truth of my notion. Ask the gardener why he thinks the cherry tree over there exists in the garden, and he shall tell you because he sees and feels it—in a word, because he perceives it by his senses. Ask him why he thinks an orange tree is not there, and he shall tell you because he does not perceive it. What he perceives by sense, that he terms a real being and says it *is*, or *exists*; but that which is not perceivable, the same, he says, has no being.

H: Yes, Philonous, I grant the existence of a sensible thing consists in being perceivable, but not in being actually perceived.

P: And what is perceivable but an idea? And can an idea exist without being actually perceived? These are points long since agreed between us.

H: But be your opinion never so true, yet surely you will not deny it is shocking and contrary to the common sense of men. Ask the fellow, whether tree over there has an existence out of his mind, what answer, do you think, he would make?

P: The same that I should myself, namely, that it does exist out of his mind. But then to a Christian it cannot surely be shocking to say the real tree existing without his mind is truly known and comprehended by (that is, *exists in*) the infinite mind of God. Probably he may not at first glance be aware of the direct and immediate proof there is of this, inasmuch as the very being of a tree or any other sensible thing implies a mind in which it is. But the point itself he cannot deny. The question between the materialists and me is not whether things have a real existence out of the mind of this or that person, but whether they have an absolute existence, distinct from being perceived by God and exterior to all minds. This, indeed, some heathens and philosophers have affirmed, but whoever entertains notions of the Deity suitable to the Holy Scriptures will be of another opinion.

H: But, according to your notions, what difference is there between real things and chimeras formed by the imagination or the visions of a dream, since they are all equally in the mind?

P: The ideas formed by the imagination are faint and indistinct; they have, besides, an entire dependence on the will. But the ideas perceived by sense, that is, real things, are more vivid and clear, and, being imprinted on the mind by a spirit distinct from us, have not a like dependence on our will. There is, therefore, no danger of confounding these with the foregoing, and there is as little of confounding them with the visions of a dream, which are dim, irregular, and confused. And though they should happen to be never so lively and natural, yet, by their not being connected and of a piece with the preceding and subsequent transactions of our lives, they might easily be distinguished from realities. In short, by whatever method you distinguish *things* from *chimeras* on your own scheme, the same, it is evident, will hold also upon mine. For it must be, I presume, by some perceived difference, and I am not for depriving you of any one thing that you perceive.

H: But still, Philonous, you hold there is nothing in the world but spirits and ideas. And this, you must necessarily acknowledge, sounds very odd.

P: I admit the word *idea*, not being commonly used for *thing*, sounds something out of the way. My reason for using it was because a necessary relation to the mind is understood to be implied by that term and it is now commonly used by philosophers to denote the immediate objects of the understanding. But however odd the proposition may sound in words, yet it includes nothing so very strange or shocking in its sense, which in effect amounts to no more than this, namely, that there are only things perceiving and things perceived; or that every unthinking being is necessarily and from the very nature of its existence perceived by

some mind, if not by any finite created mind, yet certainly by the infinite mind of God, in whom “we live, and move, and have our being” (Acts 17:28). Is this as strange as to say the sensible qualities are not in the objects or that we cannot be sure of the existence of things, or know anything of their real natures, though we both see and feel them and perceive them by all our senses?

H: And, in consequence of this, must we not think there are no such things as physical or corporeal causes, but that a spirit is the immediate cause of all the *phenomena* in nature? Can there be anything more extravagant than this?

P: Yes, it is infinitely more extravagant to say a thing which is inert operates on the mind and a thing which is unperceiving is the cause of our perceptions. Besides, that which to you, I do not know for what reason, seems so extravagant is no more than the Holy Scriptures assert in a hundred places. In them God is represented as the sole and immediate author of all those effects which some heathens and philosophers are accustomed to ascribe to nature, matter, fate, or the like unthinking principle. This is so much the constant language of Scripture that it would be needless to confirm it by citations.

H: You are not aware, Philonous, that in making God the immediate author of all the motions in nature, you make him the author of murder, sacrilege, adultery, and the like heinous sins.

P: In answer to that I observe, first, that the imputation of guilt is the same whether a person commits an action with or without an instrument. In case, therefore, you suppose God to act by the mediation of an instrument or occasion called *matter*, you as truly make him the author of sin as I, who think him the immediate agent in all those operations vulgarly ascribed to nature. I further observe that sin or moral turpitude does not consist in the outward physical action or motion, but in the internal deviation of the will from the laws of reason and religion. This is plain, in that the killing an enemy in a battle, or putting a criminal legally to death, is not thought sinful, though the outward acts are the very same with that in the case of murder. Since, therefore, sin does not consist in the physical action, making God an immediate cause of all such actions is not making him the author of sin. Lastly, I have nowhere said that God is the only agent who produces all the motions in bodies. It is true I have denied there are any other agents besides spirits, but this is very consistent with allowing to thinking, rational beings, in the production of motions, the use of limited powers ultimately indeed derived from God, but immediately under the direction of their own wills, which is sufficient to entitle them to all the guilt of their actions.

H: But denying matter, Philonous, or corporeal substance — there is the point. You can never persuade me that this is not repugnant to the universal sense of mankind. Were our dispute to be determined by most voices, I am confident you would give up the point without gathering the votes.

P: I wish both our opinions were fairly stated and submitted to the judgment of men who had plain common sense without the prejudices of a learned education. Let me be represented as one who trusts his senses, who thinks he knows the things he sees and feels and entertains no doubts of their existence, and you fairly set forth with all your doubts, your paradoxes, and your skepticism about you, and I shall willingly acquiesce in the determination of any indifferent person. That there is no substance in which ideas can exist besides spirit is evident to me. And that the objects immediately perceived are ideas is agreed on all hands. And that sensible qualities are objects immediately perceived no one can deny. It is therefore evident there can be no *substratum* of those qualities but spirit, in which they exist, not by way of mode or property, but as a thing perceived in that which perceives it. I deny, therefore, that there is any unthinking *substratum* of the objects of sense and, in that meaning, that there is any material substance. But if by *material substance* is meant only sensible body, that which is seen and felt (and the unphilosophical part of the world, I dare say, mean no more), then I am more certain of matter's existence than you or any other philosopher pretend to be. If there is anything which makes the generality of mankind averse from the notions I espouse, it is a misapprehension that I deny the reality of sensible things, but as it is you who are guilty of that and not I, it follows that in truth their aversion is against your notions and not mine. I do therefore assert that I am as certain of my own being as that there are bodies or corporeal substances (meaning the things I perceive by my senses), and that, granting this, the bulk of mankind will take no thought about, nor think themselves at all concerned in the fate of those unknown natures and philosophical quiddities, which some men are so fond of.

H: What do you say to this? Since, according to you, men judge of the reality of things by their senses, how can a man be mistaken in thinking the moon a plain lucid surface about a foot in diameter; or a square tower, seen at a distance, round; or an oar, with one end in the water, crooked?

P: He is not mistaken with regard to the ideas he actually perceives, but in the inferences he makes from his present perceptions. Thus, in the case of the oar, what he immediately perceives by sight is certainly crooked, and so far he is in the right. But if he then concludes that upon taking the oar out of the water he

shall perceive the same crookedness, or that it would affect his touch as crooked things are accustomed to do, in that he is mistaken. In like manner, if he should conclude from what he perceives in one station, that, in case he advances toward the moon or tower, he should still be affected with the like ideas, he is mistaken. But his mistake does not lie in what he perceives immediately and at present (it being a manifest contradiction to suppose he should err in respect of that), but in the wrong judgment he makes concerning the ideas he apprehends to be connected with those immediately perceived, or concerning the ideas that, from what he perceives at present, he imagines would be perceived in other circumstances. The case is the same with regard to the Copernican system. We do not here perceive any motion of the earth, but it would be erroneous to conclude from this that, in case we were placed at as great a distance from that as we are now from the other planets, we should not then perceive its motion.

H: I understand you and must necessarily admit you say things plausible enough, but give me leave to put you in mind of one thing. Pray, Philonous, were you not formerly as positive that matter existed as you are now that it does not?

P: I was. But here lies the difference. Before, my positiveness was founded without examination, upon prejudice; but now, after inquiry, upon evidence.

H: After all, it seems our dispute is rather about words than things. We agree in the thing, but differ in the name. That we are affected with ideas from without is evident; and it is no less evident that there must be (I will not say archetypes, but) powers outside the mind corresponding to those ideas. And as these powers cannot subsist by themselves, there is some subject of them necessarily to be admitted, which I call *matter* and you call *spirit*. This is all the difference.

P: Pray, Hylas, is that powerful being, or subject of powers, extended?

H: It has not extension; but it has the power to raise in you the idea of extension.

P: It is therefore itself unextended.

H: I grant it.

P: Is it not also active?

H: Without doubt; otherwise, how could we attribute powers to it?

P: Now let me ask you two questions: *First*, whether it is agreeable to the usage either of philosophers or others to give the name *matter* to an unextended active being? And *secondly*, whether it is not ridiculously absurd to misapply names contrary to the common use of language?

H: Well then, let it not be called matter, since you will have it so, but some *third nature* distinct from matter and spirit. For what reason is there why you should call it spirit? Does not the notion of spirit imply that it is thinking as well as active and unextended?

P: My reason is this: Because I have a mind to have some notion or meaning in what I say, but I have no notion of any action distinct from volition, neither can I conceive volition to be anywhere but in a spirit; therefore, when I speak of an active being, I am obliged to mean a spirit. Besides, what can be plainer than that a thing which has no ideas in itself cannot impart them to me; and if it has ideas, surely it must be a spirit. To make you comprehend the point still more clearly, if it is possible, I assert as well as you that since we are affected from without, we must allow powers to be without in a being distinct from ourselves. So far we are agreed. But then we differ as to the kind of this powerful being. I will have it to be spirit, you matter or I do not know what (I may add too, you do not know what) third nature. Thus I prove it to be spirit. From the effects I see produced, I conclude there are actions; and because actions, volitions; and because there are volitions, there must be a will. Again, the things I perceive must have an existence, they or their archetypes, out of my mind, but, being ideas, neither they nor their archetypes can exist otherwise than in an understanding; there is therefore an understanding. But will and understanding constitute in the strictest sense a mind or spirit. The powerful cause, therefore, of my ideas is in strict propriety of speech a *spirit*.

H: And now I warrant you think you have made the point very clear, little suspecting that what you advance leads directly to a contradiction. Is it not an absurdity to imagine any imperfection in God?

P: Without doubt.

H: To suffer pain is an imperfection.

P: It is.

H: Are we not sometimes affected with pain and uneasiness by some other being?

P: We are.

H: And have you not said that being is a spirit, and is not that spirit God?

P: I grant it.

H: But you have asserted that whatever ideas we perceive from without are in the mind which affects us. The ideas, therefore, of pain and uneasiness are in God; or in other words, God suffers pain — that is to say, there is an imperfection in the divine nature, which you acknowledged was absurd. So you are caught in a plain contradiction.

P: That God knows or understands all things and that he knows among other things what pain is, even every sort of painful sensation, and what it is for his creatures to suffer pain, I make no question. But that God, though he knows and sometimes causes painful sensations in us, can himself suffer pain, I positively deny. We, who are limited and dependent spirits, are liable to impressions of sense, the effects of an external agent, which, being produced against our wills, are sometimes painful and uneasy. But God, whom no external being can affect, who perceives nothing by sense as we do, whose will is absolute and independent, causing all things and liable to be thwarted or resisted by nothing, it is evident such a being as this can suffer nothing, nor be affected with any painful sensation, or indeed any sensation at all. We are chained to a body, that is to say, our perceptions are connected with corporeal motions. By the law of our nature we are affected upon every alteration in the nervous parts of our sensible body — which sensible body rightly considered is nothing but a complexion of such qualities or ideas as have no existence distinct from being perceived by a mind—so that this connection of sensations with corporeal motions means no more than a correspondence in the order of nature between two sets of ideas or things immediately perceivable. But God is a pure spirit, disengaged from all such sympathy or natural ties. No corporeal motions are attended with the sensations of pain or pleasure in his mind. To know everything knowable is certainly a perfection; but to endure, or suffer, or feel anything by sense, is an imperfection. The former, I say, agrees to God, but not the latter. God knows or has ideas, but his ideas are not conveyed to him by sense as ours are. Your not distinguishing where there is so manifest a difference makes you fancy you see an absurdity where there is none.

H: But all this while you have not considered that the quantity of matter has been demonstrated to be proportioned to the gravity of bodies. And what can withstand demonstration?

P: Let me see how you demonstrate that point.

H: I lay it down for a principle that the moments or quantities of motion in bodies are in a direct compounded reason of the velocities and quantities of matter contained in them. Hence, where the velocities are equal, it follows the moments are directly as the quantity of matter in each. But it is found by experience that all bodies (bating the small inequalities arising from the resistance of the air) descend with an equal velocity; the motion therefore of descending bodies, and consequently their gravity, which is the cause or principle of that motion, is proportional to the quantity of matter—which was to be demonstrated.

P: You lay it down as a self-evident principle that the quantity of motion in any body is proportional to the velocity and *matter* taken together; and this is made use of to prove a proposition from which the existence of *matter* is inferred. Pray is not this arguing in a circle?

H: In the premise I only mean that the motion is proportional to the velocity, jointly with the extension and solidity.

P: But allowing this to be true, yet it will not then follow that gravity is proportional to *matter* in your philosophic sense of the word, except you take it for granted that unknown *substratum*, or whatever else you call it, is proportional to those sensible qualities—which to suppose is plainly begging the question. That there is magnitude and solidity, or resistance, perceived by sense, I readily grant, as likewise that gravity may be proportional to those qualities, I will not dispute. But that either these qualities as perceived by us or the powers producing them do exist in a *material substratum*; this is what I deny and you indeed affirm, but notwithstanding your demonstration have not yet proved.

H: I shall insist no longer on that point. Do you think, however, you shall persuade me that natural philosophers have been dreaming all this while? Pray what becomes of all their hypotheses and explications of the *phenomena* which suppose the existence of matter?

P: What do you mean, Hylas, by the *phenomena*?

H: I mean the appearances which I perceive by my senses.

P: And the appearances perceived by sense, are they not ideas?

H: I have told you so a hundred times.

P: Therefore, to explain the *phenomena* is to show how we come to be affected with ideas, in that manner

and order in which they are imprinted on our senses. Is it not?

H: It is.

P: Now if you can prove that any philosopher has explained the production of any one idea in our minds by the help of *matter*, I shall forever acquiesce and look on all that has been said against it as nothing, but if you cannot, it is in vain to urge the explication of *phenomena*. That a being endowed with knowledge and will should produce or exhibit ideas is easily understood. But that a being which is utterly destitute of these faculties should be able to produce ideas, or in any sort to affect an intelligence, this I can never understand. This I say, though we had some positive conception of matter, though we knew its qualities and could comprehend its existence, would yet be so far from explaining things that it is itself the most inexplicable thing in the world. And yet for all this, it will not follow that philosophers have been doing nothing; for by observing and reasoning upon the connection of ideas, they discover the laws and methods of nature, which is a part of knowledge both useful and entertaining.

H: After all, can it be supposed God would deceive all mankind? Do you imagine he would have induced the whole world to believe the being of matter if there was no such thing?

P: That every epidemic opinion arising from prejudice, or passion, or thoughtlessness, may be imputed to God, as the author of it, I believe you will not affirm. Whatever opinion we father on him, it must be either because he has discovered it to us by supernatural revelation or because it is so evident to our natural faculties, which were framed and given us by God, that it is impossible we should withhold our assent from it. But where is the revelation or where is the evidence that extorts the belief of matter? No, how does it appear that matter, taken for something distinct from what we perceive by our senses, is thought to exist by all mankind, or indeed by any except a few philosophers who do not know what they would be at? Your question supposes these points are clear; and when you have cleared them, I shall think myself obliged to give you another answer. In the meantime let it suffice that I tell you I do not suppose God has deceived mankind at all.

H: But the novelty, Philonous, the novelty! There lies the danger. New notions should always be discountenanced; they unsettle men's minds and nobody knows where they will end.

P: Why rejecting a notion that has no foundation either in sense or in reason or in divine authority should be thought to unsettle the belief of such opinions as are grounded on all or any of these, I cannot imagine. That innovations in government and religion are dangerous and ought to be discountenanced, I freely admit. But is there the like reason why they should be discouraged in philosophy? Making anything known which was unknown before is an innovation in knowledge, and if all such innovations had been forbidden, men would [not] have made a notable progress in the arts and sciences. But it is none of my business to plead for novelties and paradoxes. That the qualities we perceive are not in the objects; that we must not believe our senses; that we know nothing of the real nature of things and can never be assured even of their existence; that real colors and sounds are nothing but certain unknown figures and motions; that motions are in themselves neither swift nor slow; that there are in bodies absolute extensions, without any particular magnitude or figure; that a thing stupid, thoughtless, and inactive operates on a spirit; that the least particle of a body contains innumerable extended parts. These are the novelties, these are the strange notions which shock the genuine uncorrupted judgment of all mankind, and, being once admitted, embarrass the mind with endless doubts and difficulties. And it is against these and the like innovations I endeavor to vindicate common sense. It is true, in doing this, I may perhaps be obliged to use some *ambages* and ways of speech not common. But if my notions are once thoroughly understood, that which is most singular in them will in effect be found to amount to no more than this: that it is absolutely impossible and a plain contradiction to suppose that any unthinking being should exist without being perceived by a mind. And if this notion is singular, it is a shame it should be so at this time of day and in a Christian country.

H: As for the difficulties other opinions may be liable to, those are out of the question. It is your business to defend your own opinion. Can anything be plainer than that you are for changing all things into ideas? You, I say, who are not ashamed to charge me with *skepticism*. This is so plain there is no denying it.

P: You mistake me. I am not for changing things into ideas, but rather ideas into things, since those immediate objects of perception, which, according to you, are only appearances of things, I take to be the real things themselves.

H: Things! You may pretend what you please, but it is certain you leave us nothing but the empty forms of things, the outside only which strikes the senses.

P: What you call the empty forms and outside of things seems to me the very things themselves. Nor are they empty or incomplete otherwise than upon your supposition that matter is an essential part of all corporeal things. We both, therefore, agree in this: that we perceive only sensible forms, but we differ in this: You will

have them to be empty appearances; I, real beings. In short, you do not trust your senses; I do.

H: You say you believe your senses and seem to applaud yourself that in this you agree with the vulgar. According to you, therefore, the true nature of a thing is discovered by the senses. If so, where does that disagreement come from? Why is not the same figure and other sensible qualities perceived all manner of ways? And why should we use a microscope, the better to discover the true nature of a body, if it were discoverable to the naked eye?

P: Strictly speaking, Hylas, we do not see the same object that we feel; neither is the same object perceived by the microscope which was by the naked eye. But in case every variation was thought sufficient to constitute a new kind or individual, the endless number or confusion of names would render language impracticable. Therefore, to avoid this as well as other inconveniences which are obvious upon a little thought, men combine together several ideas, apprehended by various senses, or by the same sense at different times, or in different circumstances, but observed, however, to have some connection in nature, either with respect to coexistence or succession; all which they refer to one name and consider as one thing. Hence it follows that when I examine by my other senses a thing I have seen, it is not in order to understand better the same object which I had perceived by sight, the object of one sense not being perceived by the other senses. And when I look through a microscope, it is not that I may perceive more clearly what I perceived already with my bare eyes, the object perceived by the glass being quite different from the former. But in both cases my aim is only to know what ideas are connected together; and the more a man knows of the connection of ideas, the more he is said to know of the nature of things. What, therefore, if our ideas are variable? What if our senses are not in all circumstances affected with the same appearances? It will not then follow they are not to be trusted, or that they are inconsistent either with themselves or anything else, except with your preconceived notion of (I do not know what) one single, unchanged, unperceivable, real nature, marked by each name, which prejudice seems to have taken its rise from not rightly understanding the common language of men speaking of several distinct ideas as united into one thing by the mind. And, indeed, there is cause to suspect several erroneous conceits of the philosophers are owing to the same original: while they began to build their schemes, not so much on notions as words which were framed by the vulgar merely for convenience and dispatch in the common actions of life, without any regard to speculation.

H: I think I apprehend your meaning.

P: It is your opinion the ideas we perceive by our senses are not real things, but images or copies of them. Our knowledge, therefore, is no further real than as our ideas are the true representations of those originals. But as these supposed originals are in themselves unknown, it is impossible to know how far our ideas resemble them or whether they resemble them at all. We cannot, therefore, be sure we have any real knowledge. Further, as our ideas are perpetually varied, without any change in the supposed real things, it necessarily follows they cannot all be true copies of them, or, if some are and others are not, it is impossible to distinguish the former from the latter. And this plunges us yet deeper in uncertainty. Again, when we consider the point, we cannot conceive how any idea, or anything like an idea, should have an absolute existence out of a mind, nor consequently, according to you, how there should be any real thing in nature. The result of all this is that we are thrown into the most hopeless and abandoned *skepticism*. Now give me leave to ask you, *first*, whether your referring ideas to certain absolutely existing unperceived substances, as their originals, is not the source of all this *skepticism*? *Secondly*, whether you are informed, either by sense or reason, of the existence of those unknown originals? And in case you are not, whether it is not absurd to suppose them? *Thirdly*, whether upon inquiry, you find there is anything distinctly conceived or meant by the *absolute or external existence of unperceiving substances*? *Lastly*, whether, the premises considered, it is not the wisest way to follow nature, trust your senses, and laying aside all anxious thought about unknown natures or substances, admit with the vulgar those for real things which are perceived by the senses?

H: For the present, I have no inclination to the answering part. I would much rather see how you can get over what follows. Pray, are not the objects perceived by the senses of one likewise perceivable to others present? If there were a hundred more here, they would all see the garden, the trees, and flowers as I see them. But they are not in the same manner affected with the ideas I frame in my imagination. Does not this make a difference between the former sort of objects and the latter?

P: I grant it does. Nor have I ever denied a difference between the objects of sense and those of imagination. But what would you infer from this? You cannot say that sensible objects exist unperceived because they are perceived by many.

H: I admit I can make nothing of that objection, but it has led me into another. Is it not your opinion that by our senses we perceive only the ideas existing in our minds?

P: It is.

H: But the same idea which is in my mind cannot be in yours or in any other mind. Does it not, therefore, follow from your principles that no two can see the same thing? And is not this highly absurd?

P: If the term *same* be taken in the vulgar meaning, it is certain (and not at all repugnant to the principles I maintain) that different persons may perceive the same thing, or the same thing or idea exist in different minds. Words are of arbitrary imposition; and since men are accustomed to apply the word *same* where no distinction or variety is perceived, and I do not pretend to alter their perceptions, it follows that, as men have said before, *several saw the same thing*, so they may upon like occasions, still continue to use the same phrase without any deviation either from propriety of language or the truth of things. But if the term *same* is used in the meaning of philosophers who pretend to an abstracted notion of identity, then, according to their sundry definitions of this notion (for it is not yet agreed in what that philosophic identity consists), it may or may not be possible for various persons to perceive the same thing. But whether philosophers shall think fit to call a thing the *same* or not, is, I conceive, of small importance. Let us suppose several men together, all endowed with the same faculties, and consequently affected in like sort by their senses, and who had yet never known the use of language; they would without question agree in their perceptions. Though perhaps, when they came to the use of speech, some regarding the uniformity of what was perceived might call it the *same* thing; others, especially regarding the diversity of persons who perceived, might choose the denomination of different things. But who does not see that all the dispute is about a word — namely, whether what is perceived by different persons may yet have the term *same* applied to it? Or suppose a house whose walls or outward shell remaining unaltered, the chambers are all pulled down, and new ones built in their place, and that you should call this the *same*, and I should say it was not the *same* house—would we not for all this perfectly agree in our thoughts of the house considered in itself? And would not all the difference consist in a sound? If you should say we differ in our notions, for that you superadded to your idea of the house the simple abstracted idea of identity, whereas I did not; I would tell you I do not know what you mean by that *abstracted idea of identity*; and I should desire you to look into your own thoughts and be sure you understood yourself. —Why so silent, Hylas? Are you not yet satisfied that men may dispute about identity and diversity without any real difference in their thoughts and opinions abstracted from names? Take this further reflection with you, that whether matter be allowed to exist or not, the case is exactly the same as to the point in hand. For the materialists themselves acknowledge what we immediately perceive by our senses to be our own ideas. Your difficulty, therefore, that no two see the same thing makes equally against the materialists and me.

H: But they suppose an external archetype to which, referring their several ideas, they may truly be said to perceive the same thing.

P: And (not to mention your having discovered those archetypes) so may you suppose an external archetype on my principles — *external*, I mean, to your own mind, though indeed it must be supposed to exist in that mind which comprehends all things; but then this serves all the ends of identity as well as if it existed out of a mind. And I am sure you yourself will not say it is less intelligible.

H: You have indeed clearly satisfied me, either that there is no difficulty at bottom in this point or if there is, it counts equally against both opinions.

P: But that which counts equally against two contradictory opinions can be a proof against neither.

H: I acknowledge it. But, after all, Philonous, when I consider the substance of what you advance against *skepticism*, it amounts to no more than this: We are sure that we really see, hear, feel — in a word, that we are affected with sensible impressions.

P: And how are we concerned any further? I see this *cherry*, I feel it, I taste it — and I am sure *nothing* cannot be seen or felt or tasted — it is therefore *real*. Take away the sensations of softness, moisture, redness, tartness, and you take away the *cherry*. Since it is not a being distinct from sensations, a *cherry*, I say, is nothing but a congeries of sensible impressions or ideas perceived by various senses, which ideas are united into one thing (or have one name given them) by the mind because they are observed to attend each other. Thus, when the palate is affected with such a particular taste, the sight is affected with a red color, the touch with roundness, softness, etc. Hence, when I see and feel and taste in sundry certain manners, I am sure the *cherry* exists or is real, its reality being in my opinion nothing abstracted from those sensations. But if by the word *cherry* you mean an unknown nature distinct from all those sensible qualities, and by its existence something distinct from its being perceived, then indeed I admit neither you nor I nor anyone else can be sure it exists.

H: But what would you say, Philonous, if I should bring the very same reasons against the existence of sensible things in a mind which you have offered against their existing in a material *substratum*?

P: When I see your reasons, you shall hear what I have to say to them.

H: Is the mind extended or unextended?

P: Unextended, without doubt.

H: Do you say the things you perceive are in your mind?

P: They are.

H: Again, have I not heard you speak of sensible impressions?

P: I believe you may.

H: Explain to me now, O Philonous, how it is possible there should be room for all those trees and houses to exist in your mind. Can extended things be contained in that which is unextended? Or are we to imagine impressions made on a thing void of all solidity? You cannot say objects are in your mind as books in your study or that things are imprinted on it as the figure of a seal upon wax. In what sense, therefore, are we to understand those expressions? Explain this to me, if you can, and I shall then be able to answer all those queries you formerly put to me about my *substratum*.

P: Look you, Hylas, when I speak of objects as existing in the mind or imprinted on the senses, I would not be understood in the gross literal sense, as when bodies are said to exist in a place or a seal to make an impression upon wax. My meaning is only that the mind comprehends or perceives them and that it is affected from without or by some being distinct from itself. This is my explication of your difficulty, and how it can serve to make your tenet of an unperceiving material *substratum* intelligible, I would gladly know.

H: No, if that be all, I confess I do not see what use can be made of it. But are you not guilty of some abuse of language in this?

P: None at all, it is no more than common custom, which you know is the rule of language, has authorized, nothing being more usual than for philosophers to speak of the immediate objects of the understanding as things existing in the mind. Nor is there anything in this, but what is conformable to the general analogy of language, most part of the mental operations being signified by words borrowed from sensible things — as is plain in the terms *comprehend*, *reflect*, *discourse*, etc., which being applied to the mind, must not be taken in their gross original sense.

H: You have, I admit, satisfied me in this point. But there still remains one great difficulty, which I do not know how you will get over. And, indeed, it is of such importance that if you could solve all others, without being able to find a solution for this, you must never expect to make me a proselyte to your principles.

P: Let me know this mighty difficulty.

H: The Scripture account of the creation is what appears to me utterly irreconcilable with your notions. Moses tells us of a creation,⁵ a creation of what? of ideas? No, certainly, but of things, of real things, solid corporeal substances. Bring your principles to agree with this and I shall perhaps agree with you.

P: Moses mentions the sun, moon, and stars, earth and sea, plants and animals — that all these do really exist and were in the beginning created by God, I make no question. If by *ideas* you mean fictions and fancies of the mind, then these are no ideas. If by *ideas* you mean immediate objects of the understanding, or sensible things which cannot exist unperceived, or out of a mind, then these things are ideas. But whether you do or do not call them *ideas*, it matters little. The difference is only about a name. And whether that name is retained or rejected, the sense, the truth, and reality of things continues the same. In common talk, the objects of our senses are not termed *ideas*, but *things*. Call them so still, provided you do not attribute to them any absolute external existence, and I shall never quarrel with you for a word. The creation, therefore, I allow to have been a creation of things, of *real* things. Neither is this in the least inconsistent with my principles, as is evident from what I have now said, and would have been evident to you without this, if you had not forgotten what had been so often said before. But as for solid corporeal substances, I desire you to show where Moses makes any mention of them, and if they should be mentioned by him or any other inspired writer, it would still be incumbent on you to show those words were not taken in the vulgar meaning, for things falling under our senses, but in the philosophic meaning, for matter, or an unknown quiddity, with an absolute existence. When you have proved these points, then (and not until then) may you bring the authority of Moses into our dispute.

H: It is in vain to dispute about a point so clear. I am content to refer it to your own conscience. Are you not satisfied there is some peculiar repugnance between the Mosaic account of the creation and your notions?

P: If all possible sense which can be put on the first chapter of Genesis may be conceived as consistently with my principles as any other, then it has no peculiar repugnance with them. But there is no sense you may not as well conceive, believing as I do. Since, besides spirits, all you conceive are ideas, and the existence of

these I do not deny. Neither do you pretend they exist without the mind.

H: Pray let me see any sense you can understand it in.

P: Why I imagine that if I had been present at the creation, I should have seen things produced into being, that is, become perceptible, in the order described by the sacred historian. I ever before believed the Mosaic account of the creation and now find no alteration in my manner of believing it. When things are said to begin or end their existence, we do not mean this with regard to God, but his creatures. All objects are eternally known by God, or, which is the same thing, have an eternal existence in his mind, but when things, before imperceptible to creatures, are by a decree of God made perceptible to them, then are they said to begin a relative existence with respect to created minds. Upon reading therefore the Mosaic account of the creation, I understand that the several parts of the world became gradually perceivable to finite spirits, endowed with proper faculties, so that, whoever such were present, they were in truth perceived by them. This is the literal, obvious sense suggested to me by the words of the Holy Scripture, in which is included no mention or no thought, either of *substratum*, instrument, occasion, or absolute existence. And upon inquiry, I do not doubt it will be found that most plain, honest men, who believe the creation, never think of those things any more than I. What metaphysical sense you may understand it in, you only can tell.

H: But, Philonous, you do not seem to be aware that you allow created things in the beginning only a relative, and, consequently, hypothetical being—that is to say, upon supposition there were men to perceive them, without which they have no actuality of absolute existence in which creation might terminate. Is it not, therefore, according to you, plainly impossible that the creation of any inanimate creatures should precede that of man? And is not this directly contrary to the Mosaic account?

P: In answer to that, I say, *first*, created beings might begin to exist in the mind of other created intelligences besides men. You will not, therefore, be able to prove any contradiction between Moses and my notions unless you first show there was no other order of finite created spirits in being before man. I say further—in case we conceive the creation as we should at this time a parcel of plants or vegetables of all sorts produced by an invisible power in a desert where nobody was present—that this way of explaining or conceiving it is consistent with my principles, since they deprive you of nothing, either sensible or imaginable; that it exactly suits with the common, natural, undebauched notions of mankind; that it manifests the dependence of all things on God, and consequently has all the good effect or influence which it is possible that important article of our faith should have in making men humble, thankful, and resigned to their Creator. I say, moreover, that in this naked conception of things, divested of words, there will not be found any notion of what you call the *actuality of absolute existence*. You may indeed raise a dust with those terms and so lengthen our dispute to no purpose. But I entreat you calmly to look into your own thoughts and then tell me if they are not a useless and unintelligible jargon.

H: I admit I have no very clear notion annexed to them. But what do you say to this? Do you not make the existence of sensible things consist in their being in a mind? And were not all things eternally in the mind of God? Did they not therefore exist from all eternity, according to you? And how could that which was eternal be created in time? Can anything be clearer or better connected than this?

P: And are not you too of the opinion that God knew all things from eternity?

H: I am.

P: Consequently, they always had a being in the divine intellect.

H: This I acknowledge.

P: By your own confession, therefore, nothing is new, or begins to be, in respect of the mind of God. So we are agreed in that point.

H: What shall we make then of the creation?

P: May we not understand it to have been entirely in respect of finite spirits, so that things with regard to us may properly be said to begin their existence, or be created, when God decreed they should become perceptible to intelligent creatures in that order and manner which he then established and we now call the laws of nature? You may call this a *relative*, or *hypothetical existence* if you please. But so long as it supplies us with the most natural, obvious, and literal sense of the Mosaic history of the creation—so long as it answers all the religious ends of that great article—in a word, so long as you can assign no other sense or meaning in its stead, why should we reject this? Is it to comply with a ridiculous skeptical humor of making everything nonsense and unintelligible? I am sure you cannot say it is for the glory of God. For allowing it to be a thing possible and conceivable that the corporeal world should have an absolute subsistence extrinsic to the mind of God, as well as to the minds of all created spirits, yet how could this set forth either the immensity or

omniscience of the Deity or the necessary and immediate dependence of all things on him? No, would it not rather seem to derogate from those attributes?

H: Well, but as to this decree of God's for making things perceptible, what do you say, Philonous, is it not plain God did either execute that decree from all eternity or at some certain time began to will what he had not actually willed before, but only designed to will? If the former, then there could be no creation or beginning of existence in finite things. If the latter, then we must acknowledge something new to befall the Deity, which implies a sort of change; and all change argues imperfection.

P: Pray consider what you are doing. Is it not evident this objection concludes equally against a creation in any sense, no, against every other act of the Deity discoverable by the light of nature? None of which can we conceive otherwise than as performed in time and having a beginning. God is a being of transcendent and unlimited perfections; his nature, therefore, is incomprehensible to finite spirits. It is not, therefore, to be expected that any man, whether *materialist* or *immaterialist*, should have exactly just notions of the Deity, his attributes, and ways of operation. If then you would infer anything against me, your difficulty must not be drawn from the inadequateness of our conceptions of the divine nature, which is unavoidable on any scheme, but from the denial of matter, of which there is not one word directly or indirectly in what you have now objected.

H: I must acknowledge the difficulties you are concerned to clear are such only as arise from the nonexistence of matter and are peculiar to that notion. So far you are in the right. But I cannot by any means bring myself to think there is no such peculiar repugnance between the creation and your opinion, though indeed where to fix it I do not distinctly know.

P: What would you have? Do I not acknowledge a twofold state of things, the one ectypal or natural, the other archetypal and eternal? The former was created in time, the latter existed from everlasting in the mind of God. Is not this agreeable to the common notions of theologians? Or is any more than this necessary in order to conceive the creation? But you suspect some peculiar repugnance, though you do not know where it lies. To take away all possibility of scruple in the case, do but consider this one point. Either you are not able to conceive the creation on any hypothesis whatsoever, and if so, there is no ground for dislike or complaint against my particular opinion on that score, or you are able to conceive it, and if so, why not on my principles, since nothing conceivable is taken away by that means? You have all along been allowed the full scope of sense, imagination, and reason. Whatever, therefore, you could before apprehend, either immediately or mediately by your senses, or by ratiocination from your senses, whatever you could perceive, imagine, or understand remains still with you. If, therefore, the notion you have of the creation by other principles is intelligible, you have it still upon mine; if it is not intelligible, I conceive it to be no notion at all, and so there is no loss of it. And, indeed, it seems to me very plain that the supposition of matter, that is, a thing perfectly unknown and inconceivable, cannot serve to make us conceive anything. And I hope it does not need to be proved to you that if the existence of matter does not make the creation conceivable, the creation's being without it inconceivable can be no objection against its nonexistence.

H: I confess, Philonous, you have almost satisfied me in this point of the creation.

P: I would gladly know why you are not quite satisfied. You tell me indeed of a repugnance between the Mosaic history and immaterialism, but you do not know where it lies. Is this reasonable, Hylas? Can you expect I should solve a difficulty without knowing what it is? But to pass by all that, would not a man think you were assured there is no repugnance between the received notions of materialists and the inspired writings?

H: And so I am.

P: Ought the historical part of Scripture to be understood in a plain, obvious sense, or in a sense which is metaphysical and out of the way?

H: In the plain sense, doubtless.

P: When Moses speaks of herbs, earth, water, etc., as having been created by God, do you not think the sensible things, commonly signified by those words, are suggested to every unphilosophical reader?

H: I cannot help thinking so.

P: And are not all ideas, or things perceived by sense, to be denied a real existence by the doctrine of the materialists?

H: This I have already acknowledged.

P: The creation, therefore, according to them, was not the creation of sensible things, which have only a relative being, but of certain unknown natures, which have an absolute being in which creation might

terminate.

H: True.

P: Is it not, therefore, evident the asserters of matter destroy the plain obvious sense of Moses, with which their notions are utterly inconsistent, and instead of it obtrude on us I do not know what, something equally unintelligible to themselves and me.

H: I cannot contradict you.

P: Moses tells us of a creation. A creation of what? Of unknown quiddities, of occasions, or *substratums*? No, certainly; but of things obvious to the senses. You must first reconcile this with your notions if you expect I should be reconciled to them.

H: I see you can assault me with my own weapons.

P: Then as to *absolute existence*, was there ever known a more jejune notion than that? Something it is, so abstracted and unintelligible, that you have frankly owned you could not conceive it, much less explain anything by it. But allowing matter to exist and the notion of absolute existence to be as clear as light, yet was this ever known to make the creation more credible? No, has it not furnished the *atheists* and *infidels* of all ages with the most plausible argument against a creation? That a corporeal substance, which has an absolute existence without the minds of spirits, should be produced out of nothing by the mere will of a spirit has been looked upon as a thing so contrary to all reason, so impossible and absurd that not only the most celebrated among the ancients, but even various modern and Christian philosophers have thought matter coeternal with the Deity. Lay these things together and then judge whether materialism disposes men to believe the creation of things.

H: I admit, Philonous, I think it does not. This of the *creation* is the last objection I can think of, and I must necessarily admit it has been sufficiently answered as well as the rest. Nothing now remains to be overcome but a sort of unaccountable backwardness that I find in myself toward your notions.

P: When a man is swayed to one side of a question, he does not know why; can this, do you think, be anything else but the effect of prejudice, which never fails to attend old and rooted notions? And indeed in this respect I cannot deny the belief of matter to have very much the advantage over the contrary opinion with men of a learned education.

H: I confess it seems to be as you say.

P: As a balance, therefore, to this weight of prejudice, let us throw into the scale the great advantages that arise from the belief of immaterialism, both in regard to religion and human learning. The being of a God and incorruptibility of the soul, those great articles of religion, are they not proved with the clearest and most immediate evidence? When I say the being of a *God*, I do not mean an obscure, general cause of things, of which we have no conception, but *God* in the strict and proper sense of the word. A being whose spirituality, omnipresence, providence, omniscience, infinite power, and goodness are as conspicuous as the existence of sensible things, of which (notwithstanding the fallacious pretenses and affected scruples of *skeptics*) there is no more reason to doubt than of our own being. Then with relation to human sciences: In natural philosophy, what intricacies, what obscurities, what contradictions, has the belief of matter led men into! To say nothing of the numberless disputes about its extent, continuity, homogeneity, gravity, divisibility, etc., do they not pretend to explain all things by bodies operating on bodies, according to the laws of motion? And yet, are they able to comprehend how any one body should move another? No, admitting there was no difficulty in reconciling the notion of an inert being with a cause or in conceiving how an accident might pass from one body to another, yet by all their strained thoughts and extravagant suppositions, have they been able to reach the mechanical production of any one animal or vegetable body? Can they account, by the laws of motion, for sounds, tastes, smells, or colors, or for the regular course of things? Have they accounted, by physical principles, for the aptitude and contrivance even of the most inconsiderable parts of the universe? But laying aside matter and corporeal causes and admitting only the efficiency of an all-perfect mind, are not all the effects of nature easy and intelligible? If the *phenomena* are nothing else but *ideas*, God is a *spirit*, but matter an unintelligent, unperceiving being. If they demonstrate an unlimited power in their cause, God is active and omnipotent, but matter an inert mass. If the order, regularity, and usefulness of them can never be sufficiently admired, God is infinitely wise and provident, but matter destitute of all contrivance and design. These surely are great advantages in *physics*. Not to mention that the apprehension of a distant Deity naturally disposes men to a negligence in their *moral* actions, which they would be more cautious of in case they thought him immediately present and acting on their minds without the interposition of matter or unthinking second causes. Then in *metaphysics*; what difficulties concerning entity in abstract, substantial forms, hylarchic principles, plastic natures, substance and accident, principle of individuation, possibility of matter's thinking,

origin of ideas, the manner how two independent substances, so widely different as *spirit* and *matter*, should mutually operate on each other! What difficulties, I say, and endless disquisitions concerning these and innumerable other like points, do we escape by supposing only spirits and ideas? Even *mathematics* itself, if we take away the absolute existence of extended things, becomes much more clear and easy, the most shocking paradoxes and intricate speculations in those sciences depending on the infinite divisibility of finite extension, which depends on that supposition. But what need is there to insist on the particular sciences? Is not that opposition to all science whatsoever, that frenzy of the ancient and modern *skeptics*, built on the same foundation? Or can you produce so much as one argument against the reality of corporeal things, or in behalf of that avowed utter ignorance of their natures which does not suppose their reality to consist in an external absolute existence? Upon this supposition indeed the objections from the change of colors in a pigeon's neck or the appearances of a broken oar in the water must be allowed to have weight. But those and the like objections vanish if we do not maintain the being of absolute external originals, but place the reality of things in ideas, fleeting indeed, and changeable, however, not changed at random, but according to the fixed order of nature. For in this consists that constancy and truth of things which secures all the concerns of life and distinguishes that which is *real* from the irregular visions of the fancy.

H: I agree to all you have now said and must admit that nothing can incline me to embrace your opinion more than the advantages I see it is attended with. I am by nature lazy and this would be a mighty abridgment in knowledge. What doubts, what hypotheses, what labyrinths of amusement, what fields of disputation, what an ocean of false learning may be avoided by that single notion of *immaterialism*?

P: After all, is there anything further remaining to be done? You may remember you promised to embrace that opinion which upon examination should appear most agreeable to common sense and remote from *skepticism*. This, by your own confession, is that which denies matter or the absolute existence of corporeal things. Nor is this all; the same notion has been proved several ways, viewed in different lights, pursued in its consequences, and all objections against it cleared. Can there be a greater evidence of its truth? Or is it possible it should have all the marks of a true opinion and yet be false?

H: I admit myself entirely satisfied for the present in all respects. But what security can I have that I shall still continue the same full assent to your opinion and that no unthought-of objection or difficulty will occur hereafter?

P: Pray, Hylas, do you in other cases, when a point is once evidently proved, withhold your assent on account of objections or difficulties it may be liable to? Are the difficulties that attend the doctrine of incommensurable quantities, of the angle of contact, of the asymptotes to curves, or the like, sufficient to make you hold out against mathematical demonstration? Or will you disbelieve the providence of God because there may be some particular things which you do not know how to reconcile with it? If there are difficulties attending immaterialism, there are at the same time direct and evident proofs for it. But for the existence of matter there is not one proof and far more numerous and insurmountable objections lie against it. But where are those mighty difficulties you insist on? Alas, you do not know where or what they are — something which may possibly occur later. If this is a sufficient pretense for withholding your full assent, you should never yield it to any proposition, however free from exceptions, however clearly and solidly demonstrated.

H: You have satisfied me, Philonous.

P: But to arm you against all future objections, do but consider that what bears equally hard on two contradictory opinions can be a proof against neither. Whenever, therefore, any difficulty occurs, try if you can find a solution for it on the hypothesis of the *materialists*. Be not deceived by words, but sound your own thoughts. And in case you cannot conceive it easier by the help of *materialism*, it is plain it can be no objection against *immaterialism*. Had you proceeded all along by this rule, you would probably have spared yourself abundance of trouble in objecting, since of all your difficulties I challenge you to show one that is explained by matter, no, which is not more unintelligible with than without that supposition, and consequently makes rather *against* than *for* it. You should consider, in each particular, whether the difficulty arises from the *nonexistence of matter*. If it does not, you might as well argue from the infinite divisibility of extension against divine foreknowledge as from such a difficulty against *immaterialism*. And yet, upon recollection, I believe you will find this to have been often if not always the case. You should likewise take heed not to argue on a *petitio principii*. One is apt to say the unknown substances ought to be esteemed real things rather than the ideas in our minds; and who can tell but the unthinking external substance may concur as a cause or instrument in the production of our ideas? But is not this proceeding on a supposition that there are such external substances? And to suppose this, is it not begging the question? But, above all things, you should beware of imposing on yourself by that vulgar sophism, which is called *ignoratio elenchi*. You talked often as if you thought I

maintained the nonexistence of sensible things, whereas in truth no one can be more thoroughly assured of their existence than I am, and it is you who doubt—I should have said, positively deny it. Everything that is seen, felt, heard, or any way perceived by the senses is, on the principles I embrace, a real being, but not on yours. Remember, the matter you contend for is an unknown somewhat (if indeed it may be termed *somewhat*), which is quite stripped of all sensible qualities, and can be neither perceived by sense, nor apprehended by the mind. Remember, I say that it is not any object which is hard or soft, hot or cold, blue or white, round or square, etc. For all these things I affirm do exist. Though, indeed, I deny they have existence distinct from being perceived or that they exist out of all minds whatsoever. Think on these points; let them be attentively considered and still kept in view. Otherwise you will not comprehend the state of the question — without which your objections will always be wide of the mark and, instead of mine, may possibly be directed (as more than once they have been) against your own notions.

H: I must necessarily admit, Philonous, nothing seems to have kept me from agreeing with you more than this same *mistaking the question*. In denying matter, at first glimpse I am tempted to imagine you deny the things we see and feel, but, upon reflection, find there is no ground for it. What do you think, therefore, of retaining the name *matter* and applying it to sensible things? This may be done without any change in your sentiments, and, believe me, it would be a means of reconciling them to some persons who may be more shocked at an innovation in words than in opinion.

P: With all my heart, retain the word *matter* and apply it to the objects of sense, if you please, provided you do not attribute to them any subsistence distinct from their being perceived. I shall never quarrel with you for an expression. *Matter* or *material substance* are terms introduced by philosophers, and, as used by them, imply a sort of independence or a subsistence distinct from being perceived by a mind, but are never used by common people, or if ever, it is to signify the immediate objects of sense. One would think, therefore, so long as the names of all particular things, with the terms *sensible*, *substance*, *body*, *stuff*, and the like, are retained, the word *matter* should be never missed in common talk. And in philosophical discourses it seems the best way to leave it quite out, since there is not perhaps any one thing that has more favored and strengthened the depraved bent of the mind toward atheism than the use of that general confused term.

H: Well, but, Philonous, since I am content to give up the notion of an unthinking substance exterior to the mind, I think you ought not deny me the privilege of using the word *matter* as I please and annexing it to a collection of sensible qualities subsisting only in the mind. I freely admit there is no other substance in a strict sense than *spirit*. But I have been so long accustomed to the term *matter* that I do not know how to part with it. To say there is no *matter* in the world is still shocking to me. Whereas to say there is no *matter*, if by that term is meant an unthinking substance existing without the mind, but if by *matter* is meant some sensible thing whose existence consists in being perceived, then there is *matter*— this distinction gives it quite another turn—and men will come into your notions with small difficulty when they are proposed in that manner. For, after all, the controversy about *matter* in the strict meaning of it lies altogether between you and the philosophers, whose principles, I acknowledge, are not near so natural or so agreeable to the common sense of mankind and Holy Scripture as yours. There is nothing we either desire or shun but as it makes or is apprehended to make some part of our happiness or misery. But what has happiness or misery, joy or grief, pleasure or pain, to do with absolute existence or with unknown entities, abstracted from all relation to us? It is evident, things regard us only as they are pleasing or displeasing, and they can please or displease only insofar as they are perceived. Further, therefore, we are not concerned; and thus far you leave things as you found them. Yet still there is something new in this doctrine. It is plain, I do not now think with the philosophers, nor yet altogether with the vulgar. I would like to know how the case stands in that respect, precisely what you have added to or altered in my former notions.

P: I do not pretend to be a setter-up of *new notions*. My endeavors tend only to unite and place in a clearer light that truth which was before shared between the vulgar and the philosophers—the former being of opinion that *those things they immediately perceive are the real things* and the latter that *the things immediately perceived are ideas which exist only in the mind*—which two notions put together do in effect constitute the substance of what I advance.

H: I have been a long time distrusting my senses; I thought I saw things by a dim light and through false glasses. Now the glasses are removed and a new light breaks in upon my understanding. I am clearly convinced that I see things in their native forms and am no longer in pain about their unknown natures or absolute existence. This is the state I find myself in at present, though, indeed, the course that brought me to it I do not yet thoroughly comprehend. You set out upon the same principles that Academics, Cartesians, and the like sects usually do; and for a long time it looked as if you were advancing their philosophical *skepticism*; but, in the end, your conclusions are directly opposite to theirs.

P: You see, Hylas, the water of the fountain over there, how it is forced upwards in a round column to a certain height, at which it breaks and falls back into the basin from which it rose, its ascent as well as descent proceeding from the same uniform law or principle of *gravitation*. Just so, the same principles which, at first view, lead to *skepticism*, pursued to a certain point, bring men back to common sense.

David Hume

David Hume was born in 1711 in Edinburgh. At the age of fifteen he had completed his education at Edinburgh University, and he began to study law. Three years later, convinced that he had made a major philosophical discovery, he abandoned his legal studies to devote his entire attention to philosophy. In 1739, Hume published his *Treatise of Human Nature*, which, in his own words, “fell deadborn from the press.” Disappointed by his failure to obtain an audience for his ideas, Hume decided that the style of the *Treatise* was at fault, and in 1748 he published an abbreviated version of Book I of the *Treatise*. This later work, *An Enquiry Concerning Human Understanding*, is reprinted here, along with three excerpts from the *Treatise*. The first excerpt presents Hume’s famous dismissal of personal identity and his reflections on what he has accomplished. The second contains his important contributions to the free will debate, and the last his seminal discussion of the foundations of ethics.

Hume continued to write on philosophical topics, publishing his *Enquiry Concerning the Principles of Morals* in 1751. He also wrote works on political theory, as well as a history of England; in his lifetime, his fame rested chiefly on these nonphilosophical writings. A sociable and witty man, he had numerous friends and, at his death in 1776, was widely mourned. The *Dialogues Concerning Natural Religion* was published posthumously.

Hume’s official aim in the *Enquiry* is to investigate the powers of human reason. Yet from its first page, the work has a very definite thrust. A vigorous opponent of superstition, Hume is interested in disclosing the pretensions of traditional metaphysics, which he regards as providing cover for dogmatism and prejudice.

An important weapon in Hume’s attack is his distinction between “relations of ideas” and “matter of fact.” In some areas of inquiry, says Hume, we establish our conclusions by reasoning deductively from first principles, but these merely record the meanings we have given to our terms. Arithmetic and geometry are prime examples of sciences in which, according to Hume’s theory, we work out the logical consequences of our definitions. However, not all our knowledge is founded on definition and deduction. The laws of nature cannot be deduced from definitions but are established by experiment and observation. Hume points out that we are not able to deduce these laws from statements that record our observations. Rather, our acceptance of them is based on a kind of inference that is more risky than deduction. In a deductive argument the truth of the premises guarantees the truth of the conclusion. But, as Hume notes, our belief that the sun will rise every morning is founded on our past experience; and even though it may be true that the sun has risen every morning of our lives that evidence does not guarantee the truth of the thesis that the sun will always rise.

Hume poses for us the problem of how we can reasonably accept statements about the entire course of nature. What justifies us in generalizing, from our own limited experience, about principles that allegedly hold true throughout the universe? Hume offers a simple and devastating argument in response: we cannot find any a priori guarantee for the orderliness of the universe, and we can appeal to past experience to support the idea that nature is regular only by arguing in a circle, since past experience is a good indicator of the future only if we assume the orderliness of nature.

Hume’s own solution to this problem is to claim that no rational justifications can be given for our ordinary nondeductive inferences. We make these inferences through the operation of habit, or, as Hume calls it, custom. A similar operation is at work when we make causal judgments. Hume argues that such judgments have a complex logical structure. Custom determines us to expect a regular succession in which an earlier event, which we call the cause, is followed by events of the type of the effect. Hume then applies this analysis of causation to the issue of human freedom. He argues that once we have a clear understanding of what is involved in causation, and once we know what is meant by human freedom, we will recognize that there is no inconsistency between the thesis that all human actions are caused and the claim that humans sometimes act freely.

The second passage from the *Treatise* adds two crucial points to the argument about free will. Hume distinguishes the “liberty of spontaneity” that is essential to freedom from the “liberty of indifference” that no one has any reason to want. He also observes that the practice of praise and blame itself required an ability to impute an action to an agent, which in turn requires that we understand the action as caused by the agent’s character. So, far from being inimical to moral responsibility, causation is crucial in assigning responsibility. The last section of this excerpt maintains that what determines the will is not reason, but passion. This section lays the groundwork for the discussion of the third excerpt, where Hume considers the basis of ethical

judgments: as reason is impotent to move the will, so it is impotent to judge actions. Despite the sloppy formulations of moralists, there is no way to reason from facts about what is, to moral judgments about what ought to be. Morality does not rest on the calculations of reason but on the warmth of feeling.

In the excerpt from Book I of the *Treatise*, Hume turns his formidable critical powers on the problem of understanding persons themselves. What justifies us in believing that we preserve our identity as persons through time? When he looks inward, he can find no simple and continuing self. The weakness of previous philosophical arguments for a self leads him to the startling claim that the identity of persons is a fiction.

In the *Dialogues Concerning Natural Religion*, Hume's principal aim is to show that religious debates are futile. Since we cannot reason deductively to conclusions about the nature and existence of God, our reasoning in this area must be nondeductive. That is, we must examine the evidence of the creation to look for clues about the Creator. As Hume notes, however, the evidence is morally ambiguous. Since both good and bad things happen, how is an inference to an all-good Creator to be justified?

*An Enquiry Concerning Human Understanding**

SECTION I

Of the Different Species of Philosophy.

Moral philosophy, or the science of human nature, may be treated after two different manners, each of which has its peculiar merit and may contribute to the entertainment, instruction, and reformation of mankind. The one considers man chiefly as born for action and as influenced in his measures by taste and sentiment, pursuing one object and avoiding another according to the value which these objects seem to possess and according to the light in which they present themselves. As virtue, of all objects, is allowed to be the most valuable, this species of philosophers paint her in the most amiable colors, borrowing all help from poetry and eloquence and treating their subject in an easy and obvious manner, and such as is best fitted to please the imagination and engage the affections. They select the most striking observations and instances from common life, place opposite characters in a proper contrast, and, alluring us into the paths of virtue by the views of glory and happiness, direct our steps in these paths by the soundest precepts and most illustrious examples. They make us *feel* the difference between vice and virtue; they excite and regulate our sentiments; and so they can but bend our hearts to the love of probity and true honor, they think, that they have fully attained the end of all their labors.

The other species of philosophers consider man in the light of a reasonable rather than an active being and endeavor to form his understanding more than cultivate his manners. They regard human nature as a subject of speculation and, with a narrow scrutiny, examine it in order to find those principles which regulate our understanding, excite our sentiments, and make us approve or blame any particular object, action, or behavior. They think it a reproach to all literature that philosophy should not yet have fixed, beyond controversy, the foundation of morals, reasoning, and criticism, and should forever talk of truth and falsehood, vice and virtue, beauty and deformity, without being able to determine the source of these distinctions. While they attempt this arduous task, they are deterred by no difficulties; but proceeding from particular instances to general principles, they still push on their inquiries to principles more general and rest not satisfied until they arrive at those original principles by which, in every science, all human curiosity must be bounded. Though their speculations seem abstract and even unintelligible to common readers, they aim at the approbation of the learned and the wise and think themselves sufficiently compensated for the labor of their whole lives, if they can discover some hidden truths which may contribute to the instruction of posterity.

It is certain that the easy and obvious philosophy will always, with the generality of mankind, have the preference above the accurate and abstruse, and by many will be recommended not only as more agreeable, but more useful than the other. It enters more into common life, molds the heart and affections, and, by touching those principles which actuate men, reforms their conduct and brings them nearer to that model of perfection which it describes. On the contrary, the abstruse philosophy, being founded on a turn of mind which cannot enter into business and action, vanishes when the philosopher leaves the shade and comes into open day, nor can its principles easily retain any influence over our conduct and behavior. The feelings of our heart, the agitation of our passions, the vehemence of our affections, dissipate all its conclusions and reduce the profound philosopher to a mere plebeian.

This also must be confessed that the most durable as well as most just fame has been acquired by the easy philosophy and that abstract reasoners seem up to now to have enjoyed only a momentary reputation from the caprice or ignorance of their own age, but have not been able to support their renown with more equitable posterity. It is easy for a profound philosopher to commit a mistake in his subtle reasonings; and one mistake is the necessary parent of another, while he pushes on his consequences and is not deterred from embracing any conclusion by its unusual appearance or its contradiction to popular opinion. But a philosopher whose only purpose is to represent the common sense of mankind in more beautiful and more engaging colors, if by accident he falls into error, goes no further, but, renewing his appeal to common sense and the natural sentiments of the mind, returns into the right path and secures himself from any dangerous illusions. The fame of Cicero¹ flourishes at present, but that of Aristotle is utterly decayed. La Bruyère² passes the seas and still maintains his reputation. But the glory of Malebranche³ is confined to his own nation and to his own age. And Addison,⁴ perhaps, will be read with pleasure when Locke shall be entirely forgotten.

The mere philosopher is a character which is commonly but little acceptable in the world, as being supposed to contribute nothing either to the advantage or pleasure of society, while he lives remote from communication with mankind and is wrapped up in principles and notions equally remote from their comprehension. On the other hand, the mere ignorant is still more despised, nor is anything deemed a surer

sign of an illiberal genius in an age and nation where the sciences flourish than to be entirely destitute of all relish for those noble entertainments. The most perfect character is supposed to lie between those extremes: retaining an equal ability and taste for books, company, and business; preserving in conversation that discernment and delicacy which arise from polite letters, and in business that probity and accuracy which are the natural result of a just philosophy. In order to diffuse and cultivate so accomplished a character, nothing can be more useful than compositions of the easy style and manner which do not draw too much from life, require no deep application or retreat to be comprehended, and send back the student among mankind full of noble sentiments and wise precepts applicable to every exigency of human life. By means of such compositions virtue becomes amiable, science agreeable, company instructive, and retirement entertaining.

Man is a reasonable being and, as such, receives from science his proper food and nourishment. But so narrow are the bounds of human understanding that little satisfaction can be hoped for in this particular, either from the extent or security of his acquisitions. Man is a sociable no less than a reasonable being. But neither can he always enjoy company agreeable and amusing or preserve the proper relish for them. Man is also an active being and, from that disposition, as well as from the various necessities of human life, must submit to business and occupation. But the mind requires some relaxation and cannot always support its bent to care and industry. It seems, then, that nature has pointed out a mixed kind of life as most suitable to human race and secretly admonished them to allow none of these biases to *draw* too much, so as to incapacitate them for other occupations and entertainments. Indulge your passion for science, she says, but let your science be human and such as may have a direct reference to action and society. Abstruse thought and profound researches I prohibit and will severely punish by the pensive melancholy which they introduce, by the endless uncertainty in which they involve you and by the cold reception which your pretended discoveries shall meet with, when communicated. Be a philosopher, but, amid all your philosophy, be still a man.

Were the generality of mankind contented to prefer the easy philosophy to the abstract and profound, without throwing any blame or contempt on the latter, it might not be improper, perhaps, to comply with this general opinion and allow every man to enjoy, without opposition, his own taste and sentiment. But as the matter is often carried further, even to the absolute rejecting of all profound reasonings, or what is commonly called *metaphysics*, we shall now proceed to consider what can reasonably be pleaded in their behalf.

We may begin with observing that one considerable advantage which results from the accurate and abstract philosophy is its subservience to the easy and humane, which, without the former, can never attain a sufficient degree of exactness in its sentiments, precepts, or reasonings. All polite letters are nothing but pictures of human life in various attitudes and situations, and inspire us with different sentiments of praise or blame, admiration or ridicule, according to the qualities of the object which they set before us. An artist must be better qualified to succeed in this undertaking who, besides a delicate taste and a quick apprehension, possesses an accurate knowledge of the internal fabric, the operations of the understanding, the workings of the passions, and the various species of sentiment which discriminate vice and virtue. However painful this inward search or inquiry may appear, it becomes in some measure requisite to those who would describe with success the obvious and outward appearances of life and manners. The anatomist presents to the eye the most hideous and disagreeable objects, but his science is useful to the painter in delineating even a Venus⁵ or a Helen.⁶ While the latter employs all the richest colors of his art and gives his figures the most graceful and engaging airs, he must still carry his attention to the inward structure of the human body, the position of the muscles, the fabric of the bones, and the use and figure of every part or organ. Accuracy is, in every case, advantageous to beauty, and just reasoning to delicate sentiment. In vain would we exalt the one by depreciating the other.

Besides, we may observe, in every art or profession, even those which most concern life or action, that a spirit of accuracy, however acquired, carries all of them nearer their perfection and renders them more subservient to the interests of society. And though a philosopher may live remote from business, the genius of philosophy, if carefully cultivated by several, must gradually diffuse itself throughout the whole society and bestow a similar correctness on every art and calling. The politician will acquire greater foresight and subtlety in the subdividing and balancing of power, the lawyer more method and finer principles in his reasonings, and the general more regularity in his discipline and more caution in his plans and operations. The stability of modern governments above the ancient and the accuracy of modern philosophy have improved, and probably will still improve, by similar gradations.

Were there no advantage to be reaped from these studies beyond the gratification of an innocent curiosity, yet ought not even this be despised as being one accession to those few safe and harmless pleasures which are bestowed on human race. The sweetest and most inoffensive path of life leads through the avenues of science and learning; and whoever can either remove any obstructions in this way or open up any new prospect ought

so far to be esteemed a benefactor to mankind. And though these researches may appear painful and fatiguing, it is with some minds as with some bodies, which, being endowed with vigorous and florid health, require severe exercise, and reap a pleasure from what, to the generality of mankind, may seem burdensome and laborious. Obscurity, indeed, is painful to the mind as well as to the eye, but to bring light from obscurity, by whatever labor, must necessarily be delightful and rejoicing.

But this obscurity in the profound and abstract philosophy is objected to, not only as painful and fatiguing, but as the inevitable source of uncertainty and error. Here indeed lies the most just and most plausible objection against a considerable part of metaphysics that they are not properly a science, but arise either from the fruitless efforts of human vanity, which would penetrate into subjects utterly inaccessible to the understanding, or from the craft of popular superstitions, which, being unable to defend themselves on fair ground, raise these entangling brambles to cover and protect their weakness. Chased from the open country, these robbers fly into the forest and lie in wait to break in upon every unguarded avenue of the mind and overwhelm it with religious fears and prejudices. The stoutest antagonist, if he remits his watch a moment, is oppressed. And many, through cowardice and folly, open the gates to the enemies and willingly receive them with reverence and submission as their legal sovereigns.

But is this a sufficient reason why philosophers should desist from such researches and leave superstition still in possession of her retreat? Is it not proper to draw an opposite conclusion and perceive the necessity of carrying the war into the most secret recesses of the enemy? In vain do we hope that men, from frequent disappointment, will at last abandon such airy sciences and discover the proper province of human reason. For, besides the fact that many persons find too sensible an interest in perpetually recalling such topics — besides this, I say, the motive of blind despair can never reasonably have place in the sciences, since, however unsuccessful former attempts may have proved, there is still room to hope that the industry, good fortune, or improved sagacity of succeeding generations may reach discoveries unknown to former ages. Each adventurous genius will still leap at the arduous prize and find himself stimulated, rather than discouraged by the failures of his predecessors, while he hopes that the glory of achieving so hard an adventure is reserved for him alone. The only method of freeing learning at once from these abstruse questions is to inquire seriously into the nature of human understanding and show, from an exact analysis of its powers and capacity, that it is by no means fitted for such remote and abstruse subjects. We must submit to this fatigue in order to live at ease ever after and must cultivate true metaphysics with some care in order to destroy the false and adulterate. Indolence, which to some persons affords a safeguard against this deceitful philosophy, is, with others, overbalanced by curiosity; and despair, which at some moments prevails, may give place afterwards to sanguine hopes and expectations. Accurate and just reasoning is the only catholic remedy fitted for all persons and all dispositions and is alone able to subvert that abstruse philosophy and metaphysical jargon which, being mixed up with popular superstition, renders it in a manner impenetrable to careless reasoners and gives it the air of science and wisdom.

Besides this advantage of rejecting, after deliberate inquiry, the most uncertain and disagreeable part of learning, there are many positive advantages which result from an accurate scrutiny into the powers and faculties of human nature. It is remarkable concerning the operations of the mind that, though most intimately present to us, yet, whenever they become the object of reflection, they seem involved in obscurity, nor can the eye readily find those lines and boundaries which discriminate and distinguish them. The objects are too fine to remain long in the same aspect or situation and must be apprehended in an instant by a superior penetration derived from nature and improved by habit and reflection. It becomes, therefore, no inconsiderable part of science barely to know the different operations of the mind, to separate them from each other, to class them under their proper heads, and to correct all that seeming disorder in which they lie involved when made the object of reflection and inquiry. This task of ordering and distinguishing, which has no merit when performed with regard to external bodies, the objects of our senses, rises in its value when directed towards the operations of the mind in proportion to the difficulty and labor which we meet with in performing it. And if we can go no further than this mental geography or delineation of the distinct parts and powers of the mind, it is at least a satisfaction to go so far; and the more obvious this science may appear (and it is by no means obvious), the more contemptible still must the ignorance of it be esteemed in all pretenders to learning and philosophy.

Nor can there remain any suspicion that this science is uncertain and chimerical, unless we should entertain such a skepticism as is entirely subversive of all speculation and even action. It cannot be doubted that the mind is endowed with several powers and faculties, that these powers are distinct from each other, that what is really distinct to immediate perception may be distinguished by reflection, and consequently that there is a truth and falsehood in all propositions on this subject, and a truth and falsehood which does not lie

beyond the compass of human understanding. There are many obvious distinctions of this kind, such as those between the will and understanding, the imagination and passions, which fall within the comprehension of every human creature; and the finer and more philosophical distinctions are no less real and certain, though more difficult to be comprehended. Some instances, especially late ones, of success in these inquiries may give us a more just notion of the certainty and solidity of this branch of learning. And shall we esteem it worthy the labor of a philosopher to give us a true system of the planets and adjust the position and order of those remote bodies, while we affect to overlook those who, with so much success, delineate the parts of the mind in which we are so intimately concerned?

But may we not hope that philosophy, if cultivated with care and encouraged by the attention of the public, may carry its researches still further and discover, at least in some degree, the secret springs and principles by which the human mind is actuated in its operations? Astronomers had long contented themselves with proving, from the phenomena, the true motions, order, and magnitude of the heavenly bodies, until a philosopher at last arose⁷ who seems, from the happiest reasoning, to have also determined the laws and forces by which the revolutions of the planets are governed and directed. The like has been performed with regard to other parts of nature. And there is no reason to despair of equal success in our inquiries concerning the mental powers and economy, if prosecuted with equal capacity and caution. It is probable that one operation and principle of the mind depends on another, which again may be resolved into one more general and universal. And how far these researches may possibly be carried, it will be difficult for us, before or even after a careful trial, exactly to determine. This much is certain — that attempts of this kind are made every day even by those who philosophize the most negligently. And nothing can be more requisite than to enter upon the enterprise with thorough care and attention that, if it lies within the compass of human understanding, it may at last be happily achieved; if not, it may, however, be rejected with some confidence and security. This last conclusion, surely, is not desirable nor ought it be embraced too rashly. For how much must we diminish from the beauty and value of this species of philosophy upon such a supposition? Moralists have been accustomed up to now, when they considered the vast multitude and diversity of those actions that excite our approbation or dislike, to search for some common principle on which this variety of sentiments might depend. And though they have sometimes carried the matter too far, by their passion for some one general principle, it must, however, be confessed that they are excusable in expecting to find some general principles into which all the vices and virtues were justly to be resolved. The like has been the endeavor of critics, logicians, and even politicians; nor have their attempts been wholly unsuccessful, though perhaps longer time, greater accuracy, and more ardent application may bring these sciences still nearer their perfection. To throw up at once all pretensions of this kind may justly be deemed more rash, precipitate, and dogmatic than even the boldest and most affirmative philosophy that has ever attempted to impose its crude dictates and principles on mankind.

What? Though these reasonings concerning human nature seem abstract and of difficult comprehension, this affords no presumption of their falsehood. On the contrary, it seems impossible that what has escaped so many wise and profound philosophers up to now can be very obvious and easy. And whatever pains these researches may cost us, we may think ourselves sufficiently rewarded, not only in point of profit but of pleasure, if, by that means, we can make any addition to our stock of knowledge in subjects of such unspeakable importance.

But as, after all, the abstractedness of these speculations is no recommendation, but rather a disadvantage to them, and as this difficulty may perhaps be surmounted by care and art and the avoiding of all unnecessary detail, we have, in the following inquiry, attempted to throw some light upon subjects from which uncertainty has deterred the wise up to now, and obscurity the ignorant. Happy if we can unite the boundaries of the different species of philosophy by reconciling profound inquiry with clearness and truth with novelty! And still more happy if, reasoning in this easy manner, we can undermine the foundations of an abstruse philosophy which seems to have up to now served only as a shelter to superstition and a cover to absurdity and error!

SECTION II

Of the Origin of Ideas.

Everyone will readily allow that there is a considerable difference between the perceptions of the mind when a man feels the pain of excessive heat or the pleasure of moderate warmth and when he afterwards recalls to his memory this sensation or anticipates it by his imagination. These faculties may mimic or copy the perceptions of the senses, but they never can entirely reach the force and vivacity of the original sentiment. The utmost we say of them, even when they operate with greatest vigor, is that they represent their object in so lively a manner that we could *almost* say we feel or see it: But, unless the mind is disordered by disease or madness, they never can arrive at such a pitch of vivacity as to render these perceptions altogether indistinguishable. All the colors of poetry, however splendid, can never paint natural objects in such a manner as to make the description be taken for a real landscape. The most lively thought is still inferior to the dullest sensation.

We may observe a like distinction to run through all the other perceptions of the mind. A man in a fit of anger is actuated in a very different manner from one who only thinks of that emotion. If you tell me that any person is in love, I easily understand your meaning and form a just conception of his situation, but never can mistake that conception for the real disorders and agitations of the passion. When we reflect on our past sentiments and affections, our thought is a faithful mirror and copies its objects truly, but the colors which it employs are faint and dull in comparison of those in which our original perceptions were clothed. It requires no nice discernment or metaphysical head to mark the distinction between them.

Here, therefore, we may divide all the perceptions of the mind into two classes or species which are distinguished by their different degrees of force and vivacity. The less forcible and lively are commonly denominated thoughts or ideas. The other species want a name in our language and in most others, I suppose, because it was not requisite for any but philosophical purposes to rank them under a general term or appellation. Let us, therefore, use a little freedom and call them impressions, employing that word in a sense somewhat different from the usual. By the term *impression*, then, I mean all our more lively perceptions, when we hear, or see, or feel, or love, or hate, or desire, or will. And impressions are distinguished from ideas, which are the less lively perceptions of which we are conscious when we reflect on any of those sensations or movements above mentioned.

Nothing, at first view, may seem more unbounded than the thought of man, which not only escapes all human power and authority, but is not even restrained within the limits of nature and reality. To form monsters and join incongruous shapes and appearances costs the imagination no more trouble than to conceive the most natural and familiar objects. And while the body is confined to one planet, along which it creeps with pain and difficulty, the thought can in an instant transport us into the most distant regions of the universe or even beyond the universe into the unbounded chaos where nature is supposed to lie in total confusion. What never was seen or heard of, may yet be conceived, nor is anything beyond the power of thought except what implies an absolute contradiction.

But though our thought seems to possess this unbounded liberty, we shall find upon a nearer examination that it is really confined within very narrow limits and that all this creative power of the mind amounts to no more than the faculty of compounding, transposing, augmenting, or diminishing the materials afforded us by the senses and experience. When we think of a golden mountain, we only join two consistent ideas, *gold* and *mountain*, with which we were formerly acquainted. A virtuous horse we can conceive, because, from our own feeling, we can conceive virtue; and this we may unite to the figure and shape of a horse, which is an animal familiar to us. In short, all the materials of thinking are derived either from our outward or inward sentiment. The mixture and composition of these belongs alone to the mind and will. Or, to express myself in philosophical language, all our ideas or more feeble perceptions are copies of our impressions or more lively ones.

To prove this, the two following arguments will, I hope, be sufficient. *First*, when we analyze our thoughts or ideas, however compounded or sublime, we always find that they resolve themselves into such simple ideas as were copied from a precedent feeling or sentiment. Even those ideas which at first view seem the most wide of this origin are found, upon a nearer scrutiny, to be derived from it. The idea of God, as meaning an infinitely intelligent, wise, and good being, arises from reflecting on the operations of our own mind and augmenting, without limit, those qualities of goodness and wisdom. We may prosecute this inquiry to what length we please; where we shall always find that every idea which we examine is copied from a similar impression. Those who would assert that this position is not universally true, nor without exception, have only

one method, and an easy one at that, of refuting it by producing that idea which, in their opinion, is not derived from this source. It will then be incumbent on us, if we would maintain our doctrine, to produce the impression or lively perception which corresponds to it.

Secondly, if it happens, from a defect of the organ, that a man is not susceptible of any species of sensation, we always find that he is as little susceptible of the correspondent ideas. A blind man can form no notion of colors, a deaf man of sounds. Restore either of them that sense in which he is deficient by opening this new inlet for his sensations, you also open an inlet for the ideas and he finds no difficulty in conceiving these objects. The case is the same if the object proper for exciting any sensation has never been applied to the organ. A Laplander⁸ or Negro has no notion of the relish of wine. And though there are few or no instances of a like deficiency in the mind where a person has never felt or is wholly incapable of a sentiment or passion that belongs to his species, yet we find the same observation to take place in a less degree. A man of mild manners can form no idea of inveterate revenge or cruelty, nor can a selfish heart easily conceive the heights of friendship and generosity. It is readily allowed that other beings may possess many senses of which we can have no conception, because the ideas of them have never been introduced to us in the only manner by which an idea can have access to the mind, namely, by the actual feeling and sensation.

There is, however, one contradictory phenomenon which may prove that it is not absolutely impossible for ideas to arise independent of their correspondent impressions. I believe it will readily be allowed that the several distinct ideas of color which enter by the eye or those of sound which are conveyed by the ear are really different from each other, though at the same time resembling. Now if this is true of different colors, it must be no less so of the different shades of the same color; and each shade produces a distinct idea, independent of the rest. For if this should be denied, it is possible, by the continual gradation of shades, to run a color insensibly into what is most remote from it; and if you will not allow any of the means to be different, you cannot without absurdity deny the extremes to be the same. Suppose, therefore, a person to have enjoyed his sight for thirty years and to have become perfectly acquainted with colors of all kinds, except one particular shade of blue, for instance, which it never has been his fortune to meet with. Let all the different shades of that color, except that single one, be placed before him, descending gradually from the deepest to the lightest, it is plain that he will perceive a blank where that shade is wanting, and will be sensible that there is a greater distance in that place between the contiguous colors than in any other. Now I ask whether it is possible for him, from his own imagination, to supply this deficiency and raise up to himself the idea of that particular shade, though it had never been conveyed to him by his senses? I believe there are few but will be of the opinion that he can. And this may serve as a proof that the simple ideas are not always, in every instance, derived from the correspondent impressions, though this instance is so singular that it is scarcely worth our observing and does not merit that for it alone we should alter our general maxim.

Here, therefore, is a proposition which not only seems in itself simple and intelligible, but, if a proper use were made of it, might render every dispute equally intelligible and banish all that jargon, which has so long taken possession of metaphysical reasonings and drawn disgrace upon them. All ideas, especially abstract ones, are naturally faint and obscure. The mind has but a slender hold of them. They are apt to be confounded with other resembling ideas; and when we have often employed any term, though without a distinct meaning, we are apt to imagine that it has a determinate idea annexed to it. On the contrary, all impressions, that is, all sensations either outward or inward, are strong and vivid. The limits between them are more exactly determined; nor is it easy to fall into any error or mistake with regard to them. When we entertain, therefore, any suspicion that a philosophical term is employed without any meaning or idea (as is but too frequent), we need but inquire *from what impression is that supposed idea derived?* And if it is impossible to assign any, this will serve to confirm our suspicion. By bringing ideas into so clear a light, we may reasonably hope to remove all dispute which may arise concerning their nature and reality.⁹

SECTION III

Of the Association of Ideas.

It is evident that there is a principle of connection between the different thoughts or ideas of the mind and that, in their appearance to the memory or imagination, they introduce each other with a certain degree of method and regularity. In our more serious thinking or discourse this is so observable that any particular thought which breaks in upon the regular tract or chain of ideas is immediately remarked and rejected. And even in our wildest and most wandering reveries, no, in our very dreams, we shall find, if we reflect, that the imagination did not run altogether at adventures, but that there was still a connection upheld among the different ideas which succeeded each other. Were the loosest and freest conversation to be transcribed, there would immediately be observed something which connected it in all its transitions. Or where this is wanting, the person who broke the thread of discourse might still inform you that there had secretly revolved in his mind a succession of thought which had gradually led him from the subject of conversation. Among different languages, even where we cannot suspect the least connection or communication, it is found that the words expressive of ideas the most compounded do yet nearly correspond to each other — certain proof that the simple ideas comprehended in the compound ones were bound together by some universal principle which had an equal influence on all mankind.

Though it is too obvious to escape observation that different ideas are connected together, I do not find that any philosopher has attempted to enumerate or class all the principles of association—a subject, however, that seems worthy of curiosity. To me there appear to be only three principles of connection among ideas, namely, *resemblance*, *contiguity* in time or place, and *cause* or *effect*.

That these principles serve to connect ideas will not, I believe, be much doubted. A picture naturally leads our thoughts to the original.¹⁰ The mention of one apartment in a building naturally introduces an inquiry or discourse concerning the others;¹¹ and if we think of a wound, we can scarcely forbear reflecting on the pain which follows it.¹² But that this enumeration is complete, and that there are no other principles of association except these, may be difficult to prove to the satisfaction of the reader or even to a man's own satisfaction. All we can do, in such cases, is to run over several instances and examine carefully the principle which binds the different thoughts to each other, never stopping until we render the principle as general as possible.¹³ The more instances we examine and the more care we employ, the more assurance shall we acquire that the enumeration, which we form from the whole, is complete and entire.

SECTION IV

Skeptical Doubts Concerning the Operations of the Understanding.

Part I.

All the objects of human reason or inquiry may naturally be divided into two kinds, namely, *relations of ideas* and *matters of fact*. Of the first kind are the sciences of geometry, algebra, and arithmetic, and, in short, every affirmation which is either intuitively or demonstratively certain. *That the square of the hypotenuse is equal to the squares of the two sides* is a proposition which expresses a relation between these figures. *That three times five is equal to the half of thirty* expresses a relation between these numbers. Propositions of this kind are discoverable by the mere operation of thought, without dependence on what is anywhere existent in the universe. Though there never were a circle or triangle in nature, the truths demonstrated by Euclid would forever retain their certainty and evidence.

Matters of fact, which are the second objects of human reason, are not ascertained in the same manner; nor is our evidence of their truth, however great, of a like nature with the foregoing. The contrary of every matter of fact is still possible, because it can never imply a contradiction and is conceived by the mind with the same facility and distinctness, as if ever so conformable to reality. *That the sun will not rise tomorrow* is no less intelligible a proposition and implies no more contradiction than the affirmation that *it will rise*. We should in vain, therefore, attempt to demonstrate its falsehood. Were it demonstratively false, it would imply a contradiction and could never be distinctly conceived by the mind.

It may, therefore, be a subject worthy of curiosity to inquire what is the nature of that evidence which assures us of any real existence and matter of fact beyond the present testimony of our senses or the records of our memory. This part of philosophy, it is observable, has been little cultivated either by the ancients or moderns, and, therefore, our doubts and errors in the prosecution of so important an inquiry may be the more excusable, while we march through such difficult paths without any guide or direction. They may even prove useful by exciting curiosity and destroying that implicit faith and security which is the bane of all reasoning and free inquiry. The discovery of defects in the common philosophy, if there are any, will not, I presume, be a discouragement, but rather an incitement, as is usual, to attempt something more full and satisfactory than has yet been proposed to the public.

All reasonings concerning matter of fact seem to be founded on the relation of *cause and effect*. By means of that relation alone we can go beyond the evidence of our memory and senses. If you were to ask a man why he believes any matter of fact which is absent — for instance, that his friend is in the country or in France — he would give you a reason, and this reason would be some other fact: as a letter received from him or the knowledge of his former resolutions and promises. A man finding a watch or any other machine on a desert island would conclude that there had once been men on that island. All our reasonings concerning fact are of the same nature. And here it is constantly supposed that there is a connection between the present fact and that which is inferred from it. Were there nothing to bind them together, the inference would be entirely precarious. The hearing of an articulate voice and rational discourse in the dark assures us of the presence of some person. Why? Because these are the effects of the human make and fabric, and closely connected with it. If we anatomize all the other reasonings of this nature, we shall find that they are founded on the relation of cause and effect and that this relation is either near or remote, direct or collateral. Heat and light are collateral effects of fire and the one effect may justly be inferred from the other.

If we would satisfy ourselves, therefore, concerning the nature of that evidence which assures us of matters of fact, we must inquire how we arrive at the knowledge of cause and effect.

I shall venture to affirm, as a general proposition which admits of no exception, that the knowledge of this relation is not, in any instance, attained by reasonings *a priori*, but arises entirely from experience when we find that any particular objects are constantly conjoined with each other. Let an object be presented to a man of ever so strong natural reason and abilities; if that object is entirely new to him, he will not be able, by the most accurate examination of its sensible qualities, to discover any of its causes or effects. Adam, though his rational faculties are supposed entirely perfect at the very first, could not have inferred from the fluidity and transparency of water that it would suffocate him, or from the light and warmth of fire that it would consume him. No object ever discovers, by the qualities which appear to the senses, either the causes which produced it or the effects which will arise from it; nor can our reason, unassisted by experience, ever draw any inference concerning real existence and matter of fact.

This proposition, *that causes and effects are discoverable, not by reason but by experience*, will readily be admitted with regard to such objects as we remember to have once been altogether unknown to us, since we must be conscious of the utter inability which we then lay under of foretelling what would arise from them. Present two smooth pieces of marble to a man who has no tincture of natural philosophy; he will never

discover that they will adhere together in such a manner as to require great force to separate them in a direct line, while they make so small a resistance to a lateral pressure. Such events as bear little analogy to the common course of nature are also readily confessed to be known only by experience, nor does any man imagine that the explosion of gunpowder or the attraction of a lodestone could ever be discovered by *a priori* arguments. In like manner, when an effect is supposed to depend upon an intricate machinery or secret structure of parts, we make no difficulty in attributing all our knowledge of it to experience. Who will assert that he can give the ultimate reason why milk or bread is proper nourishment for a man, not for a lion or a tiger?

But the same truth may not appear at first sight to have the same evidence with regard to events which have become familiar to us from our first appearance in the world, which bear a close analogy to the whole course of nature, and which are supposed to depend on the simple qualities of objects without any secret structure of parts. We are apt to imagine that we could discover these effects by the mere operation of our reason without experience. We fancy that were we brought, all of the sudden, into this world, we could at first have inferred that one billiard ball would communicate motion to another upon impulse and that we did not need to have waited for the event in order to pronounce with certainty concerning it. Such is the influence of custom that where it is strongest it not only covers our natural ignorance, but even conceals itself and seems not to take place, merely because it is found in the highest degree.

But to convince us that all the laws of nature and all the operations of bodies without exception are known only by experience, the following reflections may perhaps suffice. Were any object presented to us and were we required to pronounce concerning the effect which will result from it without consulting past observation, after what manner, I beseech you, must the mind proceed in this operation? It must invent or imagine some event which it ascribes to the object as its effect and it is plain that this invention must be entirely arbitrary. The mind can never possibly find the effect in the supposed cause by the most accurate scrutiny and examination. For the effect is totally different from the cause and consequently can never be discovered in it. Motion in the second billiard ball is a quite distinct event from motion in the first, nor is there anything in the one to suggest the smallest hint of the other. A stone or piece of metal raised into the air and left without any support immediately falls. But to consider the matter *a priori*, is there anything we discover in this situation which can beget the idea of a downward rather than an upward or any other motion in the stone or metal?

And as the first imagination or invention of a particular effect in all natural operations is arbitrary where we do not consult experience, so must we also esteem the supposed tie or connection between the cause and effect which binds them together and renders it impossible that any other effect could result from the operation of that cause. When I see, for instance, a billiard ball moving in a straight line towards another, even suppose motion in the second ball should by accident be suggested to me as the result of their contact or impulse, may I not conceive that a hundred different events might as well follow from that cause? May not both these balls remain at absolute rest? May not the first ball return in a straight line or leap off from the second in any line or direction? All these suppositions are consistent and conceivable. Why then should we give the preference to one which is no more consistent or conceivable than the rest? All our reasonings *a priori* will never be able to show us any foundation for this preference.

In a word, then, every effect is a distinct event from its cause. It could not, therefore, be discovered in the cause and the first invention or conception of it, *a priori*, must be entirely arbitrary. And even after it is suggested, the conjunction of it with the cause must appear equally arbitrary, since there are always many other effects which, to reason, must seem fully as consistent and natural. In vain, therefore, should we pretend to determine any single event or infer any cause or effect without the assistance of observation and experience.

Hence we may discover the reason why no philosopher who is rational and modest has ever pretended to assign the ultimate cause of any natural operation or to show distinctly the action of that power which produces any single effect in the universe. It is confessed that the utmost effort of human reason is to reduce the principles productive of natural phenomena to a greater simplicity and to resolve the many particular effects into a few general causes by means of reasonings from analogy, experience, and observation. But as to the causes of these general causes, we should in vain attempt their discovery, nor shall we ever be able to satisfy ourselves by any particular explication of them. These ultimate springs and principles are totally shut up from human curiosity and inquiry. Elasticity, gravity, cohesion of parts, communication of motion by impulse — these are probably the ultimate causes and principles which we shall ever discover in nature; and we may esteem ourselves sufficiently happy if, by accurate inquiry and reasoning, we can trace up the particular phenomena to, or near to, these general principles. The most perfect philosophy of the natural kind only staves off our ignorance a little longer, as perhaps the most perfect philosophy of the moral or metaphysical kind serves only to discover larger portions of it. Thus the observation of human blindness and weakness is the

result of all philosophy and meets us at every turn in spite of our endeavors to elude or avoid it.

Nor is geometry, when taken into the assistance of natural philosophy, ever able to remedy this defect or lead us into the knowledge of ultimate causes by all that accuracy of reasoning for which it is so justly celebrated. Every part of mixed mathematics proceeds upon the supposition that certain laws are established by nature in her operations and abstract reasonings are employed either to assist experience in the discovery of these laws or to determine their influence in particular instances where it depends upon any precise degree of distance and quantity. Thus, it is a law of motion, discovered by experience, that the moment or force of any body in motion is in the compound ratio or proportion of its solid contents and its velocity, and consequently that a small force may remove the greatest obstacle or raise the greatest weight if, by any contrivance or machinery, we can increase the velocity of that force so as to make it an overmatch for its antagonist. Geometry assists us in the application of this law by giving us the just dimensions of all the parts and figures which can enter into any species of machine, but still the discovery of the law itself is owing merely to experience and all the abstract reasonings in the world could never lead us one step towards the knowledge of it. When we reason *a priori* and consider merely any object or cause as it appears to the mind, independent of all observation, it never could suggest to us the notion of any distinct object, such as its effect, much less show us the inseparable and inviolable connection between them. A man must be very sagacious who could discover by reasoning that crystal is the effect of heat, and ice of cold, without being previously acquainted with the operation of these qualities.

Part II.

But we have not yet attained any tolerable satisfaction with regard to the question first proposed. Each solution still gives rise to a new question as difficult as the foregoing and leads us on to further inquiries. When it is asked, *What is the nature of all our reasonings concerning matter of fact?* the proper answer seems to be that they are founded on the relation of cause and effect. When again it is asked, *What is the foundation of all our reasonings and conclusions concerning that relation?* it may be replied in one word, experience. But if we still carry on our sifting humor and ask, *What is the foundation of all conclusions from experience?* this implies a new question which may be of more difficult solution and explication. Philosophers who give themselves airs of superior wisdom and sufficiency have a hard task when they encounter persons of inquisitive dispositions, who push them from every corner to which they retreat, and who are sure at last to bring them to some dangerous dilemma. The best expedient to prevent this confusion is to be modest in our pretensions and even to discover the difficulty ourselves before it is objected to us. By this means we may make a kind of merit of our very ignorance.

I shall content myself in this section with an easy task and shall pretend only to give a negative answer to the question here proposed. I say, then, that even after we have experience of the operations of cause and effect, our conclusions from that experience are not founded on reasoning or any process of the understanding. This answer we must endeavor both to explain and to defend.

It must certainly be allowed that nature has kept us at a great distance from all her secrets and has afforded us only the knowledge of a few superficial qualities of objects, while she conceals from us those powers and principles on which the influence of these objects entirely depends. Our senses inform us of the color, weight, and consistency of bread, but neither sense nor reason can ever inform us of those qualities which fit it for the nourishment and support of a human body. Sight or feeling conveys an idea of the actual motion of bodies, but as to that wonderful force or power which would carry on a moving body forever in a continued change of place and which bodies never lose but by communicating it to others, of this we cannot form the most distant conception. But notwithstanding this ignorance of natural powers¹⁴ and principles, we always presume when we see like sensible qualities that they have like secret powers and expect that effects similar to those which we have experienced will follow from them. If a body of like color and consistency with that bread which we have formerly eaten is presented to us, we make no scruple of repeating the experiment and foresee with certainty like nourishment and support. Now this is a process of the mind or thought of which I would willingly know the foundation. It is allowed on all hands that there is no known connection between the sensible qualities and the secret powers, and consequently that the mind is not led to form such a conclusion concerning their constant and regular conjunction by anything which it knows of their nature. As to past *experience*, it can be allowed to give *direct* and *certain* information of those precise objects only and that precise period of time which fell under its cognizance. But why this experience should be extended to future times and to other objects which, for all we know, may be only similar in appearance; this is the main question on which I would insist. The bread which I formerly ate nourished me — that is, a body of such sensible qualities was, at that time, endowed with such secret powers. But does it follow that other bread must also nourish me at another time and that like sensible qualities must always be attended with like secret powers? The consequence seems in no way necessary. At least, it must be acknowledged that there is here a consequence drawn by the mind that there is a certain step taken, a process of thought, and an inference which wants to be explained. These two propositions are far from being the same: *I have found that such an object has always been attended with such an effect*, and *I foresee that other objects which are similar in appearance will be attended with similar effects*. I shall allow, if you please, that the one proposition may justly be inferred from the other; I know in fact that it always is inferred. But if you insist that the inference is made by a chain of reasoning, I desire you to produce that reasoning. The connection between these propositions is not intuitive. There is required a medium which may enable the mind to draw such an inference, if indeed it is drawn by reasoning and argument. What that medium is, I must confess, passes my comprehension; and it is incumbent on those to produce it who assert that it really exists and is the origin of all our conclusions concerning matter of fact.

This negative argument must certainly, in process of time, become altogether convincing if many penetrating and able philosophers shall turn their inquiries this way and no one is everable to discover any connecting proposition or intermediate step which supports the understanding in this conclusion. But as the question is yet new, every reader may not trust so far to his own penetration as to conclude that, because an argument escapes his inquiry, therefore it does not really exist. For this reason it may be requisite to venture upon a more difficult task, and, enumerating all the branches of human knowledge, endeavor to show that none of them can afford such an argument.

All reasonings may be divided into two kinds, namely, demonstrative reasoning, or that concerning relations of ideas, and moral reasoning, or that concerning matter of fact and existence. That there are no demonstrative arguments in the case seems evident, since it implies no contradiction that the course of nature may change and that an object, seemingly like those which we have experienced, may be attended with different or contrary effects. May I not clearly and distinctly conceive that a body, falling from the clouds and which in all other respects resembles snow, has yet the taste of salt or feeling of fire? Is there any more intelligible proposition than to affirm that all the trees will flourish in December and January and decay in May and June? Now, whatever is intelligible and can be distinctly conceived implies no contradiction and can never be proved false by any demonstrative argument or abstract reasoning *a priori*.

If we are, therefore, engaged by arguments to put trust in past experience and make it the standard of our future judgment, these arguments must be probable only, or such as regard matter of fact and real existence according to the division above mentioned. But that there is no argument of this kind must appear if our explication of that species of reasoning is admitted as solid and satisfactory. We have said that all arguments concerning existence are founded on the relation of cause and effect, that our knowledge of that relation is derived entirely from experience, and that all our experimental conclusions proceed upon the supposition that the future will be conformable to the past. To endeavor, therefore, the proof of this last supposition by probable arguments, or arguments regarding existence, must be evidently going in a circle and taking that which is the very point in question for granted.

In reality, all arguments from experience are founded on the similarity which we discover among natural objects and by which we are induced to expect effects similar to those which we have found to follow from such objects. And though none but a fool or madman will ever pretend to dispute the authority of experience or to reject that great guide of human life, it may surely be allowed a philosopher to have so much curiosity at least as to examine the principle of human nature which gives this mighty authority to experience and makes us draw advantage from that similarity which nature has placed among different objects. From causes which appear *similar*, we expect similar effects. This is the sum of all our experimental conclusions. Now it seems evident that, if this conclusion were formed by reason, it would be as perfect at first, and upon one instance, as after ever so long a course of experience. But the case is far otherwise. Nothing so like as eggs, yet no one, on account of this appearing similarity, expects the same taste and relish in all of them. It is only after a long course of uniform experiments in any kind that we attain a firm reliance and security with regard to a particular event. Now where is that process of reasoning which, from one instance, draws a conclusion so different from that which it infers from a hundred instances that are in no way different from that single one? This question I propose as much for the sake of information as with an intention of raising difficulties. I cannot find, I cannot imagine any such reasoning. But I keep my mind still open to instruction, if anyone will vouchsafe to bestow it on me.

Should it be said that, from a number of uniform experiments, we *infer* a connection between the sensible qualities and the secret powers? This, I must confess, seems the same difficulty couched in different terms. The question still recurs: on what process of argument this *inference* is founded? Where is the medium, the interposing ideas which join propositions so very wide of each other? It is confessed that the color, consistency, and other sensible qualities of bread do not appear of themselves to have any connection with the secret powers of nourishment and support. For otherwise we could infer these secret powers from the first appearance of these sensible qualities without the aid of experience, contrary to the sentiment of all philosophers and contrary to plain matter of fact. Here, then, is our natural state of ignorance with regard to the powers and influence of all objects. How is this remedied by experience? It only shows us a number of uniform effects resulting from certain objects and teaches us that those particular objects, at that particular time, were endowed with such powers and forces. When a new object endowed with similar sensible qualities is produced, we expect similar powers and forces and look for a like effect. From a body of like color and consistency with bread, we expect like nourishment and support. But this surely is a step or progress of the mind which wants to be explained. When a man says, *I have found, in all past instances, such sensible qualities conjoined with such secret powers*: And when he says, *Similar sensible qualities will always be conjoined with similar secret powers*; he is not guilty of a tautology, nor are these propositions in any respect the same. You say that the one proposition is an inference from the other. But you must confess that the inference is not intuitive, neither is it demonstrative. Of what nature is it then? To say it is experimental is begging the question. For all inferences from experience suppose as their foundation that the future will resemble the past and that similar powers will be conjoined with similar sensible qualities. If there is any suspicion that the course of nature may change, and that the past may be no rule for the future, all experience becomes useless and can give rise to no inference or conclusion. It is impossible, therefore, that any arguments from experience can prove this resemblance of the past to the future, since all these arguments are founded on the supposition of that

resemblance. Let the course of things be allowed up to now ever so regular, that alone, without some new argument or inference, does not prove that for the future it will continue so. In vain do you pretend to have learned the nature of bodies from your past experience. Their secret nature and, consequently, all their effects and influence may change without any change in their sensible qualities. This happens sometimes and with regard to some objects. Why may it not happen always and with regard to all objects? What logic, what process of argument secures you against this supposition? My practice, you say, refutes my doubts. But you mistake the purport of my question. As an agent, I am quite satisfied in the point; but as a philosopher who has some share of curiosity—I will not say skepticism — I want to learn the foundation of this inference. No reading, no inquiry has yet been able to remove my difficulty or give me satisfaction in a matter of such importance. Can I do better than propose the difficulty to the public, even though, perhaps, I have small hopes of obtaining a solution? We shall at least, by this means, be sensible of our ignorance, if we do not augment our knowledge.

I must confess that a man is guilty of unpardonable arrogance who concludes, because an argument has escaped his own investigation, that therefore it does not really exist. I must also confess that, though all the learned for several ages should have employed themselves in fruitless search upon any subject, it may still, perhaps, be rash to conclude positively that the subject must therefore pass all human comprehension. Even though we examine all the sources of our knowledge and conclude them unfit for such a subject, there may still remain a suspicion that the enumeration is not complete or the examination not accurate. But with regard to the present subject, there are some considerations which seem to remove all this accusation of arrogance or suspicion of mistake.

It is certain that the most ignorant and stupid peasants, no infants, no even brute beasts, improve by experience and learn the qualities of natural objects by observing the effects which result from them. When a child has felt the sensation of pain from touching the flame of a candle, he will be careful not to put his hand near any candle, but will expect a similar effect from a cause which is similar in its sensible qualities and appearance. If you assert, therefore, that the understanding of the child is led into this conclusion by any process of argument or ratiocination, I may justly require you to produce that argument, nor have you any pretense to refuse so equitable a demand. You cannot say that the argument is abstruse and may possibly escape your inquiry, since you confess that it is obvious to the capacity of a mere infant. If you hesitate therefore a moment or if, after reflection, you produce any intricate or profound argument, you, in a manner, give up the question and confess that it is not reasoning which engages us to suppose the past resembling the future and to expect similar effects from causes which are similar to appearance. This is the proposition which I intended to enforce in the present section. If I am right, I pretend not to have made any mighty discovery. And if I am wrong, I must acknowledge myself to be indeed a very backward scholar, since I cannot now discover an argument which, it seems, was perfectly familiar to me long before I was out of my cradle.

SECTION V
Skeptical Solution of These Doubts.

Part I.

The passion for philosophy, like that for religion, seems liable to this inconvenience that, though it aims at the correction of our manners and extirpation of our vices, it may only serve, by imprudent management, to foster a predominant inclination and push the mind, with more determined resolution, towards that side which already *draws* too much by the bias and propensity of the natural temper. It is certain that, while we aspire to the magnanimous firmness of the philosophic sage and endeavor to confine our pleasures altogether within our own minds, we may, at last, render our philosophy like that of Epictetus and other *Stoics*, only a more refined system of selfishness, and reason ourselves out of all virtue as well as social enjoyment. While we study with attention the vanity of human life and turn all our thoughts towards the empty and transitory nature of riches and honors, we are, perhaps, all the while flattering our natural indolence which, hating the bustle of the world and drudgery of business, seeks a pretense of reason to give itself a full and uncontrolled indulgence. There is, however, one species of philosophy which seems little liable to this inconvenience, and that because it strikes in with no disorderly passion of the human mind, nor can mingle itself with any natural affection or propensity; and that is the Academic or skeptical philosophy. The academics always talk of doubt and suspense of judgment, of danger in hasty determinations, of confining to very narrow bounds the inquiries of the understanding, and of renouncing all speculations which do not lie within the limits of common life and practice. Nothing, therefore, can be more contrary than such a philosophy to the supine indolence of the mind, its rash arrogance, its lofty pretensions, and its superstitious credulity. Every passion is mortified by it except the love of truth; and that passion never is nor can be carried to too high a degree. It is surprising, therefore, that this philosophy, which in almost every instance must be harmless and innocent, should be the subject of so much groundless reproach and blame. But, perhaps, the very circumstance which renders it so innocent is what chiefly exposes it to the public hatred and resentment. By flattering no irregular passion, it gains few partisans. By opposing so many vices and follies, it raises to itself abundance of enemies who stigmatize it as libertine, profane, and irreligious.

Nor need we fear that this philosophy, while it endeavors to limit our inquiries to common life, should ever undermine the reasonings of common life and carry its doubts so far as to destroy all action as well as speculation. Nature will always maintain her rights and prevail in the end over any abstract reasoning whatsoever. Though we should conclude, for instance, as in the foregoing section that, in all reasonings from experience, there is a step taken by the mind which is not supported by any argument or process of the understanding, there is no danger that these reasonings, on which almost all knowledge depends, will ever be affected by such a discovery. If the mind is not engaged by argument to make this step, it must be induced by some other principle of equal weight and authority and that principle will preserve its influence as long as human nature remains the same. What that principle is may well be worth the pains of inquiry.

Suppose a person, though endowed with the strongest faculties of reason and reflection, to be brought on a sudden into this world; he would, indeed, immediately observe a continual succession of objects and one event following another, but he would not be able to discover anything further. He would not at first, by any reasoning, be able to reach the idea of cause and effect, since the particular powers by which all natural operations are performed never appear to the senses; nor is it reasonable to conclude, merely because one event in one instance precedes another, that therefore the one is the cause, the other the effect. Their conjunction may be arbitrary and casual. There may be no reason to infer the existence of one from the appearance of the other. And in a word, such a person without more experience could never employ his conjecture or reasoning concerning any matter of fact or be assured of anything beyond what was immediately present to his memory and senses.

Suppose again that he has acquired more experience and has lived so long in the world as to have observed similar objects or events to be constantly conjoined together — what is the consequence of this experience? He immediately infers the existence of one object from the appearance of the other. Yet he has not, by all his experience, acquired any idea or knowledge of the secret power by which the one object produces the other, nor is it by any process of reasoning he is engaged to draw this inference. But still he finds himself determined to draw it. And though he should be convinced that his understanding has no part in the operation, he would nevertheless continue in the same course of thinking. There is some other principle which determines him to form such a conclusion.

This principle is *custom* or *habit*. For wherever the repetition of any particular act or operation produces a propensity to renew the same act or operation without being impelled by any reasoning or process of the understanding, we always say that this propensity is the effect of *custom*. By employing that word we pretend not to have given the ultimate reason of such a propensity. We only point out a principle of human nature

which is universally acknowledged and which is well known by its effects. Perhaps we can push our inquiries no further or pretend to give the cause of this cause, but must rest contented with it as the ultimate principle which we can assign of all our conclusions from experience. It is sufficient satisfaction that we can go so far without repining at the narrowness of our faculties because they will carry us no further. And it is certain we here advance a very intelligible proposition at least, if not a true one, when we assert that after the constant conjunction of two objects, heat and flame, for instance, or weight and solidity, we are determined by custom alone to expect the one from the appearance of the other. This hypothesis seems even the only one which explains the difficulty why we draw, from a thousand instances, an inference which we are not able to draw from one instance that is in no respect different from them. Reason is incapable of any such variation. The conclusions which it draws from considering one circle are the same which it would form upon surveying all the circles in the universe. But no man, having seen only one body move after being impelled by another, could infer that every other body will move after a like impulse. All inferences from experience, therefore, are effects of custom, not of reasoning.¹⁵

Custom, then, is the great guide of human life. It is that principle alone which renders our experience useful to us and makes us expect, for the future, a similar train of events with those which have appeared in the past. Without the influence of custom we should be entirely ignorant of every matter of fact beyond what is immediately present to the memory and senses. We should never know how to adjust means to ends or to employ our natural powers in the production of any effect. There would be an end at once of all action as well as of the chief part of speculation.

But here it may be proper to remark that though our conclusions from experience carry us beyond our memory and senses and assure us of matters of fact, which happened in the most distant places and most remote ages, yet some fact must always be present to the senses or memory from which we may first proceed in drawing these conclusions. A man who should find in a desert country the remains of pompous buildings would conclude that the country had, in ancient times, been cultivated by civilized inhabitants, but did nothing of this nature occur to him, he could never form such an inference. We learn the events of former ages from history, but then we must peruse the volumes in which this instruction is contained and from this carry up our inferences from one testimony to another, until we arrive at the eyewitnesses and spectators of these distant events. In a word, if we proceed not upon some fact present to the memory or senses, our reasonings would be merely hypothetical; and however the particular links might be connected with each other, the whole chain of inferences would have nothing to support it, nor could we ever, by its means, arrive at the knowledge of any real existence. If I ask, why you believe any particular matter of fact which you relate, you must tell me some reason; and this reason will be some other fact connected with it. But as you cannot proceed after this manner *in infinitum*, you must at last terminate in some fact which is present to your memory or senses or must allow that your belief is entirely without foundation.

What then is the conclusion of the whole matter? A simple one, though it must be confessed, pretty remote from the common theories of philosophy. All belief of matter of fact or real existence is derived merely from some object present to the memory or senses and a customary conjunction between that and some other object. Or, in other words, having found in many instances that any two kinds of objects, flame and heat, snow and cold, have always been conjoined together, if flame or snow is presented anew to the senses, the mind is carried by custom to expect heat or cold and to *believe* that such a quality does exist and will discover itself upon a nearer approach. This belief is the necessary result of placing the mind in such circumstances. It is an operation of the soul when we are so situated, as unavoidable as feeling the passion of love, when we receive benefits — or hatred, when we meet with injuries. All these operations are a species of natural instincts which no reasoning or process of the thought and understanding is able either to produce or to prevent.

At this point, it would be very allowable for us to stop our philosophical researches. In most questions we can never make a single step further; and in all questions, we must terminate here at last, after our most restless and curious inquiries. But still our curiosity will be pardonable, perhaps commendable, if it carry us on to still further researches and make us examine more accurately the nature of this *belief* and of the *customary conjunction* from which it is derived. By this means we may meet with some explications and analogies that will give satisfaction, at least to such as love the abstract sciences and can be entertained with speculations which, however accurate, may still retain a degree of doubt and uncertainty. As to readers of a different taste, the remaining part of this section is not calculated for them and the following inquiries may well be understood, though it is neglected.

Part II.

Nothing is more free than the imagination of man, and though it cannot exceed that original stock of ideas furnished by the internal and external senses, it has unlimited power of mixing, compounding, separating, and dividing these ideas, in all the varieties of fiction and vision. It can feign a train of events with all the appearance of reality, ascribe to them a particular time and place, conceive them as existent, and paint them out to itself with every circumstance that belongs to any historical fact which it believes with the greatest certainty. In what, therefore, consists the difference between such a fiction and belief? It lies not merely in any peculiar idea which is annexed to such a conception as commands our assent and which is wanting to every known fiction. For as the mind has authority over all its ideas, it could voluntarily annex this particular idea to any fiction and consequently be able to believe whatever it pleases; contrary to what we find by daily experience. We can, in our conception, join the head of a man to the body of a horse, but it is not in our power to believe that such an animal has ever really existed.

It follows, therefore, that the difference between *fiction* and *belief* lies in some sentiment or feeling which is annexed to the latter, not to the former, and which depends not on the will, nor can be commanded at pleasure. It must be excited by nature like all other sentiments and must arise from the particular situation in which the mind is placed at any particular juncture. Whenever any object is presented to the memory or senses, it immediately, by the force of custom, carries the imagination to conceive that object which is usually conjoined to it; and this conception is attended with a feeling or sentiment different from the loose reveries of the fancy. In this consists the whole nature of belief. For as there is no matter of fact which we believe so firmly that we cannot conceive the contrary, there would be no difference between the conception assented to and that which is rejected were it not for some sentiment which distinguishes the one from the other. If I see a billiard ball moving towards another on a smooth table, I can easily conceive it to stop upon contact. This conception implies no contradiction, but still it feels very differently from that conception by which I represent to myself the impulse and the communication of motion from one ball to another.

Were we to attempt a *definition* of this sentiment, we should, perhaps, find it a very difficult, if not an impossible task; in the same manner as if we should endeavor to define the feeling of cold, or passion of anger, to a creature who never had any experience of these sentiments. Belief is the true and proper name of this feeling, and no one is ever at a loss to know the meaning of that term, because every man is every moment conscious of the sentiment represented by it. It may not, however, be improper to attempt a *description* of this sentiment, in hopes we may by that means arrive at some analogies which may afford a more perfect explication of it. I say then that belief is nothing but a more vivid, lively, forcible, firm, steady conception of an object than what the imagination alone is ever able to attain. This variety of terms, which may seem so unphilosophical, is intended only to express that act of the mind which renders realities, or what is taken for such, more present to us than fictions, causes them to weigh more in the thought, and gives them a superior influence on the passions and imagination. Provided we agree about the thing, it is needless to dispute about the terms. The imagination has the command over all its ideas and can join and mix and vary them in all the ways possible. It may conceive fictitious objects with all the circumstances of place and time. It may set them in a manner before our eyes, in their true colors, just as they might have existed. But as it is impossible that this faculty of imagination can ever, of itself, reach belief, it is evident that belief consists not in the peculiar nature or order of ideas, but in the *manner* of their conception and in their *feeling* to the mind. I confess that it is impossible perfectly to explain this feeling or manner of conception. We may make use of words which express something near it. But its true and proper name, as we observed before, is *belief*, which is a term that everyone sufficiently understands in common life. And in philosophy we can go no further than assert that *belief* is something felt by the mind which distinguishes the ideas of the judgment from the fictions of the imagination. It gives them more weight and influence, makes them appear of greater importance, enforces them in the mind, and renders them the governing principle of our actions. I hear at present, for instance, a person's voice with whom I am acquainted and the sound comes as from the next room. This impression of my senses immediately conveys my thought to the person, together with all the surrounding objects. I paint them out to myself as existing at present with the same qualities and relations of which I formerly knew them possessed. These ideas take faster hold of my mind than ideas of an enchanted castle. They are very different to the feeling and have a much greater influence of every kind, either to give pleasure or pain, joy or sorrow.

Let us, then, take in the whole compass of this doctrine and allow that the sentiment of belief is nothing but a conception more intense and steady than what attends the mere fictions of the imagination and that this *manner* of conception arises from a customary conjunction of the object with something present to the memory or senses. I believe that it will not be difficult, upon these suppositions, to find other operations of

the mind analogous to it and to trace up these phenomena to principles still more general.

We have already observed that nature has established connections among particular ideas and that no sooner one idea occurs to our thoughts than it introduces its correlative and carries our attention towards it by a gentle and insensible movement. These principles of connection or association we have reduced to three, namely, *resemblance*, *contiguity*, and *causation*; these are the only bonds that unite our thoughts together and beget that regular train of reflection or discourse which, in a greater or less degree, takes place among all mankind. Now here arises a question on which the solution of the present difficulty will depend. Does it happen in all these relations that when one of the objects is presented to the senses or memory the mind is not only carried to the conception of the correlative, but reaches a steadier and stronger conception of it than what otherwise it would have been able to attain? This seems to be the case with that belief which arises from the relation of cause and effect. And if the case is the same with the other relations or principles of association, this may be established as a general law which takes place in all the operations of the mind.

We may, therefore, observe, as the first experiment to our present purpose, that upon the appearance of the picture of an absent friend, our idea of him is evidently enlivened by the *resemblance*, and that every passion which that idea occasions, whether of joy or sorrow, acquires new force and vigor. In producing this effect there concur both a relation and a present impression. Where the picture bears him no resemblance, at least was not intended for him, it never so much as conveys our thought to him. And where it is absent, as well as the person, though the mind may pass from the thought of the one to that of the other, it feels its idea to be rather weakened than enlivened by that transition. We take a pleasure in viewing the picture of a friend when it is set before us; but when it is removed, rather choose to consider him directly than by reflection in an image which is equally distant and obscure.

The ceremonies of the Roman Catholic religion may be considered as instances of the same nature. The devotees of that superstition usually plead in excuse for the mummeries with which they are upbraided that they feel the good effect of those external motions, and postures, and actions in enlivening their devotion and quickening their fervor, which otherwise would decay, if directed entirely to distant and immaterial objects. We shadow out the objects of our faith, they say, in sensible types and images, and render them more present to us by the immediate presence of these types than it is possible for us to do merely by an intellectual view and contemplation. Sensible objects have always a greater influence on the fancy than any other, and this influence they readily convey to those ideas to which they are related and which they resemble. I shall only infer from these practices and this reasoning that the effect of resemblance in enlivening the ideas is very common; and as in every case a resemblance and a present impression must concur, we are abundantly supplied with experiments to prove the reality of the foregoing principle.

We may add force to these experiments by others of a different kind, in considering the effects of *contiguity* as well as of *resemblance*. It is certain that distance diminishes the force of every idea and that, upon our approach to any object, though it does not discover itself to our senses, it operates upon the mind with an influence which imitates an immediate impression. The thinking on any object readily transports the mind to what is contiguous; but it is only the actual presence of an object that transports it with a superior vivacity. When I am a few miles from home, whatever relates to it touches me more nearly than when I am two hundred leagues distant, though even at that distance the reflecting on anything in the neighborhood of my friends or family naturally produces an idea of them. But, as in this latter case, both the objects of the mind are ideas, notwithstanding there is an easy transition between them; that transition alone is not able to give a superior vivacity to any of the ideas, for want of some immediate impression.

No one can doubt but causation has the same influence as the other two relations of resemblance and contiguity. Superstitious people are fond of the relics of saints and holy men, for the same reason that they seek after types or images in order to enliven their devotion and give them a more intimate and strong conception of those exemplary lives which they desire to imitate. Now it is evident that one of the best relics which a devotee could procure would be the handiwork of a saint; and if his clothes and furniture are ever to be considered in this light, it is because they were once at his disposal and were moved and affected by him; in this respect they are to be considered as imperfect effects and as connected with him by a shorter chain of consequences than any of those by which we learn the reality of his existence.

Suppose that the son of a friend who had been long dead or absent were presented to us; it is evident that this object would instantly revive its correlative idea and recall to our thoughts all past intimacies and familiarities in more lively colors than they would otherwise have appeared to us. This is another phenomenon which seems to prove the principle above mentioned.

We may observe that in these phenomena the belief of the correlative object is always presupposed, without which the relation could have no effect. The influence of the picture supposes that we *believe* our

friend to have once existed. Contiguity to home can never excite our ideas of home unless we *believe* that it really exists. Now I assert that this belief, where it reaches beyond the memory or senses, is of a similar nature and arises from similar causes with the transition of thought and vivacity of conception here explained. When I throw a piece of dry wood into a fire, my mind is immediately carried to conceive that it augments, not extinguishes, the flame. This transition of thought from the cause to the effect does not proceed from reason. It derives its origin altogether from custom and experience. And as it first begins from an object present to the senses, it renders the idea or conception of flame more strong and lively than any loose, floating reverie of the imagination. That idea arises immediately. The thought moves instantly towards it and conveys to it all that force of conception which is derived from the impression present to the senses. When a sword is leveled at my breast, does not the idea of wound and pain strike me more strongly than when a glass of wine is presented to me, even though by accident this idea should occur after the appearance of the latter object? But what is there in this whole matter to cause such a strong conception except only a present object and a customary transition to the idea of another object which we have been accustomed to conjoin with the former? This is the whole operation of the mind in all our conclusions concerning matter of fact and existence; and it is a satisfaction to find some analogies by which it may be explained. The transition from a present object does in all cases give strength and solidity to the related idea.

Here, then, is a kind of preestablished harmony between the course of nature and the succession of our ideas; and though the powers and forces by which the former is governed are wholly unknown to us, yet our thoughts and conceptions have still, we find, gone on in the same train with the other works of nature. Custom is that principle by which this correspondence has been effected, so necessary to the subsistence of our species and the regulation of our conduct in every circumstance and occurrence of human life. Had not the presence of an object instantly excited the idea of those objects commonly conjoined with it, all our knowledge must have been limited to the narrow sphere of our memory and senses and we should never have been able to adjust means to ends or employ our natural powers either to the producing of good or avoiding of evil. Those who delight in the discovery and contemplation of *final causes* have here ample subject to employ their wonder and admiration.

I shall add, for a further confirmation of the foregoing theory, that as this operation of the mind by which we infer like effects from like causes, and *vice versa*, is so essential to the subsistence of all human creatures, it is not probable that it could be trusted to the fallacious deductions of our reason, which is slow in its operations, does not appear, in any degree, during the first years of infancy, and at best is in every age and period of human life extremely liable to error and mistake. It is more conformable to the ordinary wisdom of nature to secure so necessary an act of the mind by some instinct or mechanical tendency which may be infallible in its operations, may discover itself at the first appearance of life and thought, and may be independent of all the labored deductions of the understanding. As nature has taught us the use of our limbs without giving us the knowledge of the muscles and nerves by which they are actuated, so has she implanted in us an instinct which carries forward the thought in a correspondent course to that which she has established among external objects, though we are ignorant of those powers and forces on which this regular course and succession of objects totally depends.

SECTION VI

*Of Probability.*¹⁶

Though there is no such thing as *chance* in the world, our ignorance of the real cause of any event has the same influence on the understanding and begets a like species of belief or opinion.

There is certainly a probability which arises from a superiority of chances on any side and, according as this superiority increases and surpasses the opposite chances, the probability receives a proportional increase and begets still a higher degree of belief or assent to that side in which we discover the superiority. If a die were marked with one figure or number of spots on four sides, and with another figure or number of spots on the two remaining sides, it would be more probable that the former would turn up than the latter, though, if it had a thousand sides marked in the same manner and only one side different, the probability would be much higher and our belief or expectation of the event more steady and secure. This process of the thought or reasoning may seem trivial and obvious, but to those who consider it more narrowly, it may, perhaps, afford matter for curious speculation.

It seems evident that when the mind looks forward to discover the event which may result from the throw of such a die, it considers the turning up of each particular side as alike probable and it is the very nature of chance to render all the particular events comprehended in it entirely equal. But finding a greater number of sides concur in the one event than in the other, the mind is carried more frequently to that event and meets it more often in revolving the various possibilities or chances on which the ultimate result depends. This concurrence of several views in one particular event begets immediately, by an inexplicable contrivance of nature, the sentiment of belief and gives that event the advantage over its antagonist which is supported by a smaller number of views and recurs less frequently to the mind. If we allow that belief is nothing but a firmer and stronger conception of an object than what attends the mere fictions of the imagination, this operation may, perhaps, in some measure be accounted for. The concurrence of these several views or glimpses imprints the idea more strongly on the imagination, gives it superior force and vigor, renders its influence on the passions and affections more sensible, and, in a word, begets that reliance or security which constitutes the nature of belief and opinion.

The case is the same with the probability of causes as with that of chance. There are some causes which are entirely uniform and constant in producing a particular effect and no instance has ever yet been found of any failure or irregularity in their operation. Fire has always burned, and water suffocated, every human creature. The production of motion by impulse and gravity is a universal law which has up to now admitted of no exception. But there are other causes which have been found more irregular and uncertain; nor has rhubarb always proved a purge, or opium a soporific, to everyone who has taken these medicines. It is true, when any cause fails of producing its usual effect, philosophers do not ascribe this to any irregularity in nature, but suppose that some secret causes in the particular structure of parts have prevented the operation. Our reasonings, however, and conclusions concerning the event are the same as if this principle had no place. Being determined by custom to transfer the past to the future in all our inferences, where the past has been entirely regular and uniform, we expect the event with the greatest assurance and leave no room for any contrary supposition. But where different effects have been found to follow from causes which are to *appearance* exactly similar, all these various effects must occur to the mind in transferring the past to the future and enter into our consideration when we determine the probability of the event. Though we give the preference to that which has been found most usual and believe that this effect will exist, we must not overlook the other effects, but must assign to each of them a particular weight and authority in proportion as we have found it to be more or less frequent. It is more probable, in almost every country of Europe, that there will be frost sometime in January than that the weather will continue open throughout that whole month, though this probability varies according to the different climates and approaches to a certainty in the more northern kingdoms. Here, then, it seems evident that when we transfer the past to the future in order to determine the effect which will result from any cause, we transfer all the different events in the same proportion as they have appeared in the past and conceive one to have existed a hundred times, for instance, another ten times, and another once. As a great number of views do here concur in one event, they fortify and confirm it to the imagination, beget that sentiment which we call *belief*, and give its object the preference above the contrary event which is not supported by an equal number of experiments and does not recur so frequently to the thought in transferring the past to the future. Let anyone try to account for this operation of the mind upon any of the received systems of philosophy and he will be sensible of the difficulty. For my part,

I shall think it sufficient if the present hints excite the curiosity of philosophers and make them sensible how defective all common theories are in treating of such curious and such sublime subjects.

SECTION VII
Of the Idea of Necessary Connection.

Part I.

The great advantage of the mathematical sciences above the moral consists in this, that the ideas of the former, being sensible, are always clear and determinate, the smallest distinction between them is immediately perceptible, and the same terms are still expressive of the same ideas without ambiguity or variation. An oval is never mistaken for a circle, nor an hyperbola for an ellipsis. The isosceles and scalene are distinguished by boundaries more exact than vice and virtue, right and wrong. If any term is defined in geometry, the mind readily, of itself, substitutes on all occasions the definition for the term defined. Or even when no definition is employed, the object itself may be presented to the senses and by that means be steadily and clearly apprehended. But the finer sentiments of the mind, the operations of the understanding, the various agitations of the passions, though really in themselves distinct, easily escape us when surveyed by reflection; nor is it in our power to recall the original object as often as we have occasion to contemplate it. Ambiguity, by this means, is gradually introduced into our reasonings. Similar objects are readily taken to be the same and the conclusion becomes at last very wide of the premises.

One may safely, however, affirm that if we consider these sciences in a proper light, their advantages and disadvantages nearly compensate each other and reduce both of them to a state of equality. If the mind, with greater facility, retains the ideas of geometry clear and determinate, it must carry on a much longer and more intricate chain of reasoning and compare ideas much wider of each other in order to reach the more abstruse truths of that science. And if moral ideas are apt, without extreme care, to fall into obscurity and confusion, the inferences are always much shorter in these disquisitions and the intermediate steps which lead to the conclusion much fewer than in the sciences which treat of quantity and number. In reality, there is scarcely a proposition in Euclid so simple as not to consist of more parts than are to be found in any moral reasoning which runs not into chimera and conceit. Where we trace the principles of the human mind through a few steps, we may be very well satisfied with our progress, considering how soon nature throws a bar to all our inquiries concerning causes and reduces us to an acknowledgment of our ignorance. The chief obstacle, therefore, to our improvement in the moral or metaphysical sciences is the obscurity of the ideas and ambiguity of the terms. The principal difficulty in mathematics is the length of inferences and compass of thought requisite to the forming of any conclusion. And, perhaps, our progress in natural philosophy is chiefly retarded by the want of proper experiments and phenomena which are often discovered by chance and cannot always be found when requisite, even by the most diligent and prudent inquiry. As moral philosophy seems up to now to have received less improvement than either geometry or physics, we may conclude that if there is any difference in this respect among these sciences, the difficulties which obstruct the progress of the former require superior care and capacity to be surmounted.

There are no ideas which occur in metaphysics more obscure and uncertain than those of *power*, *force*, *energy*, or *necessary connection*, of which it is every moment necessary for us to treat in all our disquisitions. We shall, therefore, endeavor in this section to fix, if possible, the precise meaning of these terms and thereby remove some part of that obscurity which is so much complained of in this species of philosophy.

It seems a proposition which will not admit of much dispute that all our ideas are nothing but copies of our impressions, or, in other words, that it is impossible for us to *think* of anything which we have not antecedently *felt* either by our external or internal senses. I have endeavored¹⁷ to explain and prove this proposition, and have expressed my hopes that by a proper application of it men may reach a greater clearness and precision in philosophical reasonings than what they have up to now been able to attain. Complex ideas may, perhaps, be well known by definition, which is nothing but an enumeration of those parts or simple ideas that compose them. But when we have pushed up definitions to the most simple ideas and find still some ambiguity and obscurity, what resource are we then possessed of? By what invention can we throw light upon these ideas and render them altogether precise and determinate to our intellectual view? Produce the impressions or original sentiments from which the ideas are copied. These impressions are all strong and sensible. They do not admit of ambiguity. They are not only placed in a full light themselves, but may throw light on their correspondent ideas, which lie in obscurity. And by this means we may, perhaps, attain a new microscope or species of optics by which, in the moral sciences, the most minute and most simple ideas may be so enlarged as to fall readily under our apprehension and be equally known with the grossest and most sensible ideas that can be the object of our inquiry.

To be fully acquainted, therefore, with the idea of power or necessary connection, let us examine its impression and, in order to find the impression with greater certainty, let us search for it in all the sources from which it may possibly be derived.

When we look about us towards external objects and consider the operation of causes, we are never able, in a single instance, to discover any power or necessary connection, any quality which binds the effect to the cause and renders the one an infallible consequence of the other. We only find that the one does actually in fact follow the other. The impulse of one billiard ball is attended with motion in the second. This is the whole that appears to the *outward* senses. The mind feels no sentiment or *inward* impression from this succession of objects. Consequently, there is not, in any single particular instance of cause and effect, anything which can suggest the idea of power or necessary connection.

From the first appearance of an object we never can conjecture what effect will result from it. But were the power or energy of any cause discoverable by the mind, we could foresee the effect, even without experience, and might, at first, pronounce with certainty concerning it by the mere dint of thought and reasoning.

In reality, there is no part of matter that ever does, by its sensible qualities, discover any power or energy or give us ground to imagine that it could produce anything or be followed by any other object which we could denominate its effect. Solidity, extension, motion — these qualities are all complete in themselves and never point out any other event which may result from them. The scenes of the universe are continually shifting and one object follows another in an uninterrupted succession; but the power or force which actuates the whole machine is entirely concealed from us and never discovers itself in any of the sensible qualities of body. We know that, in fact, heat is a constant attendant of flame, but what is the connection between them we have no room so much as to conjecture or imagine. It is impossible, therefore, that the idea of power can be derived from the contemplation of bodies in single instances of their operation, because no bodies ever discover any power which can be the original of this idea.¹⁸

Since, therefore, external objects as they appear to the senses give us no idea of power or necessary connection by their operation in particular instances, let us see whether this idea is derived from reflection on the operations of our own minds and is copied from any internal impression. It may be said that we are every moment conscious of internal power, while we feel that, by the simple command of our will, we can move the organs of our body or direct the faculties of our mind. An act of volition produces motion in our limbs or raises a new idea in our imagination. This influence of the will we know by consciousness. Hence we acquire the idea of power or energy and are certain that we ourselves and all other intelligent beings are possessed of power. This idea, then, is an idea of reflection, since it arises from reflecting on the operations of our own mind and on the command which is exercised by will, both over the organs of the body and faculties of the mind.

We shall proceed to examine this pretension and, first, with regard to the influence of volition over the organs of the body. This influence, we may observe, is a fact which, like all other natural events, can be known only by experience and can never be foreseen from any apparent energy or power in the cause which connects it with the effect and renders the one an infallible consequence of the other. The motion of our body follows upon the command of our will. Of this we are every moment conscious. But the means by which this is effected, the energy by which the will performs so extraordinary an operation, of this we are so far from being immediately conscious that it must forever escape our most diligent inquiry.

For *first*, is there any principle in all nature more mysterious than the union of soul with body, by which a supposed spiritual substance acquires such an influence over a material one that the most refined thought is able to actuate the grossest matter? Were we empowered by a secret wish to remove mountains or control the planets in their orbit, this extensive authority would not be more extraordinary, nor more beyond our comprehension. But if by consciousness we perceived any power or energy in the will, we must know this power; we must know its connection with the effect; we must know the secret union of soul and body, and the nature of both these substances by which the one is able to operate in so many instances upon the other.

Secondly, we are not able to move all the organs of the body with a like authority, though we cannot assign any reason besides experience for so remarkable a difference between one and the other. Why has the will an influence over the tongue and fingers, not over the heart or liver? This question would never embarrass us were we conscious of a power in the former case, not in the latter. We should then perceive, independent of experience, why the authority of will over the organs of the body is circumscribed within such particular limits. Being in that case fully acquainted with the power or force by which it operates, we should also know why its influence reaches precisely to such boundaries, and no further.

A man suddenly struck with a palsy in the leg or arm or who had newly lost those members frequently endeavors, at first, to move them and employ them in their usual offices. Here he is as much conscious of power to command such limbs as a man in perfect health is conscious of power to actuate any member which remains in its natural state and condition. But consciousness never deceives. Consequently, neither in the one

case nor in the other are we ever conscious of any power. We learn the influence of our will from experience alone. And experience only teaches us how one event constantly follows another, without instructing us in the secret connection which binds them together and renders them inseparable.

Thirdly, we learn from anatomy that the immediate object of power in voluntary motion is not the member itself which is moved, but certain muscles and nerves and animal spirits and, perhaps, something still more minute and more unknown through which the motion is successively propagated before it reaches the member itself whose motion is the immediate object of volition. Can there be a more certain proof that the power by which this whole operation is performed, so far from being directly and fully known by an inward sentiment or consciousness, is to the last degree mysterious and unintelligible? Here the mind wills a certain event. Immediately another event, unknown to ourselves and totally different from the one intended, is produced. This event produces another, equally unknown, until at last, through a long succession the desired event is produced. But if the original power was felt, it must be known. If it was known, its effect must also be known, since all power is relative to its effect. And *vice versa*, if the effect is not known, the power cannot be known nor felt. How indeed can we be conscious of a power to move our limbs when we have no such power, but only that to move certain animal spirits which, though they produce at last the motion of our limbs, yet operate in such a manner as is wholly beyond our comprehension?

We may, therefore, conclude from the whole, I hope, without any temerity, though with assurance, that our idea of power is not copied from any sentiment or consciousness of power within ourselves when we give rise to animal motion or apply our limbs to their proper use and office. That their motion follows the command of the will is a matter of common experience, like other natural events. But the power or energy by which this is effected, like that in other natural events, is unknown and inconceivable.¹⁹

Shall we then assert that we are conscious of a power or energy in our own minds when, by an act or command of our will, we raise up a new idea, fix the mind to the contemplation of it, turn it on all sides, and at last dismiss it for some other idea when we think that we have surveyed it with sufficient accuracy? I believe the same arguments will prove that even this command of the will gives us no real idea of force or energy.

First, it must be allowed that when we know a power, we know that very circumstance in the cause by which it is enabled to produce the effect, for these are supposed to be synonymous. We must, therefore, know both the cause and effect and the relation between them. But do we pretend to be acquainted with the nature of the human soul and the nature of an idea or the aptitude of the one to produce the other? This is a real creation, a production of something out of nothing, which implies a power so great that it may seem, at first sight, beyond the reach of any being less than infinite. At least it must be admitted that such a power is not felt, nor known, nor even conceivable by the mind. We only feel the event, namely, the existence of an idea consequent to a command of the will. But the manner in which this operation is performed, the power by which it is produced, is entirely beyond our comprehension.

Secondly, the command of the mind over itself is limited, as well as its command over the body; and these limits are not known by reason or any acquaintance with the nature of cause and effect, but only by experience and observation, as in all other natural events and in the operation of external objects. Our authority over our sentiments and passions is much weaker than that over our ideas; and even the latter authority is circumscribed within very narrow boundaries. Will anyone pretend to assign the ultimate reason of these boundaries or show why the power is deficient in one case, not in another?

Thirdly, this self-command is very different at different times. A man in health possesses more of it than one languishing with sickness. We are more master of our thoughts in the morning than in the evening — fasting, than after a full meal. Can we give any reason for these variations except experience? Where, then, is the power of which we pretend to be conscious? Is there not here, either in a spiritual or material substance or both, some secret mechanism or structure of parts upon which the effect depends and which, being entirely unknown to us, renders the power or energy of the will equally unknown and incomprehensible?

Volition is surely an act of the mind with which we are sufficiently acquainted. Reflect upon it. Consider it on all sides. Do you find anything in it like this creative power by which it raises from nothing a new idea and, with a kind of fiat, imitates the omnipotence of its Maker — if I may be allowed so to speak—who called forth into existence all the various scenes of nature? So far from being conscious of this energy in the will, it requires as certain experience as that of which we are possessed to convince us that such extraordinary effects do ever result from a simple act of volition.

The generality of mankind never find any difficulty in accounting for the more common and familiar operations of nature, such as the descent of heavy bodies, the growth of plants, the generation of animals, or the nourishment of bodies by food. But suppose that in all these cases they perceive the very force or energy of

the cause by which it is connected with its effect and is forever infallible in its operation. They acquire, by long habit, such a turn of mind that upon the appearance of the cause they immediately expect with assurance its usual attendant and hardly conceive it possible that any other event could result from it. It is only on the discovery of extraordinary phenomena, such as earthquakes, pestilence, and prodigies of any kind, that they find themselves at a loss to assign a proper cause and to explain the manner in which the effect is produced by it. It is usual for men, in such difficulties, to have recourse to some invisible intelligent principle as the immediate cause of that event which surprises them and which they think cannot be accounted for from the common powers of nature. But philosophers, who carry their scrutiny a little further, immediately perceive that, even in the most familiar events, the energy of the cause is as unintelligible as in the most unusual and that we only learn by experience the frequent conjunction of objects, without being ever able to comprehend anything like connection between them. Here, then, many philosophers²⁰ think themselves obliged by reason to have recourse, on all occasions, to the same principle which the vulgar never appeal to but in cases that appear miraculous and supernatural. They acknowledge mind and intelligence to be not only the ultimate and original cause of all things, but the immediate and sole cause of every event which appears in nature. They pretend that those objects which are commonly denominated *causes* are in reality nothing but *occasions*; and that the true and direct principle of every effect is not any power or force in nature, but a volition of the Supreme Being, who wills that such particular objects should forever be conjoined with each other. Instead of saying that one billiard ball moves another by a force which it has derived from the author of nature, it is the Deity himself, they say, who, by a particular volition, moves the second ball, being determined to this operation by the impulse of the first ball, in consequence of those general laws which he has laid down to himself in the government of the universe. But philosophers advancing still in their inquiries, discover that as we are totally ignorant of the power on which depends the mutual operation of bodies, we are no less ignorant of that power on which depends the operation of mind on body or of body on mind; nor are we able, either from our senses or consciousness, to assign the ultimate principle in one case more than in the other. The same ignorance, therefore, reduces them to the same conclusion. They assert that the Deity is the immediate cause of the union between soul and body and that they are not the organs of sense which, being agitated by external objects, produce sensations in the mind, but that it is a particular volition of our omnipotent Maker which excites such a sensation in consequence of such a motion in the organ. In like manner, it is not any energy in the will that produces local motion in our members. It is God himself, who is pleased to second our will, in itself impotent, and to command that motion which we erroneously attribute to our own power and efficacy. Nor do philosophers stop at this conclusion. They sometimes extend the same inference to the mind itself in its internal operations. Our mental vision or conception of ideas is nothing but a revelation made to us by our Maker. When we voluntarily turn our thoughts to any object and raise up its image in the fancy, it is not the will which creates that idea, it is the universal Creator who discovers it to the mind and renders it present to us.

Thus, according to these philosophers, every thing is full of God. Not content with the principle that nothing exists but by his will, that nothing possesses any power but by his concession, they rob nature and all created beings of every power in order to render their dependence on the Deity still more sensible and immediate. They do not consider that by this theory they diminish, instead of magnifying, the grandeur of those attributes which they affect so much to celebrate. It argues surely more power in the Deity to delegate a certain degree of power to inferior creatures than to produce everything by his own immediate volition. It argues more wisdom to contrive at first the fabric of the world with such perfect foresight that, of itself and by its proper operation, it may serve all the purposes of providence than if the great Creator were obliged every moment to adjust its parts and animate by his breath all the wheels of that stupendous machine.

But if we would have a more philosophical confutation of this theory, perhaps the two following reflections may suffice.

First, it seems to me that this theory of the universal energy and operation of the Supreme Being is too bold ever to carry conviction with it to a man sufficiently apprised of the weakness of human reason and the narrow limits to which it is confined in all its operations. Though the chain of arguments which conduct to it were ever so logical, there must arise a strong suspicion, if not an absolute assurance, that it has carried us quite beyond the reach of our faculties when it leads to conclusions so extraordinary and so remote from common life and experience. We arrived in fairyland long before we have reached the last steps of our theory; and *there* we have no reason to trust our common methods of argument or to think that our usual analogies and probabilities have any authority. Our line is too short to fathom such immense abysses. And however we may flatter ourselves that we are guided, in every step which we take, by a kind of verisimilitude and experience, we may be assured that this fancied experience has no authority when we thus apply it to subjects

that lie entirely out of the sphere of experience. But on this we shall have occasion to touch afterwards.²¹

Secondly, I cannot perceive any force in the arguments on which this theory is founded. We are ignorant, it is true, of the manner in which bodies operate on each other. Their force or energy is entirely incomprehensible. But are we not equally ignorant of the manner or force by which a mind, even the supreme mind, operates either on itself or on body? From where, I beseech you, do we acquire any idea of it? We have no sentiment or consciousness of this power in ourselves. We have no idea of the Supreme Being but what we learn from reflection on our own faculties. Were our ignorance, therefore, a good reason for rejecting anything, we should be led into that principle of denying all energy in the Supreme Being as much as in the grossest matter. We surely comprehend as little the operations of one as of the other. Is it more difficult to conceive that motion may arise from impulse than that it may arise from volition? All we know is our profound ignorance in both cases.²²

Part II.

But to hasten to a conclusion of this argument, which is already drawn out to too great a length. We have sought in vain for an idea of power or necessary connection in all the sources from which we could suppose it to be derived. It appears that in single instances of the operation of bodies we never can, by our utmost scrutiny, discover anything but one event following another, without being able to comprehend any force or power by which the cause operates or any connection between it and its supposed effect. The same difficulty occurs in contemplating the operations of mind on body, where we observe the motion of the latter to follow upon the volition of the former, but are not able to observe or conceive the tie which binds together the motion and volition, or the energy by which the mind produces this effect. The authority of the will over its own faculties and ideas is not a whit more comprehensible, so that, upon the whole, there does not appear, throughout all nature, any one instance of connection which is conceivable by us. All events seem entirely loose and separate. One event follows another, but we never can observe any tie between them. They seem *conjoined*, but never *connected*. And as we can have no idea of anything which never appeared to our outward sense or inward sentiment, the necessary conclusion *seems* to be that we have no idea of connection or power at all and that these words are absolutely without any meaning when employed either in philosophical reasonings or common life.

But there still remains one method of avoiding this conclusion and one source which we have not yet examined. When any natural object or event is presented, it is impossible for us, by any sagacity or penetration to discover, or even conjecture, without experience, what event will result from it, or to carry our foresight beyond that object which is immediately present to the memory and senses. Even after one instance or experiment where we have observed a particular event to follow upon another, we are not entitled to form a general rule or foretell what will happen in like cases, it being justly esteemed an unpardonable temerity to judge of the whole course of nature from one single experiment, however accurate or certain. But when one particular species of event has always, in all instances, been conjoined with another, we make no longer any scruple of fore-telling one upon the appearance of the other and of employing that reasoning which can alone assure us of any matter of fact or existence. We then call the one object *cause*, the other *effect*. We suppose that there is some connection between them, some power in the one by which it infallibly produces the other and operates with the greatest certainty and strongest necessity.

It appears, then, that this idea of a necessary connection among events arises from a number of similar instances which occur, of the constant conjunction of these events, nor can that idea ever be suggested by any one of these instances surveyed in all possible lights and positions. But there is nothing in a number of instances, different from every single instance, which is supposed to be exactly similar, except only that after a repetition of similar instances the mind is carried by habit, upon the appearance of one event, to expect its usual attendant and to believe that it will exist. This connection, therefore, which we *feel* in the mind, this customary transition of the imagination from one object to its usual attendant, is the sentiment or impression from which we form the idea of power or necessary connection. Nothing further is in the case. Contemplate the subject on all sides, you will never find any other origin of that idea. This is the sole difference between one instance, from which we can never receive the idea of connection, and a number of similar instances by which it is suggested. The first time a man saw the communication of motion by impulse, as by the shock of two billiard balls, he could not pronounce that the one event was *connected*, but only that it was *conjoined* with the other. After he has observed several instances of this nature, he then pronounces them to be *connected*. What alteration has happened to give rise to this new idea of *connection*? Nothing but that he now *feels* these events to be *connected* in his imagination and can readily foretell the existence of one from the appearance of the other. When we say, therefore, that one object is connected with another, we mean only that they have acquired a connection in our thought and give rise to this inference by which they become proofs of each other's existence — a conclusion, which is somewhat extraordinary, but which seems founded on sufficient evidence. Nor will its evidence be weakened by any general diffidence of the understanding or skeptical suspicion concerning every conclusion which is new and extraordinary. No conclusions can be more agreeable to skepticism than such as make discoveries concerning the weakness and narrow limits of human reason and capacity.

And what stronger instance can be produced of the surprising ignorance and weakness of the understanding than the present? For surely, if there is any relation among objects which it imports to us to know perfectly, it is that of cause and effect. On this are founded all our reasonings concerning matter of fact or existence. By means of it alone we attain any assurance concerning objects which are removed from the present testimony of our memory and senses. The only immediate utility of all sciences is to teach us how to

control and regulate future events by their causes. Our thoughts and inquiries are, therefore, every moment employed about this relation; yet so imperfect are the ideas which we form concerning it that it is impossible to give any just definition of cause, except what is drawn from something extraneous and foreign to it. Similar objects are always conjoined with similar. Of this we have experience. Suitably to this experience, therefore, we may define a cause to be *an object followed by another and where all the objects similar to the first are followed by objects similar to the second*. Or, in other words, *where, if the first object had not been, the second never had existed*. The appearance of a cause always conveys the mind, by a customary transition, to the idea of the effect. Of this also we have experience. We may, therefore, suitably to this experience, form another definition of cause, and call it *an object followed by another and whose appearance always conveys the thought to that other*. But though both these definitions are drawn from circumstances foreign to the cause, we cannot remedy this inconvenience or attain any more perfect definition which may point out that circumstance in the cause which gives it a connection with its effect. We have no idea of this connection, nor even any distinct notion what it is we desire to know when we endeavor at a conception of it. We say, for instance, that the vibration of this string is the cause of this particular sound. But what do we mean by that affirmation? We either mean that *this vibration is followed by this sound, and that all similar vibrations have been followed by similar sounds*: Or that *this vibration is followed by this sound and that upon the appearance of one, the mind anticipates the senses and forms immediately an idea of the other*. We may consider the relation of cause and effect in either of these two lights; but beyond these, we have no idea of it.²³

To recapitulate, therefore, the reasonings of this section: Every idea is copied from some preceding impression or sentiment; and where we cannot find any impression, we may be certain that there is no idea. In all single instances of the operation of bodies or minds, there is nothing that produces any impression, nor consequently can suggest any idea of power or necessary connection. But when many uniform instances appear and the same object is always followed by the same event, we then begin to entertain the notion of cause and connection. We then *feel* a new sentiment or impression, namely, a customary connection in the thought or imagination between one object and its usual attendant and this sentiment is the original of that idea which we seek for. For as this idea arises from a number of similar instances and not from any single instance, it must arise from that circumstance in which the number of instances differ from every individual instance. But this customary connection or transition of the imagination is the only circumstance in which they differ. In every other particular they are alike. The first instance which we saw of motion communicated by the shock of two billiard balls (to return to this obvious illustration) is exactly similar to any instance that may, at present, occur to us, except only that we could not at first *infer* one event from the other, which we are enabled to do at present, after so long a course of uniform experience. I do not know whether the reader will readily apprehend this reasoning. I am afraid that, should I multiply words about it or throw it into a greater variety of lights, it would only become more obscure and intricate. In all abstract reasonings, there is one point of view which, if we can happily hit, we shall go further towards illustrating the subject than by all the eloquence and copious expression in the world. This point of view we should endeavor to reach, and reserve the flowers of rhetoric for subjects which are more adapted to them.

SECTION VIII
Of Liberty and Necessity.

Part I.

It might reasonably be expected in questions which have been canvassed and disputed with great eagerness since the first origin of science and philosophy that the meaning of all the terms, at least, should have been agreed upon among the disputants, and our inquiries, in the course of two thousand years, been able to pass from words to the true and real subject of the controversy. For how easy may it seem to give exact definitions of the terms employed in reasoning and make these definitions, not the mere sound of words, the object of future scrutiny and examination? But if we consider the matter more narrowly, we shall be apt to draw a quite opposite conclusion. From this circumstance alone that a controversy has been long kept on foot and remains still undecided, we may presume that there is some ambiguity in the expression and that the disputants affix different ideas to the terms employed in the controversy. For as the faculties of the mind are supposed to be naturally alike in every individual — otherwise nothing could be more fruitless than to reason or dispute together— it would be impossible, if men affix the same ideas to their terms, that they could so long form different opinions of the same subject, especially when they communicate their views and each party turn themselves on all sides in search of arguments which may give them the victory over their antagonists. It is true that if men attempt the discussion of questions which lie entirely beyond the reach of human capacity, such as those concerning the origin of worlds or the economy of the intellectual system or region of spirits, they may long beat the air in their fruitless contests and never arrive at any determinate conclusion. But if the question regards any subject of common life and experience, nothing, one would think, could preserve the dispute so long undecided, but some ambiguous expressions which keep the antagonists still at a distance and hinder them from grappling with each other.

This has been the case in the long disputed question concerning liberty and necessity and to so remarkable a degree that, if I am not much mistaken, we shall find that all mankind, both learned and ignorant, have always been of the same opinion with regard to this subject and that a few intelligible definitions would immediately have put an end to the whole controversy. I admit that this dispute has been so much canvassed on all hands and has led philosophers into such a labyrinth of obscure sophistry that it is no wonder if a sensible reader indulge his ease so far as to turn a deaf ear to the proposal of such a question from which he can expect neither instruction nor entertainment. But the state of the argument here proposed may, perhaps, serve to renew his attention, as it has more novelty, promises at least some decision of the controversy, and will not much disturb his ease by any intricate or obscure reasoning.

I hope, therefore, to make it appear that all men have ever agreed in the doctrine both of necessity and of liberty, according to any reasonable sense which can be put on these terms, and that the whole controversy has up to now turned merely upon words. We shall begin with examining the doctrine of necessity.

It is universally allowed that matter, in all its operations, is actuated by a necessary force and that every natural effect is so precisely determined by the energy of its cause that no other effect, in such particular circumstances, could possibly have resulted from it. The degree and direction of every motion are, by the laws of nature, prescribed with such exactness that a living creature may as soon arise from the shock of two bodies as motion in any other degree or direction than what is actually produced by it. Would we, therefore, form a just and precise idea of *necessity*, we must consider from where that idea arises when we apply it to the operation of bodies.

It seems evident that, if all the scenes of nature were continually shifted in such a manner that no two events bore any resemblance to each other, but every object was entirely new, without any similitude to whatever had been seen before, we should never, in that case, have attained the least idea of necessity or of a connection among these objects. We might say, upon such a supposition, that one object or event has followed another, not that one was produced by the other. The relation of cause and effect must be utterly unknown to mankind. Inference and reasoning concerning the operations of nature would, from that moment, be at an end; and the memory and senses remain the only canals by which the knowledge of any real existence could possibly have access to the mind. Our idea, therefore, of necessity and causation arises entirely from the uniformity observable in the operations of nature, where similar objects are constantly conjoined together and the mind is determined by custom to infer the one from the appearance of the other. These two circumstances form the whole of that necessity which we ascribe to matter. Beyond the constant *conjunction* of similar objects and the consequent *inference* from one to the other, we have no notion of any necessity or connection.

If it appears, therefore, that all mankind have ever allowed, without any doubt or hesitation, that these two circumstances take place in the voluntary actions of men and in the operations of mind, it must follow that all

mankind have ever agreed in the doctrine of necessity and that they have up to now disputed merely for not understanding each other.

As to the first circumstance, the constant and regular conjunction of similar events, we may possibly satisfy ourselves by the following considerations. It is universally acknowledged that there is a great uniformity among the actions of men in all nations and ages and that human nature remains still the same in its principles and operations. The same motives always produce the same actions. The same events follow from the same causes. Ambition, avarice, self-love, vanity, friendship, generosity, public spirit — these passions, mixed in various degrees and distributed through society, have been, from the beginning of the world, and still are the source of all the actions and enterprises which have ever been observed among mankind. Would you know the sentiments, inclinations, and course of life of the Greeks and Romans? Study well the temper and actions of the French and English. You cannot be much mistaken in transferring to the former *most* of the observations which you have made with regard to the latter. Mankind are so much the same, in all times and places, that history informs us of nothing new or strange in this particular. Its chief use is only to discover the constant and universal principles of human nature by showing men in all varieties of circumstances and situations and furnishing us with materials from which we may form our observations and become acquainted with the regular springs of human action and behavior. These records of wars, intrigues, factions, and revolutions are so many collections of experiments by which the politician or moral philosopher fixes the principles of his science, in the same manner as the physician or natural philosopher becomes acquainted with the nature of plants, minerals, and other external objects by the experiments which he forms concerning them. Nor are the earth, water, and other elements examined by Aristotle and Hippocrates²⁴ more like to those which at present lie under our observation than the men described by Polybius²⁵ and Tacitus²⁶ are to those who now govern the world.

Should a traveler, returning from a far country, bring us an account of men, wholly different from any with whom we were ever acquainted, men, who were entirely divested of avarice, ambition, or revenge, who knew no pleasure but friendship, generosity, and public spirit, we should immediately, from these circumstances, detect the falsehood and prove him a liar with the same certainty as if he had stuffed his narration with stories of centaurs and dragons, miracles and prodigies. And if we would explode any forgery in history, we cannot make use of a more convincing argument than to prove that the actions ascribed to any person are directly contrary to the course of nature and that no human motives, in such circumstances, could ever induce him to such a conduct. The veracity of Quintus Curtius²⁷ is as much to be suspected when he describes the supernatural courage of Alexander²⁸ by which he was hurried on singly to attack multitudes, as when he describes his supernatural force and activity by which he was able to resist them. So readily and universally do we acknowledge a uniformity in human motives and actions as well as in the operations of body.

Hence, likewise, the benefit of that experience acquired by long life and a variety of business and company, in order to instruct us in the principles of human nature and regulate our future conduct as well as speculation. By means of this guide we mount up to the knowledge of men's inclinations and motives from their actions, expressions, and even gestures, and again descend to the interpretation of their actions from our knowledge of their motives and inclinations. The general observations, treasured up by a course of experience, give us the clue of human nature and teach us to unravel all its intricacies. Pretexts and appearances no longer deceive us. Public declarations pass for the specious coloring of a cause. And though virtue and honor are allowed their proper weight and authority, that perfect disinterestedness, so often pretended to, is never expected in multitudes and parties, seldom in their leaders, and scarcely even in individuals of any rank or station. But were there no uniformity in human actions and were every experiment which we could form of this kind irregular and anomalous, it would be impossible to collect any general observations concerning mankind and no experience, however accurately digested by reflection, would ever serve to any purpose. Why is the aged husband more skillful in his calling than the young beginner, but because there is a certain uniformity in the operation of the sun, rain, and earth towards the production of vegetables, and experience teaches the old practitioner the rules by which this operation is governed and directed?

We must not, however, expect that this uniformity of human actions should be carried to such a length as that all men, in the same circumstances, will always act precisely in the same manner, without making any allowance for the diversity of characters, prejudices, and opinions. Such a uniformity in every particular is found in no part of nature. On the contrary, from observing the variety of conduct in different men, we are enabled to form a greater variety of maxims which still suppose a degree of uniformity and regularity.

Are the manners of men different in different ages and countries? We learn from this the great force of custom and education which mold the human mind from its infancy and form it into a fixed and established

character. Is the behavior and conduct of the one sex very unlike that of the other? It is from this we become acquainted with the different characters which nature has impressed upon the sexes and which she preserves with constancy and regularity. Are the actions of the same person much diversified in the different periods of his life from infancy to old age? This affords room for many general observations concerning the gradual change of our sentiments and inclinations and the different maxims which prevail in the different ages of human creatures. Even the characters which are peculiar to each individual have a uniformity in their influence; otherwise our acquaintance with the persons and our observation of their conduct could never teach us their dispositions or serve to direct our behavior with regard to them.

I grant it possible to find some actions which seem to have no regular connection with any known motives and are exceptions to all the measures of conduct which have ever been established for the government of men. But if we would willingly know what judgment should be formed of such irregular and extraordinary actions, we may consider the sentiments commonly entertained with regard to those irregular events which appear in the course of nature and the operations of external objects. All causes are not conjoined to their usual effects with like uniformity. An artificer who handles only dead matter may be disappointed of his aim as well as the politician who directs the conduct of sensible and intelligent agents.

The vulgar, who take things according to their first appearance, attribute the uncertainty of events to such an uncertainty in the causes as makes the latter often fail of their usual influence, though they meet with no impediment in their operation. But philosophers, observing that almost in every part of nature there is contained a vast variety of springs and principles which are hid by reason of their minuteness or remoteness, find that it is at least possible the contrariety of events may not proceed from any contingency in the cause but from the secret operation of contrary causes. This possibility is converted into certainty by further observation, when they remark that, upon an exact scrutiny, a contrariety of effects always betrays a contrariety of causes and proceeds from their mutual opposition. A peasant can give no better reason for the stopping of any clock or watch than to say that it does not commonly go right. But an artist easily perceives that the same force in the spring or pendulum always has the same influence on the wheels, but fails of its usual effect, perhaps by reason of a grain of dust which puts a stop to the whole movement. From the observation of several parallel instances, philosophers form a maxim that the connection between all causes and effects is equally necessary and that its seeming uncertainty in some instances proceeds from the secret opposition of contrary causes.

Thus, for instance, in the human body, when the usual symptoms of health or sickness disappoint our expectation, when medicines do not operate with their wonted powers, when irregular events follow from any particular cause, the philosopher and physician are not surprised at the matter, nor are ever tempted to deny, in general, the necessity and uniformity of those principles by which the animal economy is conducted. They know that a human body is a mighty complicated machine, that many secret powers lurk in it which are altogether beyond our comprehension, that to us it must often appear very uncertain in its operations, and that therefore the irregular events which outwardly discover themselves can be no proof that the laws of nature are not observed with the greatest regularity in its internal operations and government.

The philosopher, if he is consistent, must apply the same reasoning to the actions and volitions of intelligent agents. The most irregular and unexpected resolutions of men may frequently be accounted for by those who know every particular circumstance of their character and situation. A person of an obliging disposition gives a peevish answer; but he has a toothache or has not dined. A stupid fellow discovers an uncommon alacrity in his carriage; but he has met with a sudden piece of good fortune. Or even when an action, as sometimes happens, cannot be particularly accounted for either by the person himself or by others, we know, in general, that the characters of men are to a certain degree inconstant and irregular. This is, in a manner, the constant character of human nature, though it is applicable in a more particular manner to some persons who have no fixed rule for their conduct, but proceed in a continued course of caprice and inconstancy. The internal principles and motives may operate in a uniform manner, notwithstanding these seeming irregularities — in the same manner as the winds, rain, clouds, and other variations of the weather are supposed to be governed by steady principles, though not easily discoverable by human sagacity and inquiry.

Thus, it appears not only that the conjunction between motives and voluntary actions is as regular and uniform as that between the cause and effect in any part of nature, but also that this regular conjunction has been universally acknowledged among mankind and has never been the subject of dispute either in philosophy or common life. Now, as it is from past experience that we draw all inferences concerning the future and as we conclude that objects will always be conjoined together which we find to have always been conjoined, it may seem superfluous to prove that this experienced uniformity in human actions is a source from which we draw *inferences* concerning them. But in order to throw the argument into a greater variety of lights, we shall also

insist, though briefly, on this latter topic.

The mutual dependence of men is so great in all societies that scarcely any human action is entirely complete in itself or is performed without some reference to the actions of others, which are requisite to make it answer fully the intention of the agent. The poorest artificer who labors alone expects at least the protection of the magistrate to ensure him the enjoyment of the fruits of his labor. He also expects that, when he carries his goods to market and offers them at a reasonable price, he shall find purchasers and shall be able, by the money he acquires, to engage others to supply him with those commodities which are requisite for his subsistence. In proportion as men extend their dealings and render their intercourse with others more complicated, they always comprehend in their schemes of life a greater variety of voluntary actions which they expect, from the proper motives, to cooperate with their own. In all these conclusions they take their measures from past experience in the same manner as in their reasonings concerning external objects, and firmly believe that men as well as all the elements are to continue in their operations the same that they have ever found them. A manufacturer reckons upon the labor of his servants for the execution of any work as much as upon the tools which he employs and would be equally surprised were his expectations disappointed. In short, this experimental inference and reasoning concerning the actions of others enters so much into human life that no man, while awake, is ever a moment without employing it. Have we not reason, therefore, to affirm that all mankind have always agreed in the doctrine of necessity, according to the foregoing definition and explication of it?

Nor have philosophers ever entertained a different opinion from the people in this particular. For not to mention that almost every action of their life supposes that opinion, there are even few of the speculative parts of learning to which it is not essential. What would become of *history* had we not a dependence on the veracity of the historian, according to the experience which we have had of mankind? How could *politics* be a science, if laws and forms of government had not a uniform influence upon society? Where would be the foundation of *morals*, if particular characters had no certain or determinate power to produce particular sentiments and if these sentiments had no constant operation on actions? And with what pretense could we employ our *criticism* upon any poet or polite author, if we could not pronounce the conduct and sentiments of his actors either natural or unnatural to such characters and in such circumstances? It seems almost impossible, therefore, to engage either in science or action of any kind without acknowledging the doctrine of necessity and this *inference* from motives to voluntary actions, from characters to conduct.

And indeed, when we consider how aptly *natural* and *moral* evidence link together and form only one chain of argument, we shall make no scruple to allow that they are of the same nature and derived from the same principles. A prisoner who has neither money nor interest discovers the impossibility of his escape as well when he considers the obstinacy of the jailer as the walls and bars with which he is surrounded and in all attempts for his freedom chooses to work upon the stone and iron of the one rather than upon the inflexible nature of the other. The same prisoner, when conducted to the scaffold, foresees his death as certainly from the constancy and fidelity of his guards as from the operation of the ax or wheel. His mind runs along a certain train of ideas: the refusal of the soldiers to consent to his escape; the action of the executioner; the separation of the head and body; bleeding, convulsive motions, and death. Here is a connected chain of natural causes and voluntary actions, but the mind feels no difference between them in passing from one link to another, nor is less certain of the future event than if it were connected with the objects present to the memory or senses by a train of causes cemented together by what we are pleased to call a *physical* necessity. The same experienced union has the same effect on the mind, whether the united objects are motives, volition, and actions, or figure and motion. We may change the names of things, but their nature and their operation on the understanding never change.

Were a man whom I know to be honest and opulent and with whom I live in intimate friendship to come into my house where I am surrounded with my servants, I rest assured that he is not to stab me before he leaves it in order to rob me of my silver standish; and I no more suspect this event than the falling of the house itself which is new and solidly built and founded. — *But he may have been seized with a sudden and unknown frenzy.* — So may a sudden earthquake arise, and shake and tumble my house about my ears. I shall therefore change the suppositions. I shall say that I know with certainty that he is not to put his hand into the fire and hold it there until it is consumed. And this event I think I can foretell with the same assurance as that, if he threw himself out at the window and met with no obstruction, he will not remain a moment suspended in the air. No suspicion of an unknown frenzy can give the least possibility to the former event which is so contrary to all the known principles of human nature. A man who at noon leaves his purse full of gold on the pavement at Charing Cross²⁹ may as well expect that it will fly away like a feather as that he will find it untouched an hour after. Over one half of human reasonings contain inferences of a similar nature, attended with more or

less degrees of certainty, proportioned to our experience of the usual conduct of mankind in such particular situations.

I have frequently considered what could possibly be the reason why all mankind, though they have ever, without hesitation, acknowledged the doctrine of necessity in their whole practice and reasoning, have yet discovered such a reluctance to acknowledge it in words and have rather shown a propensity, in all ages, to profess the contrary opinion. The matter, I think, may be accounted for after the following manner. If we examine the operations of body and the production of effects from their causes, we shall find that all our faculties can never carry us further in our knowledge of this relation than barely to observe that particular objects are *constantly conjoined* together and that the mind is carried, by a *customary transition*, from the appearance of one to the belief of the other. But though this conclusion concerning human ignorance is the result of the strictest scrutiny of this subject, men still entertain a strong propensity to believe that they penetrate further into the powers of nature and perceive something like a necessary connection between the cause and the effect. When again they turn their reflections towards the operations of their own minds and *feel* no such connection of the motive and the action, they are apt to suppose from this that there is a difference between the effects which result from material force and those which arise from thought and intelligence. But being once convinced that we know nothing further of causation of any kind than merely the *constant conjunction* of objects and the consequent *inference* of the mind from one to another and finding that these two circumstances are universally allowed to have place in voluntary actions, we may be more easily led to admit the same necessity common to all causes. And though this reasoning may contradict the systems of many philosophers in ascribing necessity to the determinations of the will, we shall find, upon reflection, that they dissent from it in words only, not in their real sentiment. Necessity, according to the sense in which it is here taken, has never yet been rejected, nor can ever, I think, be rejected by any philosopher. It may only, perhaps, be pretended that the mind can perceive in the operations of matter some further connection between the cause and effect and a connection that has no place in the voluntary actions of intelligent beings. Now whether it is so or not can only appear upon examination, and it is incumbent on these philosophers to make good their assertion by defining or describing that necessity and pointing it out to us in the operations of material causes.

It would seem, indeed, that men begin at the wrong end of this question concerning liberty and necessity when they enter upon it by examining the faculties of the soul, the influence of the understanding, and the operations of the will. Let them first discuss a more simple question, namely, the operations of body and of brute unintelligent matter, and try whether they can there form any idea of causation and necessity, except that of a constant conjunction of objects and subsequent inference of the mind from one to another. If these circumstances form, in reality, the whole of that necessity which we conceive in matter and if these circumstances are also universally acknowledged to take place in the operations of the mind, the dispute is at an end — at least must be admitted to be merely verbal thereafter. But as long as we will rashly suppose that we have some further idea of necessity and causation in the operations of external objects, at the same time that we can find nothing further in the voluntary actions of the mind, there is no possibility of bringing the question to any determinate issue while we proceed upon so erroneous a supposition. The only method of undeceiving us is to mount up higher, to examine the narrow extent of science when applied to material causes, and to convince ourselves that all we know of them is the constant conjunction and inference above mentioned. We may, perhaps, find that it is with difficulty we are induced to fix such narrow limits to human understanding. But we can afterwards find no difficulty when we come to apply this doctrine to the actions of the will. For as it is evident that these have a regular conjunction with motives and circumstances and characters and as we always draw inferences from one to the other, we must be obliged to acknowledge in words that necessity which we have already avowed in every deliberation of our lives and in every step of our conduct and behavior.³⁰

But to proceed in this reconciling project with regard to the question of liberty and necessity—the most contentious question of metaphysics, the most contentious science—it will not require many words to prove that all mankind have ever agreed in the doctrine of liberty as well as in that of necessity, and that the whole dispute, in this respect also, has been up to now merely verbal. For what is meant by liberty when applied to voluntary actions? We cannot surely mean that actions have so little connection with motives, inclinations, and circumstances that one does not follow with a certain degree of uniformity from the other and that one affords no inference by which we can conclude the existence of the other. For these are plain and acknowledged matters of fact. By liberty, then, we can only mean *a power of acting or not acting according to the determinations of the will* — that is, if we choose to remain at rest, we may; if we choose to move, we also may. Now this hypothetical liberty is universally allowed to belong to everyone who is not a prisoner and in chains.

Here then is no subject of dispute.

Whatever definition we may give of liberty, we should be careful to observe two requisite circumstances: *first*, that it is consistent with plain matter of fact; *secondly*, that it is consistent with itself. If we observe these circumstances and render our definition intelligible, I am persuaded that all mankind will be found of one opinion with regard to it.

It is universally allowed that nothing exists without a cause of its existence, and that chance, when strictly examined, is a mere negative word and does not mean any real power which has anywhere a being in nature. But it is pretended that some causes are necessary, some not necessary. Here then is the advantage of definitions. Let anyone *define* a cause without comprehending, as a part of the definition, a *necessary connection* with its effect, and let him show distinctly the origin of the idea expressed by the definition, and I shall readily give up the whole controversy. But if the foregoing explication of the matter is received, this must be absolutely impracticable. Had not objects a regular conjunction with each other, we should never have entertained any notion of cause and effect and this regular conjunction produces that inference of the understanding which is the only connection that we can have any comprehension of. Whoever attempts a definition of cause exclusive of these circumstances will be obliged either to employ unintelligible terms or such as are synonymous to the term which he endeavors to define.³¹ And if the definition above mentioned is admitted, liberty, when opposed to necessity, not to constraint, is the same thing with chance, which is universally allowed to have no existence.

Part II.

There is no method of reasoning more common and yet none more blamable than in philosophical disputes to endeavor the refutation of any hypothesis by a pretense of its dangerous consequences to religion and morality. When any opinion leads to absurdities, it is certainly false; but it is not certain that an opinion is false because it is of dangerous consequence. Such topics, therefore, ought entirely to be forborne, as serving nothing to the discovery of truth, but only to make the person of an antagonist odious. This I observe in general, without pretending to draw any advantage from it. I frankly submit to an examination of this kind and shall venture to affirm that the doctrines both of necessity and of liberty, as above explained, are not only consistent with morality, but are absolutely essential to its support.

Necessity may be defined two ways, conformably to the two definitions of cause of which it makes an essential part. It consists either in the constant conjunction of like objects or in the inference of the understanding from one object to another. Now necessity, in both these senses, (which, indeed, are at bottom the same) has universally, though tacitly, in the schools, in the pulpit, and in common life been allowed to belong to the will of man and no one has ever pretended to deny that we can draw inferences concerning human actions and that those inferences are founded on the experienced union of like actions with like motives, inclinations, and circumstances. The only particular in which anyone can differ is that either, perhaps, he will refuse to give the name of necessity to this property of human actions — but as long as the meaning is understood I hope the word can do no harm — or that he will maintain it possible to discover something further in the operations of matter. But this, it must be acknowledged, can be of no consequence to morality or religion, whatever it may be to natural philosophy or metaphysics. We may here be mistaken in asserting that there is no idea of any other necessity or connection in the actions of body. But surely we ascribe nothing to the actions of the mind but what everyone does and must readily allow of. We change no circumstance in the received orthodox system with regard to the will, but only in that with regard to material objects and causes. Nothing, therefore, can be more innocent at least than this doctrine.

All laws being founded on rewards and punishments, it is supposed as a fundamental principle that these motives have a regular and uniform influence on the mind and both produce the good and prevent the evil actions. We may give to this influence what name we please; but, as it is usually conjoined with the action, it must be esteemed a *cause* and be looked upon as an instance of that necessity which we would here establish.

The only proper object of hatred or vengeance is a person or creature endowed with thought and consciousness, and when any criminal or injurious actions excite that passion, it is only by their relation to the person or connection with him. Actions are, by their very nature, temporary and perishing, and where they do not proceed from some cause in the character and disposition of the person who performed them, they can neither redound to his honor if good, nor infamy if evil. The actions themselves may be blamable; they may be contrary to all the rules of morality and religion. But the person is not answerable for them and, as they proceeded from nothing in him that is durable and constant and leave nothing of that nature behind them, it is impossible he can, upon their account, become the object of punishment or vengeance. According to the principle, therefore, which denies necessity and consequently causes that a man is as pure and untainted after having committed the most horrid crime as at the first moment of his birth, nor is his character any way concerned in his actions, since they are not derived from it, and the wickedness of the one can never be used as a proof of the depravity of the other.

Men are not blamed for such actions as they perform ignorantly and casually, whatever may be the consequences. Why? But because the principles of these actions are only momentary and terminate in them alone. Men are less blamed for such actions as they perform hastily and unpremeditatedly than for such as proceed from deliberation. For what reason? But because a hasty temper, though a constant cause or principle in the mind, operates only by intervals and does not infect the whole character. Again, repentance wipes off every crime, if attended with a reformation of life and manners. How is this to be accounted for? But by asserting that actions render a person criminal merely as they are proofs of criminal principles in the mind; and when, by an alteration of these principles, they cease to be just proofs, they likewise cease to be criminal. But, except upon the doctrine of necessity, they never were just proofs and consequently never were criminal.

It will be equally easy to prove, and from the same arguments, that *liberty*, according to that definition above mentioned, in which all men agree, is also essential to morality and that no human actions, where it is wanting, are susceptible of any moral qualities or can be the objects either of approbation or dislike. For as actions are objects of our moral sentiment only so far as they are indications of the internal character, passions, and affections, it is impossible that they can give rise either to praise or blame where they do not proceed from

these principles, but are derived altogether from external violence.

I do not pretend to have obviated or removed all objections to this theory with regard to necessity and liberty. I can foresee other objections derived from topics which have not here been treated of. It may be said, for instance, that if voluntary actions are subjected to the same laws of necessity with the operations of matter, there is a continued chain of necessary causes, preordained and predetermined, reaching from the original cause of all to every single volition of every human creature. No contingency anywhere in the universe, no indifference, no liberty. While we act, we are at the same time acted upon. The ultimate Author of all our volitions is the Creator of the world, who first bestowed motion on this immense machine and placed all beings in that particular position from which every subsequent event, by an inevitable necessity, must result. Human actions, therefore, either can have no moral turpitude at all, as proceeding from so good a cause, or if they have any turpitude, they must involve our Creator in the same guilt, while he is acknowledged to be their ultimate cause and author. For as a man who fired a mine is answerable for all the consequences, whether the train he employed is long or short, so wherever a continued chain of necessary causes is fixed, that Being, either finite or infinite, who produces the first is likewise the author of all the rest and must both bear the blame and acquire the praise which belong to them. Our clear and unalterable ideas of morality establish this rule upon unquestionable reasons when we examine the consequences of any human action and these reasons must still have greater force when applied to the volitions and intentions of a Being infinitely wise and powerful. Ignorance or impotence may be pleaded for so limited a creature as man, but those imperfections have no place in our Creator. He foresaw, he ordained, he intended all those actions of men which we so rashly pronounce criminal. And we must therefore conclude either that they are not criminal or that the Deity, not man, is accountable for them. But as either of these positions is absurd and impious, it follows that the doctrine from which they are deduced cannot possibly be true, as being liable to all the same objections. An absurd consequence, if necessary, proves the original doctrine to be absurd in the same manner as criminal actions render criminal the original cause, if the connection between them is necessary and inevitable.

This objection consists of two parts, which we shall examine separately: *First*, that if human actions can be traced up, by a necessary chain, to the Deity, they can never be criminal, on account of the infinite perfection of that Being from whom they are derived and who can intend nothing but what is altogether good and laudable. Or, *secondly*, if they are criminal, we must retract the attribute of perfection which we ascribe to the Deity and must acknowledge him to be the ultimate author of guilt and moral turpitude in all his creatures.

The answer to the first objection seems obvious and convincing. There are many philosophers who, after an exact scrutiny of all the phenomena of nature, conclude that the whole, considered as one system, is, in every period of its existence, ordered with perfect benevolence, and that the utmost possible happiness will, in the end, result to all created beings without any mixture of positive or absolute ill and misery. Every physical ill, they say, makes an essential part of this benevolent system and could not possibly be removed, even by the Deity himself, considered as a wise agent, without giving entrance to greater ill or excluding greater good which will result from it. From this theory some philosophers, and the ancient *Stoics* among the rest, derived a topic of consolation under all afflictions, while they taught their pupils that those ills under which they labored were in reality goods to the universe and that to an enlarged view which could comprehend the whole system of nature every event became an object of joy and exultation. But though this topic is specious and sublime, it was soon found in practice weak and ineffectual. You would surely more irritate than appease a man lying under the racking pains of gout by preaching up to him the rectitude of those general laws which produced the malignant humors in his body and led them through the proper canals to the sinews and nerves, where they now excite such acute torments. These enlarged views may, for a moment, please the imagination of a speculative man who is placed in ease and security, but neither can they dwell with constancy on his mind, even though undisturbed by the emotions of pain or passion, much less can they maintain their ground when attacked by such powerful antagonists. The affections take a narrower and more natural survey of their object, and, by an economy more suitable to the infirmity of human minds, regard alone the beings around us, and are actuated by such events as appear good or ill to the private system.

The case is the same with *moral* as with *physical* ill. It cannot reasonably be supposed that those remote considerations which are found of so little efficacy with regard to one will have a more powerful influence with regard to the other. The mind of man is so formed by nature that, upon the appearance of certain characters, dispositions, and actions, it immediately feels the sentiment of approbation or blame; nor are there any emotions more essential to its frame and constitution. The characters which engage our approbation are chiefly such as contribute to the peace and security of human society, as the characters which excite blame are chiefly such as tend to public detriment and disturbance. From this it may reasonably be presumed that the moral sentiments arise, either mediately or immediately, from a reflection of these opposite interests. What

though philosophical meditations establish a different opinion or conjecture that everything is right with regard to the whole, and that the qualities which disturb society are, in the main, as beneficial and are as suitable to the primary intention of nature as those which more directly promote its happiness and welfare? Are such remote and uncertain speculations able to counterbalance the sentiments which arise from the natural and immediate view of the objects? A man who is robbed of a considerable sum, does he find his vexation for the loss any way diminished by these sublime reflections? Why then should his moral resentment against the crime be supposed incompatible with them? Or why should not the acknowledgment of a real distinction between vice and virtue be reconcilable to all speculative systems of philosophy, as well as that of a real distinction between personal beauty and deformity? Both these distinctions are founded in the natural sentiments of the human mind. And these sentiments are not to be controlled or altered by any philosophical theory or speculation whatsoever.

The *second* objection does not admit of so easy and satisfactory an answer, nor is it possible to explain distinctly how the Deity can be the mediate cause of all the actions of men without being the author of sin and moral turpitude. These are mysteries which mere natural and unassisted reason is very unfit to handle; and whatever system she embraces, she must find herself involved in inextricable difficulties, and even contradictions, at every step which she takes with regard to such subjects. To reconcile the indifference and contingency of human actions with prescience or to defend absolute decrees and yet free the Deity from being the author of sin has been found up to now to exceed all the power of philosophy. Happy, if she is sensible of her temerity from there, when she pries into these sublime mysteries, and, leaving a scene so full of obscurities and perplexities, returns with suitable modesty to her true and proper province, the examination of common life, where she will find difficulties enough to employ her inquiries without launching into so boundless an ocean of doubt, uncertainty, and contradiction!

SECTION IX

Of the Reason of Animals.

All our reasonings concerning matter of fact are founded on a species of analogy which leads us to expect from any cause the same events which we have observed to result from similar causes. Where the causes are entirely similar, the analogy is perfect and the inference drawn from it is regarded as certain and conclusive. Nor does any man ever entertain a doubt where he sees a piece of iron that it will have weight and cohesion of parts, as in all other instances which have ever fallen under his observation. But where the objects do not have so exact a similarity, the analogy is less perfect and the inference is less conclusive, though still it has some force in proportion to the degree of similarity and resemblance. The anatomical observations formed upon one animal are, by this species of reasoning, extended to all animals; and it is certain that, when the circulation of the blood, for instance, is clearly proved to have place in one creature, as a frog, or fish, it forms a strong presumption that the same principle has place in all. These analogical observations may be carried further, even to this science of which we are now treating, and any theory by which we explain the operations of the understanding or the origin and connection of the passions in man will acquire additional authority, if we find that the same theory is requisite to explain the same phenomena in all other animals. We shall make trial of this with regard to the hypothesis by which we have, in the foregoing discourse, endeavored to account for all experimental reasoning and it is hoped that this new point of view will serve to confirm all our former observations.

First, it seems evident that animals, as well as men, learn many things from experience and infer that the same events will always follow from the same causes. By this principle they become acquainted with the more obvious properties of external objects and gradually, from their birth, treasure up a knowledge of the nature of fire, water, earth, stones, heights, depths, etc., and of the effects which result from their operation. The ignorance and inexperience of the young are here plainly distinguishable from the cunning and sagacity of the old, who have learned, by long observation, to avoid what hurt them and to pursue what gave ease or pleasure. A horse that has been accustomed to the field becomes acquainted with the proper height which he can leap, and will never attempt what exceeds his force and ability. An old greyhound will trust the more fatiguing part of the chase to the younger and will place himself so as to meet the hare in her doubles; nor are the conjectures which he forms on this occasion founded in anything but his observation and experience.

This is still more evident from the effects of discipline and education on animals who, by the proper application of rewards and punishments, may be taught any course of action the most contrary to their natural instincts and propensities. Is it not experience which renders a dog apprehensive of pain when you menace him or lift up the whip to beat him? Is it not even experience which makes him answer to his name and infer, from such an arbitrary sound, that you mean him rather than any of his fellows and intend to call him when you pronounce it in a certain manner and with a certain tone and accent?

In all these cases we may observe that the animal infers some fact beyond what immediately strikes his senses and that this inference is altogether founded on past experience, while the creature expects from the present object the same consequences which it has always found in its observation to result from similar objects.

Secondly, it is impossible that this inference of the animal can be founded on any process of argument or reasoning by which he concludes that like events must follow like objects and that the course of nature will always be regular in its operations. For if there are in reality any arguments of this nature, they surely lie too abstruse for the observation of such imperfect understandings, since it may well employ the utmost care and attention of a philosophic genius to discover and observe them. Animals, therefore, are not guided in these inferences by reasoning. Neither are children. Neither are the generality of mankind in their ordinary actions and conclusions. Neither are philosophers themselves, who, in all the active parts of life, are in the main the same with the vulgar and are governed by the same maxims. Nature must have provided some other principle, of more ready and more general use and application; nor can an operation of such immense consequence in life as that of inferring effects from causes be trusted to the uncertain process of reasoning and argumentation. Were this doubtful with regard to men, it seems to admit of no question with regard to the brute creation; and the conclusion being once firmly established in the one, we have a strong presumption, from all the rules of analogy, that it ought to be universally admitted without any exception or reserve. It is custom alone which engages animals from every object that strikes their senses to infer its usual attendant and carries their imagination from the appearance of the one to conceive the other in that particular manner which we

denominate *belief*. No other explication can be given of this operation, in all the higher as well as lower classes of sensitive beings which fall under our notice and observation.³²

But though animals learn many parts of their knowledge from observation, there are also many parts of it which they derive from the original hand of nature, which much exceed the share of capacity they possess on ordinary occasions and in which they improve little or nothing by the longest practice and experience. These we denominate instincts and are so apt to admire as something very extraordinary and inexplicable by all the disquisitions of human understanding. But our wonder will perhaps cease or diminish when we consider that the experimental reasoning itself which we possess in common with beasts and on which the whole conduct of life depends is nothing but a species of instinct or mechanical power that acts in us unknown to ourselves and in its chief operations is not directed by any such relations or comparisons of ideas as are the proper objects of our intellectual faculties. Though the instinct is different, yet still it is an instinct which teaches a man to avoid the fire, as much as that which teaches a bird, with such exactness, the art of incubation and the whole economy and order of its nursery.

SECTION X
Of Miracles.

Part I.

There is, in Dr. Tillotson's writings,³³ an argument against the *real presence*³⁴ which is as concise and elegant and strong as any argument can possibly be supposed against a doctrine so little worthy of a serious refutation. It is acknowledged on all hands, says that learned prelate, that the authority either of the Scripture or of tradition is founded merely in the testimony of the Apostles who were eyewitnesses to those miracles of our Savior by which he proved his divine mission. Our evidence, then, for the truth of the *Christian* religion is less than the evidence for the truth of our senses, because even in the first authors of our religion it was no greater; and it is evident it must diminish in passing from them to their disciples, nor can anyone rest such confidence in their testimony as in the immediate object of his senses. But a weaker evidence can never destroy a stronger; and, therefore, were the doctrine of the real presence ever so clearly revealed in scripture, it would be directly contrary to the rules of just reasoning to give our assent to it. It contradicts sense, though both the Scripture and tradition, on which it is supposed to be built, do not carry such evidence with them as sense, when they are considered merely as external evidences and are not brought home to everyone's breast by the immediate operation of the Holy Spirit.

Nothing is so convenient as a decisive argument of this kind, which must at least *silence* the most arrogant bigotry and superstition and free us from their impertinent solicitations. I flatter myself that I have discovered an argument of a like nature which, if just, will, with the wise and learned, be an everlasting check to all kinds of superstitious delusion and consequently will be useful as long as the world endures. For so long, I presume, will the accounts of miracles and prodigies be found in all history, sacred and profane.

Though experience is our only guide in reasoning concerning matters of fact, it must be acknowledged that this guide is not altogether infallible, but in some cases is apt to lead us into errors. One who in our climate should expect better weather in any week of June than in one of December would reason justly and conformably to experience, but it is certain that he may happen, in the event, to find himself mistaken. However, we may observe that in such a case he would have no cause to complain of experience, because it commonly informs us beforehand of the uncertainty by that contrariety of events which we may learn from a diligent observation. All effects do not follow with like certainty from their supposed causes. Some events are found, in all countries and all ages, to have been constantly conjoined together. Others are found to have been more variable and sometimes to disappoint our expectations, so that in our reasonings concerning matter of fact there are all imaginable degrees of assurance from the highest certainty to the lowest species of moral evidence.

A wise man, therefore, proportions his belief to the evidence. In such conclusions as are founded on an infallible experience, he expects the event with the last degree of assurance and regards his past experience as a full *proof* of the future existence of that event. In other cases he proceeds with more caution. He weighs the opposite experiments. He considers which side is supported by the greater number of experiments — to that side he inclines with doubt and hesitation; and when at last he fixes his judgment, the evidence does not exceed what we properly call *probability*. All probability, then, supposes an opposition of experiments and observations where the one side is found to overbalance the other and to produce a degree of evidence proportioned to the superiority. A hundred instances or experiments on one side and fifty on another afford a doubtful expectation of any event, though a hundred uniform experiments with only one that is contradictory reasonably beget a pretty strong degree of assurance. In all cases we must balance the opposite experiments where they are opposite and deduct the smaller number from the greater in order to know the exact force of the superior evidence.

To apply these principles to a particular instance, we may observe that there is no species of reasoning more common, more useful, and even necessary to human life than that which is derived from the testimony of men and the reports of eyewitnesses and spectators. This species of reasoning, perhaps, one may deny to be founded on the relation of cause and effect. I shall not dispute about a word. It will be sufficient to observe that our assurance in any argument of this kind is derived from no other principle than our observation of the veracity of human testimony and of the usual conformity of facts to the reports of witnesses. It being a general maxim that no objects have any discoverable connection together and that all the inferences which we can draw from one to another are founded merely on our experience of their constant and regular conjunction, it is evident that we ought not make an exception to this maxim in favor of human testimony whose connection with any event seems in itself as little necessary as any other. Were not the memory tenacious to a certain degree, had not men commonly an inclination to truth and a principle of probity, were they not sensible to shame when detected in a falsehood, were not these, I say, discovered by *experience* to be qualities inherent in

human nature, we should never repose the least confidence in human testimony. A man delirious or noted for falsehood and villainy has no manner of authority with us.

And as the evidence derived from witnesses and human testimony is founded on past experience, so it varies with the experience and is regarded either as a *proof* or a *probability*, according as the conjunction between any particular kind of report and any kind of object has been found to be constant or variable. There are a number of circumstances to be taken into consideration in all judgments of this kind; and the ultimate standard by which we determine all disputes that may arise concerning them is always derived from experience and observation. Where this experience is not entirely uniform on any side, it is attended with an unavoidable contrariety in our judgments and with the same opposition and mutual destruction of argument as in every other kind of evidence. We frequently hesitate concerning the reports of others. We balance the opposite circumstances which cause any doubt or uncertainty; and when we discover a superiority on any side, we incline to it, but still with a diminution of assurance in proportion to the force of its antagonist.

This contrariety of evidence, in the present case, may be derived from several different causes: from the opposition of contrary testimony, from the character or number of the witnesses, from the manner of their delivering their testimony, or from the union of all these circumstances. We entertain a suspicion concerning any matter of fact when the witnesses contradict each other, when they are but few or of a doubtful character, when they have an interest in what they affirm, when they deliver their testimony with hesitation or, on the contrary, with too violent affirmations. There are many other particulars of the same kind which may diminish or destroy the force of any argument derived from human testimony.

Suppose, for instance, that the fact which the testimony endeavors to establish partakes of the extraordinary and the marvelous — in that case, the evidence resulting from the testimony admits of a diminution, greater or less in proportion as the fact is more or less unusual. The reason why we place any credit in witnesses and historians is not derived from any *connection* which we perceive *a priori* between testimony and reality, but because we are accustomed to find a conformity between them. But when the fact attested is such a one as has seldom fallen under our observation, here is a contest of two opposite experiences, of which the one destroys the other as far as its force goes and the superior can only operate on the mind by the force which remains. The very same principle of experience which gives us a certain degree of assurance in the testimony of witnesses gives us also, in this case, another degree of assurance against the fact which they endeavor to establish— from which contradiction there necessarily arises a counterpoise and mutual destruction of belief and authority.

*I should not believe such a story were it told me by Cato*³⁵ was a proverbial saying in Rome, even during the lifetime of that philosophical patriot.³⁶ The incredibility of a fact, it was allowed, might invalidate so great an authority.

The Indian prince³⁷ who refused to believe the first relations concerning the effects of frost reasoned justly, and it naturally required very strong testimony to engage his assent to facts that arose from a state of nature with which he was unacquainted and which bore so little analogy to those events of which he had had constant and uniform experience. Though they were not contrary to his experience, they were not conformable to it.³⁸

But in order to increase the probability against the testimony of witnesses, let us suppose that the fact which they affirm, instead of being only marvelous, is really miraculous, and suppose also that the testimony, considered apart and in itself, amounts to an entire proof— in that case, there is proof against proof, of which the strongest must prevail, but still with a diminution of its force in proportion to that of its antagonist.

A miracle is a violation of the laws of nature; and as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as entire as any argument from experience can possibly be imagined. Why is it more than probable that all men must die, that lead cannot of itself remain suspended in the air, that fire consumes wood and is extinguished by water, unless it is that these events are found agreeable to the laws of nature and there is required a violation of these laws or, in other words, a miracle to prevent them? Nothing is esteemed a miracle if it ever happen in the common course of nature. It is no miracle that a man, seemingly in good health, should die all of a sudden, because such a kind of death, though more unusual than any other, has yet been frequently observed to happen. But it is a miracle that a dead man should come to life, because that has never been observed in any age or country. There must, therefore, be a uniform experience against every miraculous event; otherwise the event would not merit that appellation. And as a uniform experience amounts to a proof, there is here a direct and full *proof*, from the nature of the fact, against the existence of any miracle, nor can such a proof be destroyed or the miracle

rendered credible but by an opposite proof which is superior.³⁹

The plain consequence is (and it is a general maxim worthy of our attention): that no testimony is sufficient to establish a miracle, unless the testimony is of such a kind that its falsehood would be more miraculous than the fact which it endeavors to establish; and even in that case there is a mutual destruction of arguments and the superior only gives us an assurance suitable to that degree of force which remains after deducting the inferior. When anyone tells me that he saw a dead man restored to life, I immediately consider with myself whether it is more probable that this person should either deceive or be deceived or that the fact which he relates should really have happened. I weigh the one miracle against the other and, according to the superiority which I discover, I pronounce my decision and always reject the greater miracle. If the falsehood of his testimony would be more miraculous than the event which he relates, then, and not until then, can he pretend to command my belief or opinion.

Part II.

In the foregoing reasoning we have supposed that the testimony upon which a miracle is founded may possibly amount to an entire proof and that the falsehood of that testimony would be a real prodigy. But it is easy to show that we have been a great deal too liberal in our concession and that there never was a miraculous event established on so full an evidence.

For *first*, there is not to be found, in all history, any miracle attested by a sufficient number of men of such unquestioned good sense, education, and learning, as to secure us against all delusion in themselves; of such undoubted integrity as to place them beyond all suspicion of any design to deceive others; of such credit and reputation in the eyes of mankind as to have a great deal to lose in case of their being detected in any falsehood, and at the same time attesting facts performed in such a public manner and in so celebrated a part of the world as to render the detection unavoidable — all which circumstances are requisite to give us a full assurance in the testimony of men.

Secondly, we may observe in human nature a principle which, if strictly examined, will be found to diminish extremely the assurance which we might, from human testimony, have in any kind of prodigy. The maxim by which we commonly conduct ourselves in our reasonings is that the objects of which we have no experience resemble those of which we have; that what we have found to be most usual is always most probable; and that where there is an opposition of arguments, we ought to give the preference to such as are founded on the greatest number of past observations. But though, in proceeding by this rule, we readily reject any fact which is unusual and incredible in an ordinary degree, yet in advancing further, the mind does not observe always the same rule; but when anything is affirmed utterly absurd and miraculous, it rather the more readily admits of such a fact upon account of that very circumstance which ought to destroy all its authority. The passion of *surprise* and *wonder*, arising from miracles, being an agreeable emotion, gives a sensible tendency towards the belief of those events from which it is derived. And this goes so far that even those who cannot enjoy this pleasure immediately, nor can believe those miraculous events of which they are informed, yet love to partake of the satisfaction at secondhand or by rebound, and place a pride and delight in exciting the admiration of others.

With what greediness are the miraculous accounts of travelers received, their descriptions of sea and land monsters, their relations of wonderful adventures, strange men, and uncouth manners? But if the spirit of religion joins itself to the love of wonder, there is an end of common sense and human testimony in these circumstances loses all pretensions to authority. A religionist may be an enthusiast and imagine he sees what has no reality. He may know his narrative to be false and yet persevere in it with the best intentions in the world, for the sake of promoting so holy a cause. Or even where this delusion does not have place, vanity, excited by so strong a temptation, operates on him more powerfully than on the rest of mankind in any other circumstances, and self-interest with equal force. His auditors may not have and commonly do not have sufficient judgment to canvass his evidence. What judgment they have, they renounce by principle in these sublime and mysterious subjects. Or if they were ever so willing to employ it, passion and a heated imagination disturb the regularity of its operations. Their credulity increases his impudence and his impudence overpowers their credulity.

Eloquence, when at its highest pitch, leaves little room for reason or reflection, but, addressing itself entirely to the fancy or the affections, captivates the willing hearers and subdues their understanding. Happily, this pitch it seldom attains. But what a Tully⁴⁰ or a Demosthenes⁴¹ could scarcely effect over a Roman or Athenian audience, every Capuchin,⁴² every itinerant or stationary teacher can perform over the generality of mankind, and in a higher degree by touching such gross and vulgar passions.

The many instances of forged miracles and prophecies and supernatural events, which, in all ages, have either been detected by contrary evidence or which detect themselves by their absurdity, prove sufficiently the strong propensity of mankind to the extraordinary and the marvelous and ought reasonably to beget a suspicion against all relations of this kind. This is our natural way of thinking, even with regard to the most common and most credible events. For instance, there is no kind of report which rises so easily and spreads so quickly, especially in country places and provincial towns, as those concerning marriages, inasmuch that two young persons of equal condition never see each other twice, but the whole neighborhood immediately join them together. The pleasure of telling a piece of news so interesting, of propagating it, and of being the first reporters of it spreads the intelligence. And this is so well known that no man of sense gives attention to these reports until he finds them confirmed by some greater evidence. Do not the same passions, and others still stronger, incline the generality of mankind to believe and report with the greatest vehemence and assurance all

religious miracles?

Thirdly, it forms a strong presumption against all supernatural and miraculous relations that they are observed chiefly to abound among ignorant and barbarous nations; or if a civilized people has ever given admission to any of them that people will be found to have received them from ignorant and barbarous ancestors, who transmitted them with that inviolable sanction and authority which always attend received opinions. When we peruse the first histories of all nations, we are apt to imagine ourselves transported into some new world where the whole frame of nature is disjointed and every element performs its operations in a different manner from what it does at present. Battles, revolutions, pestilence, famine, and death are never the effect of those natural causes which we experience. Prodigies, omens, oracles, judgments quite obscure the few natural events that are intermingled with them. But as the former grow thinner every page, in proportion as we advance nearer the enlightened ages, we soon learn that there is nothing mysterious or supernatural in the case, but that all proceeds from the usual propensity of mankind towards the marvelous, and that, though this inclination may at intervals receive a check from sense and learning, it can never be thoroughly extirpated from human nature.

It is strange, a judicious reader is apt to say, upon the perusal of these wonderful historians, that *such prodigious events never happen in our days*. But it is nothing strange, I hope, that men should lie in all ages. You must surely have seen instances enough of that frailty. You have yourself heard many such marvelous relations started which, being treated with scorn by all the wise and judicious, have at last been abandoned even by the vulgar. Be assured that those renowned lies which have spread and flourished to such a monstrous height arose from like beginnings, but being sown in a more proper soil, shot up at last into prodigies almost equal to those which they relate.

It was a wise policy in that false prophet Alexander, who, though now forgotten, was once so famous, to lay the first scene of his impostures in Paphlagonia, where, as Lucian tells us,⁴³ the people were extremely ignorant and stupid and ready to swallow even the grossest delusion. People at a distance, who are weak enough to think the matter at all worth inquiry, have no opportunity of receiving better information. The stories come magnified to them by a hundred circumstances. Fools are industrious in propagating the imposture, while the wise and learned are contented, in general, to deride its absurdity, without informing themselves of the particular facts by which it may be distinctly refuted. And thus the impostor above mentioned was enabled to proceed from his ignorant Paphlagonians to the enlisting of votaries, even among the Greek philosophers and men of the most eminent rank and distinction in Rome — No, could engage the attention of that sage emperor Marcus Aurelius⁴⁴ so far as to make him trust the success of a military expedition to his delusive prophecies.

The advantages are so great of starting an imposture among an ignorant people that, even though the delusion should be too gross to impose on the generality of them (*which, though seldom, is sometimes the case*), it has a much better chance for succeeding in remote countries than if the first scene had been laid in a city renowned for arts and knowledge. The most ignorant and barbarous of these barbarians carry the report abroad. None of their countrymen have a large correspondence or sufficient credit and authority to contradict and beat down the delusion. Men's inclination to the marvelous has full opportunity to display itself. And thus a story which is universally exploded in the place where it was first started shall pass for certain at a thousand miles distance. But had Alexander fixed his residence at Athens, the philosophers of that renowned mart of learning had immediately spread throughout the whole Roman empire their sense of the matter, which, being supported by so great authority and displayed by all the force of reason and eloquence, had entirely opened the eyes of mankind. It is true, Lucian, passing by chance through, had an opportunity of performing this good office. But, though much to be wished, it does not always happen that every Alexander meets with a Lucian, ready to expose and detect his impostures.

I may add, as a *fourth* reason which diminishes the authority of prodigies, that there is no testimony for any, even those which have not been expressly detected, that is not opposed by an infinite number of witnesses, so that not only the miracle destroys the credit of testimony, but the testimony destroys itself. To make this the better understood, let us consider that in matters of religion whatever is different is contrary and that it is impossible the religions of ancient Rome, of Turkey, of Siam, and of China should all of them be established on any solid foundation. Every miracle, therefore, pretended to have been wrought in any of these religions (and all of them abound in miracles), as its direct scope is to establish the particular system to which it is attributed, so it has the same force, though more indirectly, to overthrow every other system. In destroying a rival system, it likewise destroys the credit of those miracles on which that system was established, so that all the prodigies of different religions are to be regarded as contrary facts and the evidences of these prodigies, whether weak or strong, as opposite to each other. According to this method of reasoning,

when we believe any miracle of Mahomet or his successors, we have for our warrant the testimony of a few barbarous Arabians. And, on the other hand, we are to regard the authority of Titus Livius,⁴⁵ Plutarch, Tacitus, and, in short, of all the authors and witnesses, Greek, Chinese, and Roman Catholic, who have related any miracle in their particular religion — I say, we are to regard their testimony in the same light as if they had mentioned that Mahometan miracle and had in express terms contradicted it with the same certainty as they have for the miracle they relate. This argument may appear over subtle and refined, but is not in reality different from the reasoning of a judge who supposes that the credit of two witnesses maintaining a crime against anyone is destroyed by the testimony of two others who affirm him to have been two hundred leagues distant at the same instant when the crime is said to have been committed.

One of the best attested miracles in all profane history is that which Tacitus⁴⁶ reports of Vespasian,⁴⁷ who cured a blind man in Alexandria by means of his spittle and a lame man by the mere touch of his foot, in obedience to a vision of the god Serapis, who had enjoined them to have recourse to the Emperor for these miraculous cures. The story may be seen in that fine historian,⁴⁸ where every circumstance seems to add weight to the testimony, and might be displayed at large with all the force of argument and eloquence, if anyone were now concerned to enforce the evidence of that exploded and idolatrous superstition: the gravity, solidity, age, and probity of so great an emperor, who, through the whole course of his life, conversed in a familiar manner with his friends and courtiers and never affected those extraordinary airs of divinity assumed by Alexander and Demetrius;⁴⁹ the historian, a contemporary writer noted for candor and veracity, and in addition the greatest and most penetrating genius perhaps of all antiquity, and so free from any tendency to credulity that he even lies under the contrary imputation of atheism and profaneness; the persons from whose authority he related the miracle of established character for judgment and veracity, as we may well presume; eyewitnesses of the fact, and confirming their testimony after the Flavian family was despoiled of the empire and could no longer give any reward as the price of a lie. *Utrumque, qui interfuere, nunc quoque memorant, postquam nullum mendacio pretium.*⁵⁰ To which, if we add the public nature of the facts, as related, it will appear that no evidence can well be supposed stronger for so gross and so palpable a falsehood.

There is also a memorable story related by Cardinal de Retz,⁵¹ which may well deserve our consideration. When that intriguing politician fled into Spain to avoid the persecution of his enemies, he passed through Saragossa, the capital of Arragon, where he was shown, in the cathedral, a man who had served seven years as a doorkeeper and was well known to everybody in town who had ever paid his devotions at that church. He had been seen for so long a time wanting a leg, but recovered that limb by the rubbing of holy oil upon the stump; and when the Cardinal examined it, he found it to be a true natural leg like the other. This miracle was vouched by all the canons of the church; and the whole company in town were appealed to for a confirmation of the fact, whom the cardinal found, by their zealous devotion, to be thorough believers of the miracle. Here the relater was also contemporary to the supposed prodigy, of an incredulous and libertine character, as well as of great genius; the miracle of so *singular* a nature as could scarcely admit of a counterfeit, and the witnesses very numerous, and all of them, in a manner, spectators of the fact to which they gave their testimony. And what adds mightily to the force of the evidence and may double our surprise on this occasion is that the Cardinal himself, who relates the story, does not seem to give any credit to it and, consequently, cannot be suspected of any concurrence in the holy fraud. He considered justly that it was not requisite, in order to reject a fact of this nature, to be able accurately to disprove the testimony and to trace its falsehood through all the circumstances of knavery and credulity which produced it. He knew that, as this was commonly altogether impossible at any small distance of time and place, so was it extremely difficult, even where one was immediately present, by reason of the bigotry, ignorance, cunning, and roguery of a great part of mankind. He therefore concluded, like a just reasoner, that such an evidence carried falsehood upon the very face of it and that a miracle supported by any human testimony was more properly a subject of derision than of argument.

There surely never was a greater number of miracles ascribed to one person than those which were lately said to have been wrought in France upon the tomb of Abbe Paris, the famous Jansenist,⁵² with whose sanctity the people were so long deluded. The curing of the sick, giving hearing to the deaf and sight to the blind, were everywhere talked of as the usual effects of that holy sepulcher. But what is more extraordinary, many of the miracles were immediately proved upon the spot, before judges of unquestioned integrity, attested by witnesses of credit and distinction, in a learned age, and on the most eminent theater that is now in the world. Nor is this all: A relation of them was published and dispersed everywhere, nor were the *Jesuits*, though a learned body supported by the civil magistrate and determined enemies to those opinions in whose favor the miracles were said to have been wrought, ever able distinctly to refute or detect them. Where shall we find such a number of circumstances agreeing to the corroboration of one fact? And what have we to oppose to

such a cloud of witnesses but the absolute impossibility or miraculous nature of the events which they relate? And this, surely, in the eyes of all reasonable people, will alone be regarded as a sufficient refutation.

Is the consequence just, because some human testimony has the utmost force and authority in some cases, when it relates the battle of Philippi⁵³ or Pharsalia,⁵⁴ for instance, that therefore all kinds of testimony must in all cases have equal force and authority? Suppose that the Caesarean and Pompeian factions had, each of them, claimed the victory in these battles, and that the historians of each party had uniformly ascribed the advantage to their own side, how could mankind, at this distance, have been able to determine between them? The contrariety is equally strong between the miracles related by Herodotus⁵⁵ or Plutarch and those delivered by Mariana,⁵⁶ Bede,⁵⁷ or any monkish historian.

The wise lend a very academic faith to every report which favors the passion of the reporter, whether it magnifies his country, his family, or himself, or in any other way strikes in with his natural inclinations and propensities. But what greater temptation than to appear a missionary, a prophet, an ambassador from heaven? Who would not encounter many dangers and difficulties in order to attain so sublime a character? Or if, by the help of vanity and a heated imagination, a man has first made a convert of himself and entered seriously into the delusion, who ever scruples to make use of pious frauds in support of so holy and meritorious a cause?

The smallest spark may here kindle into the greatest flame, because the materials are always prepared for it. The *avidum genus auricularum*,⁵⁸ the gazing populace, receive greedily, without examination, whatever soothes superstition and promotes wonder.

How many stories of this nature have, in all ages, been detected and exploded in their infancy? How many more have been celebrated for a time and have afterwards sunk into neglect and oblivion? Where such reports, therefore, fly about, the solution of the phenomenon is obvious and we judge in conformity to regular experience and observation when we account for it by the known and natural principles of credulity and delusion. And shall we, rather than have a recourse to so natural a solution, allow of a miraculous violation of the most established laws of nature?

I need not mention the difficulty of detecting a falsehood in any private or even public history at the place where it is said to happen, much more when the scene is removed to ever so small a distance. Even a court of judicature, with all the authority, accuracy, and judgment, which they can employ, find themselves often at a loss to distinguish between truth and falsehood in the most recent actions. But the matter never comes to any issue, if trusted to the common method of altercation and debate and flying rumors, especially when men's passions have taken part on either side.

In the infancy of new religions, the wise and learned commonly esteem the matter too inconsiderable to deserve their attention or regard. And when afterwards they would willingly detect the cheat in order to undeceive the deluded multitude, the season is now past and the records and witnesses which might clear up the matter have perished beyond recovery.

No means of detection remain but those which must be drawn from the very testimony itself of the reporters. And these, though always sufficient with the judicious and knowing, are commonly too fine to fall under the comprehension of the vulgar.

Upon the whole, then, it appears that no testimony for any kind of miracle has ever amounted to a probability, much less to a proof; and that, even supposing it amounted to a proof, it would be opposed by another proof derived from the very nature of the fact which it would endeavor to establish. It is experience only which gives authority to human testimony and it is the same experience which assures us of the laws of nature. When, therefore, these two kinds of experience are contrary, we have nothing to do but subtract the one from the other and embrace an opinion either on one side or the other with that assurance which arises from the remainder. But according to the principle here explained, this subtraction with regard to all popular religions amounts to an entire annihilation and, therefore, we may establish it as a maxim that no human testimony can have such force as to prove a miracle and make it a just foundation for any such system of religion.

I beg the limitations here made may be remarked, when I say that a miracle can never be proved so as to be the foundation of a system of religion. For I admit that otherwise there may possibly be miracles or violations of the usual course of nature of such a kind as to admit of proof from human testimony; though perhaps it will be impossible to find any such in all the records of history. Thus, suppose all authors, in all languages, agree that from the first of January 1600 there was a total darkness over the whole earth for eight days; suppose that the tradition of this extraordinary event is still strong and lively among the people — that all travelers who

return from foreign countries bring us accounts of the same tradition without the least variation or contradiction—it is evident that our present philosophers, instead of doubting the fact, ought to receive it as certain and ought to search for the causes from which it might be derived. The decay, corruption, and dissolution of nature is an event rendered probable by so many analogies that any phenomenon which seems to have a tendency towards that catastrophe comes within the reach of human testimony, if that testimony is very extensive and uniform.

But suppose that all the historians who treat of England should agree that on the first of January 1600, Queen Elizabeth died; that both before and after her death she was seen by her physicians and the whole court, as is usual with persons of her rank; that her successor was acknowledged and proclaimed by the parliament; and that, after being interred a month, she again appeared, resumed the throne, and governed England for three years—I must confess that I should be surprised at the concurrence of so many odd circumstances, but should not have the least inclination to believe so miraculous an event. I should not doubt of her pretended death and of those other public circumstances that followed it; I should only assert it to have been pretended, and that it neither was nor possibly could be real. You would in vain object to me the difficulty and almost impossibility of deceiving the world in an affair of such consequence; the wisdom and solid judgment of that renowned queen, with the little or no advantage which she could reap from so poor an artifice — all this might astonish me, but I would still reply that the knavery and folly of men are such common phenomena that I should rather believe the most extraordinary events to arise from their concurrence than admit of so signal a violation of the laws of nature.

But should this miracle be ascribed to any new system of religion, men in all ages have been so much imposed on by ridiculous stories of that kind that this very circumstance would be a full proof of a cheat and sufficient, with all men of sense, not only to make them reject the fact, but even reject it without further examination. Though the Being to whom the miracle is ascribed is in this case Almighty, it does not, upon that account, become a whit more probable, since it is impossible for us to know the attributes or actions of such a Being otherwise than from the experience which we have of his productions in the usual course of nature. This still reduces us to past observation and obliges us to compare the instances of the violation of truth in the testimony of men with those of the violation of the laws of nature by miracles, in order to judge which of them is most likely and probable. As the violations of truth are more common in the testimony concerning religious miracles than in that concerning any other matter of fact, this must diminish very much the authority of the former testimony and make us form a general resolution, never to lend any attention to it, with whatever specious pretense it may be covered.

Lord Bacon seems to have embraced the same principles of reasoning. “We ought,” says he, “make a collection or particular history of all monsters and prodigious births or productions and, in a word, of everything new, rare, and extraordinary in nature. But this must be done with the most severe scrutiny, lest we depart from truth. Above all, every relation must be considered as suspicious which depends in any degree upon religion, as the prodigies of Livy. And no less so, everything that is to be found in the writers of natural magic or alchemy or such authors who seem, all of them, to have an unconquerable appetite for falsehood and fable.”⁵⁹

I am the better pleased with the method of reasoning here delivered, as I think it may serve to confound those dangerous friends or disguised enemies to the *Christian Religion* who have undertaken to defend it by the principles of human reason. Our most holy religion is founded on Faith, not on reason; and it is a sure method of exposing it to put it to such a trial as it is by no means fitted to endure. To make this more evident, let us examine those miracles related in Scripture and, not to lose ourselves in too wide a field, let us confine ourselves to such as we find in the *Pentateuch*,⁶⁰ which we shall examine according to the principles of these pretended Christians, not as the word or testimony of God himself, but as the production of a mere human writer and historian. Here then we are first to consider a book presented to us by a barbarous and ignorant people, written in an age when they were still more barbarous, and in all probability long after the facts which it relates, corroborated by no concurring testimony, and resembling those fabulous accounts which every nation gives of its origin. Upon reading this book we find it full of prodigies and miracles. It gives an account of a state of the world and of human nature entirely different from the present: of our fall from that state; of the age of man extended to near a thousand years; of the destruction of the world by a deluge; of the arbitrary choice of one people as the favorites of heaven, and that people the countrymen of the author; of their deliverance from bondage by prodigies the most astonishing imaginable: I desire anyone to lay his hand upon his heart and, after a serious consideration, declare whether he thinks that the falsehood of such a book, supported by such a testimony, would be more extraordinary and miraculous than all the miracles it relates — which is, however, necessary to make it be received according to the measures of probability above established.

What we have said of miracles may be applied without any variation to prophecies; and, indeed, all prophecies are real miracles and as such only can be admitted as proofs of any revelation. If it did not exceed the capacity of human nature to foretell future events, it would be absurd to employ any prophecy as an argument for a divine mission or authority from heaven. So that, upon the whole, we may conclude that the Christian religion not only was at first attended with miracles, but even at this day cannot be believed by any reasonable person without one. Mere reason is insufficient to convince us of its veracity. And whoever is moved by faith to assent to it is conscious of a continued miracle in his own person which subverts all the principles of his understanding and gives him a determination to believe what is most contrary to custom and experience.

SECTION XI

Of a Particular Providence and of a Future State.

I was lately engaged in conversation with a friend who loves skeptical paradoxes, where, though he advanced many principles of which I can by no means approve, yet as they seem to be curious and to bear some relation to the chain of reasoning carried on throughout this inquiry, I shall here copy them from my memory as accurately as I can in order to submit them to the judgment of the reader.

Our conversation began with my admiring the singular good fortune of philosophy, which, as it requires entire liberty above all other privileges and chiefly flourishes from the free opposition of sentiments and argumentation, received its first birth in an age and country of freedom and toleration, and was never cramped, even in its most extravagant principles, by any creeds, confessions, or penal statutes. For, except the banishment of Protagoras⁶¹ and the death of Socrates, which last event proceeded partly from other motives, there are scarcely any instances to be met with, in ancient history, of this bigoted jealousy with which the present age is so much infested. Epicurus lived at Athens to an advanced age in peace and tranquillity. Epicureans⁶² were even admitted to receive the sacerdotal character and to officiate at the altar in the most sacred rites of the established religion. And the public encouragement⁶³ of pensions and salaries was afforded equally by the wisest of all the Roman emperors⁶⁴ to the professors of every sect of philosophy. How requisite such kind of treatment was to philosophy, in her early youth, will easily be conceived, if we reflect that even at present, when she may be supposed more hardy and robust, she bears with much difficulty the inclemency of the seasons and those harsh winds of calumny and persecution which blow upon her.

You admire, says my friend, as the singular good fortune of philosophy what seems to result from the natural course of things and to be unavoidable in every age and nation. This pertinacious bigotry, of which you complain as so fatal to philosophy, is really her off spring who, after allying with superstition, separates himself entirely from the interest of his parent and becomes her most inveterate enemy and persecutor. Speculative dogmas of religion, the present occasions of such furious dispute, could not possibly be conceived or admitted in the early ages of the world, when mankind, being wholly illiterate, formed an idea of religion more suitable to their weak apprehension and composed their sacred tenets of such tales chiefly as were the objects of traditional belief more than of argument or disputation. After the first alarm, therefore, was over, which arose from the new paradoxes and principles of the philosophers, these teachers seem ever after, during the ages of antiquity, to have lived in great harmony with the established superstition and to have made a fair partition of mankind between them—the former claiming all the learned and wise, the latter possessing all the vulgar and illiterate.

It seems then, I say, that you leave politics entirely out of the question and never suppose that a wise magistrate can justly be jealous of certain tenets of philosophy, such as those of Epicurus, which, denying a divine existence and consequently a providence and a future state, seem to loosen in a great measure the ties of morality and may be supposed, for that reason, pernicious to the peace of civil society.

I know, he replied, that in fact these persecutions never, in any age, proceeded from calm reason or from experience of the pernicious consequences of philosophy, but arose entirely from passion and prejudice. But what if I should advance further and assert that, if Epicurus had been accused before the people by any of the *sycophants* or informers of those days, he could easily have defended his cause and proved his principles of philosophy to be as salutary as those of his adversaries who endeavored with such zeal to expose him to the public hatred and jealousy?

I wish, I said, you would try your eloquence upon so extraordinary a topic and make a speech for Epicurus which might satisfy, not the mob of Athens, if you will allow that ancient and polite city to have contained any mob, but the more philosophical part of his audience, such as might be supposed capable of comprehending his arguments.

The matter would not be difficult upon such conditions, he replied; and if you please, I shall suppose myself Epicurus for a moment and make you stand for the Athenian people, and shall deliver you such an harangue as will fill all the urn with white beans and leave not a black one to gratify the malice of my adversaries.⁶⁵

Very well. Pray proceed upon these suppositions.

I come here, O you Athenians, to justify in your assembly what I maintained in my school and I find

myself impeached by furious antagonists, instead of reasoning with calm and dispassionate inquirers. Your deliberations, which of right should be directed to questions of public good and the interest of the commonwealth, are diverted to the disquisitions of speculative philosophy, and these magnificent, but perhaps fruitless inquiries take place of your more familiar, but more useful occupations. But so far as in me lies I will prevent this abuse. We shall not here dispute concerning the origin and government of worlds. We shall only inquire how far such questions concern the public interest. And if I can persuade you that they are entirely indifferent to the peace of society and security of government, I hope that you will presently send us back to our schools, there to examine at leisure the question, the most sublime, but, at the same time, the most speculative of all philosophy.

The religious philosophers, not satisfied with the tradition of your forefathers and doctrine of your priests (in which I willingly acquiesce), indulge a rash curiosity in trying how far they can establish religion upon the principles of reason; and they thereby excite, instead of satisfying, the doubts which naturally arise from a diligent and scrupulous inquiry. They paint in the most magnificent colors the order, beauty, and wise arrangement of the universe and then ask if such a glorious display of intelligence could proceed from the fortuitous concourse of atoms or if chance could produce what the greatest genius can never sufficiently admire. I shall not examine the justness of this argument. I shall allow it to be as solid as my antagonists and accusers can desire. It is sufficient if I can prove, from this very reasoning, that the question is entirely speculative, and that, when, in my philosophical disquisitions, I deny a providence and a future state, I do not undermine the foundations of society, but advance principles which they themselves, upon their own topics, if they argue consistently, must allow to be solid and satisfactory.

You then, who are my accusers, have acknowledged that the chief or sole argument for a divine existence (which I never questioned) is derived from the order of nature, where there appear such marks of intelligence and design that you think it extravagant to assign for its cause either chance or the blind and unguided force of matter. You allow that this is an argument drawn from effects to causes. From the order of the work you infer that there must have been project and forethought in the workman. If you cannot make out this point, you allow that your conclusion fails and you do not pretend to establish the conclusion in a greater latitude than the phenomena of nature will justify. These are your concessions. I desire you to mark the consequences.

When we infer any particular cause from an effect, we must proportion the one to the other and can never be allowed to ascribe to the cause any qualities but what are exactly sufficient to produce the effect. A body of ten ounces raised in any scale may serve as a proof that the counterbalancing weight exceeds ten ounces, but can never afford a reason that it exceeds a hundred. If the cause assigned for any effect is not sufficient to produce it, we must either reject that cause or add to it such qualities as will give it a just proportion to the effect. But if we ascribe to it further qualities or affirm it capable of producing other effects, we can only indulge the license of conjecture and arbitrarily suppose the existence of qualities and energies without reason or authority.

The same rule holds whether the cause assigned is brute unconscious matter or a rational intelligent being. If the cause is known only by the effect, we never ought to ascribe to it any qualities beyond what are precisely requisite to produce the effect; nor can we, by any rules of just reasoning, return back from the cause and infer other effects from it, beyond those by which alone it is known to us. No one, merely from the sight of one of Zeuxis's⁶⁶ pictures, could know that he was also a statuary or architect and was an artist no less skillful in stone and marble than in colors. The talents and taste displayed in the particular work before us — these we may safely conclude the workman to be possessed of. The cause must be proportioned to the effect; and if we exactly and precisely proportion it, we shall never find in it any qualities that point further or afford an inference concerning any other design or performance. Such qualities must be somewhat beyond what is merely requisite for producing the effect which we examine.

Allowing, therefore, the gods to be the authors of the existence or order of the universe, it follows that they possess that precise degree of power, intelligence, and benevolence which appears in their workmanship, but nothing further can ever be proved, except we call in the assistance of exaggeration and flattery to supply the defects of argument and reasoning. So far as the traces of any attributes at present appear, so far may we conclude these attributes to exist. The supposition of further attributes is mere hypothesis, much more the supposition that in distant regions of space or periods of time there has been or will be a more magnificent display of these attributes and a scheme of administration more suitable to such imaginary virtues. We can never be allowed to mount up from the universe, the effect, to Jupiter,⁶⁷ the cause, and then descend downwards to infer any new effect from that cause, as if the present effects alone were not entirely worthy of the glorious attributes which we ascribe to that deity. The knowledge of the cause being derived solely from the effect, they must be exactly adjusted to each other and the one can never refer to anything further or be the

foundation of any new inference and conclusion.

You find certain phenomena in nature. You seek a cause or author. You imagine that you have found him. You afterwards become so enamored of this offspring of your brain that you imagine it impossible but he must produce something greater and more perfect than the present scene of things, which is so full of ill and disorder. You forget that this superlative intelligence and benevolence are entirely imaginary or, at least, without any foundation in reason and that you have no ground to ascribe to him any qualities but what you see he has actually exerted and displayed in his productions. Let your gods, therefore, O philosophers, be suited to the present appearances of nature and do not presume to alter these appearances by arbitrary suppositions in order to suit them to the attributes which you so fondly ascribe to your deities.

When priests and poets, supported by your authority, O Athenians, talk of a golden or silver age which preceded the present state of vice and misery, I hear them with attention and with reverence. But when philosophers who pretend to neglect authority and to cultivate reason hold the same discourse, I do not pay them, I admit, the same obsequious submission and pious deference. I ask: Who carried them into the celestial regions, who admitted them into the councils of the gods, who opened to them the book of fate that they thus rashly affirm that their deities have executed or will execute any purpose beyond what has actually appeared? If they tell me that they have mounted on the steps or by the gradual ascent of reason and by drawing inferences from effects to causes, I still insist that they have aided the ascent of reason by the wings of imagination; otherwise they could not thus change their manner of inference and argue from causes to effects, presuming that a more perfect production than the present world would be more suitable to such perfect beings as the gods and forgetting that they have no reason to ascribe to these celestial beings any perfection or any attribute but what can be found in the present world.

Hence all the fruitless industry to account for the ill appearances of nature and save the honor of the gods, while we must acknowledge the reality of that evil and disorder with which the world so much abounds. The obstinate and intractable qualities of matter, we are told, or the observance of general laws, or some such reason, is the sole cause which controlled the power and benevolence of Jupiter and obliged him to create mankind and every sensible creature so imperfect and so unhappy. These attributes, then, are, it seems, beforehand taken for granted in their greatest latitude. And upon that supposition, I admit that such conjectures may, perhaps, be admitted as plausible solutions of the ill phenomena. But still I ask: Why take these attributes for granted or why ascribe to the cause any qualities but what actually appear in the effect? Why torture your brain to justify the course of nature upon suppositions which, for all you know, may be entirely imaginary and of which there are to be found no traces in the course of nature?

The religious hypothesis, therefore, must be considered only as a particular method of accounting for the visible phenomena of the universe. But no just reasoner will ever presume to infer from it any single fact and alter or add to the phenomena in any single particular. If you think that the appearances of things prove such causes, it is allowable for you to draw an inference concerning the existence of these causes. In such complicated and sublime subjects, everyone should be indulged in the liberty of conjecture and argument. But here you ought to rest. If you come backward and, arguing from your inferred causes, conclude that any other fact has existed or will exist in the course of nature which may serve as a fuller display of particular attributes I must admonish you that you have departed from the method of reasoning attached to the present subject and have certainly added something to the attributes of the cause beyond what appears in the effect; otherwise you could never, with tolerable sense or propriety, add anything to the effect in order to render it more worthy of the cause.

Where, then, is the odiousness of that doctrine which I teach in my school, or rather, which I examine in my gardens? Or what do you find in this whole question in which the security of good morals or the peace and order of society are in the least concerned?

I deny a providence, you say, and supreme governor of the world who guides the course of events and punishes the vicious with infamy and disappointment, and rewards the virtuous with honor and success in all their undertakings. But surely I do not deny the course itself of events, which lies open to everyone's inquiry and examination. I acknowledge that, in the present order of things, virtue is attended with more peace of mind than vice and meets with a more favorable reception from the world. I am sensible that, according to the past experience of mankind, friendship is the chief joy of human life and moderation the only source of tranquillity and happiness. I never balance between the virtuous and the vicious course of life, but am sensible that, to a well-disposed mind, every advantage is on the side of the former. And what can you say more, allowing all your suppositions and reasonings? You tell me, indeed, that this disposition of things proceeds from intelligence and design. But whatever it proceeds from, the disposition itself, on which depends our happiness or misery and consequently our conduct and deportment in life, is still the same. It is still open for

me, as well as you, to regulate my behavior by my experience of past events. And if you affirm that, while a divine providence is allowed, and a supreme distributive justice in the universe, I ought to expect some more particular reward of the good and punishment of the bad beyond the ordinary course of events, I here find the same fallacy which I have before endeavored to detect. You persist in imagining that, if we grant that divine existence for which you so earnestly contend, you may safely infer consequences from it and add something to the experienced order of nature by arguing from the attributes which you ascribe to your gods. You do not seem to remember that all your reasonings on this subject can only be drawn from effects to causes and that every argument deduced from causes to effects must of necessity be a gross sophism, since it is impossible for you to know anything of the cause but what you have antecedently not inferred, but discovered to the full in the effect.

But what must a philosopher think of those vain reasoners who, instead of regarding the present scene of things as the sole object of their contemplation, so far reverse the whole course of nature as to render this life merely a passage to something further — a porch which leads to a greater and vastly different building, a prologue which serves only to introduce the piece and give it more grace and propriety? From where, do you think, can such philosophers derive their idea of the gods? From their own conceit and imagination surely. For if they derived it from the present phenomena, it would never point to anything further, but must be exactly adjusted to them. That the divinity may *possibly* be endowed with attributes which we have never seen exerted, may be governed by principles of action which we cannot discover to be satisfied. All this will freely be allowed. But still this is mere *possibility* and hypothesis. We never can have reason to *infer* any attributes or any principles of action in him, but so far as we know them to have been exerted and satisfied.

Are there any marks of a distributive justice in the world? If you answer in the affirmative, I conclude that, since justice here exerts itself, it is satisfied. If you reply in the negative, I conclude that you have then no reason to ascribe justice, in our sense of it, to the gods. If you hold a medium between affirmation and negation, by saying that the justice of the gods at present exerts itself in part, but not in its full extent, I answer that you have no reason to give it any particular extent, but only so far as you see it, *at present*, exert itself.

Thus I bring the dispute, O Athenians, to a short issue with my antagonists. The course of nature lies open to my contemplation as well as to theirs. The experienced train of events is the great standard by which we all regulate our conduct. Nothing else can be appealed to in the field or in the senate. Nothing else ought ever to be heard of in the school or in the closet. In vain would our limited understanding break through those boundaries which are too narrow for our fond imagination. While we argue from the course of nature and infer a particular intelligent cause which first bestowed and still preserves order in the universe, we embrace a principle which is both uncertain and useless. It is uncertain because the subject lies entirely beyond the reach of human experience. It is useless because our knowledge of this cause being derived entirely from the course of nature, we can never, according to the rules of just reasoning, return back from the cause with any new inference or, making additions to the common and experienced course of nature, establish any new principles of conduct and behavior.

I observe (I said, finding he had finished his harangue) that you do not neglect the artifice of the demagogues of old and as you were pleased to make me stand for the people, you insinuate yourself into my favor by embracing those principles to which, you know, I have always expressed a particular attachment. But allowing you to make experience (as indeed I think you ought) the only standard of our judgment concerning this and all other questions of fact, I do not doubt but, from the very same experience to which you appeal, it may be possible to refute this reasoning which you have put into the mouth of Epicurus. If you saw, for instance, a half-finished building surrounded with heaps of brick and stone and mortar and all the instruments of masonry, could you not *infer* from the effect that it was a work of design and contrivance? And could you not return again, from this inferred cause, to infer new additions to the effect and conclude that the building would soon be finished and receive all the further improvements which art could bestow upon it? If you saw upon the seashore the print of one human foot, you would conclude that a man had passed that way and that he had also left the traces of the other foot, though effaced by the rolling of the sands or inundation of the waters. Why then do you refuse to admit the same method of reasoning with regard to the order of nature? Consider the world and the present life only as an imperfect building from which you can infer a superior intelligence and, arguing from that superior intelligence which can leave nothing imperfect, why may you not infer a more finished scheme or plan which will receive its completion in some distant point of space or time? Are not these methods of reasoning exactly similar? And under what pretense can you embrace the one while you reject the other?

The infinite difference of the subjects, he replied, is a sufficient foundation for this difference in my

conclusions. In works of human art and contrivance, it is allowable to advance from the effect to the cause, and, returning back from the cause, to form new inferences concerning the effect and examine the alterations which it has probably undergone or may still undergo. But what is the foundation of this method of reasoning? Plainly this: that man is a being whom we know by experience, whose motives and designs we are acquainted with, and whose projects and inclinations have a certain connection and coherence according to the laws which nature has established for the government of such a creature. When, therefore, we find that any work has proceeded from the skill and industry of man, as we are otherwise acquainted with the nature of the animal, we can draw a hundred inferences concerning what may be expected from him; and these inferences will all be founded in experience and observation. But did we know man only from the single work or production which we examine, it would be impossible for us to argue in this manner, because our knowledge of all the qualities which we ascribe to him, being in that case derived from the production, it is impossible they could point to anything further or be the foundation of any new inference. The print of a foot in the sand can only prove, when considered alone, that there was some figure adapted to it by which it was produced. But the print of a human foot proves likewise, from our other experience, that there was probably another foot which also left its impression, though effaced by time or other accidents. Here we mount from the effect to the cause, and, descending again from the cause, infer alterations in the effect; but this is not a continuation of the same simple chain of reasoning. We comprehend in this case a hundred other experiences and observations concerning the *usual* figure and members of that species of animal without which this method of argument must be considered as fallacious and sophistical.

The case is not the same with our reasonings from the works of nature. The Deity is known to us only by his productions and is a single being in the universe, not comprehended under any species or genus, from whose experienced attributes or qualities we can, by analogy, infer any attribute or quality in him. As the universe shows wisdom and goodness, we infer wisdom and goodness. As it shows a particular degree of these perfections, we infer a particular degree of them precisely adapted to the effect which we examine. But further attributes or further degrees of the same attributes we can never be authorized to infer or suppose by any rules of just reasoning. Now, without some such license of supposition, it is impossible for us to argue from the cause or infer any alteration in the effect beyond what has immediately fallen under our observation. Greater good produced by this Being must still prove a greater degree of goodness. A more impartial distribution of rewards and punishments must proceed from a greater regard to justice and equity. Every supposed addition to the works of nature makes an addition to the attributes of the Author of nature, and, consequently, being entirely unsupported by any reason or argument, can never be admitted but as mere conjecture and hypothesis.⁶⁸

The great source of our mistake in this subject and of the unbounded license of conjecture which we indulge is that we tacitly consider ourselves as in the place of the Supreme Being and conclude that he will, on every occasion, observe the same conduct which we ourselves, in his situation, would have embraced as reasonable and eligible. But, besides that the ordinary course of nature may convince us that almost everything is regulated by principles and maxims very different from ours — besides this, I say, it must evidently appear contrary to all rules of analogy to reason from the intentions and projects of men to those of a Being so different and so much superior. In human nature there is a certain experienced coherence of designs and inclinations, so that when, from any fact, we have discovered one intention of any man, it may often be reasonable, from experience, to infer another and draw a long chain of conclusions concerning his past or future conduct. But this method of reasoning can never have place with regard to a Being so remote and incomprehensible, who bears much less analogy to any other being in the universe than the sun to a waxen taper, and who discovers himself only by some faint traces or outlines beyond which we have no authority to ascribe to him any attribute or perfection. What we imagine to be a superior perfection may really be a defect. Or were it ever so much a perfection, the ascribing of it to the Supreme Being, where it does not appear to have been really exerted to the full in his works, savors more of flattery and panegyric than of just reasoning and sound philosophy. All the philosophy, therefore, in the world and all the religion, which is nothing but a species of philosophy, will never be able to carry us beyond the usual course of experience or give us measures of conduct and behavior different from those which are furnished by reflections on common life. No new fact can ever be inferred from the religious hypothesis, no event foreseen or foretold, no reward or punishment expected or dreaded beyond what is already known by practice and observation. So that my apology for Epicurus will still appear solid and satisfactory, nor have the political interests of society any connection with the philosophical disputes concerning metaphysics and religion.

There is still one circumstance, I replied, which you seem to have overlooked. Though I should allow your premises, I must deny your conclusion. You conclude that religious doctrines and reasonings *can* have no

influence on life because they *ought* to have no influence, never considering that men reason not in the same manner you do, but draw many consequences from the belief of a divine Existence and suppose that the Deity will inflict punishments on vice and bestow rewards on virtue beyond what appear in the ordinary course of nature. Whether this reasoning of theirs is just or not is no matter. Its influence on their life and conduct must still be the same. And those who attempt to disabuse them of such prejudices may, for all I know, be good reasoners, but I cannot allow them to be good citizens and politicians, since they free men from one restraint upon their passions and make the infringement of the laws of society in one respect more easy and secure.

After all, I may perhaps agree to your general conclusion in favor of liberty, though upon different premises from those on which you endeavor to found it. I think that the state ought to tolerate every principle of philosophy, nor is there an instance that any government has suffered in its political interests by such indulgence. There is no enthusiasm among philosophers; their doctrines are not very alluring to the people and no restraint can be put upon their reasonings but what must be of dangerous consequence to the sciences and even to the state, by paving the way for persecution and oppression in points where the generality of mankind are more deeply interested and concerned.

But there occurs to me (I continued) with regard to your main topic a difficulty which I shall just propose to you, without insisting on it, lest it lead into reasonings of too nice and delicate a nature. In a word, I much doubt whether it is possible for a cause to be known only by its effect (as you have all along supposed) or to be of so singular and particular a nature as to have no parallel and no similarity with any other cause or object that has ever fallen under our observation. It is only when two species of objects are found to be constantly conjoined that we can infer the one from the other; and were an effect presented which was entirely singular and could not be comprehended under any known species, I do not see that we could form any conjecture or inference at all concerning its cause. If experience and observation and analogy are, indeed, the only guides which we can reasonably follow in inferences of this nature, both the effect and cause must bear a similarity and resemblance to other effects and causes which we know, and which we have found in many instances to be conjoined with each other. I leave it to your own reflection to pursue the consequences of this principle. I shall just observe that, as the antagonists of Epicurus always suppose the universe, an effect quite singular and unparalleled, to be the proof of a Deity, a cause no less singular and unparalleled, your reasonings upon that supposition seem, at least, to merit our attention. There is, I admit, some difficulty how we can ever return from the cause to the effect and, reasoning from our ideas of the former, infer any alteration on the latter or any addition to it.

SECTION XII
Of the Academic or Skeptical Philosophy.

Part I.

There is not a greater number of philosophical reasonings displayed upon any subject than those which prove the existence of a Deity and refute the fallacies of *atheists*; and yet the most religious philosophers still dispute whether any man can be so blinded as to be a speculative atheist. How shall we reconcile these contradictions? The knights-errant who wandered about to clear the world of dragons and giants never entertained the least doubt with regard to the existence of these monsters.

The *skeptic* is another enemy of religion, who naturally provokes the indignation of all divines and graver philosophers, though it is certain that no man ever met with any such absurd creature or conversed with a man who had no opinion or principle concerning any subject, either of action or speculation. This begets a very natural question: What is meant by a skeptic? And how far it is possible to push these philosophical principles of doubt and uncertainty?

There is a species of skepticism, *antecedent* to all study and philosophy, which is much inculcated by Descartes and others as a sovereign preservative against error and precipitate judgment. It recommends a universal doubt not only of all our former opinions and principles, but also of our very faculties, of whose veracity, they say, we must assure ourselves by a chain of reasoning deduced from some original principle which cannot possibly be fallacious or deceitful. But neither is there any such original principle which has a prerogative above others that are self-evident and convincing. Or if there were, could we advance a step beyond it but by the use of those very faculties of which we are supposed to be already diffident. The Cartesian doubt, therefore, were it ever possible to be attained by any human creature (as it plainly is not) would be entirely incurable and no reasoning could ever bring us to a state of assurance and conviction upon any subject.

It must, however, be confessed that this species of skepticism, when more moderate, may be understood in a very reasonable sense and is a necessary preparative to the study of philosophy by preserving a proper impartiality in our judgments and weaning our mind from all those prejudices which we may have imbibed from education or rash opinion. To begin with clear and self-evident principles, to advance by timorous and sure steps, to review frequently our conclusions and examine accurately all their consequences — though by these means we shall make both a slow and a short progress in our systems—are the only methods by which we can ever hope to reach truth and attain a proper stability and certainty in our determinations.

There is another species of skepticism, *consequent* to science and inquiry, when men are supposed to have discovered either the absolute fallaciousness of their mental faculties or their unfitness to reach any fixed determination in all those curious subjects of speculation about which they are commonly employed. Even our very senses are brought into dispute by a certain species of philosophers and the maxims of common life are subjected to the same doubt as the most profound principles or conclusions of metaphysics and theology. As these paradoxical tenets (if they may be called tenets) are to be met with in some philosophers, and the refutation of them in several, they naturally excite our curiosity and make us inquire into the arguments on which they may be founded.

I need not insist upon the more trite topics employed by the skeptics in all ages against the evidence of *sense* such as those which are derived from the imperfection and fallaciousness of our organs on numberless occasions: the crooked appearance of an oar in water, the various aspects of objects according to their different distances, the double images which arise from the pressing one eye, with many other appearances of a like nature. These skeptical topics, indeed, are only sufficient to prove that the senses alone are not implicitly to be depended on, but that we must correct their evidence by reason and by considerations derived from the nature of the medium, the distance of the object, and the disposition of the organ, in order to render them, within their sphere, the proper *criteria* of truth and falsehood. There are other more profound arguments against the senses which do not admit of so easy a solution.

It seems evident that men are carried by a natural instinct or prepossession to repose faith in their senses, and that without any reasoning, or even almost before the use of reason, we always suppose an external universe which does not depend on our perception, but would exist though we and every sensible creature were absent or annihilated. Even the animal creation are governed by a like opinion and preserve this belief of external objects, in all their thoughts, designs, and actions.

It seems also evident that when men follow this blind and powerful instinct of nature they always suppose the very images presented by the senses to be the external objects and never entertain any suspicion that the one are nothing but representations of the other. This very table which we see white and which we feel hard is believed to exist independent of our perception and to be something external to our mind which perceives it.

Our presence does not bestow being on it. Our absence does not annihilate it. It preserves its existence uniform and entire, independent of the situation of intelligent beings who perceive or contemplate it.

But this universal and primary opinion of all men is soon destroyed by the slightest philosophy which teaches us that nothing can ever be present to the mind but an image or perception, and that the senses are only the inlets through which these images are conveyed, without being able to produce any immediate intercourse between the mind and the object. The table which we see seems to diminish as we remove further from it. But the real table which exists independent of us suffers no alteration. It was, therefore, nothing but its image which was present to the mind. These are the obvious dictates of reason and no man who reflects ever doubted that the existences which we consider when we say *this house* and *that tree* are nothing but perceptions in the mind and fleeting copies or representations of other existences which remain uniform and independent.

So far, then, are we necessitated by reasoning to contradict or depart from the primary instincts of nature and to embrace a new system with regard to the evidence of our senses. But here philosophy finds herself extremely embarrassed when she would justify this new system and obviate the cavils and objections of the skeptics. She can no longer plead the infallible and irresistible instinct of nature, for that led us to a quite different system which is acknowledged fallible and even erroneous. And to justify this pretended philosophical system by a chain of clear and convincing argument, or even any appearance of argument, exceeds the power of all human capacity.

By what argument can it be proved that the perceptions of the mind must be caused by external objects entirely different from them, though resembling them (if that is possible), and could not arise either from the energy of the mind itself, or from the suggestion of some invisible and unknown spirit, or from some other cause still more unknown to us? It is acknowledged that in fact many of these perceptions arise not from anything external, as in dreams, madness, and other diseases. And nothing can be more inexplicable than the manner in which body should so operate upon mind as ever to convey an image of itself to a substance supposed of so different and even contrary a nature.

It is a question of fact whether the perceptions of the senses are produced by external objects resembling them; how shall this question be determined? By experience surely as all other questions of a like nature. But here experience is and must be entirely silent. The mind never has anything present to it but the perceptions and cannot possibly reach any experience of their connection with objects. The supposition of such a connection is, therefore, without any foundation in reasoning.

To have recourse to the veracity of the supreme Being in order to prove the veracity of our senses is surely making a very unexpected circuit. If his veracity were at all concerned in this matter, our senses would be entirely infallible, because it is not possible that he can ever deceive. Not to mention that, if the external world is once called in question, we shall be at a loss to find arguments by which we may prove the existence of that Being or any of his attributes.

This is a topic, therefore, in which the profounder and more philosophical skeptics will always triumph when they endeavor to introduce a universal doubt into all subjects of human knowledge and inquiry. Do you follow the instincts and propensities of nature, may they say, in assenting to the veracity of sense? But these lead you to believe that the very perception or sensible image is the external object. Do you disclaim this principle in order to embrace a more rational opinion that the perceptions are only representations of something external? You here depart from your natural propensities and more obvious sentiments and yet are not able to satisfy your reason, which can never find any convincing argument from experience to prove that the perceptions are connected with any external objects.

There is another skeptical topic of a like nature, derived from the most profound philosophy, which might merit our attention were it requisite to dive so deep in order to discover arguments and reasonings which can so little serve to any serious purpose. It is universally allowed by modern inquirers that all the sensible qualities of objects, such as hard, soft, hot, cold, white, black, etc., are merely secondary and do not exist in the objects themselves, but are perceptions of the mind, without any external archetype or model which they represent. If this is allowed with regard to secondary qualities, it must also follow with regard to the supposed primary qualities of extension and solidity, nor can the latter be any more entitled to that denomination than the former. The idea of extension is entirely acquired from the senses of sight and feeling and if all the qualities perceived by the senses are in the mind, not in the object, the same conclusion must reach the idea of extension which is wholly dependent on the sensible ideas or the ideas of secondary qualities. Nothing can save us from this conclusion but the asserting that the ideas of those primary qualities are attained by *abstraction*; an opinion which, if we examine it accurately, we shall find to be unintelligible and even absurd. An extension that is neither tangible nor visible cannot possibly be conceived; and a tangible or visible

extension which is neither hard nor soft, black nor white, is equally beyond the reach of human conception. Let any man try to conceive a triangle in general which is neither *isosceles* nor *scalene*, nor has any particular length or proportion of sides, and he will soon perceive the absurdity of all the scholastic notions with regard to abstraction and general ideas.⁶⁹

Thus the first philosophical objection to the evidence of sense or to the opinion of external existence consists in this, that such an opinion, if rested on natural instinct, is contrary to reason and, if referred to reason, is contrary to natural instinct and at the same time carries no rational evidence with it to convince an impartial inquirer. The second objection goes further and represents this opinion as contrary to reason, at least, if it is a principle of reason that all sensible qualities are in the mind, not in the object. Deprive matter of all its intelligible qualities, both primary and secondary, you in a manner annihilate it and leave only a certain unknown, inexplicable *something* as the cause of our perceptions — a notion so imperfect that no skeptic will think it worthwhile to contend against it.

Part II.

It may seem a very extravagant attempt of the skeptics to destroy *reason* by argument and ratiocination, yet is this the grand scope of all their inquiries and disputes. They endeavor to find objections both to our abstract reasonings and to those which regard matter of fact and existence.

The chief objection against all *abstract* reasonings is derived from the ideas of space and time—ideas which, in common life and to a careless view, are very clear and intelligible, but when they pass through the scrutiny of the profound sciences (and they are the chief object of these sciences) afford principles which seem full of absurdity and contradiction. No priestly *dogmas* invented on purpose to tame and subdue the rebellious reason of mankind ever shocked common sense more than the doctrine of the infinite divisibility of extension, with its consequences, as they are pompously displayed by all geometers and metaphysicians with a kind of triumph and exultation. A real quantity, infinitely less than any finite quantity, containing quantities infinitely less than itself, and so on *in infinitum*; this is an edifice so bold and prodigious that it is too weighty for any pretended demonstration to support because it shocks the clearest and most natural principles of human reason.⁷⁰ But what renders the matter more extraordinary is that these seemingly absurd opinions are supported by a chain of reasoning, the clearest and most natural, nor is it possible for us to allow the premises without admitting the consequences. Nothing can be more convincing and satisfactory than all the conclusions concerning the properties of circles and triangles, and yet, when these are once received, how can we deny that the angle of contact between a circle and its tangent is infinitely less than any rectilinear angle—that as you may increase the diameter of the circle *in infinitum*, this angle of contact becomes still less, even *in infinitum*, and that the angle of contact between other curves and their tangents may be infinitely less than those between any circle and its tangent, and so on, *in infinitum*? The demonstration of these principles seems as unexceptionable as that which proves the three angles of a triangle to be equal to two right ones, though the latter opinion is natural and easy and the former big with contradiction and absurdity. Reason here seems to be thrown into a kind of amazement and suspense which, without the suggestions of any skeptic, gives her a diffidence of herself and of the ground on which she treads. She sees a full light which illuminates certain places, but that light borders upon the most profound darkness. And between these she is so dazzled and confounded that she scarcely can pronounce with certainty and assurance concerning any one object.

The absurdity of these bold determinations of the abstract sciences seems to become, if possible, still more palpable with regard to time than extension. An infinite number of real parts of time, passing in succession and exhausted one after another, appears so evident a contradiction that no man, one should think, whose judgment is not corrupted, instead of being improved by the sciences, would ever be able to admit of it.

Yet still reason must remain restless and unquiet, even with regard to that skepticism to which she is driven by these seeming absurdities and contradictions. How any clear, distinct idea can contain circumstances contradictory to itself, or to any other clear, distinct idea, is absolutely incomprehensible and is, perhaps, as absurd as any proposition which can be formed—so that nothing can be more skeptical or more full of doubt and hesitation than this skepticism itself which arises from some of the paradoxical conclusions of geometry or the science of quantity.⁷¹

The skeptical objections to *moral* evidence or to the reasonings concerning matter of fact are either *popular* or *philosophical*. The popular objections are derived from the natural weakness of human understanding; the contradictory opinions which have been entertained in different ages and nations; the variations of our judgment in sickness and health, youth and old age, prosperity and adversity; the perpetual contradiction of each particular man's opinions and sentiments with many other topics of that kind. It is needless to insist further on this head. These objections are but weak. For, as in common life, we reason every moment concerning fact and existence and cannot possibly subsist without continually employing this species of argument, any popular objections derived from this must be insufficient to destroy that evidence. The great subverter of *Pyrrhonism*, or the excessive principles of skepticism, is action, and employment, and the occupations of common life. These principles may flourish and triumph in the schools, where it is indeed difficult, if not impossible, to refute them. But as soon as they leave the shade and by the presence of the real objects which actuate our passions and sentiments are put in opposition to the more powerful principles of our nature, they vanish like smoke and leave the most determined skeptic in the same condition as other mortals.

The skeptic, therefore, had better keep within his proper sphere and display those *philosophical* objections which arise from more profound researches. Here he seems to have ample matter of triumph, while he justly insists that all our evidence for any matter of fact which lies beyond the testimony of sense or memory is derived entirely from the relation of cause and effect; that we have no other idea of this relation than that of

two objects which have been frequently *conjoined* together; that we have no argument to convince us that objects which have, in our experience, been frequently conjoined, will likewise, in other instances, be conjoined in the same manner; and that nothing leads us to this inference but custom or a certain instinct of our nature which it is indeed difficult to resist, but which, like other instincts, may be fallacious and deceitful. While the skeptic insists upon these topics, he shows his force, or rather, indeed, his own and our weakness, and seems, for the time at least, to destroy all assurance and conviction. These arguments might be displayed at greater length, if any durable good or benefit to society could ever be expected to result from them.

For here is the chief and most confounding objection to *excessive* skepticism, that no durable good can ever result from it while it remains in its full force and vigor. We need only ask such a skeptic *What his meaning is? And what he proposes by all these curious researches?* He is immediately at a loss and does not know what to answer. A Copernican⁷² or Ptolemaist⁷³ who each supports his different system of astronomy may hope to produce a conviction which will remain constant and durable with his audience. A Stoic or Epicurean displays principles which may not only be durable, but which have an effect on conduct and behavior. But a Pyrrhonian cannot expect that his philosophy will have any constant influence on the mind or, if it had, that its influence would be beneficial to society. On the contrary, he must acknowledge, if he will acknowledge anything, that all human life must perish, were his principles universally and steadily to prevail. All discourse, all action would immediately cease and men would remain in a total lethargy until the necessities of nature, unsatisfied, put an end to their miserable existence. It is true — so fatal an event is very little to be dreaded. Nature is always too strong for principle. And though a Pyrrhonian may throw himself or others into a momentary amazement and confusion by his profound reasonings, the first and most trivial event in life will put to flight all his doubts and scruples and leave him the same, in every point of action and speculation, with the philosophers of every other sect or with those who never concerned themselves in any philosophical researches. When he awakes from his dream, he will be the first to join in the laugh against himself and to confess that all his objections are mere amusement and can have no other tendency than to show the whimsical condition of mankind, who must act and reason and believe, though they are not able, by their most diligent inquiry, to satisfy themselves concerning the foundation of these operations or to remove the objections which may be raised against them.

Part III.

There is, indeed, a more *mitigated* skepticism or *academic* philosophy which may be both durable and useful and which may, in part, be the result of this Pyrrhonism or *excessive* skepticism when its undistinguished doubts are in some measure corrected by common sense and reflection. The greater part of mankind are naturally apt to be affirmative and dogmatic in their opinions and while they see objects only on one side and have no idea of any counterpoising argument, they throw themselves precipitately into the principles to which they are inclined, nor have they any indulgence for those who entertain opposite sentiments. To hesitate or balance perplexes their understanding, checks their passion, and suspends their action. They are, therefore, impatient until they escape from a state which to them is so uneasy and they think that they can never remove themselves far enough from it by the violence of their affirmations and obstinacy of their belief. But could such dogmatic reasoners become sensible of the strange infirmities of human understanding, even in its most perfect state and when most accurate and cautious in its determinations, such a reflection would naturally inspire them with more modesty and reserve, and diminish their fond opinion of themselves and their prejudice against antagonists. The illiterate may reflect on the disposition of the learned who, amid all the advantages of study and reflection, are commonly still diffident in their determinations. And if any of the learned are inclined, from their natural temper, to haughtiness and obstinacy, a small tincture of Pyrrhonism might abate their pride by showing them that the few advantages which they may have attained over their fellows are but inconsiderable, if compared with the universal perplexity and confusion which is inherent in human nature. In general, there is a degree of doubt and caution and modesty which, in all kinds of scrutiny and decision, ought forever accompany a just reasoner.

Another species of *mitigated* skepticism which may be of advantage to mankind and which may be the natural result of the Pyrrhonian doubts and scruples is the limitation of our inquiries to such subjects as are best adapted to the narrow capacity of human understanding. The *imagination* of man is naturally sublime, delighted with whatever is remote and extraordinary, and running without control into the most distant parts of space and time in order to avoid the objects which custom has rendered too familiar to it. A correct *judgment* observes a contrary method and, avoiding all distant and high inquiries, confines itself to common life and to such subjects as fall under daily practice and experience, leaving the more sublime topics to the embellishment of poets and orators or to the arts of priests and politicians. To bring us to so salutary a determination, nothing can be more serviceable than to be once thoroughly convinced of the force of the Pyrrhonian doubt and of the impossibility that anything but the strong power of natural instinct could free us from it. Those who have a propensity to philosophy will still continue their researches, because they reflect that, besides the immediate pleasure attending such an occupation, philosophical decisions are nothing but the reflections of common life, methodized and corrected. But they will never be tempted to go beyond common life so long as they consider the imperfection of those faculties which they employ, their narrow reach, and their inaccurate operations. While we cannot give a satisfactory reason why we believe, after a thousand experiments, that a stone will fall or fire burn, can we ever satisfy ourselves concerning any determination which we may form with regard to the origin of worlds and the situation of nature from and to eternity?

This narrow limitation, indeed, of our inquiries is in every respect so reasonable that it suffices to make the slightest examination into the natural powers of the human mind and to compare them with their objects, in order to recommend it to us. We shall then find what are the proper subjects of science and inquiry.

It seems to me that the only objects of the abstract sciences or of demonstration are quantity and number and that all attempts to extend this more perfect species of knowledge beyond these bounds are mere sophistry and illusion. As the component parts of quantity and number are entirely similar, their relations become intricate and involved and nothing can be more curious, as well as useful, than to trace, by a variety of mediums, their equality or inequality through their different appearances. But as all other ideas are clearly distinct and different from each other, we can never advance further, by our utmost scrutiny, than to observe this diversity and, by an obvious reflection, pronounce one thing not to be another. Or if there is any difficulty in these decisions, it proceeds entirely from the indeterminate meaning of words, which is corrected by more just definitions. That *the square of the hypotenuse is equal to the squares of the other two sides* cannot be known, let the terms be ever so exactly defined, without a train of reasoning and inquiry. But to convince us of this proposition, *that where there is no property there can be no injustice*, it is only necessary to define the terms and explain injustice to be a violation of property. This proposition is, indeed, nothing but a more imperfect definition. It is the same case with all those pretended syllogistic reasonings which may be found in every other branch of learning except the sciences of quantity and number; and these may safely, I think, be pronounced the only proper objects of knowledge and demonstration.

All other inquiries of men regard only matter of fact and existence and these are evidently incapable of demonstration. Whatever *is* may *not be*. No negation of a fact can involve a contradiction. The nonexistence of any being, without exception, is as clear and distinct an idea as its existence. The proposition which affirms it not to be, however false, is no less conceivable and intelligible than that which affirms it to be. The case is different with the sciences, properly so called. Every proposition which is not true is there confused and unintelligible. That the cube root of 64 is equal to the half of 10 is a false proposition and can never be distinctly conceived. But that Caesar, or the angel Gabriel, or any being never existed may be a false proposition, but still is perfectly conceivable, and implies no contradiction.

The existence, therefore, of any being can only be proved by arguments from its cause or its effect and these arguments are founded entirely on experience. If we reason *a priori*, anything may appear able to produce anything. The falling of a pebble may, for all we know, extinguish the sun or the wish of a man control the planets in their orbits. It is only experience which teaches us the nature and bounds of cause and effect and enables us to infer the existence of one object from that of another.⁷⁴ Such is the foundation of moral reasoning, which forms the greater part of human knowledge and is the source of all human action and behavior.

Moral reasonings are either concerning particular or general facts. All deliberations in life regard the former, as also all disquisitions in history, chronology, geography, and astronomy.

The sciences which treat of general facts are politics, natural philosophy, physics, chemistry, etc., where the qualities, causes, and effects of a whole species of objects are inquired into.

Divinity or theology, as it proves the existence of a Deity and the immortality of souls, is composed partly of reasonings concerning particular, partly concerning general facts. It has a foundation in *reason* so far as it is supported by experience. But its best and most solid foundation is *faith* and divine revelation.

Morals and criticism are not so properly objects of the understanding as of taste and sentiment. Beauty, whether moral or natural, is felt more properly than perceived. Or if we reason concerning it and endeavor to fix its standard, we regard a new fact, namely, the general taste of mankind or some such fact which may be the object of reasoning and inquiry.

When we run over libraries, persuaded of these principles, what havoc must we make? If we take in our hand any volume — of divinity or school metaphysics, for instance — let us ask: *Does it contain any abstract reasoning concerning quantity or number?* No. *Does it contain any experimental reasoning concerning matter of fact and existence?* No. Commit it then to the flames, for it can contain nothing but sophistry and illusion.

9. It is probable that no more was meant by those, who denied innate ideas, than that all ideas were copies of our impressions; though it must be confessed, that the terms, which they employed, were not chosen with such caution, nor so exactly defined, as to prevent all mistakes about their doctrine. For what is meant by *innate*? If innate be equivalent to natural, then all the perceptions and ideas of the mind must be allowed to be innate or natural, in whatever sense we take the latter word, whether in opposition to what is uncommon, artificial, or miraculous. If by innate be meant, contemporary to our birth, the dispute seems to be frivolous; nor is it worth while to enquire at what time thinking begins, whether before, at, or after our birth. Again, the word *idea*, seems to be commonly taken in a very loose sense, by *Locke* and others: As standing for any of our perceptions, our sensations and passions, as well as thoughts. Now in this sense, I should desire to know, what can be meant by asserting, that self-love, or resentment of injuries, or the passion between the sexes is not innate?

But admitting these terms, *impressions* and *ideas*, in the sense above explained, and understanding by *innate*, what is original or copied from no precedent perception, then may we assert, that all our impressions are innate, and our ideas not innate.

To be ingenuous, I must own it to be my opinion, that *Locke* was betrayed into this question by the schoolmen, who, making use of undefined terms, draw out their disputes to a tedious length, without ever touching the point in question. A like ambiguity and circumlocution

seem to run through that great philosopher's reasonings on this as well as most other subjects.

10. Resemblance.

11. Contiguity.

12. Cause and Effect.

13. For instance, *Contrast* or *Contrariety* is also a connexion among ideas: But it may, perhaps, be considered as a mixture of *Causation* and *Resemblance*. Where two objects are contrary, the one destroys the other; that is, the cause of its annihilation, and the idea of the annihilation of an object, implies the idea of its former existence.

14. "Power" is used loosely, in a popular sense. A more detailed explanation of the word would lend strength to the argument. See Section VII.

15. Nothing is more usual than for writers, even on *moral*, *political*, or *physical* subjects, to distinguish between *reason* and *experience*, and to suppose, that these species of argumentation are entirely different from each other. The former are taken for the mere result of our intellectual faculties, which, by considering *a priori* the nature of things, and examining the effects, that must follow from their operation, establish particular principles of science and philosophy. The latter are supposed to be derived entirely from sense and observation, by which we learn what has actually resulted from the operation of particular objects, and are thence able to infer, what will, for the future, result from them. Thus, for instance, the limitations and restraints of civil government, and a legal constitution, may be defended, either from *reason*, which reflecting on the great frailty and corruption of human nature, teaches, that no man can safely be trusted with unlimited authority; or from *experience* and history, which inform us of the enormous abuses, that ambition, in every age and country, has been found to make of so imprudent a confidence.

The same distinction between reason and experience is maintained in all our deliberations concerning the conduct of life; while the experienced statesman, general, physician, or merchant is trusted and followed; and the unpractised novice, with whatever natural talents endowed, neglected and despised. Though it be allowed, that reason may form very plausible conjectures with regard to the consequences of such a particular conduct in such particular circumstances; it is still supposed imperfect, without the assistance of experience, which is alone able to give stability and certainty to the maxims, derived from study and reflection.

But notwithstanding that this distinction be thus universally received, both in the active and speculative scenes of life, I shall not scruple to pronounce, that it is, at bottom, erroneous, at least, superficial.

If we examine those arguments which, in any of the sciences above-mentioned, are supposed to be the mere effects of reasoning and reflection, they will be found to terminate, at last, in some general principle or conclusion, for which we can assign no reason but observation and experience. The only difference between them and those maxims, which are vulgarly esteemed the result of pure experience, is, that the former cannot be established without some process of thought, and some reflection on what we have observed, in order to distinguish its circumstances, and trace its consequences: Whereas in the latter, the experienced event is exactly and fully similar to that which we infer as the result of any particular situation. The history of a Tiberius [Roman emperor (14–37)] or a Nero [Roman emperor (54–69)] makes us dread a tyranny, were our monarchs freed from the restraints of laws and senates: But the observation of any fraud or cruelty in private life is sufficient, with the aid of a little thought, to give us the same apprehension; while it serves as an instance of the general corruption of human nature, and shows us the danger which we must incur by reposing an entire confidence in mankind. In both cases, it is experience which is ultimately the foundation of our inference and conclusion.

There is no man so young and unexperienced, as not to have formed, from observation, many general and just maxims concerning human affairs and the conduct of life; but it must be confessed, that when a man comes to put these in practice, he will be extremely liable to error, till time and farther experience both enlarge these maxims, and teach him their proper use and application. In every situation or incident, there are many particular and seemingly minute circumstances, which the man of greatest talents is, at first, apt to overlook, though on them the justness of his conclusions, and consequently the prudence of his conduct, entirely depend. Not to mention, that, to a young beginner, the general observations and maxims occur not always on the proper occasions, nor can be immediately applied with due calmness and distinction. The truth is, an unexperienced reasoner could be no reasoner at all, were he absolutely unexperienced; and when we assign that character to any one, we mean it only in a comparative sense, and suppose him possessed of experience, in a smaller and more imperfect degree.

16. Mr. Locke divides all arguments into demonstrative and probable. In this view, we must say, that it is only probable all men must die, or that the sun will rise tomorrow. But to conform our language more to common use, we ought to divide arguments into *demonstrations*, *proofs*, and *probabilities*. By proofs meaning such arguments from experience as leave no room for doubt or opposition.

17. Section II. Of the Origin of Ideas.

18. Mr. Locke, in his chapter of power, says, that, finding from experience, that there are several new productions in matter, and concluding that there must somewhere be a power capable of producing them, we arrive at last by this reasoning at the idea of power. But no reasoning can ever give us a new, original, simple idea; as this philosopher himself confesses. This, therefore, can never be the origin of that idea. [The reference is to Locke's *Essay*, Bk. II, ch. XXI.]

19. It may be pretended, that the resistance which we meet with in bodies, obliging us frequently to exert our force, and call up all our power, this gives us the idea of force and power. It is this *nisus* or strong endeavour, of which we are conscious, that is the original impression from which this idea is copied. But, first, we attribute power to a vast number of objects, where we never can suppose this resistance or exertion of force to take place; to the Supreme Being, who never meets with any resistance; to the mind in its command over its ideas and limbs, in common thinking and motion, where the effect follows immediately upon the will, without any exertion or summoning up of force; to

inanimate matter, which is not capable of this sentiment. *Secondly*, This sentiment of an endeavour to overcome resistance has no known connexion with any event: What follows it, we know by experience; but could not know it *a priori*. It must, however, be confessed, that the animal *nisus*, which we experience, though it can afford no accurate precise idea of power, enters very much into that vulgar, inaccurate idea, which is formed of it.

20. [The reference is to the “occasionalists,” regarding whom see Berkeley’s *Three Dialogues*, n.3.]

21. Section XII.

22. I need not examine at length the *vis inertiae* which is so much talked of in the new philosophy, and which is ascribed to matter. We find by experience, that a body at rest or in motion continues for ever in its present state, till put from it by some new cause: And that a body impelled takes as much motion from the impelling body as it acquires itself. These are facts. When we call this a *vis inertiae*, we only mark these facts, without pretending to have any idea of the inert power; in the same manner as, when we talk of gravity, we mean certain effects without comprehending that active power. It was never the meaning of Sir Isaac Newton to rob second causes of all force or energy; though some of his followers have endeavoured to establish that theory upon his authority. On the contrary, that great philosopher had recourse to an ethereal active fluid to explain his universal attraction; though he was so cautious and modest as to allow, that it was a mere hypothesis, not to be insisted on, without more experiments. I must confess, that there is something in the fate of opinions a little extraordinary. Descartes insinuated that doctrine of the universal and sole efficacy of the Deity, without insisting on it. Malebranche and other Cartesians made it the foundation of all their philosophy. It had, however, no authority in England. Locke, Clarke [the Cambridge philosopher Samuel Clarke (1675–1729)], and Cudworth [the English philosopher and theologian Ralph Cudworth (1617–1688)] never so much as take notice of it, but supposed all along that matter has a real, though subordinate and derived power. By what means has it become so prevalent among our modern metaphysicians?

23. According to these explications and definitions, the idea of *power* is relative as much as that of *cause*; and both have a reference to an effect, or some other event constantly conjoined with the former. When we consider the *unknown* circumstance of an object, by which the degree or quantity of its effect is fixed and determined, we call that its power: And accordingly, it is allowed by all philosophers, that the effect is the measure of the power. But if they had any idea of power, as it is in itself, why could not they measure it in itself? The dispute whether the force of a body in motion be as its velocity, or the square of its velocity; this dispute, I say, needed not be decided by comparing its effects in equal or unequal times; but by a direct mensuration and comparison.

As to the frequent use of the words, Force, Power, Energy, etc. which every where occur in common conversation, as well as in philosophy; that is no proof, that we are acquainted, in any instance, with the connecting principle between cause and effect, or can account ultimately for the production of one thing by another. These words, as commonly used, have very loose meanings annexed to them; and their ideas are very uncertain and confused. No animal can put external bodies in motion without the sentiment of a *nisus* or endeavour; and every animal has a sentiment or feeling from the stroke or blow of an external object, that is in motion. These sensations, which are merely animal, and from which we can *a priori* draw no inference, we are apt to transfer to inanimate objects, and to suppose, that they have some such feelings, whenever they transfer or receive motion. With regard to energies, which are exerted, without our annexing to them any idea of communicated motion, we consider only the constant experienced conjunction of the events; and as we *feel* a customary connexion between the ideas, we transfer that feeling to the objects; as nothing is more usual than to apply to external bodies every internal sensation, which they occasion.

24. [Hippocrates (c. 460—c. 370 B.C.), a Greek physician, became known as “The Father of Medicine.”]

25. [Polybius (c. 201–120 B.C.), a Greek historian, wrote of the rise of Rome.]

26. [Tacitus (55–c. 117), a Roman historian, wrote about the Germanic tribes and about the luxurious habits of Romans, which he criticized sharply.]

27. [Quintus Curtius Rufus, a first-century Roman author, wrote a history of Alexander the Great.]

28. [Alexander the Great (356–323 B.C.) was king of Macedon and conqueror of much of Asia.]

29. [An area in central London.]

30. The prevalence of the doctrine of liberty may be accounted for, from another cause, *viz.* a false sensation or seeming experience which we have, or may have, of liberty or indifference, in many of our actions. The necessity of any action, whether of matter or of mind, is not, properly speaking, a quality in the agent, but in any thinking or intelligent being, who may consider the action; and it consists chiefly in the determination of his thoughts to infer the existence of that action from some preceding objects; as liberty, when opposed to necessity, is nothing but the want of that determination, and a certain looseness or indifference, which we feel, in passing, or not passing, from the idea of one object to that of any succeeding one. Now we may observe, that, though, in *reflecting* on human actions, we seldom feel such a looseness or indifference, but are commonly able to infer them with considerable certainty from their motives, and from the dispositions of the agent; yet is frequently happens, that, in *performing* the actions themselves, we are sensible of something like it: And as all resembling objects are readily taken for each other, this has been employed as a demonstrative and even intuitive proof of human liberty. We feel, that our actions are subject to our will, on most occasions; and imagine we feel, that the will itself is subject to nothing, because, when by a denial of it we are provoked to try, we feel, that it moves easily every way, and produces an image of itself, (or a *Velleity*, as it is called in the schools) even on that side, on which it did not settle. This image, or faint motion, we persuade ourselves, could, at that time, have been completed into the thing itself; because, should that be denied, we find, upon a second trial, that, at present, it can. We consider not, that the fantastical desire of showing liberty, is here the motive of our actions. And it seems certain, that, however we may imagine we feel a liberty within ourselves, a spectator can commonly infer our actions from our motives and character; and even where he cannot, he concludes in general, that he might, were he perfectly

acquainted with every circumstance of our situation and temper, and the most secret springs of our complexion and disposition. Now this is the very essence of necessity, according to the foregoing doctrine.

31. Thus, if a cause be defined, *that which produces any thing*; it is easy to observe, that *producing* is synonymous to *causing*. In like manner, if a cause be defined, *that by which anything exists*; this is liable to the same objection. For what is meant by these words, *by which*? Had it been said, that a cause is *that* after which *anything constantly exists*; we should have understood the terms. For this is, indeed, all we know of the matter. And this constancy forms the very essence of necessity, nor have we any other idea of it.

32. Since all reasonings concerning facts or causes is derived merely from custom, it may be asked how it happens, that men so much surpass animals in reasoning, and one man so much surpasses another? Has not the same custom the same influence on all?

We shall here endeavour briefly to explain the great difference in human understandings: After which the reason of the difference between men and animals will easily be comprehended.

1. When we have lived any time, and have been accustomed to the uniformity of nature, we acquire a general habit, by which we always transfer the known to the unknown, and conceive the latter to resemble the former. By means of this general habitual principle, we regard even one experiment as the foundation of reasoning, and expect a similar even with some degree of certainty, where the experiment has been made accurately, and free from all foreign circumstances. It is therefore considered as a matter of great importance to observe the consequences of things; and as one man may very much surpass another in attention and memory and observation, this will make a very great difference in their reasoning.

2. Where there is a complication of causes to produce any effect, one mind may be much larger than another, and better able to comprehend the whole system of objects, and to infer justly their consequences.

3. One man is able to carry on a chain of consequences to a greater length than another.

4. Few men can think long without running into a confusion of ideas, and mistaking one for another; and there are various degrees of this infirmity.

5. The circumstance, on which the effect depends, is frequently involved in other circumstances, which are foreign and extrinsic. The separation of it often requires great attention, accuracy, and subtlety.

6. The forming of general maxims from particular observation is a very nice operation; and nothing is more usual, from haste or a narrowness of mind, which sees not on all sides, than to commit mistakes in this particular.

7. When we reason from analogies, the man, who has the greater experience or the greater promptitude of suggesting analogies, will be the better reasoner.

8. Biases from prejudice, education, passion, party, etc. hang more upon one mind than another.

9. After we have acquired a confidence in human testimony, books and conversation enlarge much more the sphere of one man's experience and thought than those of another.

It would be easy to discover many other circumstances that make a difference in the understandings of men.

33. [John Tilloston (1630–1694), a Presbyterian theologian who became archbishop of Canterbury in 1691.]

34. [The reference is to the presence of the body and blood of Jesus in the bread and wine of the Christian sacrament of Holy Communion.]

35. [The reference is to Marcus Porcius Cato (Cato the Younger) (95–46 B.C.), a Roman statesman and philosopher.]

36. Plutarch in *Vita Catonis*.

37. [An apparent reference to a story about the King of Siam.]

38. No Indian, it is evident, could have experience that water did not freeze in cold climates. This is placing nature in a situation quite unknown to him; and it is impossible for him to tell *a priori* what will result from it. It is making a new experiment, the consequence of which is always uncertain. One may sometimes conjecture from analogy what will follow; but still this is but conjecture. And it must be confessed, that, in the present case of freezing, the event follows contrary to the rules of analogy, and is such as a rational Indian would not look for. The operations of cold upon water are not gradual, according to the degrees of cold; but whenever it comes to the freezing point, the water passes in a moment, from the utmost liquidity to perfect hardness. Such an event, therefore, may be denominated *extraordinary*, and requires a pretty strong testimony, to render it credible to people in a warm climate. But still it is not *miraculous*, nor contrary to uniform experience of the course of nature in cases where all the circumstances are the same. The inhabitants of Sumatra have always seen water fluid in their own climate, and the freezing of their rivers ought to be deemed a prodigy: But they never saw water in Muscovy during the winter; and therefore they cannot reasonably be positive what would there be the consequence.
